

Editorial

Information Management and Business Review (IMBR) provides a digital forum for researchers to share their knowledge and publish research work in the fields of information management, business, management and related disciplines. The work submitted for publication consideration in IMBR should address empirical and theoretical developments in the subjects related to the scope of the journal in particular and allied theories and practices in general. Author(s) should declare that work submitted to the journal is original, not under consideration for publication by another journal and that all listed authors approve its submission to IMBR. It is IMBR policy to welcome submissions for consideration, which are original, and not under consideration for publication by another journal at the same time. Author (s) can submit: Research Paper, Conceptual Paper, Case Studies and Book Review. The current issue of IMBR is comprises papers of scholars from different universities of Malaysia, Indonesia, China, Thailand and Oman. Acceptance of Korean Food Culture among Young Generations, Tourism Destination Image, Pushing the Boundaries of Food Product Innovation Acceptance, Educator and Caregiver Challenges in Transitioning Students, Impact of Environmental Knowledge on Food Waste Reduction and Sustainability Practices, Hospitality and Tourism Education Perspective, Data Mining and Sentiment Analysis, Student Engagement and Performance Towards Work-Based Learning, Domestic Tourist Intentions, Development of Halal Well-Being Experience Quality, Managing Complexities in Giant Freshwater Prawn Breeding Facilities, Integrated Circular Supply Chain Framework, Social and Finance Security on Gig Workers' Well-being, Medicine Wastage in Private Clinics, How Artificial Intelligence Affected Audit Quality, Role of Artificial Intelligence in the Halal Industry, Digital Zakat Management Research, Decision-Making For Entrepreneurship, Success of SMEs in the Digital Transformation Era, Fraudulent Financial Reporting, Intention to Receive Future COVID-19 Booster Vaccines, Purchase Intention of Fashion Goods via Digital Marketing, Mismatch between Individual Values and Organizational Values, Trend-Driven Innovation for Food Market, Organizational Resilience Through Digital Technology Adoption, Sentiment Analysis on Digital Barriers, Big Five Personality Traits and Waqf Participation, Social Media Content among MSMEs, Knowledge Management Capabilities and Learning Orientation, Social Media Marketing, Foreign Direct Investment and Economic Growth, Effects of Sustainable Development on the Sustainable Performance, Optimal Despatch Rider Management, Technology-Organization-Authoritative Framework, Retirement Savings Behavior, Impact of Remuneration and Motivation on Employee Performance, Community-Based Ecotourism, Public Private Partnership and Financial Implication, Islamic Financial Literacy, Non-Payment of Housing Maintenance Fees, Job Satisfaction and Turnover Intention, Progressive 4.0 Technology Integration, Optimization of Warehouse Operations, Healthcare Service Quality, Fostering Future Investors, Financial Liberalization, Framework for Technopreneurial Behavior, Industrial Relations with Ukhuwwah, Innovative Work Behavior, Social Sustainability in Malaysian Supply Chains, Innovation Capability and Employee Performance, Unclaimed Property, Revisiting Okun's Law, Food Consumption Preference, Non-Shariah Compliance Risks, Online Food Delivery Apps, Mobile Banking Users, Retirement Schemes, Retirement Preparedness among Low-Income Private Sector Employees, Taxation and Cost of Living, Trust in Blockchain Technology, Green Purchase Behavior, Buy Now, Pay Later Spending Spree, Employee's Work-Life Balance, Team Effectiveness, Customer Satisfaction on Online Banking, Housing Prices, Employer Brand Knowledge, Determinants of Participatory Intention, Leadership on Organisational Commitment, Digital Economy and Exports, SWOT Analysis, Offline-Online Learning Switching Behavior, Psychosocial Factors of Mental Health Well-being, Sustainable Transport, Retaining Talent in Digital Era, Predictors of Social Media Marketing, Online Shopping Patterns, Efficacy of Cosmetic Product Safety Regulations, Development of Human Capital, Broadband Services Ouality, Determinants of Zakat Payment, Spirituality at Work in Enhancing Job Performance, Islamic Environmental, Social and Governance, Green Innovation and Firm Performance, Internal Control Mechanisms in Malaysian Public Sector, Radio Frequency Identification System, Work-Life Balance among Gig Workers, Elements of Life Necessities, Service Monitoring System Ratings, Knowledge Management, Kaizen Culture and Training, E-SERVOUAL and Expectancy Disconfirmation Theory, Banks' Performance Amid the Unexpected Crises, Halal Organizational Sustainability, Expertise for Sustainable Ecotourism, Zakat Assistance on Academic Achievement, Financial Literacy of Female Entrepreneurs, Community-Driven Industrial Education, Socioeconomic Profiling and CSR-Driven STEM Education are some of the major practices and concepts examined in these studies. All the submitted papers were first assessed by the journal committee and then the external editorial team for relevance and originality of the work and then blindly peer-reviewed by external reviewers depending on the subject matter of the paper. After the rigorous peer-review process, the submitted papers were selected based on originality, significance and clarity of the purpose. The special issue will therefore be a unique proposition, where scholars will be able to appreciate the latest results in their field of expertise and to acquire additional knowledge in other relevant fields.

Acceptance of Korean Food Culture among Young Generations in Malaysia: Health and Authentic Taste Perspectives

Nurul Afiqah Abdul Razak, Nor Azureen Rozekhi^{*}, Shahril Hussin Faculty of Hotel and Tourism Management, Universiti Teknologi MARA, Cawangan Pulau Pinang, Kampus Permatang Pauh, Permatang Pauh, Pulau Pinang, Malaysia *nor.azureen@uitm.edu.my Corresponding Author: Nor Azureen Rozekhi

Abstract: The Korean Wave, also known as Hallyu, has significantly impacted global culture, and has affected people around the world. This influence has also become a trend in Malaysia, where Korean cultural products are widely embraced, especially by the younger generation. The authenticity of Korean flavors is essential for maintaining its unique culinary identity while health-conscious markets around the world have led to a surge in demand for Korean food Therefore, this study aims to assess the consumer acceptance of Korean food in Malaysia, particularly in Sungai Petani, Kedah, and Pulau Pinang. The Korean Wave, which represents the global popularity of South Korean culture since the 2000s, has exerted a considerable influence on various cultural aspects, including cuisine. Through a quantitative survey, data were collected from 150 participants in the northern area, specifically targeting Generations Y and Z through convenience sampling. The collected data was then analyzed for descriptive statistics, and the correlation to test the hypotheses. The results indicate a significant positive correlation between consumer acceptance of Korean food, health perspectives, and authentic taste variables. The findings of this study suggest that increased exposure to Korean culture through the Korean Wave boosts consumer acceptance and purchase intentions for Korean food culture in Malaysia. This information is valuable for marketers and restaurateurs seeking to capture the growing demand for Korean cuisine. This study offers a localized perspective on the global phenomenon of Korean cultural influence and provides practical recommendations for future research.

Keywords: Consumer acceptance, Korean food, Culture, Health Perspective, Authentic taste

1. Introduction

The Korean Wave, or Hallyu, refers to the global popularity of South Korean culture, which began to spread in East Asia and has since spread worldwide. This phenomenon encompasses various elements of Korean pop culture, including music, movies, fashion, cosmetics, and cuisine (Hanaki, Singhal, Han, Kim, & Chitnis, 2007). Since 2002, Malaysia has actively participated in this cultural trend (Cho, 2010). Growing interest in Korean society and culture has spurred Malaysians to learn the Korean language and explore Korean food, which has become increasingly popular.

The Korean Wave's influence in Malaysia began with the "Winter Sonata" broadcast in 2002, leading to a broader acceptance of Korean pop culture. The show's theme song, rebranded in Malay as "Sonata Musim Salju" and performed by Hazami, topped the Malaysian music charts. Korean music (K-pop) has also gained a substantial following among Malaysian teenagers and young adults, especially at concerts such as I.Seoul.U Concert featuring K-pop artists at the KL Convention Center attracting 6000 fans (New Straits Times, 2017). Korean food popularity in Malaysia has been bolstered by TV shows like "Running Man," which often feature Korean cuisine. The show has a significant following, with 6,000 fans attending a fan meeting in Malaysia in 2017 (The Star, 2017). Additionally, Korean cultural events such as the Korean Lifestyle Road Show 2016 and K-Food Fair have further exposed Malaysians to Korean culture, lifestyle, and culinary traditions.

Asian cuisine, particularly Korean cuisine, has been attracting increasing attention worldwide. Consumers are drawn to Korean cuisine due to its perceived uniqueness and nutritional value compared to other Asian food options (Ha & Jang, 2009). Kim and Sim (2017) observed that the main reason for the increase in the positive perception of Korean food among consumers was the influence of Korean dramas and movies streaming in Malaysia. Based on Jobst (2023), a global survey conducted in 2022 on South Korean cultural content among select countries found that Korean food was highly popular among Malaysian respondents, with over 68% reporting that Korean food was popular in their country. This can be seen by the mushrooming of outlets based in Korea, such as Kyochon 1991, Seoul Garden, Myeondong Topokki, and K-Fry, with halal certification. Jobst

(2022) also stated that the most preferred Korean food worldwide is Korean fried chicken, followed by kimchi, bibimbap, bulgogi, and tteokbokki. Nahar et al., (2018) also revealed that some of the most popular Korean dishes in Malaysia include kimchi, ramen, chigae, chimek, and samgyupsal. Furthermore, according to Astuti and Asih (2021), Korean food has gained popularity worldwide because of its diverse range of dishes and robust flavors. Korean cuisine, which includes dishes like bibimbap and kimchi, has captured the attention of many foodies all over the world and has helped Korean cuisine become more widely accepted (Mujani et al., 2022).

In Malaysia, Korean cuisine has expanded, especially in Kuala Lumpur (Akbarruddin, 2020). With a strong preference for spicy cuisine, Malaysians have influenced the Korean restaurant industry to focus on meeting customers' desires by providing a diverse selection of spicy dishes (Mon and Pil, 2017; Chee & Yazdanifard, 2021). Local Malaysians have a strong interest in the variety of Korean cuisines and the culture they represent. Due to its growing popularity, Korean food faces widespread acceptance in Asia. It is known for its health benefits, featuring low-calorie dishes containing whole grains, vegetables, seafood, meat, and fish (Min, 2009). In addition to health perceptions, the halal label on a restaurant is getting the attention of Malaysian consumers, especially Muslim consumers (Buang et. al, 2018). There has been an increased awareness of the halal status of oriental foods, including Chinese, Japanese, and Korean cuisines. Therefore, more attention must be paid to the halal integrity of Korean foods (Mohd Amin et.al, 2020). Meanwhile, food is a powerful symbol of cultural identity and can influence social status and tourism (Frochot, 2003; Sims, 2009). Therefore, the preservation and authenticity of traditional Korean flavors are essential for maintaining their unique culinary identity. Moreover, the ease of making Korean dishes, accessible in a supermarket, with their nutritional value and unique flavors, positions Korean food as both practical and appealing to a global audience. This demonstrates how the traditional culinary practices of Korea resonate with contemporary food trends and consumer preferences.

This study examines how ethnic authenticity and health influence customer acceptance intentions. Although the popularity of the Korean Wave has been increasing in Malaysia over time, there has been little attempt to conduct empirical or nonempirical research, particularly on the topics linked to customer satisfaction and the acceptability of healthy and authentic taste of Korean food in Malaysia. Consumer satisfaction and acceptance research on food consumption has generally focused on other cultural foods in Malaysia, such as Korean Japanese by Agus et al. (2018) which investigated how a Korean restaurant's ambiance influences repurchase intention. This study aims to examine how Malaysian consumers perceive Korean cuisine, with a particular emphasis on the Sungai Petani, Kedah, and Pulau Pinang regions. This research seeks to understand and further explore the factors (health and authentic flavors perspectives) that influence young generations of Malaysians' acceptance of the culture of Korean cuisine.

2. Literature Review

Overview of Korean Food in Malaysia

The relationship between food and tourism has been extensively examined in terms of various terminologies, such as food tourism, cuisine tourism, culinary tourism, and gastronomic tourism. Food is crucial for attracting international visitors to a country as a tourist destination. Long (2004) highlighted that countries leveraging their unique culinary offerings can enhance their tourism appeal by creating a distinctive gastronomic image. The awareness and appreciation of a country's culinary image have been identified as major components of a travel experience. Consequently, national, and local policies must effectively link food and tourism to actively foster food tourism as a key attraction (Long, 2004; Hwang et al., 2017). The success of such policies is evident in the case of Korean cuisine, where dishes like "kimchi" and "bulgogi" have piqued the interest of Malaysian visitors who seek to experience authentic Korean flavors (Hwang et al., 2017).

One of the standout successes in Korean cuisine is "bibimbap," which has gained international popularity because of its appealing presentation and unique taste profile (Shin & Jeong, 2015). The colorful vegetable and egg dish with red chili paste is visually appealing and flavourful and is loved by people worldwide. Long (2004) further explained that the combination of diverse ingredients provides a complex yet harmonious taste, making it a culinary highlight. In Korean cuisine, grilling and frying are not as commonly used methods, such as fermentation, boiling, grilling, seasoning, and pickles making. Among these options, fermentation is the most

favored because it not only enhances the flavors of the food but also helps preserve it for an extended period (Kim et al., 2016). A distinct characteristic of Korean food is its emphasis on fermentation, with "kimchi" being the most renowned example. Kimchi, a well-known spicy napa cabbage dish, is traditionally buried in the earth during its fermentation time (Oum, 2019). Fermented food culture is a unique element that distinguishes Korean food and adds to its appeal in the culinary tourism sector.

Health Perspectives

The literature on the health benefits and cultural significance of Korean food highlights the unique aspects of its culinary traditions. Kim et al. (2016) asserted that Korea's agricultural history has fostered a distinctive food culture characterized by a high vegetable intake and the use of fermentation techniques. This has spurred growing curiosity about Korean cuisine, particularly its health benefits. Research indicates that the health benefits of Korean food are largely attributable to its ingredients and cooking methods (Health Magazine, 2006). For instance, the fermentation process, which uses effective microorganisms to prevent spoilage, is a key component of many Korean dishes. Popular fermented foods, such as kimchi, doenjang (fermented soybean paste), and gochujang (fermented red chili paste), are not only integral to Korean cuisine but also offer numerous health benefits (Shin & Jeong, 2015).

Kimchi, for example, is known for its probiotic properties, which help reduce harmful gut bacteria, thereby promoting digestive health. Similarly, other fermented foods like jeotgal (salted fermented seafood) enhance flavor, appetite, and nutritional value (Kim et al., 2016). Furthermore, the Korean diet is rich in vegetables and seaweed, which provide essential vitamins and fiber. Vegetables such as lettuce, peppers, carrots, and cucumbers are often consumed raw with sauces like gochujang and doenjang, while seaweed dishes made from laver, kelp, and green algae are common (Kim et al., 2016). The inclusion of varied seasonings, or yangnyeom, created from ingredients like garlic, green onions, red pepper, and ginger, sets Korean food apart from other East Asian cuisines (Surh, 2003). Medicinal herbs and spices, such as black pepper, are also used to enhance the flavors and health benefits of Korean dishes, demonstrating the deep connection between food and health in Korean culinary practices (Hu, 1610). Additionally, the cultural significance of food in Korea is deeply rooted in family traditions, with home-cooked meals (jipbap) symbolizing a mother's love and dedication and emphasizing the importance of natural, unprocessed ingredients (Kim et al., 2016).

Halal Issues: The concept of halal, which denotes what is permissible or lawful in Islamic law, has become a prevalent term in the food industry, particularly in Muslim countries. The term not only applies to food and beverages but also extends to various aspects of Muslim daily life, emphasizing sanitation, protection, and nutritional value. Baharuddin et al. (2015) highlighted that halal and toyyiban (meaning clean and nutritious) symbolize sensitivity toward ensuring food safety and hygiene that is acceptable for Muslim consumption. The growing awareness of and demand for halal food aligns with broader consumer trends toward food safety, health, and ethical considerations.

Previous studies have indicated a significant overlap between the principles of halal food and the general consumer demand for sustainable and ethically produced food. For instance, the halal food market's expansion is partly driven by non-Muslim consumers who are attracted to the perceived higher standards of food safety and quality associated with halal certification (Alqudsi, 2014). This means that halal food products, by adhering to stringent health and ethical standards, can appeal to a broader market beyond the Muslim community. Furthermore, the integration of halal standards into mainstream food safety practices can enhance overall food quality. For example, Tieman and Ghazali (2014) argued that adopting halal certification in global supply chains not only ensures compliance with Islamic dietary laws but also promotes better food safety practices, benefiting all consumers. This demonstrates how halal accreditation can serve as a benchmark for high-quality, safe, and ethically produced food.

Easy to make and prepare: The convenience and simplicity of preparing Korean dishes are integral aspects of their popularity, particularly dishes like bibimbap, which primarily uses grains such as rice and barley. Shin and Jeong (2015) note that Korean cuisine frequently features various types of bap (cooked rice), including steamed rice, boiled barley, and multigrain rice, as the fundamental components of main dishes. Kimchi, a staple side dish in Korean cuisine, exemplifies the ease of preparation. It is typically accompanied by grilled meats, vegetables, and salads seasoned with garlic and chili powder. These side dishes, whether cooked fresh or

seasoned with vinegar, are straightforward to make, highlighting the practicality of Korean cooking (Shin & Jeong, 2015). Seasoning is another critical element that enhances the flavor of Korean food. Key seasonings include fermented soy sauce, fermented soybean paste, vinegar, gochujang (fermented red chili paste), and fermented fish sauces made from anchovies and shrimp. These seasonings not only add depth and complexity to dishes but also underscore traditional fermentation techniques that are central to Korean culinary practices (Shin & Jeong, 2015).

Research supports the idea that the simplicity and ease of preparation of Korean dishes contribute to their appeal. Korean food is not only tasty and varied, but it is also affordable and easy to find, therefore, it is a popular choice for food exploration. According to Ashraf (2024), many traditional Korean dishes are made with simple, easily accessible ingredients, which contributes to their affordability. This accessibility is further enhanced by the health benefits associated with the ingredients and preparation methods used in Korean dishes, making them attractive to health-conscious consumers (Kim et al., 2016). Moreover, the incorporation of fermented ingredients not only improves the taste and nutritional profile of dishes but also aligns with modern dietary preferences that favor natural and minimally processed foods. The fermentation process, which has been refined over centuries, plays a crucial role in preserving food and enhancing its flavors, contributing to the distinctive taste of Korean cuisine (Kim et al., 2016). By referring to the literature review, the following hypothesis is proposed:

H1: There is a relationship between the health perspectives and the acceptance of Korean food culture by young consumers.

Authentic Taste of Korean Food

Food represents a country's culture and is part of it. Accordingly, foods from other countries can appeal to foreigners as unique and sometimes exotic characteristics reflecting a country's culture (Jang et.al, 2012). This uniqueness and difference are often described as "authenticity." This authenticity factor has a significant impact on customers in other countries and is a crucial element of ethnic foods that sets them apart from local cuisines (Chandon et al., 2000; Peabody, 1985; Leclerc et al., 1994). Authenticity is a powerful concept frequently used by restaurateurs to market their cuisine; and deliver a genuine experience to consumers (Jang et al., 2011). The evaluation of authenticity in ethnic restaurants hinges on whether the food is prepared according to traditional methods by local people, ensuring that it is not modified to satisfy consumer expectations (Ebster & Guist, 2004). The definition of traditional Korean food by Chung (2015) and Chung (2009) reflects the idea that food is made with raw materials or ingredients that are traditionally used in Korea, or with similar ingredients. It also involves using authentic or similar cooking methods as well as having historical and cultural characteristics. Additionally, traditional Korean food has developed and is passed on throughout people's lives. Another significant factor is the visual appeal of Korean cuisine, characterized by vibrant colors and textures. Kwon et al. (2015) highlighted that the aesthetic presentation of Korean food, including the arrangement of various banchan (side dishes), plays a crucial role in the dining experience. Fermentation and preservation are central to Korean culinary practices. Kimchi, a staple of Korean cuisine, exemplifies these methods. Park et al. (2016) discussed how fermentation imparts unique flavors and health benefits, making it a cornerstone of Korean dietary habits. The fermentation of kimchi and other fermented foods like doenjang (soybean paste) and gochujang (chili paste), is essential for flavor development and nutritional enhancement.

Creating an authentic dining experience involves more than just tasting the food; it encompasses the entire restaurant atmosphere (Jang et al., 2011). For instance, employees at Korean ethnic restaurants may wear traditional Korean clothing (hanbok), and the decor may reflect Korean cultural elements, making customers feel as though they are in a mini Korea. This immersive environment, combined with the hiring of original Korean chefs to maintain authentic tastes, reinforces the restaurant's commitment to authenticity. Despite the staged elements, customers can still perceive these experiences as authentic, demonstrating that authenticity is subjective and can be shaped by ethnic images and atmospheres (Ebster & Guist, 2004). This indicates that authenticity in ethnic restaurants is not only about maintaining traditional culinary methods but also about creating a holistic experience that resonates with consumers' expectations of authenticity.

Ethnic Foods: In recent years, various ethnic cuisines have become increasingly popular in global food markets. Ethnic food evolves from human culture, and human biological phenomena have significant sociocultural characteristics and are integral to human values (Kwon, 2017). This surge is driven by the increasing availability of ethnic food restaurants and supplies, along with consumers' growing desire to diversify and balance their nutritional diets (Jones, 1997). Mun (2009) emphasized that Asia plays a crucial role in the global food market, particularly in promoting unique foods with functional benefits. Modern consumers are keen on exploring new food experiences and flavor combinations, spurred, by the global exchange of culinary traditions, which include the distinctive flavors imparted by specific spices (Danhi and Slatkin, 2009).

Dietary changes are essential for maintaining a healthy lifestyle, and simplified diets often lead to more health issues (Frison et al., 2006). As cultures evolve and spread globally, consumers' food preferences expand, with various ethnic foods being incorporated into their regular diets (Tian, 2001). Different ethnic groups possess unique cultural backgrounds that influence their food and dietary habits. The recognition of flavor is closely linked to memory, and personal experiences with food are significant in consumer choices (Brandon et al., 2011). Varadachari (2002) noted that the inability to precisely define or measure taste contributes to the connection between memories and taste experiences. Gilmore and Pine's (2007) model asserts that ethnic cuisine must maintain its original taste to remain "true to itself." The global use of diverse sauces has significantly enhanced the flavor profiles of various dishes (Rengsutthi and Charoenrein, 2011), with sauces being a crucial factor in defining the unique taste of a dish. The waste of food products leads to an underappreciation of their unique qualities, which influence eating habits (Mojet and Koster, 2005).

Previous studies have revealed variations in consumers' ability to recall traditional cuisines. For instance, Yusop et al. (2009) found that Chinese consumers living in Europe struggled to identify Chinese dishes. This noted that "authenticity" may vary according to individual experiences and the primary foods used in testing. Jang et al. (2012) discovered that customers experience positive emotions when dining in Korean restaurants because of the authentic atmosphere, highlighting the importance of maintaining an ethnic restaurant's genuine environment. Tey et.al (2018) highlighted the current understanding of why consumers choose to eat ethnic food and stated that this understanding can be improved by identifying the values that influence food preferences. By referring to the literature review, the following hypothesis is proposed:

H2: There is a relationship between the authentic taste of Korean food and young consumer acceptance.

Acceptance of Malaysian Consumers toward Korean food

The growing popularity of Korean dramas (K-dramas) in Malaysia has significantly boosted the visibility and acceptance of Korean culture, particularly its cuisine. The interest in Korean culture has penetrated various aspects of Malaysian life, from entertainment to culinary preferences. This cultural influence is evident in the increasing demand for Korean food among Malaysians, particularly teenagers and young adults, who actively seek out and embrace these culinary experiences. The popularity of Hallyu culture offers an opportunity to expose Korean food goods to consumers in Muslim-majority nations who are already familiar with and interested in Korean culture (Basri et.al, 2024)). This phenomenon can be observed in the widespread popularity of Korean restaurants and food products in Malaysia, which cater to the growing demand for authentic Korean dining experiences.

Previous studies have highlighted the Malaysian market's acceptance of Korean food is driven by its portrayal in popular media, which has successfully captured the imagination and taste buds of the younger demographic (Tan, 2023). The visual and narrative appeal of K-dramas often includes detailed depictions of Korean food, enticing viewers to explore these dishes in their real lives. This media influence is corroborated by empirical research indicating that exposure to foreign cultures through media significantly impacts food choices and dining preferences (Mun, 2009). Furthermore, the trend of Malaysian teenagers actively seeking Korean food aligns with broader global trends of increasing interest in ethnic foods. Jones (1997) notes that ethnic food consumption is rising rapidly worldwide, driven by consumers' desires for novel and diverse culinary experiences. In the Malaysian context, this trend is particularly pronounced among youth, who view Korean food as both a trendy and culturally enriching option.

Culture: According to Gupta (2003), culture can be understood as a way of life, that encompasses cultivated theories, learned behaviors, shared mental programs, convincing philosophies, and interconnected symbols that provide a framework for members of society. This definition underscores the role of culture in shaping social norms and behaviors. Food is deeply intertwined with cultural identity and social structures. Hall and Mitchell (2000) argue that food serves multiple purposes beyond mere sustenance, linking it to issues of identity, culture, production, consumption, and sustainability. This perspective highlights the potential of destination foods to connect various senses and cultural understandings, positioning food as a significant element in tourism and cultural exchange. Seo and Yun (2015) added that individual food consumption reflects personal identity and agree that what we eat conveys meaning about who we are.

The promotion of unique and traditional cuisines can significantly enhance a country's culinary image and attract tourists. Long (2004) asserted that countries with distinctive cuisines can leverage food as a key element of tourism, particularly in the realm of culinary tourism. This idea is supported by Bessière (1998), who notes that traditional food not only provides pleasure but also serves as a cultural activity that can draw tourists to specific locations. This underscores the role of local food in enriching travel experiences and fostering cultural education. Strategic promotion of local foods has become a central component of tourism development. Local dishes can enhance a destination's appeal by offering tourists the opportunity to taste unique and authentic flavors. This approach is evident in various government initiatives that promote the uniqueness of national cuisines. For example, Huang (2009) discusses how Korean tourism effectively utilizes TV dramas and entertainment to popularize Korean cuisine, illustrating the powerful influence of media on food trends. The rise of the Korean Wave (K-Wave) exemplifies how cultural products, such as TV dramas, can boost the popularity of a nation's cuisine and contribute to its cultural and economic growth. Huang (2009) further concludes that the intersection of culture and economy is vital for social structure, with Korean TV dramas serving as a successful example of cultural and economic imperialism.

Research Framework

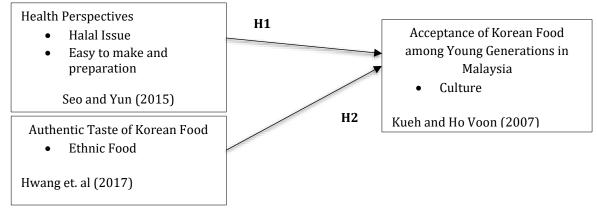

Figure 1: presents the proposed research framework of this study.

Figure 1: Propose research framework adopted from Hwang et.al (2017), Seo and Yun (2015), and Kueh and Ho Voon (2007).

3. Methodology

Research Design and Sampling

Bloomfield and Fisher (2019) stated that quantitative research explores more valuable outcomes through proper evaluation in the form of figures. Therefore, this study used a quantitative research design focusing on producing numerical evidence to analyze cause-and-effect relationships within the research context. Specifically, it is a descriptive study that aims to look at the relationship between the independent variables (health perspectives, authentic taste of Korean Food) and the dependent variable (acceptance of Korean food culture among young generations). The population of this study is Generation Y (age 22-39) and Generation Z (age 6-23) who reside in Sungai Petani, Kedah, and Pulau Pinang. A convenience sampling method was used

and randomly selected 150 respondents participated in the survey using G-Power software. All 150 questionnaires were prepared and distributed via Gmail, WhatsApp, and social media platforms such as Facebook and Instagram. The questionnaire was designed using Google Forms.

Instrumentation

The research instrument was created to meet the research objectives, research questions and research framework. The questionnaire consists of four main sections which are as follows; Part A (Hwang et.al (2017) focused on the respondent's frequency of eating Korean food, how they learned about Korean food, and how often they ate it. Part B evaluated respondents' opinions on Korean food health perspectives, such as halal certification and ease of preparation (Seo and Yun (2015). Part C assessed the respondents' perceptions of the authentic taste of Korean food from Hwang et.al (2017). Part D (Kueh and Ho Voon (2007) measured the respondents' acceptance of Korean food in terms of culture. Part E focuses on respondents' demographic profiles. The questions were designed to be simple and easy for the respondents to understand. The respondents were required to indicate their level of agreement on a five-point Likert scale ranging from (1) with "strongly disagree" to (5) with "strongly agree".

4. Results and Discussion

The statistical tests used to analyze data such as descriptive, frequency, and the Pearson Correlation analysis were used to examine the relationship between the independent variables and the dependent variable. The questionnaire item was divided into the frequency of eating Korean Food, Korean food health perspectives, authentic taste of Korean Food, consumer acceptance of Korean food, and demographic profile.

Reliability Test

To test the validity of the instrument, the study conducted a reliability test on the research instrument using Cronbach's Alpha. These results demonstrate that the research instrument had strong internal consistency and reliability across all sections. The high Cronbach's Alpha values for the items in each section are positively correlated and provide consistent measurement. The results are presented in Table 1:

Instruments	Alpha Cronbach's Value	Number of Items
Korean Food Health Perspectives	0.966	12
The authentic taste of Korean food	0.975	4
Consumer acceptance	0.984	7

Table 1: Cronbach's alpha values

Profile of Respondents

Table 2 displays the demographic profile of the respondents who participated in the study. The age distribution of the 150 respondents was as follows; 37 (24.7%) were 18-20 years old, 86 (57.3%) were 21-23 years old, 17 (11.3%) were 24-26 years old, 2 (1.3%) were 27-29 years old, and 8 (5.3%) were 30-36 years old. The gender distribution was 46 (30.7%) male and 104 (69.3%) female respondents. In terms of education level, 91 (60.7%) students had a bachelor's degree, 44 (29.3%) had a diploma, 12 (8%) had SPM, and 3 (2%) had post-graduate studies. For salary, 90 (60%) were students, 15 (10%) earned 1000-1500, 15 (10%) earned 2500-5000, 11 (7.3%) earned 0-500, 10 (6.7%) earned 1500-2500, and 9 (6%) earned 500-1000.

Table 2: Frequency and percentages of demographic profiles.

		Frequency	Percentage (%)
Gender	Male	46	30.7
	Female	104	69.3
Age	18 – 20 years	37	24.7
	21 – 23 years	86	57.3
	24 – 26 years	17	11.3
	27 – 29 years	2	1.3

Information Management and Business Review (IMBR) Vol. 16, No. 3(S), Sep 2024 (ISSN 2220-3796)			
	30-year-old and above	8	5.3
Education Level	SPM	12	8.0
	Diploma	44	29.3
	Degree	91	60.7
	Others (Master, PhD, etc)	3	2.0
Salary	Students	90	60.0
	RM 0 - RM500	11	7.3
	RM 500 – RM 1000	9	6.0
	RM 1000 – RM 1500	15	10.0
	RM 1500 – RM2500	10	6.7
	RM2500 – RM5000	15	10.0

The results of screening questions about the frequency of eating Korean food displayed in Table 3 show that out of 150 respondents, 143 (95.3%) had tried Korean food, while 7 (4.7%) had not. The second analysis focused on the sources through which respondents learned about Korean food with 22 respondents (14.7%) hearing about it from the internet, 91 (60.7%) from social media, 30 (20%) from friends, and 7 (4.7%) from family. For the frequency with which respondents eat Korean food, the analysis revealed that 2 respondents (1.3%) ate Korean food every day, 6 (4%) once a week, 65 (43.3%) once a month, and 77 (51.3%) ate it once a year. The final analysis assessed respondents' opinions on the affordability of Korean food, with 79 respondents (52.7%) believing Korean food is affordable, and 71 (47.3%) not.

Table 3: Frequency and percentage of respondents eating Korean Food

		Frequency	Percentage (%)
Have you tried Korean food?	Yes	143	95.3
	No	7	4.7
Where have you heard about Korean food?	Internet	22	14.7
	Social media	91	60.7
	Friends	30	20.0
	Family	7	4.7
How often do you eat Korean food?	Every day	2	1.3
	Once a week	6	4.0
	Once a month	65	43.3
	Once a year	77	51.3
In your opinion, Korean food is affordable to purchase	e?Yes	79	52.7
	No	71	47.3

Descriptive Analysis of Korean Food Health Perspectives

Table 4 presents the means and standard deviations of various factors related to Korean food health perspectives. The results indicate a range of perceptions regarding the health and appeal of Korean food. The highest-rated factor was "Korean food is attractive to eat" with a mean score of 3.89 (SD = 0.923), indicating strong agreement among respondents on the visual appeal of Korean cuisine. Respondents also highly rated the perception that Korean food is hygienic, with a mean score of 3.75 (SD = 1.011). The taste of Korean food acceptable to young consumers received a mean score of 3.69 (SD = 0.904), showing a generally positive attitude toward Korean cuisine flavors The ease of finding ingredients for cooking Korean food at home had a mean score of 3.62 (SD = 0.946), implying that respondents found it relatively convenient to access these

ingredients. The aspect of using organic and fresh ingredients in Korean cuisine was rated as 3.57 (SD = 0.839), indicating a favorable view toward healthier food choices. The use of halal and trustworthy ingredients in Korean restaurants received a moderate mean score of 3.55 (SD = 0.816), agreeing with a positive perception among consumers. On the other hand, the lowest-rated factor was "Have you ever cooked Korean food?" with a mean score of 2.59 (SD = 1.238), suggesting that fewer respondents have personal experience preparing Korean food.

Variable	Mean	Std. Deviation
Have you ever cooked Korean food?	2.59	1.238
The food served at the restaurant is hygienic	3.75	1.011
Korean restaurants use halal and trustworthy ingredients	3.55	0.816
Korean food is attractive to eat	3.89	0.923
The restaurant uses organic and fresh ingredients	3.57	0.839
The food served is easy and not complicated to eat	3.62	0.946
The taste of food is acceptable for Malaysians	3.69	0.904
If we want to cook at home, the ingredients are easy to find	3.12	1.032
The method of cooking Korean food is simple and not complicated	3.33	0.847
The food tastes delicious even when cooked at home	3.45	1.014
The food is rich in nutrition and delicious	3.68	0.900
The food is easy to prepare and make	3.41	0.920

Table 4: Descriptive Statistics of Korean Food Health Perspectives

Descriptive Analysis of Authentic Taste of Korean Food

Table 5 presents the mean and standard deviation for various factors related to the authentic taste of Korean food. The highest-rated factor is "Can accept the taste of Korean food" with a mean score of 3.72 (SD = 0.956), indicating a strong overall acceptance of Korean food's taste and its acceptableness to respondents. The perception of a unique and exotic relish owing to the differences in food from other countries received a mean score of 3.66 (SD = 0.858), suggesting a positive view toward the distinctiveness of Korean flavors. The feeling of dining at a high-class restaurant with effort rather than just consuming instant food received a mean score of 3.57 (SD = 0.937), indicating a moderate agreement among respondents regarding the dining experience associated with Korean food. The lowest-rated factor is "Can you eat other side dishes with rice, for example, kimchi?" with a mean score of 3.53 (SD = 1.145), suggesting reservations about specific Korean side dishes.

Table 5: Descriptive Statistics of the Authentic Taste of Korean Food

Variable	Mean	Std. Deviation
Can accept the taste of Korean food	3.72	0.956
Can feel unique and exotic relish due to having food that is different from that of other countries	3.66	0.858
Can you eat other side dishes with rice, for example, kimchi?	3.53	1.145
Can get the feeling of going to a high-class restaurant with effort, unlike just eating fast food	3.57	0.937

Descriptive Analysis of the Consumer Acceptance of Korean Food

Table 6 displays the mean and standard deviation for various factors related to consumer acceptance of Korean food. The highest-rated factor is "Can differentiate between Korean and other cuisines" with a mean score of 3.79 (SD = 0.869), indicating that consumers could clearly distinguish Korean food from other types of food. "The service offered at the restaurant was satisfactory" received a mean score of 3.67 (SD = 0.871), suggesting a generally positive perception among respondents regarding the service quality at Korean restaurants. "Can identify the Korean restaurant properly without confusing them with Chinese or Malay restaurant" had a mean

score of 3.64 (SD = 0.929), indicating a relatively high level of agreement among respondents in correctly identifying Korean restaurants. "Quickness of order and service in Korean restaurant" had a mean score of 3.59 (SD = 0.876), indicating a moderate level of agreement among respondents regarding the efficiency of service at Korean restaurants. "Customers get the feeling at Korea when entering a restaurant" had a mean score of 3.50 (SD = 0.947), indicating a moderate level of agreement among respondents that they experience a sense of being in Korea when entering a Korean restaurant". The price of the food and service provided is affordable" received a mean score of 3.34 (SD = 0.989), suggesting a moderate level of agreement among respondents that they expendents regarding the affordability of Korean food and services. On the other hand, "The staff use Korean language at the restaurants in addition to English and Malay language" received a mean score of 2.97 (SD = 1.058), suggesting a lower level of agreement among respondents regarding the use of Korean language by Korean restaurant staff.

Variable	Mean	Std. Deviation
Customers get the feeling of being in Korea when entering a restaurant	3.50	0.947
Staff use the Korean language at the restaurant in addition to English and Malay	2.97	1.058
Can identify Korean restaurants properly without confusing them with Chinese or Malay restaurants	3.64	0.929
The price of the food and services provided is affordable	3.34	0.989
Can differentiate between Korean and other cuisines	3.79	0.869
The service offered at the restaurant was satisfactory	3.67	0.871
Quickness of order and service in a Korean restaurant	3.59	0.876

Table 6: Descriptive Statistics of Consumer Acceptance of Korean Food

Correlation Analysis of Variables

The Pearson correlation coefficient analysis was conducted to determine the relationship between Korean food health perspectives (independent variable) and consumer acceptance of Korean food (dependent variable). The Pearson Correlation analysis in Table 7 shows a significant positive relationship between Korean food health perspectives and consumer acceptance of Korean food, with a correlation coefficient (r) of 0.991 and a p-value of 0.000 (p < 0.01). This means that there is a statistically significant relationship between the two variables, leading to the rejection of the null hypothesis (H0) and acceptance of the alternative hypothesis (H1). Thus, H1 is accepted. Therefore, the relationship between Korean food are likely to lead to increased consumer acceptance. The high correlation coefficient (0.991) demonstrates that as consumers perceive Korean food to be healthier, their acceptance and preference for it correspondingly increase. This aligns with previous research emphasizing the importance of health perceptions in consumer food choices (Raghunathan, Naylor, & Hoyer, 2006).

Table 7: Pearson Coefficient Correlation between Korean Food Health Perspectives and Consumer Acceptance

Variable	Korean Food Health Perspectives	Consumer Acceptance of Korean Food
Korean Food Health Perspectives	1	.991**
Consumer Acceptance of Korean Food	.991**	1
Sig. (2-tailed)	-	.000
Ν	150	150

The Pearson correlation coefficient analysis in Table 8 displays the relationship between the authentic tastes of Korean food (independent variable) and consumer acceptance of Korean food (dependent variable). The analysis revealed a significant positive relationship between authentic Korean food taste and consumer

acceptance of Korean food. The correlation coefficient (r) was 0.987, with a p-value of 0.000 (p < 0.01), indicating a statistically significant relationship between these variables. Consequently, the null hypothesis (H0) is rejected, and the alternative hypothesis (H1) is accepted. Thus, H2 is accepted. Therefore, the relationship between the authentic tastes of Korean food and consumer acceptance is effective. This highlights that as consumers perceive Korean food to be more authentic in taste, their acceptance and preference for it increase significantly.

Table 8: Pearson Coefficient Correlation be	ween Authentic Taste of Kor	ean Food and Consumer
Acceptance		

Variable	Authentic Taste of Korean Food	Consumer Acceptance of Korean Food		
Authentic Taste of Korean Food	1	.987**		
Consumer Acceptance of Korean Food	.987**	1		
Sig. (2-tailed)	-	.000		
N	150	150		
Correlation is significant at the 0.01 level (2-tailed)				

Influences of Korean Health Perspectives on Consumer Acceptance

Health perspectives related to Korean food can influence consumer acceptance of Korean food. According to the respondents, we can see that not everyone has tried Korean food, possibly because of its high cost. Respondents agreed that Korean food is appealing because it is commonly served with meat wrapped in a special sauce and fresh lettuce. This is supported by the descriptive analysis of health perspectives related to Korean food, which reveals that the item "Korean food is attractive to eat" has the highest score, with an average of 3.89. Additionally, we should consider that health also involves hygiene. Korean people are known for their cleanliness standards, as they always wear gloves when eating and their eating places are clean and tidy. Korean food is also popular because it includes various vegetables that help reduce cholesterol and promote positive biological activity. Dietitians state that many common ingredients used in Korean cuisine are vegetables, and cooking methods such as grilling, stewing, and fermenting are healthier than deep frying. Furthermore, the ingredients in Korean food can improve digestion, strengthen bones, and promote skin health. When dining at a Korean restaurant, it is common to be served soup with every meal, which is a satisfying and relatively low-calorie option. Undoubtedly, when food is served freshly, customers are more likely to seek it out due to its benefits for their well-being (Rozekhi, Hussin, Siddig, Rashid and Salmi, 2016). As Rozekhi et al. mentioned, restaurants must make customers aware of and guarantee the use of fresh products and ingredients. This is essential for establishing long-term and profitable relationships with customers.

Influence of Authentic Taste on Consumer Acceptance of Korean Food

The results show a Pearson correlation, with an R-value of 0.987. This shows a positive relationship between the authentic tastes of Korean food and consumer acceptance of Korean food. The data confirms that the authentic taste of Korean food can influence consumer acceptance. The Pearson correlation value (0.987) indicates a strong correlation between authentic taste and consumer acceptance. Regarding the research question of whether authentic taste can impact consumer acceptance, most respondents in Sungai Petani, Kedah, and Pulau Pinang agreed that taste significantly influences their choice to eat Korean food. The global popularity of Korean cuisine is demonstrated by the acceptance of authentic Korean flavors, such as kimchi. Kimchi, a staple in Korean food, is particularly noted for its unique flavors and health benefits, leading people worldwide to seek out and learn how to prepare it themselves and promote healthy meals in traditional ways (Hongu et al., 2017). This is supported by the result of the descriptive analysis, which shows that the lowest score for "Can eat other side dishes with rice, for example, kimchi" is 3.53, indicating agreement on a Likert scale ranging from 2-Disagree to 4-Agree.

5. Managerial Implications and Recommendations

This study contributes to understanding customer preferences and the acceptance of Korean food among residents in Penang and Sungai Petani, Malaysia, and it fills a gap in the literature on cultural influences in local contexts. The localized focus enhances the result accuracy and offers insights into psychological perspectives on consumer behavior. Practically, the study aids consumers in making informed choices, encourages repeat patronage, and helps restaurant owners improve customer experiences, thus driving business growth. The findings can inform policymakers on strategies to promote cultural exchange and tourism by leveraging the global popularity of Korean culture to strengthen bilateral relations and economic opportunities between Malaysia and South Korea.

However, this study has some limitations that need to be addressed. The study was geographically conducted in Sungai Petani, Kedah, and Pulau Pinang, thereby limiting the sample size of respondents. Additionally, compared to larger cities such as Kuala Lumpur, the number of Korean restaurants is relatively small, and few have halal certification. This limitation of both location and sample size may have affected the generalizability of the findings. Despite these limitations, the study provides valuable insights into Malaysian consumers' acceptance of Korean food. Therefore, future research should underscore this challenge by expanding the geographical scope to encompass various regions in Malaysia, such as Kuala Lumpur, Johor Bahru, and other cities with larger populations. Including more diverse areas will help obtain a more representative sample, which can improve the generalizability of the findings (Rozekhi et al., 2016). Moreover, increasing the sample size will enhance the reliability and validity of the results. Larger sample sizes help mitigate the effects of hidden values and provide a more accurate picture of population preferences. This will employ more robust statistical analyses, such as multivariate regression, to identify key predictors of consumer acceptance. Additionally, further studies should investigate the importance of the authenticity of Korean food which is valuable for restaurants. Understanding how different authenticity aspects, such as ingredients, cooking methods, and dining experiences, influence consumer satisfaction can guide business practices.

Conclusion

This study provides valuable insights into the factors influencing Malaysian young consumers' acceptance of Korean food, focusing on residents of Penang and Sungai Petani, Kedah. The findings reveal a strong positive correlation between the authentic taste of Korean food and consumer acceptance (r = 0.987, p < 0.01), highlighting the significant role of unique flavors in shaping consumer preferences. Furthermore, the health benefits associated with Korean food, including its vegetable-rich ingredients and hygienic dining practices, were critical in influencing consumer attitudes. This study concludes that many Malaysian consumers have already tasted Korean food, with some expressing a preference for it to the extent of regular consumption. This demonstrates the increasing presence of Korean restaurants in Malaysia, such as Seoul Garden, Mr Dakgalbi, K-Fry, Kyochon 1991, and 4Fingers, which reflects this growing interest. This information is valuable for restaurant owners and policymakers. It can help create a diverse culinary landscape that meets different consumers' needs.

Tourism Destination Image: Towards a Better Performance on Malay Restaurant by Reflecting Competitive Advantage in Business Organization

Mohd Syaifuddin Mohd Alias^{*}, Zaharah Mohamed Rani, Hashim Fadzil Ariffin Faculty of Tourism and Hotel Management, Universiti Teknologi MARA (UiTM) Penang Branch, Permatang Pauh Campus, Permatang Pauh, Penang, Malaysia *syfdnalias@gmail.com, zaharah3813@uitm.edu.my, hashim@uitm.edu.my Corresponding Author: Mohd Syaifuddin Mohd Alias

Abstract: A study on revisit intention has a different meaning in business development. Competitiveness in business activities such as in Malay restaurants needs to use a various method. To gain the functionality of the development, innovation practices and destination image should be aimed for a better understanding of the overall concept. This study aims to design a conceptual understanding of the destination image and innovation practices toward Malay restaurant performance grounded in competitive advantage theory. Furthermore, competitive advantage provides insight into how the connection between business organizations will help the development and sustainability of business performance. In addition, it will bring a more significant contribution to the structure of the organization. This article suggests that a significant measurement of competitiveness could be ascertained from a performance perspective. The article integrates previous studies on the respective measures and proposes a conceptual framework for tourist destination image. Destination image relates to restaurant performance, which can be studied further in the future. It will contribute to the significance of practicality and theoretically as it mentioned the purpose of destination image and competitive advantage towards Malay restaurant performance. However, in terms of Malay restaurant performance, it still needs to be discussed in depth as it has a limited view of the discussion. Determinants of tourism destination image, innovation practices, and restaurant performance are also discussed for future research.

Keywords: Competitive advantage, destination image, innovation practices, restaurant performance, intention to travel

1. Introduction and Background

Tourism activities have changed rapidly over the years influenced by technological advancement and application (Kumar & Shekkar, 2020). The changes are seen as an advantage for the business surroundings to support the local economy and to prepare for the significant relevancy of current demand. In terms of relation, sub-sectors such as tourism and hospitality industry have a major role in progressive advancement towards development. Tourist flexibility of interest and the complexity of their behavior in choosing their preferences during their travel including their preference on choosing food and beverages are unique (Pilis, Kabus, & Miciula, 2022). The relationship in terms of tourist movement and preferences in travel intention and revisit intention has been discussed by Pilis et al. (2022) in the context of food service management.

The rapid growth of technological factors has shaped both tourism and food service industries to become more quality-centric for the customer could be seen in the remarkable market competitiveness (Gheribi & Bonadonna, 2019). As mentioned by Gheribi and Bonadonna (2019), various job creation through these industries have helped in the local economy and generated sustainability for further development. Knowledge in cognitive behavior is illustrated by the statement as important for business opportunity as it influences people's movement, attitude, and behavior to choose their preferences. As stated by Barney (1991), knowledge is an insight that can be equipped by experience and education and it derives a competitive advantage to be more strategically developed.

The growth from the technology advancement has brought a new structure in strategizing the effort on business and marketing (Hassan, Akanmu, Mohamed, & Nazir, 2019). Most of the restaurants have developed their strategy to compete with their competitors and to follow current trends to get more insight from their potential customers. Based on this point, Nafukho, Hairston, and Brooks (2004) stated that knowledge, experience, and skills are inseparable and could reveal significant competitiveness in business performance. It is known to the business development where the prominence evidence by mentioning business performance would gain strategic attainment from the competitive advantage.

Previous studies on Malay business restaurants have indicators of the positive revealed by using competitive advantage (Ghazali, Nashuki, & Othman, 2018; Alias, Ariffin & Abdullah, 2021). However, in the discussion, tourism destination image involvement in the construction is still limited and needs to be discussed thoroughly. The discussion on the subject had not been discussed widely for the related construct and the study on tourism destination image on Malay restaurant performance is limited. Thus, the significance of the study is to specifically justify the construct of tourist destination image and the Malay restaurant performance. While it is important to see how the destination image and business organization should be operating, the study on Malay restaurants would be sufficient as revisiting the intention to travel are indicator of the construct (Kralikova, Peruthova, & Ryglova, 2020).

2. Literature Review

Competitive Advantage: In a study of competitive advantage, it has been reported that competitive advantage will assist business organizations in optimizing performance and motivate the effort of business organizations to develop (Dubey, Gunasekaran, Childe, Blome, & Papadopoulos, 2019). Collins (2020) suggested that competitive advantage is involved within the resource-based view (RBV) theory which works as a stronghold for organizational structure (Azeem, Haider, & Sajjad, 2021). Knowledge sharing and innovation in the organizational process should be implemented for competitive advantage to be integrated with the organizational structure. Other than that, the competitive advantage has been mentioned as a tool in sustaining business performance including innovation practices to maintain the proposition of organizational development (Azeem et al., 2021).

Innovation Practices: Evidence from the study concluded that creativity can be the definition of destination image development in a particular destination (Lita, Faisal, & Meuthia, 2020). This involves innovation practices which the potential can be found by the application of creativity in Indonesia. The implementation of technological advancement and the adoption of new technology would be added to the business opportunity (Ahmad & Scott, 2019). The role of innovation can be seen in the Malaysian restaurant industry which comprehends the tourism quality involving revisiting intention and travel destination practices have been described as one of the tools to develop the internal and external environment of company profitability (Najib, Septiani, & Nurlaela, 2020). As mentioned in the previous study on the restaurant to evolve (Lee, Hallak, Sardeshmukh, 2019).

Tourist Destination Image: Previous studies mentioned the concept of tourism destination image has seemed vague and normally referred to the psychological aspect which has an uncertain definition to define the term (Lai & Li, 2015). Several scholars attempted to examine the term to relate it to the current concept (Gallarza, Saura, & Garcia, 2002; Pike, 2007). Based on the empirical evidence from the previous findings, there is a different perspective on each of the evidence by using different methods. For instance, the quantitative method had different connotations on the analysis and the qualitative had a different value on the perspective. Based on Hetzel (2023), the term can be simplified by following the factors that have been listed to define tourism destination image, (1) rich with heritage, (2) cuisines heritage, (3) affordable and friendly locals, (4) entertainment consideration, (5) rich with histories, (6) shopping, and (7) festivals. These factors are common in creating an image of destination is likely to be resorted.

However, Rasoolimanesh, Seyfi, Rastegar, and Hall (2021) argued that the implication of destination image should be improved by the psychological needs of individuals which are influenced by their experience and behavior. Particularly, previous scholars have mentioned the usage of cognitive and affective components in specific destination images (Tan & Wu, 2016; Karl, Muscat, & Ritchie, 2020). In addition, other scholars mentioned that the cognitive component should be measured by implying two determinants known as an intention to travel and revisit intention. From the statement, it can be concluded that destination image can be reflected in the two factors that involve cognitive and affective as well as it could affect the whole decision of an individual to travel and revisit the destination.

The Influence of Intention to Travel on Restaurant Performance: Cognitive and affective abilities have been discussed widely by previous studies to indicate the complexity of destination image (Tassiello & Tillotson, 2020). The connection the captivity has re-known the term of destination image with travel motivation which involved subjective terms of one's previous visit and travel experience. The concept of travel intention has been justified by Zhang, Wu, Morrision, Tseng, and Chen (2018) as an indicator of the individual's desire and perception of the quality that is residual in the destination. It also involves the way the individual experiences the service quality of any hospitality provider including the restaurant business.

However, based on Ting, Fam, Cheah, Richard, & Nan (2019), found that the opportunities in the food and beverages and restaurant business with destination image have a significant contribution to the intention to travel. Following the rules in cognitive and affective abilities, the researchers have stated that the influence that might appear in individual psychological thought to choose the restaurant or food and beverages involves the authenticity, quality, ingredients, and preparation of the cuisines themselves (Ting et al., 2019). The experience that they will gain through the consumption of food will potentially bring the intention upfront. Hasan, Som, and Ismail (2018) have their opinion on the statement which justified that the intention to travel is related to the satisfaction and intention to revisit. This is where the determinant spreads for the relation between dimensions.

The Influence of Revisit Intention on Restaurant Performance: Individuals who decide to revisit the destination have a different behavior which can be classified into their intention for the destination's innovation, promotional effort, and positive memory which come from experience (Um, Chon, & Ro, 2006). Based on the report that has been prepared by Zhang, Wu, and Buhalis (2017), most of the tourists who decide to revisit the destination are generally influenced by their perception and experience. The destination also depends on these factors to keep loyal visitors from revisiting the destination. In addition, there were arguments on the revisit intention comes from the ethnic food and ethnic restaurant performance (Hwang, Kim, Choe, & Chung, 2018). For instance, Korean culture has evolved to be the most followed culture including their trend of food and the intention is majorly on the satisfaction and experience of the tourist from television, food culture, and the first-time traveller to South Korea (Omar & Karim, 2013).

On the other hand, Khairi and Darmawan (2021) suggested that restaurants should follow past studies to conserve food authenticity to keep loyal visitors. Furthermore, Safian, Osman, Wahab, Othman, and Azhar (2021) claimed the same justification which indicates that the focus of restaurants should be more on sustaining the quality, uniqueness, service quality, attractiveness of the destination, location, tourism facilities, and the most important thing is the satisfaction of the customers. These factors are inevitable and could bring more visitors and repeat customers by following the destination image logical understanding. Therefore, the destination image is an important suggestion for restaurant performance to be more reliable and competitive.

Restaurant Performance: The restaurant industry has been mentioned as one of the massive contributors to gross profit (Domi, Keco, Capelleras, & Mehmeti, 2019). The report from WTTC (2018) stated that the restaurant industry made a profitable growth financially in the development of society. The effectiveness of technological advancement and other factors in developing and sustaining restaurant performance can be seen as an external contribution for a particular reason. As mentioned by Bagur-Femenias, Perramon, and Oliveras-Villanueva (2019), the quality that is needed to sustain restaurant performance includes the serving, menu, food, and environment. These qualities will guide the restaurant to be more competitive according to the competitive advantage theoretically. It offers a direct change based on the determinants of restaurant performance namely growth, sustainability performance, profitability, and satisfaction with performance (Lai, Abidin, Hasni, Karim, & Ishak, 2021; Kim & Jang, 2020; Erkmen, 2019; Isnaini, Nurhaida, & Pratama, 2020)

In a case study in the context of Malay restaurant performance, one of the factors that provide a useful advantage for the restaurant's persistence is the image that has been portrayed by the restaurant to attract customers and revisit customers (Abdullah & Isa, 2020). An exceptional finding that mentioned clearly how the destination image would contribute to the restaurant's sustainability and performance in terms of tourism context. However, a previous study stated that in terms of sustaining the restaurant's overall performance, the managers and owners of the restaurant should emphasize the performance indicators and attributes namely resources, materials, handling, service, environment and other indicators involved (Ramli & Surbaini, 2020).

Tourist Destination Image Conceptual Framework: The contribution of the tourism sector has brought about a massive development in the local economy. Based on the statement of a previous study, the tourism sector has opened up various opportunities and left a remarkable perception of tourist destinations including destination image (Al-Ansi & Han, 2019). It has not evolved only for the sole purpose; however, it involved other sub-sectors that comprehend the availability of the massive sector. The restaurant industry is truly given an inspiring opportunity to evolve and align with the tourism sector as one of the factors of tourist perception of the destination image is restaurant attributes (Lai, Khoo-Lattimore, & Wang, 2017). Other than that, travel decision was made by the tourist because of their intention based on their perception of the destination. Meanwhile, revisit intention is based on their experience throughout the expedition in the foreign countries or the destination provider. Based on the antecedents that have been discussed, tourist experience and knowledge are a breakthrough for food image and branding (Lai et al., 2017). The positive food experience might have a possibility for the tourist to decide whether it is suitable for them to revisit the place for another food experience (Hsu & Scott, 2020).

Furthermore, competitive advantage plays a major role in connecting the performance of a restaurant to be acceptable for customer consumption (Gheribi & Bonadonna, 2019). Destination image has been mentioned as a possible indicator of the visiting customer who comes from word of mouth (WOM) or revisit customer (Kralikova et al., 2020). This argument is in line with the other scholars who mentioned that the business strategy should try to provide demand from the environment, quality of service, excellent menu, and good management (Kumar M, Govindarajo, & Khen, 2019). A case study about the changes in the restaurant has implied that the destination image has created value from the perspective of the customer which supports the restaurant's name (Ragab, Mahrous, & Ghoneim, 2019).

Literature on destination image has explained the essential dimensions of destination image known as intention to travel and revisit intention. Based on the arguments and assumptions on tourist destination image literature, there is a significant finding relating the construct to restaurant performance. The concept of destination image can be applied to get a greater impact on restaurant sustainability which eventually provides a greater effect to the local expenditure, economically. The destination image is grounded by two major elements in the construct namely intention to travel and revisit intention. Therefore, the construct can be measured for the relevancy of better restaurant performance and sustainability performance.

3. Discussion

In this article, the relationship between tourist destination image and Malay restaurant performance is discussed to get ample results of the variables. Although a fundamental understanding of tourist destination image focuses on the tourism industry, the review of previous literature has a significant impact on the restaurant industry and food and beverages industry as well (Hsu & Scott, 2020; Lai et al., 2017). It can be concluded that tourist destination image has affecting factors that can be applied in any sub-sectors in the tourism and hospitality industry. Various studies on tourist destination image have made an impact on the effort to identify the tourist experience and knowledge to revisit the destination and to have an intention to go travel because of the destination image; however, there has been limited study on the ethnic restaurant performance are two important components in handling sustainability performance. The measurement of destination image will directly respond to the Malay restaurant performance which refers to the indicators that have been mentioned (intention to travel and revisit intention).

4. Conclusion

The proposed conceptual model integrates the relationship between tourist destination image and restaurant performance in computing the overall assessment of Malay restaurant sustainability performance. The proposed conceptual model offers a different set of determinants which includes growth, sustainability performance, profitability, and satisfaction with performance (Lai et al., 2021; Kim & Jang, 2020; Erkmen, 2019; Isnaini et al., 2020). Hence, the critical understanding of the dynamism of tourist destination image and restaurant performance will help the integrated conceptual framework to understand the whole structure of tourism ability and restaurant strength in sustaining business performance.

Pushing the Boundaries of Food Product Innovation Acceptance: A Case of Radical Ready-to-Eat Food Product Innovation in Malaysia

Wan Rusni Wan Ismail¹, *Nur Hidayah Che Ahmat¹, Rafidah Aida Ramli, Sri Handajani², Anderson Ngelambong¹ ¹Faculty of Hotel and Tourism Management, Universiti Teknologi MARA Cawangan Pulau Pinang, Malaysia ²Home Economic Department, Faculty of Engineering, Universitas Negeri Surabaya, Indonesia rusni.wi@uitm.edu.my, *hidayah.ca@uitm.edu.my, wanfidah@uitm.edu.my, srihanhajani@unesa.ac.id, anderson@uitm.edu.my Corresponding Author: Nur Hidayah Che Ahmat

Abstract: This study examines the impact of food neophobia and food innovation on Malaysian consumer attitudes, subjective norms, perceived behaviour control, and consumer behaviour intention towards readyto-eat (RTE) foods. Additionally, this study investigates the mediating effects of food innovation, attitude, subjective norms, and perceived behaviour control on the relationship between food neophobia and consumer behaviour intention. A quantitative cross-sectional study was used whereby an online survey was developed and disseminated via social media platforms to all Malaysian consumers aged 18 years and above from October 2023 to January 2024. A total of 321 valid responses were used for hypothesis testing using SPSS and MPlus software. This study found eleven out of nineteen proposed hypotheses were statistically significant. Food neophobia directly influences food innovation, attitude, subjective norms, and perceived behaviour control. More importantly, this study found the significant influence of attitude, subjective norms, and food innovation as mediators in influencing the association between food neophobia and consumer behaviour intention. Findings from this study contribute to the RTE food behavioural studies by incorporating the theory of planned behaviour and stimulus-organism-response models. This study also introduces attitude, subjective norms, and food innovation as mediators in influencing the association between food neophobia and consumer behaviour intention. Results from the integrated model provide a more comprehensive understanding of the impact of food neophobia and food innovation on consumer attitude, subjective norms, perceived behaviour control, and behaviour intention. Findings underline the importance of RTE food producers exploring young consumers as the new markets for their products.

Keywords: Food innovation, Food Neophobia, Malaysia, Ready to Eat Food, Stimulus Organism Theory, Theory of planned behavior

1. Introduction and Background

Ready-to-eat (RTE) foods are described as foods that are pre-cleaned, precooked, packaged, and ready for consumption without further preparation process or cooking (Hwang et al., 2012). According to the Food Standards Agency in the United Kingdom, consumers can consume RTE foods such as salads, sandwiches, cheese, and desserts directly, as the foods do not need to be cooked or reheated before serving (Food Standard Agency, n.d.). This study operationalizes RTE foods as requiring minimal or no additional preparation or cooking before consumption. The RTE foods market is expanding worldwide due to a major shift in consumer choices and lifestyles (Malik et al., 2018; Casini et al., 2015). Consumer demographic shifted to urbanization, more disposable income and less time to spend on food preparation due to busy work and social engagement are among the factors influencing the increase in demand for RTE foods (Alvarez et al., 2018). Moreover, RTE foods require little to no preparation (Hwang et al., 2012), thus meeting the needs of modern consumers looking for convenient products (Azman et al., 2023). The variations offered convenience without sacrificing taste and, in some cases, nutrition, making the RTE a very appealing product for consumers (Scholderer & Grunert, 2005; Scholliers, 2015).

Crises such as the recent COVID-19 outbreak also contributed to the changing trends in the prepared foods market (Chenarides et al., 2021). The stay-at-home policy influenced the increase in home cooking and cooking frequency (Dezanetti et al., 2022). Although an increase in home cooking was reported during the earlier lockdown period, consumers started shifting to convenient and safe RTE options as the pandemic continued. The availability of e-hailing food delivery services, particularly during the restriction period of COVID-19, booster the growth of RTE foods trends in Malaysia as consumers can save time and order RTE foods via online

food ordering applications such as Foodpanda and Grab (Roslan & Mohd Nawi, 2022). For younger age groups in the Republic of Korea, RTE food is consumed as a snack, thus suggesting the need for a healthier RTE food diet (Choi, 2022). This trend is still observed despite the end of the lockdown restriction as consumers found the RTE foods to meet their requirement for wholesome and convenient products.

According to Statista (2024), the revenue for the RTE foods market in Malaysia as of March 2024 is US\$2.15 billion. The market is expected to grow by 6.83% yearly, and the RTE meals market volume is expected to amount to 0.50 billion kilograms by 2028 (Statista, 2024). The growing need for ready meals due to hectic lives will propel the global ready meals market's expansion. Azman et al. (2023) surveyed Malaysian consumers and found that the convenience of RTE foods was the main factor influencing consumer behaviour, followed by health and taste. Earlier, Anusha et al. (2020) found convenience as the main motivation for RTE food purchase, and most Malaysians purchase RTE foods during lunch and spend up to RM20.00 (US\$4.23) per meal. The increased desire for a variety of quick RTE options can be attributed to consumers' greater openness to tasting new and unusual flavours as international cuisines become more accessible and diverse. The rising population of health-conscious consumers increases the need to offer various healthy RTE food options that are easily accessible in the market.

Despite its popularity, RTE foods are associated with incidents of foodborne illness cases (Mengistu et al., 2022), and consumers raising concerns about their safety. RTE food suppliers serving unsafe food products to consumers without proper hygiene and safety practices are among the primary cause of foodborne illness (Cheesman et al., 2023). Such incidents create feelings of fear towards anything new and forbid consumers from trying new things or breaking from their routine, such as consuming RTE foods. Nonetheless, the RTE foods industry's globalization has also made it easier for new packaging technologies to be introduced, extending these items' shelf lives and guaranteeing their freshness and quality over time (Jabs & Devine, 2006). Chinchkar et al. (2023) addressed the importance of nanotechnology in enhancing the packaging quality of RTE food while improving the shelf life and preventing it from being contaminated by the external environment. With a proper system, RTE food producers can guarantee consumers' safety when consuming RTE foods.

Additionally, the market for RTE foods has grown significantly because of globalization, evolving social trends, and increasing disposable incomes. Interest in RTE food has recently expanded, mostly due to lifestyle changes. RTE food products are trending due to their convenience and quick preparation time. While the RTE foods business is expanding worldwide, a limited number of literature has addressed the perception and acceptance of Malaysian consumers of RTE food. Companies in the food business are actively responding to consumer needs in this dynamic landscape by focusing on health and wellness qualities, developing innovative products, and implementing sustainable practices. The rise in the market for RTE foods reflects both the food industry's flexibility and responsiveness to changing consumer demands, as well as a fundamental shift in how people approach their meals.

This study aims to answer the following research questions: (a) What is the impact of food neophobia and food innovation on consumer attitude, subjective norms, and perceived behaviour control towards RTE food's behaviour intention? (b) What is the impact of attitude, subjective norms, and perceived behaviour control on consumer RTE food's behaviour intention? (c) Does food innovation, attitude, subjective norms, and perceived behaviour control mediate the relationship between food neophobia and consumer RTE foods behaviour intention?

2. Literature Review

This research proposed two integrative theories to investigate the consumer's acceptance of radical RTE food product innovation in Malaysia: the stimulus organism response theory and the theory of planned behaviour. Applying stimulus organism response theory and the theory of planned behaviour is common in consumer behaviour studies (Alam et al., 2024; Liu et al., 2023). The theory of planned behaviour strength lies in its ability to explain the cognitive process that occurs during the decision-making process, while stimulus organism response theory adds another dimension to consumer behaviour research through stimulus or external factors that also have a significant influence in this research (Uzunoglu & Sozer, 2020; Bigne et al., 2020). Furthermore, the theory of planned behaviour constructs integrated into the stimulus organism response framework also

allows researchers to observe the mediating effect of organisms between stimulus and response, which allows for a better understanding of the phenomena under investigation (Alam et al., 2024).

Stimulus Organism Response Theory

The stimulus-organism response theory, introduced by Mehrabian and Russell (1974), is based on the notion that human response is directed by stimulus and organism. This theory is widely used in consumer behaviour studies as it can explain external and internal influences that influence consumer behaviour (Wu & Li, 2018; Chang et al., 2011; Kim et al., 2020). Consumer decision-making is a very complex process, especially for involvement purchases such as food products, as decision-making is often based on habit and automatic processes, thus creating another layer of complexity to fully understand why certain products appealed to consumers while certain products failed to attract consumers (Gigerenzer & Gaissmaier, 2011). Interaction between internal and external influences allows for a better understanding of the actual process that occurs during the decision-making process. The importance of stimulus in product packaging and the actual appearance of the products is widely discussed in the literature, as this stimulus often facilitates automatic decision-making (Clement, 2007). The perception of a stimulus is processed through the mediating response of organisms, which, in this case, is the consumer's internal cognitive process. Thus, the consumers' backgrounds and belief systems will automatically evaluate whether the stimulus fits their needs. Therefore, stimulus organism response theory allows researchers to test the specific stimulus against an organism, providing a better understanding of the area or product under investigation.

Radical Food Innovation as Stimulus: Food innovation is a standard process for staying relevant and competitive in the food industry. These include the need to cater to the changes in the consumers' expectations (Rabadán et al., 2021), managing the depletion of resources due to global warming (Gallen, 2019), and the need to feed the growing population (Hussain & El-Din Ahmed, 2023). The food industry's response to this issue is through food innovation. To ensure alignment with the goals of sustainability can be achieved, the market has launched genetically modified foods, insect-based foods, cultured meat, and plant-based products to help with the potential of future food shortages. These innovative ventures need to attract consumers while overcoming their reluctance toward unfamiliar food (Siddiqui et al., 2022). However, these unconventional foods are considered radical innovations that create a significant cultural and cognitive challenge in some cultures (Fischer & Van Loo, 2021; Gallen, 2019). While some cultures have long embraced the idea of eating insects and other unconventional foods, it is still cognitively challenging for most of the population (Onwezen et al., 2019).

Increased awareness about the relationship between food and health has pushed the innovation of products catering to consumers' health (Rabadán et al., 2021). Examples of products include vegan, gluten-free, and foods free from allergens. A study on European customers indicated that different opinions on improving health through food technology cause inconsistent approval of food innovation for health advantages (Priyadarshini et al., 2019). Organic farming, which stems from the refrainment of unnatural elements in food, brought organic foods to the shelves. Genetically modified foods are the industry's response to the need to produce superior products and quality for the masses. Nevertheless, consumers have a low acceptance of new food technologies due to the belief that the advantages of these technologies are overstated and concerns about potential adverse effects on health, natural quality, and the environment (Coutinho et al., 2021). To mitigate neophobia and promote sustainability, strategies tailored to introduce novel food items successfully are imperative (Wendt & Weinrich, 2023). Furthermore, it is strongly recommended that the industry prioritize using natural ingredients to create nutritious food that aligns with customer preferences and sustainability objectives.

Ready-to-Eat (RTE) Radical Food Innovation Influence on Neophobia and Organism: Ready-to-eat (RTE) foods refer to convenience products that require minimal preparation and are available in the market in many types and variants. RTEs have both practical and hedonistic benefits (Okada, 2005). Although some of these items are familiar to the consumers, the presentation may need to be more familiar, which causes reluctance or avoidance from the consumers. In the case of radical food innovation, the content of the product itself represents something that needs to be more familiar to most consumers; hence, it is difficult for consumers to accept these products (Gallen, 2019; Tan et al., 2015). Intrinsic stimulus refers to the actual products without looking at the packaging and often has a much more significant impact on consumer acceptance (Morris et al., 2022). Hence, without referring to the packaging, the idea of consuming the products is already rejected;

studies conducted in Western countries since 2015 indicate that specific radical food innovations are not well accepted in this society (Ardoin & Prinyawiwatkul, 2021). This psychological condition is known as food neophobia, which determines consumers' acceptance or rejection of new foods (Siddiqui et al., 2022). Rejection of foods may stem from unfavourable sensory qualities, disgust regarding the source or nature of the food, and fear of harmful health effects (Vidigal et al., 2014). Foods familiar with taste or health benefits are more acceptable to consumers (Dittmar, 1992). The selection of foods may also be a means for certain groups to demonstrate their ethnic identity and affiliation.

Furthermore, food neophobia also refers to the inclination to avoid trying new foods instead of regularly consuming the same kinds of food (Muhammad et al., 2016). As the technology matures and becomes more common, consumer behaviour changes to eliminate aversion to certain foods (Gaviria & Bluemelhuber, 2010). Food neophobia worsens with ageing (Dovey et al., 2008). As individuals enter middle age, health issues may increase their reluctance to try new foods, while younger consumers tend to have the least neophobia (Siegrist, 2008). Based on the review of the literature, this study proposed that:

H1a. There is a positive relationship between food neophobia and food innovation.

H1b. There is a positive relationship between food neophobia and attitude.

H1c. There is a positive relationship between food neophobia and subjective norms.

H1d. There is a positive relationship between food neophobia and perceived behaviour control.

Innovative Ready-to-Eat (RTE) Radical Food Influence on Organism: Consumers are sceptical of food innovation as it deviates from traditional products, which are considered authentic and healthier (Verneau et al., 2014). Technological developments in the food industry are linked to customer trust, which regrettably often results in doubt, mistrust, and ambiguity on the part of the consumer (Siegrist, 2008). It has been demonstrated that the qualities of an innovation affect how widely accepted it is (Van Wezemael et al., 2014; Barrenar et al., 2015). As technology advances and people gain confidence, product acceptance rises. Improvements in flavour, nutritional value, and packaging are among the advancements that have gained widespread acceptance (Chen, 2007; Evans & Cox, 2006). However, specific food product innovations push consumers' acceptance boundaries, which is why many food manufacturers refrain from pursuing radical innovation, as it is very costly and risky (Buijs et al., 2009).

In contrast, radical innovation can create worthwhile products for the organization; the risk often weighs more than the benefit. For instance, while radical food innovation has the potential to penetrate the underserved market (Gallen, 2019), however previous studies on radical food innovation do not support this theory (Onwezen et al., 2019). Consumer acceptance is the main issue, as the success of any product relies heavily on demand, and consumers' support is necessary for the existence to be relevant.

Genetically modified foods and nanotechnology are another example of radical food innovation. However, studies have shown that consumers fear these products as they resist them in the market (Hartmann & Siegrist, 2016). Genetically modified foods refer to "organisms in which genetic material has been modified with a new or intentionally modified primary molecular structure" (Rollin et al., 2011). When it comes to genetically modified foods, customers are worried about their health and the possibility of getting cancer. However, acceptance of genetically modified foods depends on customer understanding and information (Stanton et al., 2021). Based on the arguments, the following hypotheses are developed:

H2a. There is a positive relationship between food innovation and attitude.

H2b. There is a positive relationship between food innovation and subjective norms.

H2c. There is a positive relationship between food innovation and perceived behaviour control.

Theory of Planned Behaviour

The theory of planned behaviour introduced by Ajzen (1991) posits that human behaviour is directly related to intention, where intention directs the behaviours. Even though the behaviour is not directly observed, studies have shown that intentions accurately predict behaviour (Ajzen, 1991). The theory of planned behaviour consists of three predictors: attitude, subjective norms, and perceived behavioural control. In consumer behaviour studies, the theory of planned behaviour is one of the main theories widely used as it predicts intentions and behaviour toward product purchases for single products to various products or brands (Ajzen, 2015; Han & Stoel, 2017).

Attitude Towards RTE Radical Food Innovation and Its Influence on Behavioural Intention: Attitude refers to the evaluative judgment towards an attitude object, which also differs in strength based on valence (Fishbein & Ajzen, 2010; Haddock & Maio, 2008). Hence, attitude is multifaceted, consisting of hedonic/affective and utilitarian/cognitive dimensions (Voss et al., 2003; Nystrand & Olsen, 2020). Attitude is the foundation for predicting human behaviour, reflecting one disposition toward a specific condition or action (Ajzen, 1991; Ajzen, 2015). While intention helps to predict consumers' future intentions, attitude also plays a significant role in consumers' decision-making, as attitude is the internal force that guides the intention and behaviour, which leads to quick and effortless decision-making (Sanbonmatsu & Fazio, 1990). Attitude plays a significant role in low-involvement decision-making as it allows consumers to make quick decisions; the importance of attitude in predicting purchase behaviour for ready-to-eat products is well documented in previous studies (Smigic et al., 2023; Thienhirun & Chung, 2018; Bae et al., 2010). In food consumption, attitude and intention are frequently most strongly correlated (McDermott et al., 2015).

Attitude is one of the most robust predictors in the theory of planned behaviour due to its temporal stability or persistence toward changes (Conner et al., 2022). Hence, consumers' attitudes toward certain products, whether it is positive or negative, will have a significant influence on intention; in fact, effectiveness is one of the critical elements in attitude theory as affective represents valence or degree of likeability towards certain products or brands (Yeap et al., 2020). RTE radical food innovation studies show that most consumers find it difficult to accept new types of food due to their strong attitude toward unfamiliar or unconventional food. Culture is one of the cornerstones in forming human attitudes, which are the main barrier to radical food innovation (Pascucci & Magistris, 2013). Based on the review of the literature, the hypotheses formulated as below:

H3. There is a positive relationship between attitude and behavioural intention.

H6a. Attitude mediates the relationship between food neophobia and behavioural intention.

H6d. Food innovation and attitude mediate the relationship between food neophobia and behavioural intention.

H6g. Attitude mediates the relationship between food innovation and behavioural intention.

The Influence of Subjective Norms Towards RTE Radical Food Innovation and Behavioural Intention:

Subjective norms refer to social pressure or the influence or pressure to perform certain behaviours (Ajzen, 1991). Subjective norms strongly influence consumers' behaviour because the decision-making also considers how others, including reference groups, will view one decision and whether it meets societal expectations (Al-Swidi et al., 2014). Overall, subjective norms do have a strong influence on consumers' decisions. For instance, a study by Hofstede and Bond (1984) shows that Asian countries, including Malaysia, fall under a collectivist culture where the opinions of those surrounding them are important to them. Although this study was conducted many years ago, the latest study on a similar subject has been carried out by Sumari et al. (2020), which still indicates that Malaysian culture is firmly collectivist. Therefore, the opinion of the reference group and those surrounding the increasing numbers of women entering the workforce, the changes in women's daily chores are becoming significant (Yuhaniz & Jusan, 2016). Changes can be seen through many studies on the acceptance of ready food in Malaysia, as it is now becoming a common consumption practice, especially among young adolescents (Basurra et al., 2021; Azman et al., 2023). While the home-cooked meal is expected in the patriarchal family system, societal changes have allowed for products such as this to be accepted by society due to their advantages, such as saving time and convenience in nature (Azman et al., 2023).

On the other hand, subjective norms' influence on radical food innovation was found to be challenging as subjective norms are related to the collective perception of society. Consuming unconventional is considered socially acceptable, which can lead to unfavourable perceptions and intentions toward radical food innovation (Fischer & Van Loo, 2021). Based on this argument, this study hypothesized that:

H4. There is a positive relationship between subjective norms and consumer behavioural intention.

H6b. Subjective norms mediate the relationship between food neophobia and behavioural intention.

H6e. Food innovation and subjective norms mediate the relationship between food neophobia and behavioural intention.

H6h. Subjective norms mediate the relationship between food innovation and behavioural intention.

The Influence of Perceived Behavioural Control Towards RTE Radical Food Innovation and Behavioural

Intention: Perceived behavioural control is deciding whether to perform the behaviour based on the situation. While attitude provides the foundation for intention and subjective norms concerned about the view of others, perceived behavioural control is the actual factor determining whether the behaviour should be performed because humans still have free will (Ajzen, 1991). Hence, consumer behaviour is performed when the situation allows it; thus, consumers still have the power to control it even though the attitude and subjective norms favour performing the behaviour. For RTE food intention purchases, consumers facing time constraints and seeking convenience solutions will view these products as favourable (Azman et al., 2023). On the other hand, those who view RTE as unhealthy will only consider purchasing this product after time constraints (Alkerwi et al., 2015; Laska et al., 2015). Despite consumers consciously making the decision and having the power to do so, perceived behavioural control has a strong connection with attitude and subjective norms, and the strength of these variables will shape the final decision. Suppose the attitude and subjective norms do not favour radical food innovation. In that case, the chances are that they will not perform the behaviour even though the consumers can do so. From the review of literature, the following hypotheses are developed:

H5. There is a positive relationship between perceived behaviour control and consumer behavioural intention. H6c. Perceived behaviour control mediates the relationship between food neophobia and behaviour intention. H6f. Food innovation and perceived behaviour control mediate the relationship between food neophobia and behaviour intention.

H6i. Perceived behaviour control mediates the relationship between food innovation and behaviour intention.

Based on the literature review of the study variables, the researchers integrated the theory of planned behaviour and stimulus organism response theory and developed a conceptual framework, as shown in Figure 1. This study will investigate food neophobia and innovation's impact on Malaysian consumer attitudes, subjective norms, perceived behaviour control, and RTE food behaviour intention. Additionally, this study will investigate the impact of attitude, subjective norms, and perceived behaviour control on Malaysian consumer's RTE food behaviour intention. Lastly, this study will test the mediating effect of food innovation, attitude, subjective norms, and perceived behaviour control on the relationship between food neophobia and RTE food behaviour intention.

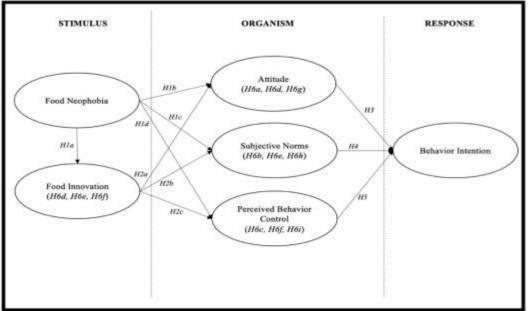

Figure 1: Conceptual framework.

3. Methodology

Sample and Procedures

The study aimed to investigate the impact of food neophobia and food innovation on consumer attitude,

subjective norms, and perceived behaviour control towards RTE foods' behaviour intention and to examine the mediation effects of food innovation, attitude, subjective norms, and perceived behaviour control. Using a quantitative convenience sampling approach, we developed an online questionnaire via Google Forms. We disseminated the survey link via social media platforms such as WhatsApp and Facebook. We sampled Malaysian consumers aged 18 years and above and asked them to forward the survey link to their networks. Respondents were assured of confidentiality and were informed about the study's purposes, data assurance, and anonymity. The respondents were asked for consent, and a screening question was included to ensure only eligible respondents (18 years and above) participated in the survey. An introduction to RTE food with some examples and the definition of each variable was given to ensure all respondents understood before proceeding with the questionnaire. The data collection period was from October 2023 to January 2024. Of the 323 responses, 321 were valid responses that were retained for analysis after eliminating non-eligible responses.

Measures

The current study adapted measures from previous studies. Food neophobia was assessed using five items developed by Pliner and Hobden (1992). Attitude (four items), subjective norms (four items), perceived behavioural control (three items), and behaviour intention (three items) were measured using scales developed by Verbeke and Vackier (2005). Food innovation was measured using six items from Goldsmith and Hofacker (1991). All the items were measured on a five-point Likert-type response scale with the level of agreement from (1) strongly disagree to (5) strongly agree. The demographic section consisted of some demographic profiling questions and consumer preferences about specific types of food. A bilingual-type questionnaire (English and Malay) was developed, and bilingual researchers performed back-to-back translation procedures for all the measures (Brislin, 1990) to ensure Malaysian consumers understood the items. A pilot study was conducted with a small sample to ensure no issue with the questionnaire. The pilot study findings did not lead to any changes in the scale items.

Data Analysis

The gathered data was coded using SPSS version 28 for preliminary and inferential statistics. Descriptive statistics were computed for each measure, such as means, standard deviations, coefficient alpha internal consistency for reliability, and intercorrelations between the constructs. Using Mplus version 8.3, a confirmatory factor analysis was conducted to determine the reliability and validity of the measures and to check for the fit of the proposed model (Muthen & Muthen, 2017). Then, we tested the conceptual model, hypothesizing the associations among the latent variables, for direct and indirect effects using structural equation modelling in Mplus. The output was assessed to determine the overall goodness of fit, the significance of the path coefficients, and the variance explained. We utilized the Harman one-factor test based on Podsakoff et al.'s (2012) recommendation for common method bias.

4. Results and Analysis

Demographic Information

Table 1 shows the characteristics of the respondents. Based on 321 respondents, the survey consisted of 51.2% females, followed by 48.8% males. Many of them were between 18 to 26 years old (61.3%, n = 196). Most respondents earned less than RM2,500 (US\$534) a month (63.2%, n = 191). The data indicated that most respondents preferred plant-based food (Yes, 66%, n = 212) and genetically modified food (Yes, 68.5%, n = 220). Nonetheless, 83.2% of respondents did not prefer insect-based foods (No, n = 367) or 3D printed foods (No, 61.1%, n = 196). Regarding ethnic foods from different countries, an equal distribution of respondents preferred Japanese (Yes, 80.7%, n = 259) and Korean (Yes, 80.7%, n = 259), justifying the rise in popularity of Japanese and Korean restaurants in Malaysia. Meanwhile, about the same distribution of respondents (77.3%) like organic foods. In terms of personalized foods, 65.7% like gluten-free food (n = 211), and 62.6% like allergen-free food (Yes, 62.6%, n = 201), while 55.8% of respondents dislike vegan food (n = 179).

Demographic	Categories	n	%
Gender	Male	156	48.8

Table 1: Respondents' demographics profiles.

Measurement Model Assessment

Table 2 presents the results of the constructs and their variables, including the reliability coefficients. composite reliability (CR), and average variance extracted (AVE). Reliability was assessed using Cronbach's alpha to check the internal consistency of the measures. The Cronbach's alpha values range from 0.788 to 0.936, above the suggested cut-off point of 0.60, which indicates internal consistency (Hair et al., 2010). Results for the measurement model indicated that all the variables had a composite reliability of > 0.60 (0.803 - 0.938), demonstrating the questionnaire's reliability. Fornell and Larcker (1981) recommended a CR value above 0.60 or more and AVE greater than 0.50. The AVE for each construct reported in Table II indicates an acceptable convergent validity (Bagozzi & Yi, 1988). The correlation of a construct with other constructs is less than the square root of its AVE, which successfully establishes the discriminant validity (Table 3). Confirmatory factor analysis revealed satisfactory goodness-of-fit indices and statistics. Chi-square test ($x^2 = 819.612$, df = 260, p < 1000.001, $x^2/df = 3.152$); Root Mean Square Error of Approximation (RMSEA) = 0.082; CFI = 0.907, TLI = 0.893; Standardized Root Mean Square Residual (SRMR) = 0.066. All factor loadings of the constructs are significant (p < 0.001), ranging from 0.624 to 0.941, except for item four, under food neophobia, with a factor loading of 0.237. We followed Harman's (1976) approach for a single-factor test to evaluate common method variance among the variables. Results revealed that without rotation, four factors with eigenvalues of > 1 could be extracted; the cumulative explained and the percentage of variance was 44.751%, which is below 50%, indicating no common method bias. Hence, we concluded that common method bias would not be an issue for our analyses (Podsakoff et al., 2012).

Construct	Items	λ	SMC (λ2)	CR	AVE

Structural Model Assessment

Results for the structural model revealed satisfactory goodness-of-fit indices and statistics. Chi-square test ($x^2 = 919.649$, df = 265, p < 0.001, $x^2/df = 3.47$); Root Mean Square Error of Approximation (RMSEA) = 0.088; CFI = 0.891, TLI = 0.877; Standardized Root Mean Square Residual (SRMR) = 0.073. The results of the hypothesis testing show that food neophobia has a positive effect on food innovation ($\beta = 0.620$, p < 0.001), attitude ($\beta = 0.901$, p < 0.001), subjective norms ($\beta = 0.577$, p < 0.001), and perceived behaviour control ($\beta = 0.453$, p < 0.001), thus supporting H1a – H1d. Nonetheless, when assessing the effect of food innovation, only the effect of food innovation on subjective norms is found to be significant ($\beta = 0.180$, p < 0.05), supporting H2b, while no significant results were found for food innovation on attitude (H2a) and on perceived behaviour control (H2c) (p > 0.05). Furthermore, this study found that attitude positively influenced behaviour intention ($\beta = 0.786$, p < 0.001) and subjective norms influenced behaviour intention ($\beta = 0.196$, p < 0.05); hence, H3 and H4 are supported. However, no significant result was obtained for perceived behaviour control on behaviour intention (p > 0.05). Figure 2 shows the structural model with direct effects.

Figure 2: A structural model with direct effects.

Mediation Analysis

Using Mplus software, we performed bias-corrected bootstrapping confidential interval analysis with 5,000 resamplings to test the mediating effects of the proposed variables in Figure 1 (Hayes, 2018). This procedure generated a bootstrapped percentile and bias-corrected confidence intervals based on 5,000 samples at a 95% confidence interval (C.I.). Based on Preacher et al. (2007), the researchers reported the significance of the mediating effect by determining whether the estimated confidence interval included zero. Based on the results presented in Table 4, the findings exhibit four significant mediation effects out of nine proposed mediation effects. The findings show that attitude significantly mediates the relationship between food neophobia and behaviour intention (95% C.I. = 0.495, 0.888), which supported H6a. Additionally, subjective norms significantly mediate the relationship between food neophobia and behaviour intention (95% C.I. = 0.026, 0.237), supported by H6b. Interestingly, this study found that innovation and subjective norms significantly mediate the relationship between food neophobia and behaviour intention (95% C.I. = 0.002, 0.065), further supporting H6e. Subjective norms mediate the relationship between innovation and behaviour intention (95%, C.I. = 0.003, 0.102); thus, supported H6h. With the present model, approximately 81.2% of the variability in attitude ($R^2 = 0.812$), 49.4% of the variability in subjective norms ($R^2 = 0.494$), 23.6% of the variability in perceived behaviour control ($R^2 = 0.236$), 38.4% of the variability in food innovation ($R^2 = 0.384$), and 79% of the variability in behaviour intention ($R^2 = 0.790$), can be explained.

Table 4: Bootstrapping mediation results.

Discussion

This study aimed to examine RTE food neophobia and food innovation on Malaysian consumers' attitudes, subjective norms, perceived behaviour control, and behaviour intention using two integrative theories: the theory of planned behaviour and stimulus organism response theory. Based on the direct associations tested, this study confirmed that food neophobia positively influenced food innovation, attitude, subjective norms, and perceived behaviour control. This finding is in tandem with previous literature on food neophobia, which determines consumer acceptance and rejection of new foods (Siddiqui et al., 2022). Food innovation acceptance may be influenced by consumer familiarity with the taste or health benefits (Dittmar, 1992), whereas rejection is influenced by unfavourable sensory qualities or fear of harmful health effects (Vidigal et al., 2014). Food neophobia among consumers might be influenced by foodborne illness cases (Mengistu et al., 2022) and improper hygiene and safety practices among RTE food suppliers (Cheesman et al., 2023). Despite that, RTE food safety and hygiene can be enhanced through quality packaging using nanotechnology to improve the shelf life and prevent contamination (Chinchkar et al., 2023). Moreover, this study found that food innovation positively influenced subjective norms, whereas attitude and subjective norms positively influenced consumer behavioural intention.

Findings from this study confirmed the role of attitude and subjective norms as mediators in influencing the associations between food neophobia and behaviour intention. Such findings corroborated Al-Swidi et al. (2014), who suggested that subjective norms strongly influence consumer behaviour because the decision-making process is also influenced by how others view one's decision and whether it meets society's expectations. Asian cultures, such as Malaysia, are still collectivist when they believe the opinions of those around them are essential (Sumari et al., 2020). Attitude is not only a significant predictor of behaviour intention but also acts as a mediator to food neophobia and behaviour intention. In other words, food neophobia can affect behavioural intention toward RTE food products through the mediator of consumer attitude (either positive or negative). Interestingly, this study reported both food innovation and subjective norms significantly mediate the relationship between food neophobia and behaviour intention. Also, this study found subjective norms mediate the relationship between food innovation and behaviour intention.

Furthermore, this study briefly profiles RTE food consumer segments in Malaysia. Based on the data, it is found that more Malaysians preferred plant-based food, genetically modified foods, and organic foods compared to insect-based foods, cell-cultured, and 3D printed foods. The plant-based food product is getting popular these days as consumers believe that plant-based alternatives are healthy, and some tried the plant-based food because of the food trend (Mahasuweerachai et al., 2023; Statista Research Department, 2022). Our findings on Malaysian consumer's preferred organic food are supported by a previous study in Malaysia by Abdullah et al. (2022). Nevertheless, the socio-economic background of the consumers might prohibit them from frequently consuming organic foods because these foods are typically sold at higher prices than non-organic food (Abdullah et al., 2022; Guine et al., 2022). Findings on organic food preference among Malaysians also aligned with a similar study conducted in China (Huo et al., 2023), Bangladesh (Kabir, 2023) as well as in Portugal and Turkey (Guine et al., 2022). Consumer knowledge of organic food health benefits could influence their food preference.

Regarding ethnicity, more Malaysians preferred Japanese and Korean food than Philippine and Spanish. Such findings aligned with the current situation in Malaysia, with many Japanese and Korean restaurants available, especially in major cities like Kuala Lumpur and Penang. Korean food is popular among young consumers (Wan & Yazdanifard, 2021). For personalized foods, more Malaysians preferred gluten- and allergen-free food to

vegan food. Nonetheless, Mohd Fauad et al. (2020) found higher carbohydrate and lower protein content in gluten-free products than in gluten-containing products; hence, they concluded that gluten-free products have no nutritional advantage but cost more than gluten-containing products. Interestingly, this study found that more people dislike vegan food, which contradicted Zainal Abidin et al. (2017), where nearly 60% of their respondents (non-vegetarian Chinese consumers in Malaysia) had a favourable view of vegetarian food. Vegetarian food is popular among the Chinese and Indian communities due to religious beliefs.

5. Implications and Conclusion

Theoretical Implications

From a theoretical perspective, the overall findings contributed to the RTE foods-related studies. This study represents the pioneering effort in combining the theory of planned behaviour and stimulus organism response theory to investigate the Malaysian consumer behaviour intention of RTE foods. Results from the integrated model provide a more comprehensive understanding of the impact of food neophobia and food innovation on consumer attitude, subjective norms, perceived behaviour control, and behaviour intention. Such findings also fill the gap in terms of model development for RTE-related research since previous studies utilized descriptive research design (Anusha et al., 2020; Basurra et al., 2020). Moreover, findings on the mediating effects of food innovation, attitude, subjective norms, and perceived behaviour control on the relationship between food neophobia and consumer behaviour intention contribute to the current literature in RTE foods-related and consumer behavioural studies; hence, justify the novel contribution of this study.

Managerial Implications

The study offers several practical implications. The growing demand for RTE foods is driven by convenience, ease of access, and various choices suitable for consumers, particularly those with a busy schedule. They do not need to spend much of their time preparing food. Therefore, food producers should promote RTE food products by increasing awareness and highlighting the benefits of consuming RTE foods. For instance, promoting the quick and convenient aspects of RTE foods and offering healthier RTE food options could diminish the negative perception toward RTE food, thus, increasing consumer acceptance. Moreover, this study sheds light on the untapped potential for RTE food producers to explore young consumers as the new markets for their products. Using young and well-known food influencers could increase the young consumers' intention to purchase RTE food products. Appropriate strategies are needed to avoid food neophobia toward new food trends in the market. For instance, food producers and marketers can positively present the food or use well-known influencers to showcase the food, so it looks delicious. Siddiqui et al. (2022) suggested that food neophobia can be reduced when consumers taste the new foods themselves. Additionally, food producers and marketers must understand consumer behaviour patterns, protect consumer health, and take preventive measures to prevent foodborne diseases from RTE foods.

Limitations and Future Research Recommendations

This study is constrained by several limitations, drawing attention to future research avenues. First, this empirical study uses cross-sectional and self-reported data to test the hypotheses; thus, there could be bias in the responses. Future research can further explore the associations between the variables using longitudinal studies. Longitudinal research could also provide more insights into RTE foods' behaviour patterns over time. Second, this study may lack generalizability due to its research context, as it focused exclusively on Malaysian consumers. For that reason, cross-country data can be beneficial in model comparisons to investigate the differences between Malaysia and other countries (e.g., Indonesia, Thailand) in terms of RTE foods behavioural intention. Future research could validate our findings with consumers from other countries. A comparison study between countries will benefit future researchers to investigate the similarities and differences of RTE food trends between countries. While no cross-country study has been found on RTE food to date, a study by Guine et al. (2022) on organic food trends and consumption among consumers from Portugal and Turkey found similar results in terms of consumption pattern, albeit consumers in Portugal have a higher value perception for organic products compared to Turkey.

Acknowledgement: The authors would like to thank Universiti Teknologi MARA Cawangan Pulau Pinang for funding this research project through an International Matching Grant Scheme [100-TNCPI/INT 16/6/2(012/2022)]. Also, thank you to all individuals to have contributed to this project.

Bridging the Gap: Addressing Educator and Caregiver Challenges in Transitioning Students with ASD to Higher Education and TVET - A Scoping Review

Norfezah Md Nor^{1*}, Nur Afiqah Mahzan¹, Ahmad Redhuan Abu Bakar¹, Wan Nurfarihin Wan Zamri¹, Siti Nur Fadzilah Muhsain² ¹Faculty of Hotel and Tourism Management, Universiti Teknologi MARA Cawangan Pulau Pinang, Permatang Pauh, Pulau Pinang, Malaysia ²Faculty of Pharmacy, Universiti Teknologi MARA Cawangan Pulau Pinang Kampus Bertam, Persiaran Pendidikan Bertam Perdana, Kepala Batas Pulau Pinang , Malaysia *norfezah420@uitm.edu.my Corresponding author: Norfezah Md Nor

Abstract: Students with Autism Spectrum Disorder (ASD) often struggle with communication and social skills, necessitating significant support from family, caregivers, and educators. In Malaysia, while Special Education Needs (SEN) students are typically integrated into general education during their school years, their presence in tertiary education or TVET remains underrepresented. This scoping review aims to identify and understand the challenges general educators and caregivers face in facilitating the transition of ASD students from higher education to tertiary education and TVET. A comprehensive analysis of literature from Scopus, ProQuest, and Science Direct databases, focusing on studies published between 2013 and 2023, was conducted. The findings reveal mixed experiences, highlighting significant difficulties and areas for improvement. General educators and caregivers report numerous challenges, including inadequate training, insufficient resources, and a lack of tailored support systems, which collectively hinder the smooth transition of ASD students into higher educational settings. It suggests that targeted interventions and increased collaboration between educators and caregivers can lead to more positive outcomes. This study provides original insights into the specific needs and barriers faced by ASD students in Malaysia, offering valuable implications for policymakers, educators, and caregivers to create more inclusive and effective educational transitions. Future research on transitioning students with ASD to higher education and TVET should focus on longitudinal studies to track long-term outcomes, the development and evaluation of targeted intervention programs, and the role of assistive technologies in the transition process.

Keywords: Autism spectrum disorder(ASD), General educators, Caregivers, Challenges, Transition, Tertiary Education, and Technical and Vocational Education Training (TVET)

1. Introduction

Autism spectrum disorder (ASD) is a rapidly growing neurodevelopmental disorder, with an increasing number of students diagnosed each year. This rise has led to more students with ASD enrolling in tertiary education and TVET (Technical and Vocational Education and Training) programs (Virolainen et al., 2020). Despite this increase, many youths with ASD face significant challenges in completing post-secondary education due to their unique needs and difficulties. Educating these students requires specialized training for educators, as emphasized by the National Autism Society of Malaysia (NASOM), which notes that students with ASD present unique challenges compared to their typically developing peers.

The current situation regarding the education of students with ASD involves examining global and Malaysian support systems for People with Disabilities (PWD), including international frameworks such as the UN Convention on the Rights of Persons with Disabilities (UNCRPD) and Malaysia's National Education Blueprint 2013-2025 (Ministry of Education Malaysia, 2013). Government policies, such as the Persons with Disabilities Act 2008, are assessed for their effectiveness in addressing the needs of students with ASD (Ministry of Women, Family and Community Development Malaysia, 2021). Current research highlights the specific needs of ASD students, including gaps in resources and support services (Smith et al., 2023). The effectiveness of intervention programs, assistive technologies, and educator training is evaluated, alongside the impact of cultural and socioeconomic factors on these students' educational experiences (Chen et.al., 2023).

Moreover, integrating a creative entrepreneurship-based learning model may leverage entrepreneurial projects to enhance problem-solving, adaptability, and creativity, providing ASD students with real-world experience

and confidence. By incorporating social skills training and collaborative opportunities, this model addresses social integration and communication challenges, preparing ASD students for academic, vocational, and entrepreneurial success in a supportive environment (Handajani et al., 2022)

There is a pressing need to prioritize support for individuals with High-Functioning Autism Spectrum Disorder (HFASD) to facilitate their development and integration into higher education settings. This review paper examines the challenges general educators and caregivers face in supporting the transition of ASD students into tertiary education and TVET. Transition experiences have a long-term impact on the social and academic performance of individuals with ASD, influencing their success in post-secondary education (Stack et al., 2020).

Recent studies have highlighted the complexities and growing concerns surrounding the education and support of individuals with ASD in Malaysian society (Ilias et al., 2019). Further, there has been a notable rise in the enrolment of students with ASD in tertiary education and Technical and Vocational Education and Training (TVET) programs across Malaysia. The Individuals with Disabilities Education Act (IDEA) in the United States was established to ensure greater accessibility and adequate educational achievements for individuals with special needs (Al Jaffal, 2022). However, youths with ASD often struggle with communication, social skills deficits, and repetitive behaviors, leading to less support due to societal misunderstandings about the disorder. General educators often display less positive attitudes and lower levels of knowledge compared to special education educators (Segall & Campbell, 2012). This is due to a lack of training and understanding negatively impacts their ability to support ASD students effectively in inclusive education settings (Messemer, 2010).

To support students with ASD in transitioning into tertiary education or TVET, it is crucial for general educators and caregivers to fully understand the disorder. ASD is associated with a wide range of behaviors and characteristics, necessitating varying levels of support. The demands of students with ASD, including distinctive traits and disruptive behaviors, pose significant challenges for educators, particularly when resources are limited (Gómez-marí et al., 2022).

Institutional support and resources are often inadequate, further complicating the challenges faced by general educators and caregivers. Proper training and clear policies are essential for effectively supporting students with ASD. Without specialized training, educators may fail to provide the necessary support, hindering the academic and social development of these students (Talib & Paulson, 2015). Additionally, societal stigmatization and discrimination exacerbate these challenges, highlighting the need for comprehensive education on ASD in teacher training programs (Majin et al., 2017).

ASD is characterized by pervasive developmental disorders affecting social capabilities, fixations on specific topics, and repetitive behaviors (Segall, 2008). Students with ASD require different levels of support depending on the severity of their disorder. Caregivers, who often understand their children's behavior better than educators, play a crucial role in this support system. However, the transition process into tertiary education or TVET can be challenging for caregivers, resulting in inadequate support.

The increasing prevalence of students with ASD in post-secondary institutions necessitates the development of strategies to meet their needs (Gardner & Iarocci, 2013). Educators must be knowledgeable about ASD, and caregivers must be prepared to assist educators in providing the necessary support for a smooth transition. Therefore, this review systematically explores the challenges faced by general educators and caregivers in supporting ASD students transitioning to higher education and TVET.

3. Methodology

The review was carried out following the framework outlined by Arksey and O'Malley (2005). The six stages are outlined below.

Study design and protocol: A scoping review method was employed, as this method can be used to identify gaps in existing literature (Arksey & O'Malley, 2005). A systematic review was based on several criteria which include record identification on the database, screening, assessing eligibility of article and data extraction for analysis. Through the synthesisation of a wide range of literature and articles, a systematic review will help to

determine the challenges faced by general educators and caregivers in supporting ASD students in their transition into tertiary education and TVET. The eligibility criteria will only focus on papers published in English journal articles and review papers were included, in line with other eligibility of accessing papers that focus only on general educators, caregivers, autism spectrum disorder (ASD), transition, tertiary education and technical and vocational education training.

Formulation of research question: The research starts by describing the rationale for the review according to the context of the research. Initial construct a statement of the question that highlights 3 important elements in (PCC) which are population, concept and context. Additionally, a research question was formulated - What are the challenges faced by general educators and caregivers in supporting students with ASD that transition into tertiary education and TVET?

Systematic searching strategies: In conducting systematic searching techniques, three stages of identification, screening, and eligibility were done to ensure the study conducted was non-biased and most importantly followed the scoping review process for a broad search outcome.

Identification: The initial stage of this systematic search is identification, which was done to identify the appropriate keyword to be used for the open database search. Based on the research question developed, several keywords were identified for database searching. The keywords for this review are "challenges", "general educators", "caregivers", "transition", "autism spectrum disorder (ASD)"AND "tertiary education", as well as other related keywords such as "high functioning autism spectrum disorder (HFASD)", "autism", "ASD", "general education", "university", "parents", "general educator", AND "technical and vocational education training (TVET)". The systematic review data identification was done on 13th July 2023 by selecting three open database sources which are Scopus, ProQuest, and Science Direct. The advanced search function in each open database helps to narrow down the literature to manageable numbers to be identified. This step has yielded (N= 1,810) prospective articles for the screening process.

Screening: The screening stage for the systematic search strategy is critical as it distinguishes between potential and non-potential articles that are appropriate for this review study. The screening process is a selection of articles by utilizing the screening function in the database search function. The early screening process was conducted by strictly observing the article keywords, title and abstract (Pahlevan-Sharif et al., 2019). This review article focuses on the challenges that general educators and caregivers encounter in facilitating ASD students' transition to postsecondary education and TVET. Because some of the papers were irrelevant to the scoping review, only the most relevant prior papers were retrieved. However, N=265 prospective papers are acquired and chosen for the eligibility process.

Eligibility: In the third step, which concerns eligibility, the selected 265 papers were re-examined to guarantee adherence to the inclusion and exclusion criteria. The abstracts were examined at this stage to establish the papers' eligibility. If the suitability of the article was not clearly stated in the title, the entire content was skimmed. As a result, 235 publications were removed as the title, abstract and content did not meet the context of the scoping review and research question. As a result, only N=30 papers articles were ultimately selected for the final qualitative synthesis.

4. Results and Discussion

Based on data charting (Figure 1), N=30 research articles were eligible for selection and analysis. Data portray research article publication from 2013 to 2023. The primary research in the similar research context is diverse with quantitative and qualitative research design. General findings noted that students with ASD face challenges relating to people's beliefs concerning their intellectual deficit, neglect of their caregivers, financial difficulty and stigmatization from their surroundings. The majority of parents (24 out of 29 or 83%) expressed concerns about their child's social relationships. This is not unexpected given that social skill challenges are a major component of ASD. Parental stress is mentioned due to ASD student's transition to the next level of education. Parent struggle with anxiety and doubts throughout the process of their autistic children's transitions.

Figure 1: Systematic Searching Strategies for Scoping Review

The findings of this scoping review reveal significant challenges faced by general educators and caregivers in supporting the transition process for ASD students into tertiary education and TVET. These challenges can be addressed and mitigated by understanding several key issues.

Firstly, students with ASD encounter difficulties stemming from societal beliefs about their intellectual capabilities, which often leads to stigmatization and neglect from caregivers and peers. This societal perception can hinder their ability to thrive in educational settings. Misconceptions and stereotypes about ASD often lead to assumptions of intellectual deficits. The general public and even some educators may wrongly perceive all individuals with ASD as having uniformly low cognitive abilities. This misconception fails to recognize the

spectrum's wide variability in intellectual functioning (Douglas & Sedgewick, (2024)). The variability in intellectual abilities within the ASD spectrum is substantial. While some individuals may have significant challenges in academic settings, others demonstrate exceptional skills in specific domains, such as mathematics, music, or visual arts. Recognizing and supporting this diversity is crucial for providing tailored educational interventions. However, the educational system often struggles to accommodate this variability adequately. Standardized assessments and rigid curriculum structures may not capture the true potential of students with ASD, leading to underestimation of their capabilities and inappropriate educational placements. Organizations like Autism Speaks emphasize the importance of personalized education plans that consider individual strengths and challenges.

Parents and families must provide a firm foundation for autistic students to feel safer and at ease engaging in school activities. Based on student replies, (Davis et al., 2021) underlined the relevance of parental and family ties for success throughout the transition to college and during enrolment. (Packer et al., 2022) discovered a similar conclusion on parental engagement playing an important role in aiding children's growth throughout their transition to a new setting. Similarly, (Sefotho & Onyishi, 2020) observed that students' responses to signs of stress and anxiety are due to a lack of family members or close friends.

Caregivers of individuals with ASD often experience profound emotional and physical stress due to the demands of caregiving. The relentless nature of managing behavioral challenges, navigating complex healthcare systems, and advocating for educational and social support can lead to caregiver burnout and compromised mental health. Research, such as studies cited by the Autism Society, underscores the higher prevalence of stressrelated disorders among caregivers compared to the general population. The neglect of caregivers' needs can perpetuate a cycle of strain and diminish their capacity to provide effective support to individuals with ASD.

Caregiver support systems play a crucial role in facilitating the transition of students with ASD into tertiary education or TVET settings, where they encounter unfamiliar environments (Wang, Liu & Zhang., 2022). These systems encompass emotional and psychological support, academic and non-academic assistance, and environmental adjustments, all aimed at helping students settle and succeed in new educational contexts. ASD students, often marginalized and misunderstood, face significant challenges such as prejudice and stereotypes, hindering their academic focus and growth (Davis, Watts & Lopez, 2021). Establishing inclusive learning environments is paramount, ensuring that these students can effectively communicate, learn, and interact with peers, tailored to their specific educational needs and capabilities (Maysela Azzahra et al., 2022). This personalized approach not only supports academic development but also fosters social and emotional growth through interactions with peers. During transitions to higher education, ASD students commonly experience feelings of isolation, anxiety, and difficulty in social engagement, necessitating strong support networks from trusted individuals to maintain their mental well-being (Davis et al., 2021). Studies emphasize the pivotal role of parental involvement, counseling, teacher support, and peer assistance in ensuring successful transitions and ongoing academic and social integration (Packer et al., 2022; Sefotho & Onvishi, 2020). These findings underscore the critical need for robust caregiver support systems to enhance the educational journey and overall well-being of ASD students navigating new educational landscapes.

The financial strain on caregivers of individuals with ASD is substantial. Costs associated with specialized therapies, medical care, and educational support often exceed typical household budgets. Moreover, the caregiving responsibilities may limit caregivers' ability to maintain full-time employment or pursue career advancements, leading to economic insecurity. The neglect of financial support mechanisms and workplace accommodations exacerbates these challenges. Policy reforms are essential to ensure equitable access to financial assistance, respite care services, and employment protections for caregivers of individuals with ASD. Additionally, financial difficulties and a lack of understanding of their surroundings exacerbate the challenges faced by these students. Parents have also expressed concerns about their children's poor social relationships, which can impact their overall educational experience (Davis et al., 2021).

Furthermore, the review found that many caregivers experience stress and anxiety during the transition process. This stress is often due to a lack of understanding of institutional policies and poor relationships with general educators. Effective collaboration and communication between caregivers and educators are crucial to providing the necessary support for ASD students (White et al., 2017). Caregivers also reported feeling

overwhelmed by the need to advocate continuously for their children's needs and support (Sefotho & Onyishi, 2020). Furthermore, the emotional and psychological strain on caregivers during the transition process is welldocumented in the literature. Davis et al. (2021) and White et al. (2017) both note that students with ASD often struggle with loneliness, anxiety, and peer interactions, necessitating substantial support from caregivers. The review corroborates these findings, highlighting the significant stress and anxiety experienced by caregivers, often due to a lack of understanding of institutional policies and poor relationships with general educators.

Educators have an important role in delivering adequate education for their pupils, whether they have special needs or are typically developing. However, not all general educators have positive attitudes towards the inclusion of students with ASD in general education settings, some have neutral and negative attitudes (Mahzan & Md Nor, 2023). General and special education educators must be properly equipped with appropriate information, a good attitude, and extensive experience to safeguard kids with ASD from being bullied by their typically developing peers who may be unaware of the disease (Dağlı Gökbulut, Gökbulut, & Yeniasır, .,2024). In examining the critical role of educators in providing effective education for students with Autism Spectrum Disorder (ASD), several key studies underscore significant challenges and necessary improvements. Ballantyne et al. (2021) highlight a pervasive issue: many general educators lack the expertise needed to effectively manage and educate students with ASD, which significantly hinders their ability to provide adequate support. This finding underscores the importance of targeted training and professional development initiatives aimed at equipping educators with the necessary skills and knowledge. Segall (2008) contributes further by revealing that educators with limited experience in ASD education often possess insufficient knowledge about the disorder, thereby impeding their effectiveness in inclusive classroom settings. Simó-Pinatella et al. (2023) emphasize that inadequate knowledge remains a significant barrier to providing inclusive education, emphasizing the need for comprehensive training programs tailored to address specific educational needs related to ASD. Ismail et al. (2018) delve into the challenges faced by Technical and Vocational Education and Training (TVET) educators, citing issues such as inadequate training and lack of industry experience, which hinder their ability to effectively prepare students with ASD for the workforce. Moreover, Talib and Paulson (2015) highlight the diverse and individualized support needs of ASD students, advocating for personalized educational approaches that accommodate varying learning styles and behavioral patterns. Together, these studies underscore the complex landscape of ASD education, pointing to critical need for ongoing professional development and tailored support strategies to enhance educational outcomes for students with ASD.

Consequently, general educators are found to be incapable of providing successful inclusion for students with ASD due to their lack of knowledge and understanding of the disorders. A study by (Simó-Pinatella et al., 2023) stated that insufficient knowledge is one of the barriers to providing inclusive education. Knowledge relating to ASD is very crucial for educators as the students might need substantial support to fulfill their needs. Students with ASD are diagnosed with brain impairment which causes them to have difficulty in two main areas which are social communication and interaction and repetitive and recurring behaviors.

Besides, many past studies have also highlighted the challenges and lack of quality among TVET educators, mentioning that they lack training and industrial experience. For instance, a study by (Ismail et al., 2018) stated that according to their interviews with lecturers, instructors, and industrial employees, the problems with incompetent educators stem from their teaching techniques, poor classroom management, a lack of industry experience, a lack of competence skills, and a lack of passion in teaching the given topics. This issue is very crucial to investigate as it will affect the performance of students in TVET programs to produce a highly skilled workforce. Educators' training is particularly important to ensure students maximize their potential in preparing them for the industrial world. Besides, well-trained educators will help in providing inclusive education for special needs students in TVET programs.

Besides, to properly accommodate these students in vocational streams, educators are needed to be knowledgeable about the disorder and each of their student's behaviors. The prior study mentioned that despite the fact all autistic students have common underlying impairments, no two are exactly alike (Talib & Paulson, 2015). For example, one of the students with ASD might have intellectual ability but also have speech and language impairments which make them socially communicate and interact with people while others might suffer emotional functioning impairment or display restricted interest in certain areas. Students with ASD who

demonstrate restricted behavior, or repetition of behaviors might have a hard time shifting from normal situations to different situations due to their rigid routines in conjunction with having a fixation on interests.

Besides that, Integrating the principles of Education 4.0 with the challenges in transitioning ASD students to higher education and TVET involves leveraging personalized learning, collaborative tools, advanced technologies, and lifelong skill development. By utilizing adaptive learning platforms, virtual reality for social skills practice, user-friendly assistive technologies, and continuous education pathways, educators and caregivers can better address the individualized needs of ASD students. Professional development for educators, tailored curriculum design, robust support systems, and advocacy for supportive policies are essential steps to create an inclusive, effective educational environment that prepares ASD students for future success (Kibat et al., 2021).

In conclusion, addressing these challenges requires a multifaceted approach that includes increasing awareness and understanding of ASD among general educators, fostering strong relationships between caregivers and educators, and providing comprehensive support systems that encompass emotional, psychological, academic, and environmental assistance (Maysela Azzahra et al., 2022). By tackling these issues, we can create a more inclusive and supportive educational environment for ASD students.

5. Conclusion

The scoping review provides an opportunity in the knowledge gap related to such context of challenges faced by general educators and caregivers in supporting the transitioning process for ASD students in tertiary education and TVET. A smooth transitioning process could be achieved by ASD students which would also help them to be in an inclusive education setting and achieve good academic performance that led them to have future careers like their typical development peers. However, the attitude of some general educators needs to be observed as they also play a significant role in ensuring ASD student's transition process can be achieved. Important note depicts that general educators and caregivers do influence the support given to students with ASD in transitioning into tertiary education and TVET. Although some issues related to general educators' experience, training, and knowledge, as well as their impacts on supporting students with ASD, emerged as significant, exploration to gain a better understanding relating to this study. Different views between scholars on whether general educators or caregivers provide a better support system for ASD students in transition, cooperation between both parties still plays a significant role in providing a better future for ASD students.

The Impact of Environmental Knowledge on Food Waste Reduction and Sustainability Practices among Hospitality Students in Malaysia

Zaharah Mohamed Rani^{*}, Anida Ismail, Noraini Rahim, Siti Rohimi Mohamed Apandi, Ferial Farook Faculty of Hotel and Tourism Management, Universiti Teknologi MARA, Permatang Pauh, Pulau Pinang, Malaysia *zaharah3813@uitm.edu.my, anida.ismail@uitm.edu.my, noraini970@uitm.edu.my, sitirohimi@uitm.edu.my, ferial498@uitm.edu.my Corresponding Author: Zaharah Mohamed Rani

Abstract: Environmental sustainability and food waste reduction are among the critical challenges facing the hospitality industry worldwide. This study was conducted to identify the impact of environmental knowledge on food waste reduction and sustainability practices among hospitality students in Malaysia. A quantitative approach was used, and we surveyed 94 hospitality students from various programs at UiTM Penang. The online questionnaire was conducted and analyzed using Pearson correlation and multiple regression analysis. There is a significant positive correlation between environmental knowledge, food waste behaviors and sustainability-related behaviors. The strongest relationship was found between food waste practices are closely related to broader sustainability behaviors in hospitality education. The study contributes to the understanding of how environmental education can shape the future of hospitality professional practice, offering valuable insights for the development of industry curricula and training programs aimed at promoting sustainable practices in the hospitality sector.

Keywords: Environmental Knowledge, Food Waste, Sustainability, Hospitality Education

1. Introduction

The hospitality industry is currently at a critical phase, facing the challenges of environmental sustainability and resource management. Of particular concern within the industry is the industry's significant contribution to food waste, a problem that causes significant economic losses but also exacerbates environmental degradation. This issue has received growing attention from researchers, policymakers, and industry leaders, as evidenced by a growing body of literature on sustainable practices in hospitality (Gössling et al., 2015; Filimonau & De Coteau, 2019).

In Malaysia, there is a very urgent need to address the issue of food waste in the particularly bad hospitality sector. Bernama (2021) has reported that the Solid Waste Management and Public Cleansing Corporation (SWCorp) found that Malaysians generate about 16,687.5 tonnes of food waste every day, a figure that has seen an alarming increase in recent years. The hospitality industry, including hotels and restaurants, is a significant contributor to this waste, underlining the need for targeted interventions and research in the sector.

The United Nations outlined that the fundamental SDGs agenda is comprised of 17 ambitious sustainable development goals (SDGs), which include 169 targets and 231 different indicators (Russell-Bennett et al., 2024). Sustainable Development Goal 12 (SDG12) is particularly pertinent as it encompasses various avenues essential for promoting responsible consumption and production. The global material footprint is increasing at a rate that surpasses both population increase and economic productivity. SDG12 specifically tackled urgent concerns related to material footprints, the comparison between disposal and recycling rates, waste reduction, waste management, food loss in the supply chain, and food waste management. Additionally, SDG12 is intricately linked to SDG4 (Quality Education) due to the pivotal role that education plays. This study underscores the power of education in enhancing awareness and comprehension of sustainability, and ways action can be taken in our respective fields to combat food waste.

It has been noted that food waste, despite its inclusion in the agendas of numerous nations and organizations poses a significant challenge that hinders the attainment of certain sustainable development goals (SDGs). Food waste (FW) is well-known for its role in causing many types of pollution that have negative impacts on public health and social justice, as well as leading to economic losses (Leal Filho et al., 2023). Universities, comparable

to mini-cities or large enterprises, are locations where FW (food waste) is a significant challenge (Lazell, 2016). This indicates the necessity for further investigation to gain a more comprehensive understanding of this significant matter and to evaluate the potential shifts in attitudes and behavior among young individuals following their exposure to information regarding food waste and its consequences (Kaur et al., 2020; Principato et al., 2015). Students, particularly university students are the future stakeholders of the world and hence their behavior towards the environment dictates their actions about environmental issues like food waste.

There is a significant gap in understanding how these factors specifically influence food waste reduction behavior among hospitality students in Malaysia, although previous studies have explored environmental knowledge and sustainable practices in various contexts. This study was conducted to address this gap by investigating the relationship between environmental knowledge, food waste behaviors, and broader sustainability practices among hospitality students.

The objectives of this study are:

To examine the level of environmental knowledge among hospitality students in Malaysia. To assess the relationship between environmental knowledge and food waste reduction behaviors. To investigate the link between food waste behaviors and broader sustainability practices. To provide recommendations for enhancing sustainability education in hospitality programs.

Therefore, the objectives of this study can contribute to the growing body of literature on sustainability in hospitality education and offer practical insights that can be applied to the development of curricula and industry training programs.

2. Literature Review

Environmental Knowledge

Environmental knowledge refers to the information individuals have on the state of the environment, climate change, environmental views, and the ecological effects of consumption and production and sustainability practices (Pagiaslis and Krontalis, 2014). In recent years, environmental knowledge has been found to have an indirect impact on individuals' intention to participate in conservation efforts; it can thus be regarded as being important in models that aim at predicting individuals' environmental behavior (Gkargkavouzi et al., 2019; Paço and Lavrador, 2017).

Recent studies show that knowledge could indirectly result in behavioral change by affecting the intention to engage in conservation efforts and could hence be used to predict behavioral intention and environmental behavior (Gkargkavouzi et al., 2019). This finding suggests that knowledge serves as a foundation for developing pro-environmental attitudes and behaviors. Similar findings on the significant impact of environmental knowledge on behavior have been presented by Otto and Pensini (2017) and Paço and Lavrador (2017). The development of environmental concerns depends on what people learn about environmental issues rather than vice versa. Moreover, even though environmental knowledge is responsible for inducing environmental concern (Saari et. al, 2021). In the context of hospitality education, Barr (2007) found that students with a deep understanding and knowledge of the issue of food waste are more expected to refrain from wasting food. These findings emphasize the impending impact of integrating environmental education into hospitality curricula to foster more sustainable practices among future industry professionals.

Food Wastage Behavior

The issue of food waste is one of the most critical issues in the hospitality industry with very significant economic, environmental and social implications. Every year third of the food produced globally is either lost or wasted along the food supply chain (FSC) causing significant economic, environmental, and social damage (Principato et. al, 2021). Food wastage behavior is significantly related to one's understanding of the issue as stated by Barr (2007) where those who possess a strong understanding of the issues associated with food waste are more inclined to refrain from wasting food. Based on this premise, we anticipate a favorable impact on the

decrease of food waste among those who possess a comprehensive understanding of the food waste issue, including its spread and measurement.

However, Peschel et al. (206) found that, while less knowledge might make one less likely to make an environmentally friendly choice, better knowledge might not make one significantly more likely to choose it either as people tend to balance between factors such as price and the environment. Household food consumption has been regarded as a key point in food waste generation and significant efforts by e.g., the Food and Agricultural Organization of the United Nations and the European Commission have been directed to assist consumers in reducing food waste (Toma et. al 2020). Another factor affecting food waste behavior is date labeling as a report in their study -date labeling influences the selection of food at the point of purchase and its subsequent consumption and most likely has a strong effect on consumers' decision of what to eat or throw out (Toma et. al, 2020).

Whereas, in the context of higher education, Lazell (2016) identified universities as significant generators of food waste, comparable to mini-cities or large enterprises. This study highlights the importance of addressing food waste behaviors among students, particularly those in hospitality programs who will go on to influence industry practices. Kaur et al. (2021) conducted a systematic literature review of food waste in educational institutions, emphasizing the need for more research on interventions to reduce food waste in these settings. The findings of their study have underlined the potential of education to play an important role in shaping sustainable food consumption behaviors.

Sustainability Related Behavior

Sustainability-related behaviors encompass a range of actions aimed at reducing the negative impact on the environment and leading to ecological balance in the long term. In the context of hospitality, these behaviors can include energy conservation, water management, and responsible sourcing practices. According to Han (2021), the essential drivers of environmentally sustainable consumer behavior include (green image, pro-environmental behavior in everyday life, environmental knowledge, green product attachment, descriptive social norm, anticipated pride and guilt, environmental corporate social responsibility, perceived effectiveness, connectedness to nature, and green value). However, this study focuses on sustainable consumption behavior since the samples are hospitality students who undertake hands-on training in the kitchen, barista lab and mock restaurant.

Sustainable consumption behavior is often associated with pro-environmental consumption behavior, which is an aspect of individuals' behavior that helps reduce their negative impact on the environment (Dhandra, 2019). Pro-environmental behavior can be defined as behavior that causes minimal harm or is beneficial to the environment (Steg and Vlek, 2009). In consumer research, the theory of planned behavior (TPB; Ajzen, 1991), has been predominant in research on sustainable consumer behavior, for example, when predicting the behavior of individuals in connection with the disposal of household waste (Ari and Yilmaz, 2016; Mannetti et al., 2004), water conservation, and green consumerism (Turaga et al., 2010). The TPB (Ajzen, 1991) is often used to measure pro-environmental behavioral intention and actual behavior. Many studies using the TPB indicate that attitudes, subjective norms, and behavioral control can strongly influence consumers' purchasing intentions (Yadav and Pathak, 2017). In addition, knowledge and awareness of environmental issues have been highlighted as having an important influence on pro-environmental behavior (Eom et al., 2016; Klockner, 2013; Tam and Chan, 2018). Saari et al. (2021) have developed a theoretical model that studies sustainable consumption behavior, by incorporating various practices related to individuals' efforts to behave more sustainably. Their models include actions such as buying pesticide-free products, reducing energy consumption, and avoiding products that are not environmentally friendly. This holistic approach to sustainability behavior is very much in line with our study of hospitality students, who may face these issues in their future professional roles.

Interconnections and Synthesis

Past literature discloses a robust interconnection between environmental knowledge, food waste behavior, and broader sustainability practices. Environmental knowledge acts as a foundation, to understand the effects of an individual's actions. As such, it can influence certain behaviors such as food waste reduction, as well as broader sustainability practices. However, the relationship between knowledge and behavior does not occur

directly. Factors such as attitudes, social norms, and behavioral control play a very important role in translating knowledge into action. These issues have highlighted the need for a multifaceted approach to promote sustainable practices in hospitality education and the industry in general. Recent studies (e.g., Principato et al., 2021; Han, 2021) have emphasized the need for a compressive approach that addresses both specific behaviors (such as food waste reduction) and broader sustainability practices. This holistic perspective is in line with the purpose of the study we conducted to examine the relationship between environmental knowledge, food waste behaviors, and sustainability-related behaviors among hospitality students. Thus, while there is a wide range of literature available that can provide useful insights into the individual components of our study, there are still gaps that exist in understanding how these factors interact specifically in the context of hospitality education in Malaysia. Our research was conducted to address this gap, while at the same time contributing to a more comprehensive understanding of how environmental knowledge shapes future hospitality professional practice related to food waste and sustainability.

3. Methodology

This study uses a quantitative approach to examine the relationship between environmental knowledge, food waste behavior, and sustainability-related behaviors among hospitality students in Malaysia. The target population for this study consists of hospitality students at UiTM Penang. We have used a combination of two techniques, namely the convenience and the snowball sampling technique to reach the participants. To collect data for this study, we leveraged modern communication channels that are familiar to our target demographic. The digital survey was created using Google Forms, a user-friendly platform that allows for easy access and completion by participants. We initially shared survey links through various student WhatsApp groups, leveraging existing social networks in the hospitality program. Recognizing the potential for wider reach, we also encourage participants to present surveys to their peers, using a snowball sampling approach. This method has proven to be effective in growing our group of participants beyond our immediate contacts, as students share links with classmates and friends in relevant programs. The combination of direct distribution and peer-to-peer sharing helps us cast a wider network, capturing multiple perspectives from within the hospitality student community. After data cleaning, our final sample consisted of 94 valid responses.

Measurement Instrument:

The questionnaire for this study consisted of four parts. Among them is demographic information: Including gender, age, year of study, current level of study and type of program. Then, the Environmental Knowledge scale: Adapted from Kaiser and Fuhrer (2003), this scale includes 10 items that measure students' understanding of environmental issues, especially those related to food waste and sustainability in the hospitality industry. Responses were measured on a 5-point Likert scale (1 = Strongly Disagree to 5 = Strongly Agree). Next, the Food Waste Behavior Scale: Item is based on Principato et al. (2015), this 8-item scale evaluates student behavior related to food waste reduction. Responses were measured on a 5-point Likert scale (1 = Never to 5 = Always). Finally, the Sustainability Practices. Responses were measured on a 5-point Likert scale (1 = Never to 5 = Always). A total of 20 hospitality students were involved in the pilot test to ensure clarity and relevance. The Cronbach alpha used to assess the reliability of each scale showed good internal consistency ($\alpha > 0.80$).

4. Findings and Discussion

The data for this study was analyzed using IBM SPSS Statistics 26. Descriptive statistics were calculated for demographic variables and scale items. Pearson correlation analysis was conducted to examine the relationship between variables. Multiple regression analyses were conducted to assess the predictive power of environmental knowledge on food waste behaviors and sustainability-related behaviors.

Descriptive Analysis

In the study, we initially had a total of 100 respondents. However, during the data cleaning process, we identified that 6 of the respondents were not from the hospitality program, which was a requirement for inclusion in the study. Consequently, we excluded these 6 invalid responses, leaving us with a final sample of 94 valid participants (Table 1).

The gender breakdown of the valid respondents shows that the majority, 73 participants (77.7%), identified as female, while the remaining 21 participants (22.3%) identified as male. When examining the age distribution, we found an equal split between the 18-20 and 21-23 age groups, each comprising 40 participants (42.6%). The remaining 14 participants (14.9%) were in the 24-26 age range. Looking at the year of study, we had a fairly even representation, with 21 first-year students (22.3%), 36 second-year students (38.3%), and 37 third-year students (39.4%). In terms of the current level of study, 44 participants (46.8%) were pursuing a bachelor's degree, while 50 participants (53.2%) were enrolled in a diploma program. Finally, the program types represented in the sample were diverse, with 51 participants (54.3%) studying Hotel Management, 27 (28.7%) in Pastry Arts, 14 (14.9%) in Culinary Arts, and 2 (2.1%) in Food Service Management.

This descriptive overview provides valuable insights into the characteristics of the 94 valid respondents included in our study, allowing us to better understand the composition of the sample and lay the groundwork for further analyses.

Table 1: Descriptive Analysis

Correlation Analysis

A Pearson correlation analysis was undertaken to investigate the associations between Environmental Knowledge (EnvKnow), Food Waste Behaviour (FoodW), and Sustainability-Related Behaviour (SustainB). The results are presented in Table 2.

Table 2: Correlations Between Environmental Knowledge, Food Waste Behavior, and Sustainability-Related

 Behavior

		Correlations		
		EnvKnow	FoodW	SustainB
EnvKnow	Pearson Correlation	1	.462**	.476**
	Sig. (2-tailed)		<.001	<.001
	N	94	94	94
FoodW	Pearson Correlation	.462**	1	.651**
	Sig. (2-tailed)	<.001		<.001

	Information Management and Business Review (IMBR) Vol. 16, No. 3(S), Sep 2024 (ISSN 2220-3796)				
	Ν	94	94	94	
SustainB	Pearson Correlation	.476**	.651**	1	
	Sig. (2-tailed)	<.001	<.001		
	Ν	94	94	94	
** Correlat	tion is significant at the 0.01	level (2-tailed)			

The results of the above correlation analysis have shown that students' environmental knowledge increases and they will tend to engage in more responsible food waste behavior and general sustainability practices. The analysis revealed significant positive correlations between all variables. Environmental Knowledge showed moderate positive correlations with both Food Waste Behavior (r = .462, p < .001) and Sustainability-Related Behavior (r = .476, p < .001). This suggests that as hospitality students' environmental knowledge increases, they are inclined to engage in more positive food waste behaviors and general sustainability practices. Particularly, the strongest correlation was observed between Food Waste Behavior and Sustainability-Related Behavior (r = .651, p < .001). This strong positive relationship suggests that students who establish more responsible food waste behaviors are also expected to participate in broader sustainability practices. These findings support our hypothesis that environmental knowledge is associated with both specific food-related behaviors and general sustainability practices among hospitality students. The strong correlation between food waste and sustainability behaviors proposes that concentrating on food waste reduction in hospitality education could have stronger impacts on overall sustainability behavior.

These results support previous research (e.g., Kaiser & Fuhrer, 2003; Redman & Redman, 2014) signifying the importance of both knowledge and specific behaviors in stimulating overall sustainability practices. They also emphasize the interconnected nature of food-specific behaviors and broader sustainability actions in the context of hospitality education.

Multiple Regression Analysis

To further examine the predictive power of environmental knowledge on food waste behavior and sustainability-related behavior, we conducted multiple regression analyses. The regression analysis revealed that Environmental Knowledge significantly predicts both Food Waste Behavior ($\beta = 0.462$, p < .001) and Sustainability-Related Behavior ($\beta = 0.476$, p < .001). These results suggest that environmental knowledge explains approximately 21.3% of the variance in Food Waste Behavior ($R^2 = 0.213$) and 22.7% of the variance in Sustainability-Related Behavior ($R^2 = 0.227$).

Table 5. Multiple Regression Results						
Dependent Variable	Predictor	В	SE B	β	t	р
Food Waste	(Constant)	1.872		0.328	5.707	<.001
Behavior						
	EnvKnow	0.497	0.097	0.462	5.124	<.001
Sustainability-	(Constant)	1.763	0.313		5.632	<.001
Related Behavior	EnvKnow	0.518	0.093	0.476	5.570	<.001

Table 3: Multiple Regression Results

5. Conclusion

The findings from this study have provided very valuable insights into the relationship between environmental knowledge, food waste behavior, and sustainability-related behaviors among hospitality students in Malaysia. A positive correlation can be seen between environmental knowledge and both food waste behavior (r = .462, p. <.001) and sustainability-related behavior (r = .476, p. <.001). This has shown that as hospitality students' environmental knowledge increases, they tend to engage in more responsible food waste behaviors and general sustainability practices. The results from results of this study have also shown that focusing on reducing food waste in hospitality education can have a wider influence on students' sustainability behaviors. These findings have provided an important insight for educators and policymakers. The positive correlation between environmental education and stressing the importance of reducing food waste in the hospitality curriculum, educators have the potential to foster a more stable-oriented generation of

hospitality professionals. This, in turn, can contribute to the broader goal of promoting environmentally sustainable practices in the hospitality industry.

Suggestions for Future Research

Future research should prioritize examining the detailed practices and instructional strategies that effectively transform environmental knowledge into tangible sustainable behavior among hospitality students. The study was limited and focused on only one institution in Malaysia and its reliance on self-reported behavior. Future research should be more detailed and extend the study to multiple institutions that have hospitality-related programs in Malaysia. Furthermore, longitudinal studies can examine the enduring effects of educational interventions on the occupational durability of graduates in real-life settings over an extended duration. In conclusion, this study strongly emphasizes the importance of environmental knowledge in fostering

sustainable practices among students and who will become future hospitality professionals. The hospitality industry can move towards more environmentally responsible operations, contributing to global sustainability goals by addressing food waste and broader sustainability issues through education.

Abstract: The prevalence of online learning has significantly increased, particularly in light of the COVID-19 pandemic. Nevertheless, the shift to online education has presented numerous obstacles and concerns. The correlation between a lack of enthusiasm towards online learning and subpar academic achievements suggests the necessity to tackle the issues that impact students' involvement. Educators need to address obstacles encountered by students in online learning, including diminished concentration and inadequate learning delivery. Metaverse technologies, which have attracted growing interest among academia and practitioners, can be the answer to mitigate issues related to online education. Although metaverse technologies show promise for online education, there is a lack of research on their suitability for hospitality education. Comprehending how metaverse technologies can be seamlessly incorporated into online hospitality educational environments is crucial for the progression of such technology. Therefore, this study aims to conceptualize an extended reality metaverse-based pedagogy model for online hospitality education. The conceptual paper is a great resource for stakeholders who are interested in investigating the possibilities of metaverse technologies for hospitality education. This work also establishes a basis for future research that investigates the application of metaverse technologies in online educational environments.

Keywords: *Metaverse, pedagogy model, extended reality, online teaching, hospitality and tourism*

1. Introduction

Online teaching has become increasingly prevalent, especially during the COVID-19 pandemic. With technological advancement, the education system has shifted from traditional classroom to online course delivery (Murray & Pérez, 2015). However, this transition to online education has brought about various challenges and issues. These challenges include obstacles that affect students' engagement and interest in the online learning process (Okyere et al., 2022). Educators have identified various challenges faced by students in online learning, such as decreased focus and unsatisfactory learning platforms (Yusuf, 2020). Students' lack of participation in online classes has also been attributed to factors such as low motivation, ineffective teaching design, and imperfect online education platforms (Agustina, 2022; Hong et al., 2021). Furthermore, the lack of interest in online learning was found to lower learning outcomes, indicating a need to address factors influencing students' engagement (Suhairi et al., 2023). These challenges can be mitigated by a metaverse-based teaching pedagogy (Rahman et al., 2023).

Metaverse is a technology that allows users to interact and engage with each other in virtual environments (Buhalis et al., 2022). Its potential for advancing online education has garnered increasing interest among academics and scholars. Generally, metaverse in education has focused on educational design that can be tailored for learners of different generations using artificial intelligence technologies (Tlili et al., 2022). This suggests the effectiveness of metaverse technologies in accommodating learners of diverse age groups. Metaverse is a new social communication platform that can radically transform conventional forms of social participation in education (Kye et al., 2021). More importantly, metaverse technologies enable a fair learning environment that is not tied to time and space (Park & Kim, 2022a). These suggest that metaverse technologies have the potential to enhance students' online learning experience, acceptance of technology, and motivation toward learning. Recently, the possibility of the metaverse to advance the learning process into a more versatile, interactive, and interesting experience has been empirically proven by Rahman et al. (2023).

Despite the promising potential of metaverse technologies for online education, limited studies have explored the viability of metaverse technologies for hospitality education. Hwang and Chien (2021) attributed this to the lack of exposure to the potential of the metaverse. Although the use of metaverse in tourism and hospitality management has been explored (Buhalis et al., 2022), a robust framework that implements metaverse technologies in hospitality education has not been conceptualized. Research in this area could investigate how metaverse applications can enhance experiential learning (Buhalis et al., 2022; Wei, 2023). But how do metaverse technologies empower education pedagogy? An understanding of how metaverse technologies can be integrated into hospitality educational settings is essential for advancing the field of metaverse-based education.

To provide an understanding of a metaverse-based pedagogy model for hospitality and tourism education, this study conceptualized a framework that integrates metaverse technologies into online hospitality education. To answer the research question, this study synthesizes previous literature to present critical components of the metaverse-based pedagogy framework, particularly on its application to hospitality online education. The study also recommends strategies for metaverse technologies implementation in online hospitality education. The study should serve as a valuable resource for educators, researchers, and practitioners interested in exploring the potential of metaverse technologies for enhancing online hospitality and tourism education. Through the conceptualization of the extended reality pedagogy framework, the study provides a foundation for future research aimed at maximizing the use of metaverse technologies in online hospitality and tourism educational settings.

2. Literature Review

Online Learning and Metaverse Technologies

Online learning refers to the provision of education through the use of the Internet and other electronic gadgets (Wallace, 2003). It has seen a significant increase in popularity, particularly during the COVID-19 pandemic, which expedited its adoption as a primary mode of education (Okyere et al., 2022). Online learning provides flexibility, accessibility, and convenience for both students and educators, enabling learning to occur at any time and from any location. However, online learning in higher education also presents challenges that can impact student experiences, interests, and engagement. Issues such as lack of personal interaction and feelings of isolation can lead to poor student experiences in online classes (Suhairi et al., 2023; Wallace, 2003). The absence of face-to-face interactions and a physical classroom environment may also decrease student engagement and motivation, ultimately affecting learning outcomes (Hafeez et al., 2022). Here, online learning presents a main challenge in maintaining student interest and willingness to stay engaged in virtual environments. This issue may be resolved by metaverse technologies.

Metaverse is characterized by immersivity and interactivity (Buhalis et al., 2022). As metaverse technologies allow for a highly interactive learning environment, the potential of metaverse technologies for improving online education has attracted scholars' attention. For example, Buhalis et al. (2022) highlighted that the metaverse is a mixture of reality and virtual environments that provide users with a platform for social engagement and interaction. Characterized by its spatial, immersive, shared, and real-time nature, the metaverse provides users with extended digital selves and virtual experiences (Hadi et al., 2023; Weinberger, 2022). Metaverse is envisioned as a futuristic digital frontier that integrates various technologies (i.e., virtual reality, augmented reality, social media) to create a seamless and interconnected virtual environment (Hadi et al., 2023; Weinberger, 2022). It serves as a platform where users can explore, interact, and collaborate in virtual spaces, blurring the boundaries between physical and digital realms. The metaverse is defined by its ability to offer users a unique and immersive experience that transcends traditional online interactions (Weinberger, 2022; Suh & Ahn, 2022).

In the context of higher learning education, the metaverse offers a chance to open completely new approaches to online learning environments for students and teachers (Onu et al, 2024). With metaverse technologies, educational institutions can build effective and meaningful learning environments that increase students' interest, interaction, and learning outcomes (Akour et al., 2022; Singla et al., 2023). Metaverse holds significant potential for creating a constructivist learning environment for learners, where they can interact with virtual avatars and flexible learning settings (Singla et al., 2023). Nevertheless, like any other significant educational

innovation such as augmented reality (Ahmad Ridzuan et al., 2020), the metaverse also has its challenges. These challenges need to be systematically addressed to ensure efficient utilization of metaverse across various learning areas of hospitality education. The benefits and challenges of integrating metaverse technologies into hospitality educational settings are discussed in the following section.

Potential Metaverse Applications, Benefits, and Challenges in Hospitality Online Education

Metaverse technologies present both benefits and challenges to online education. Jagatheesaperumal et al. (2022) who investigated the uses, difficulties, and unresolved challenges of extended reality and Internet of Things-enabled metaverses have provided a guide for integrated advanced technologies that enhance students' experience and learning outcomes. Zhang et al. (2022) discussed possible uses of metaverse in education, including blended learning, language learning, competence-based education, and inclusive education. In their view, these metaverse technology applications can be adapted to hospitality education to create dynamic and engaging learning environments. These scholars suggest that the metaverse offers exciting opportunities for hospitality education, including immersive simulations, virtual customer interactions, and experiential learning environments.

The potential benefits of metaverse applications in transforming hospitality students' learning experiences are evident in various studies. For instance, Park and Kim (2022a) examined how the metaverse impacts customer experience and value co-creation in the field of hospitality and tourism management. They suggest that integrating metaverse technologies into hospitality education can help educators enhance student engagement, and learning outcomes, and develop practical skills. Here, it indicates that hospitality education that integrates metaverse may provide students with immersive experiences that imitate real-world hospitality interactions. This could improve students' comprehension of customer service and engagement. As such, a metaverse-based teaching pedagogy is beneficial for practical-based courses such as front office, housekeeping, food and beverage service and culinary (Patiar et al., 2021).

Kye et al. (2021) provided an overview of current trends and future research directions for the metaverse in the hospitality and tourism industry. They suggest that integrating metaverse technologies into hospitality education allows students to acquire hands-on experience in hotel operations, event planning, and guest services, equipping them for a seamless transition into the hospitality industry. Tili et al. (2022) explored the potential applications of a metaverse in education, including blended learning and competency-based education. Lee and Jo (2023) found the potential of metaverse-based collaboration activities in developing students' personality traits and skills by exploring the application of metaverse in problem-based learning curricula from hospitality students' perspectives. Similarly, Horng and Hsu (2024) also demonstrated an enhanced comprehension of hospitality knowledge and skills through an evaluation of AR and VR's impact on learning outcomes.

Although metaverse technologies are advantageous for hospitality education, the challenges and potential issues of their applications require thorough consideration. Several scholars shed light on these challenges and raise questions associated with the integration of metaverse in educational settings. Park and Kim (2022b) for example, highlight the limitations and challenges (e.g., social influences, constraints regarding educational value deviations, awareness of Metaverse usage) of implementing immersive metaverse. This urges for more research on challenges that can impact the effectiveness and usability of metaverse in online education. Akyürek et al. (2024) argue that metaverse often requires a high-speed internet connection and costs more compared to traditional learning tools. Thil et al. (2022) identify a research gap in lifelogging applications in the educational metaverse, highlighting potential challenges in leveraging metaverse technologies for educational purposes.

Ajani (2023) discusses challenges such as privacy concerns, digital literacy gaps, and the importance of inclusivity in metaverse applications. The author views these challenges can pose obstacles to the widespread adoption and effective use of the metaverse in online education. Zheng et al. (2023) point out problems with online education in the metaverse, such as the risk of distractions, eye strain, and delays in question-and-answer sessions. They found these challenges can impact student engagement and learning outcomes in virtual learning environments. Li and Yu (2023) address potential challenges that may hinder sustaining metaverse-based blended English learning, emphasizing the importance of overcoming obstacles to ensure the success of

metaverse applications in educational contexts. If integrating metaverse into education is beneficial, how to overcome these challenges? To answer the question, it is therefore important to develop a robust framework on how to integrate extended reality technology such as Metaverse into online hospitality education. The proposed conceptual framework is detailed in the next section.

3. Extended Reality Empowered Educational Pedagogy Framework

As educators and institutions strive to integrate metaverse extended-reality technologies into the curriculum, it is essential to understand its critical components. Generally, there are six components entailing technology infrastructure (Coyne et al., 2021; Huang & Roscoe, 2021), technology familiarization (Kluge et al., 2022), instructional design (Khlaif et al., 2024), content development (Meccawy, 2023), assessment and evaluation (Gandolfi et al., 2020), and continuous improvement (Geisen & Klatt, 2022). Each component plays a distinctive role in the successful integration of metaverse extended-reality technologies in educational settings. Understanding the importance of these components will help educators and institutions produce a comprehensive and efficient online learning pedagogy.

The framework relies heavily on an established technology infrastructure to ensure the smooth functioning of immersive experiences. This encompasses high-performance computing resources, reliable networking, and readily accessible platforms (Al-Adwan et al., 2023; Akyürek et al., 2024). An efficient infrastructure is crucial for content delivery and seamless real-time interaction among all learners. It comprises servers, networking equipment, headsets, other devices, and platforms facilitating metaverse extended-reality technology experiences. Contrary to traditional educational settings that use simple computer laboratories or online learning platforms, metaverse extended-reality technologies require a more complex and resource-demanding infrastructure. Smooth and immersive experiences necessitate the use of more resilient and high-performing technology. The significance of a solid technical infrastructure for successful metaverse extended-reality technologies implementation is emphasized by Coyne et al. (2021) who highlighted the importance of dependable and high-performing computing resources. Huang and Roscoe (2021) provide additional insight into the issue by examining the specific requirements of head-mounted displays in engineering education. They highlight the need for hardware that can handle detailed and complex visual representations.

Secondly, educators and students should gradually introduce the technology through different platforms. A recent study by Kluge et al. (2022) found several obstacles to adopting metaverse extended-reality technologies. One of the key issues is the insufficient proficiency among educators, which hinders the effective implementation of these technologies. To tackle these problems, it is important to provide comprehensive training and assistance to educators as it enables them to acquire essential skills required to utilize metaverse extended-reality technologies (Kluge et al., 2022). Familiarisation efforts often involve training sessions, workshops, and continuous support mechanisms that improve learners' confidence and expertise. Traditional instructional technologies might require less familiarisation since they are typically more intuitive or are familiar to learners. As the use of metaverse extended-reality technologies technology grows more prevalent, it is essential to ensure that both educators and learners are familiar and at ease with these tools (Al-Adwan et al., 2023; Akyürek et al., 2024).

The third component is instructional design. Traditional education typically emphasizes instructional design that centers around textual materials, videos, and conventional interactive components. Metaverse extended-reality-enabled instructional design is a more complex procedure that entails the creation of three-dimensional models, virtual environments, and interactive simulations. This entails developing learning experiences that capitalize on the distinct capabilities of metaverse extended-reality technologies and align with the intended learning objectives (Al-Adwan et al., 2023). This encompasses interactive and immersive instructional strategies, simulations, and activities that foster engagement and enhance understanding (Onu et al., 2024). Khlaif et al. (2024) address the transition in instructional design towards more utilization of interactive and immersive content. This highlights the importance of engaging students with content that goes beyond conventional approaches while still in line with the learning objectives.

Fourth is content development, which involves the creation of educational materials that can be delivered using metaverse extended-reality platforms. This encompasses 3D models, virtual tours, augmented reality overlays,

and various other forms of immersive multimedia content. Traditional content development often entails the creation of textbooks, worksheets, and standard multimedia content. Developing the content necessitates an entirely different set of skills, encompassing 3D modelling, animation, and programming for interactive components. When creating metaverse extended-reality content, it is important to prioritize the learner experience by making sure it is easy to use, interesting and can be accessed by a wide range of learners (Al-Adwan et al., 2023). Meccawy's (2023) study indicates that involving learner-centered design in metaverse extended-reality apps significantly impacts learning efficacy. This makes it a crucial aspect in content development towards meeting learners' requirements.

To assure the efficacy of metaverse learning experiences, the fifth component incorporates developing and implementing techniques to assess and evaluate learners' progress. The assessments comprise both formative and summative evaluations. Metaverse extended-reality assessments should offer more interactivity and engagement than traditional assessments (Griffin, 2021). Employing simulations and real-time feedback offered a more thorough evaluation of learner understanding and skills (Geisen & Klatt, 2022). Furthermore, the assessment and evaluation process must establish clear performance criteria, utilize learning analytics, and quantify learning outcomes. Gandolfi et al. (2020) conducted a study that introduced the Extended Reality Presence Scale to measure learners' engagement and presence in extended-reality environments. This scale adds a new dimension to assessments that are lacking in existing methods. This suggests that extended-reality technology integration can provide more dynamic and responsive assessment methods as tools in the evaluation process.

Finally, organizational support is crucial for ongoing development in educational environments. The advancement of the metaverse extended-reality framework necessitates the consistent evaluation and revision of tools, content, and instructional approaches in response to feedback and technological improvements. This guarantees that the framework stays current and practical. This entails keeping abreast of the most recent metaverse extended-reality technology, modifying instructional content to more effectively cater to the needs of learners, and consistently assessing the efficacy of the tools in education. Geisen and Klatt (2022) proposed the use of real-time feedback mechanisms in extended reality to promote ongoing development in education. They argue that these techniques can be modified for wider educational use to boost learning outcomes. Thus, the organization's support could start by clearly defining its objectives in utilizing extended-reality technologies and promoting a culture that fosters experimentation and innovation. This approach ensures that the integration of extended reality into educational practices remains dynamic, effective, and aligned with educational goals.

Based on the abovementioned discussion, the six components namely technology infrastructure, technology familiarization, instructional design, content development, assessment and evaluation, and continuous improvement play crucial roles in ensuring a successful integration of metaverse extended-reality technologies into hospitality education. This section discusses the importance of these components and how each component helps educators and institutions produce a comprehensive and efficient online learning pedagogy. Based on the importance of these components, a conceptual framework of extended reality metaverse-based educational pedagogy is illustrated in Figure 1.

1. Technology Infrastructure (hardware, software, network, and facilities) 2. Familirization (Training, workshop, and seminar) 3. Instructional Design (learning objective alligment and personalized learning) 4. Content Development (immersive, scenario-based, and multimodal learning resources) 5. Assessment and Evaluation (performance and learning analytics) 6. Continuous Improvement (learning outcomes and feedback from educators and students)

Figure 1: Extended Reality Metaverse Empowered Educational Pedagogy Model

4. Strategies to Integrate Extended Reality Metaverse Educational Pedagogy Framework

Integrating metaverse technologies into online hospitality education involves the creation of an immersive and interactive virtual environment that simulates real-world scenarios of hospitality settings. Strategies for the integration must relate to the curriculum itself, technological investment, training for instructors and students, stakeholder involvement, and continuous assessment of metaverse technologies. First, the integration of extended reality into online hospitality education must focus on curriculum improvement. Traditional learning methods and pedagogies must be modified by creating virtual classrooms that simulate hospitality scenarios. This can be done by creating a metaverse-based module that aligns newly created activities with the current curriculum and learning outcomes. Revising curriculums by incorporating courses and training will enhance the learning experience of current students and enable future students to easily integrate metaverse technologies into learning (Al-Adwan et al., 2023).

Secondly, the successful implementation of metaverse technologies in hospitality education lies within the investment in extended reality equipment. According to Al-Adwan et al. (2023), providing access to virtual or augmented reality devices is the basis for a metaverse-based education as it creates a virtual campus for instructors and students to immerse and interact through virtual classrooms. They also suggested a few other ways of successful implementations, including the installation of a high-speed Internet connection that supports smart wearable devices and the use of gamification to increase perceived enjoyment among students. Accessibility and technological infrastructure in terms of stability and speed of the Internet are critical factors affecting students' perceived ease of use (Akyürek et al., 2024).

The next strategy for the integration of metaverse technology is professional training for instructors. Metaverse technologies are new to a lot of educators. Providing training in metaverse technologies usage will familiarise instructors with metaverse platforms, tools, and devices that enhance their effectiveness in creating and managing virtual teaching activities; at the same time, trained instructors can help students get comfortable and proficient in using metaverse for learning (Al-Adwan et al., 2023). This is agreed by Akyürek et al. (2024) who stated that improving instructors' know-how skills will increase their acceptance of new technologies. However, a one-time training is insufficient. Institutions must provide continuous support and training to help instructors keep up with the latest developments in metaverse technologies. Educators also need to pay close

attention to those students with special needs, such as autism, so that they will not be left behind (Md Nor et al., 2023)

Integration of metaverse technologies into the current hospitality education curriculum directly affects students. Therefore, the fourth strategy is to enhance student engagement and interaction. To do these, institutions must design an interactive virtual environment that is realistic for students to practice hospitality (e.g., hotel operations, airline operations, F&B services) skills. Institutions may also use metaverse technologies to encourage collaborative projects where students can be exposed to real-world hospitality operations (Griffin, 2021). Instructors also play an important role in enhancing student engagement and interaction with metaverse technologies. By creating a supportive learning environment such as necessary resources and clear learning objectives, students will understand each assignment within the metaverse-based module and trust that metaverse technologies are beneficial to their learning (Al-Adwan et al., 2023). The importance of institutions in providing training for students to adopt metaverse technologies is also highlighted by Akyürek et al. (2024) who suggested proper guidance will enhance students' perceived ease of use of new technologies.

Lastly, strict policies, rules and regulations must be implemented to guide metaverse-based education. Metaverse technologies can be double-edged swords that benefit and harm the users. While metaverse technologies are beneficial in improving learning outcomes, they challenge users in terms of the risk of privacy security (Zhou & Kim, 2022). Zhang et al. (2022) suggested the content and its creators be traceable to ensure the safety and security of its users. Al-Adwan et al. (2023) suggested the establishment of law enforcement authorities who can govern relevant laws such as real-name verification.

The integration of metaverse technologies offers a few benefits to both students, instructors, and higher learning institutions. First, it enhances teaching and learning experiences. The immersive nature of metaverse technologies allows instructors and students to immerse and interact in the simulation of real-world hospitality scenarios (Onu et al., 2024). This not only improves students' practical skills and better prepares students for employment, but the interactivity and engaging nature of the metaverse experience will also increase students' engagement and enthusiasm for learning. This leads to the second implication, in which integrating metaverse technologies into hospitality education will help develop skills and operational proficiency for students. Through the simulations of real-world hospitality scenarios, students can practice various skills, including front desk operation skills and F&B skills (Patiar et al., 2021).

However, a few challenges arise in the successful implementation of metaverse technologies in hospitality education. First, not all institutions can afford investment in such technologies. Secondly, not all students have access to extended reality devices. In these cases, these challenges must be taken into consideration as access to the devices is the basis for a successful implementation of metaverse technologies. Ensuring all instructors and students have access to relevant devices and stable and high-speed Internet is important to avoid failure. Next, the cost of implementation is high (Mystakidis, 2022). Metaverse technologies require significant investment in devices such as headsets, virtual reality glasses or a computer lab. This presents certain barriers to some institutions. Still, the metaverse offers possibilities for innovative teaching and learning experiences and transforms traditional hospitality education. It enables collaboration among instructors and students from all around the world for an enhanced learning experience. Thus, strategic integration of metaverse technologies into online hospitality education can provide students with cutting-edge and experiential learning that better prepares them for the evolving industry. Successful implementation of the metaverse will also enhance the institution's reputation and competitive advantages.

5. Conclusion

The paper discusses the integration of metaverse and extended reality technologies into hospitality education. It emphasizes the importance of instructional design, content development, assessment techniques, and organizational support for effective implementation. It outlines the need for technological investment, instructor training, and student engagement while addressing challenges such as high costs and access to technology. Additionally, it presents then strategies to integrate metaverse's applications in hospitality education, particularly in online learning contexts. However, several limitations should be addressed, such as the need for high-speed internet access, potential privacy concerns, and the digital literacy gap among the

students. Failing to consider these issues could hinder the effective implementation of metaverse extended reality technologies in online hospitality educational settings. Future research directions should focus on developing robust frameworks for integrating metaverse technologies into online hospitality education. Scholars should evaluate the long-term impacts of metaverse extended reality technologies on online learning outcomes. Additionally, future studies could investigate how metaverse applications can enhance experiential learning and customer service training. This can ultimately contribute to a more comprehensive understanding of the role of metaverse extended reality in online hospitality education.

Abstract: Unique destination branding in tourism is crucial to gaining a competitive advantage. Local food is a significant component of a destination brand which Destination Management Organisations (DMOs) must integrate into their official marketing efforts. DMOs must monitor the popularity and perception of their food promotions against the competition. Online promotion and management are challenging due to the rise of usergenerated content. Automatic data mining techniques were used to determine the extent to which tourist food choices on TripAdvisor matched foods promoted by DMOs and how distinct these choices were from a rival DMOs' promotion. We compared online food promotion between the Sabah Tourism Board and the Sarawak Tourism Board. We developed a software system to automatically extract food branding business intelligence from TripAdvisor restaurant reviews. The application of web crawling and scraping technology was applied to extract data and use Sentiment Analysis for interpretation. Online foods promoted by DMOs for each region were found to contain only a few common dishes, but these were more popular than region-specific foods. Significantly different distributions of food choices were found for each region. Some potentially useful differences between foreign and domestic tourists and locals were also identified. Sentiment analysis revealed hidden information in reviews useful for potential food destination branding. Findings from TripAdvisor confirm practical suggestions for improving brand distinctiveness found in the literature. This study is the first to develop an actual system that DMOs could use to estimate the online popularity of their promoted foods and those of their competition.

Keywords: Destination Branding, Local Food, Data Mining, Sentiment Analysis, TripAdvisor, Malaysian Borneo

1. Introduction

In the tourism industry, effective destination branding is crucial to gaining a competitive advantage (Rinaldi & Beeton, 2015). Brands are complex and consist of destination attributes ranging from the purely physical, and historical to the cultural. Good branding distinguishes a destination from comparable others to reduce the gap between projected and perceived image (Költringer & Dickinger, 2015). This can be especially difficult when destinations are geographically adjacent but culturally similar. Destination Management Organisations (DMOs) are responsible for producing, promoting and managing an official destination brand through a variety of channels (Pike & Page, 2014). DMOs need to track and manage public opinion toward the various aspects of the destination brand. DMOs must know whether the products promoted are popular and viewed positively; ideally according to different demographics such as domestic and foreign tourists. Any perceived issues with their brand and opportunities for improvement must be identified and addressed to enhance destination competitiveness (Pike & Page, 2014). DMOs also monitor the overlap between their promotions and those of the competition.

Local food is a significant tourism product that contributes to a destination brand (Ellis et al., 2018) and is the aspect of destination branding considered in this study. Local food is integrated into official destination marketing efforts by DMOs (Choe & Kim, 2018; Björk & Kauppinen-Räisänen, 2016). Stalmirska (2021) suggests local food has varied definitions categorizable into geographic, cultural, and socio-economic dimensions. Notably, local food is an important element of tourist destinations, representing culture and providing a learning opportunity for tourists (Ellis et al., 2018; Björk & Kauppinen-Räisänen, 2016). Gastronomic tourism is a significant niche market for most destinations (Berbel-Pineda et al., 2019). However, a recent study indicates cuisines are neither fully utilized nor skilfully integrated into destination marketing

efforts (Okumus et al., 2018). Attempts have been made to clarify how DMOs could use gastronomic events to enhance destination competitiveness (Nelson, 2021; Stalmirska, 2021; Pivčević & Lesić, 2020). As advocated by Lai et al. (2017) there exists a dual-perspective review of food image: one projected by destination marketers, the other a mental representation as perceived by tourists and an understanding of both is essential for building a positive brand image. Food, culinary experiences, and gastronomy are used in tourism by DMOs, governments and industry groups for place branding (Gulisova, 2022). Debates in the literature discuss whether gastronomy is used for place branding or whether place brand influences the perception of gastronomy (Gulisova, 2022). Other questions include whether gastronomy is authentic, exclusive, market-driven, single cuisine, multicultural or cosmopolitan (Gulisova, 2022).

With the advent of Web 2.0, destination branding is no longer under the sole purview of official entities. Online promotion and management are necessary nowadays due to the rise of User Generated Content (UGC) in the form of social media, blogs, and travel review sites (Mariani, 2020). In tourism destination marketing, UGC is a cost-effective communication means to promote destinations online (Mariani, 2020). An important class of UGC is found on travel review websites such as TripAdvisor (TA) comprised of voluntary unpaid contributions from virtual members. TA is used by 455 million unique visitors per month from all over the world (Putri & Kusumaningrum, 2017; Rossetti et al., 2016) and contains over 570 million reviews concerning accommodations, airlines, attractions, and restaurants. TA has been used as a source of customer opinion in tourism studies but focused on scenic spots or cruising or were general (Li et al., 2021; Tao & Kim, 2019; Schuckert et al., 2016). More recently, Lim et al. (2019) studied how online food reviews influenced tourists' behavioral intention toward ethnic foods in the context of Gen-Y tourists in Malaysia and discovered a direct relationship suggesting the result of reading online reviews increases involvement and intention to seek out local food. However, their paper did not focus solely on TA reviews and gaps remain in extracting, interpreting, and applying TA reviews which could provide insights for DMOs for destination branding.

For destination branding, DMOs could use TA to monitor their local food promotions since it contains restaurant reviews that describe foods consumed by tourists. It is also possible to find all restaurant reviews for a particular destination and to find a subset of reviews that contain a particular keyword. However, TA has several limitations as a tool for branding. First, it is not directly possible within TA to find reviews for a list of many foods, which may each go by several names, nor to compile informative and useful statistics for this list which might aid food branding. For example, if a DMO promotes 20 different foods then it should be possible to find out the popularity of each food by the number of reviews it has, and to also determine how positively it is seen after consumption.

Secondly, reviews cannot be broken down according to whether the reviewer is a foreign or domestic tourist or a resident. This information could be important for assessing the impact of DMO promotions which are aimed primarily at foreign tourists. And TA, like many review sites, has a simplistic overall rating system of 0 to 5 stars, rather than ratings for individual content, making it possible that the rating will not reflect the specific content of interest. For example, there are many zero-star reviews on Amazon.com where the reviewer loved the product but hated the delivery or customer service (Valdivia et al., 2017). To avoid misleading ratings, a finer-grained analysis of review text with analysis at a sentence level is required. In principle, DMOs could extract all this information from TA by manually querying restaurants and foods, reading thousands of reviews in detail to identify and record references to foods, making judgments about opinions in individual sentences, and compiling statistics. Considering the sheer number of TA reviews, this would require considerable time and effort, which would have to be repeated from scratch if the list of promoted foods ever changed.

Due to these practical limitations, a software system able to automatically perform these tasks could be highly beneficial for DMOs. Indeed, the application of computer-based methods taken from data mining is a wider trend in tourism studies that has demonstrated itself. Much recent work has been carried out using data mining techniques, on TA and other UGC in a tourism setting, including Sentiment Analysis (SA). "Sentiment analysis, or opinion mining, is an active area of study in the field of natural language processing that analyses people's opinions, sentiments, evaluations, attitudes, and emotions via the computational treatment of subjectivity in the text" (Hutto & Gilbert, 2014, p.217). SA aims to determine positive and negative attitudes contained in the text and has been applied in tourism studies (Ren & Hong, 2017; Valdivia et al., 2017; Becken et al., 2020; Bruno et al., 2019; Chen et al., 2020; Yu & Zhang, 2020). Few studies have explicitly considered how DMOs can utilize

data mining methods and SA in their destination branding efforts (Filho, 2020; Franzoni & Bonera, 2019). In this respect, our study attempts to address this deficiency.

We aimed to develop a software system to replace the human effort required to extract food branding business intelligence from TA restaurant reviews. This required the application of web crawling and scraping technology to extract relevant data, and the use of SA to interpret it. The type of SA was aspect-based (Valdivia et al., 2017), meaning that it was specifically conducted on review sentences regarding local food and no other features of the review. Although practical suggestions for DMOs on how to use local food as a destination marketing tool are available (Choe & Kim, 2018), this study is the first to develop an actual system that DMOs could use to estimate the online popularity of their promoted foods and those of their competition. For this purpose, we chose to focus on Malaysian Borneo, a food haven in South East Asia.

According to Zainal et al. (2010) to experience gastronomy in Malaysia, it is best to visit the peninsular states of Melaka, Perak, Penang and Borneo regions of Sabah and Sarawak. Malaysia is well-known as a food paradise due to the fusion of the culinary traditions of its diverse ethnic communities (Hussin, 2018). Recent studies on food tourism as a tool for destination branding in Malaysian Borneo have not looked at online reviews of food. Ting et al. (2019) studied tourists from Peninsular Malaysia, Sabah, Singapore, and Indonesia to examine their intention to consume Davak food when they visit Sarawak, Malaysia; findings identified differences from conative perspectives. Fam et al. (2020) examined factors that influence the consumption of Kadazan-Dusun food between foreign (China, Europe) and domestic (Malaysian) tourists uncovering some similarities. However, Fam et al. (2020) found sensory appeal influenced food choice for the China market whereas convenience and mood influenced food choice for the domestic market. There remains a dearth of knowledge on tourist sentiments towards local foods promoted by DMOs in Malaysian Borneo. Therefore, this study chose the DMOs from the Malaysian Borneo regions of Sabah and Sarawak. Although adjacent to one island, each has distinctive local foods and was considered a good case study for branding distinctiveness. The research questions, underpinned by the objectives, are as follows: [1] What local food is being promoted by DMOs in Malaysian Borneo? [2] what is tourist sentiment towards local food on TA for Malaysian Borneo? [3] how distinct are tourist food choices between two rival DMOs food promotions? We aimed to evaluate the promotion of local food by the DMOs of Sabah and Sarawak against TA reviews using data mining techniques and an SA system developed for this purpose. Could gastronomy be a factor of internal differentiation according to TA reviews?

This paper begins with an introduction to the context which will justify the choice of Malaysian Borneo as the case study. Specifically, this section presents an insight into the types of local foods being promoted on the respective regional DMOs' websites. We pinpoint the overlap between the two regions' food promotions including foods unique to the region, foods common to both regions and foods unique to the other region. Next, we outline the TA data mining systems developed for this study followed by the SA algorithm used to analyze food reviews for each region. Findings and discussion deliberate on the popularity of DMOs-promoted foods overall and in detail for each region. Finally, we evaluate the effectiveness of DMO's food promotion online.

2. Context of the Study

Malaysia has three geographic regions, Peninsular Malaysia, Sabah and Sarawak across the South China Sea on Borneo Island, the third largest island in the world with an area of 743,330 km² situated in Southeast Asia. Borneo is shared by three nations: Malaysia Brunei Darussalam, and Indonesia (region of Kalimantan) (see Figure 1). Malaysian Borneo offers unique tourist experiences different from those in Peninsular Malaysia. Sabah and Sarawak are melting pots of cultural diversity, and both utilize 'Borneo' in their tourism destination brand promoting the exotic wilderness and culture of Borneo. These bordering regions are culturally diverse yet share similar tourism offerings of nature, adventure, and culture (Kler & Wong, 2018) promoted by regional DMOs.

Figure 1: Sabah and Sarawak within Malaysia

Sabah Tourism Board (STB) markets "Sabah, Malaysian Borneo as the premier nature adventure destination in the world" (www.sabahtourism.com). Sabah on the northern portion of Borneo has an established tourism industry based on rainforests, iconic wildlife (orang utan and proboscis monkeys), national parks (terrestrial and marine) and culture. Sabah has over fifty main ethnic groups with their languages of which thirty-two comprise the Indigenous Dusunic, Murutic and Paitanic families of Austronesian languages (Kitingan, 2015, p. 269). Sabah is also home to other Austronesian communities including the Bajau (Sama Family), the Brunei and Kadayan, and the Iranun, as well as non-Austronesian peoples (Chinese and Indians), products of migration (Kitingan, 2015). The largest Indigenous group in Sabah is the Kadazan Dusun for whom Indigenous dishes are reflective of their traditions, culture and practices including the *Hinava* (flavourful raw fish salad), *Ambuyat* (a sticky dish made from sago palm starch), Jeruk Bambangan (a preserved condiment made of wild mango endemic to Sabah), Tuhau (a pungent condiment made of wild ginger endemic to Borneo), Lihing (rice wine), Pinasakan (fish dish) and Bosou (tangy fermented meat) (Fam et al., 2020). Sarawak Tourism Board (ST) promotes itself as a home to adventures of the wilderness and cultural diversity. Longhouses are a unique way of life for the indigenous people. Sarawak is known as 'The Land of the Hornbills' as these birds are symbolic of the Dayak. According to the Sarawak constitution, a Dayak, or an Indigenous person is legally defined as all non-Muslim natives (Weinlein, 2017). Fifty percent of the population here consists of indigenous people including the Iban, Kayan, Penan and Bidayuh groups (Weinlein, 2017). Other groups include the Malays, Chinese and small immigrant societies from both Asian and European backgrounds (Ting et al., 2019). According to Ting et al. (2019), traditional Dayak food includes Tubu (stems), Tuak (an alcoholic beverage made from rice wine) and *Pansuh* (meat cooked with bamboo) prepared and cooked using natural resources from the forest. Sarawak ethnic cuisine is unique due to the local ingredients, cooking processes and practices embedded within the different ethnic groups in the region (Wan Sageng et al., 2020). The next section evaluates the local foods promoted by each DMO.

Online Food Promotions: Sabah Tourism Board versus Sarawak Tourism Board

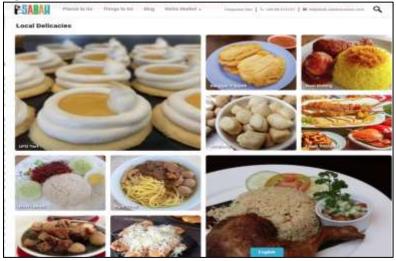

STB's website (https://www.sabahtourism.com/what-to-eat/) promotes 15 different foods on a single page entitled "What To Eat" which is accessible directly from the homepage.

Figure 2: Sabah Tourism Promoted Foods

Laksa, Amplang, Ngiu Chap, Beaufort Mee, Seafood, Bah Kut Teh, Satay, Nasi Ayam, Nasi Lemak, Soto, Pisang Goreng, Fish Head Curry, UFO Tart, Sangar Pappek, Nasi Kuning

Foods are presented using large, attractive pictures that can be clicked for more detail. Figure 3 (overlead) shows some of the foods promoted.

Figure 3: Sabah Tourism Website Food Promotion

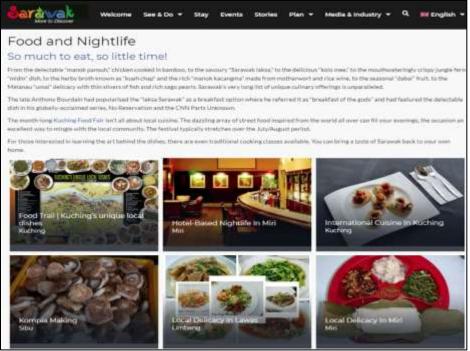

ST's promotion (https://sarawaktourism.com/attractions_type/food-nightlife/) is far less focused than that of STB. Their website provides a combined "Food and Nightlife" section where a total of 43 foods are found scattered across 19 separate pages. The foods are not specifically listed and are simply part of paragraphs describing various events and restaurants. There are also two pages promoting Western and International foods rather than local food in this section. ST promotes a total of 43 foods:

Figure 4: Sarawak Tourism Website Food Promotion

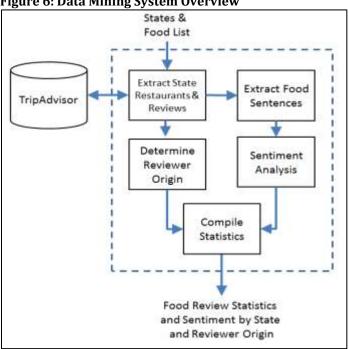

Figure 5: Sarawak Tourism Website Food Promotion

There is some overlap between DMO promotions. Both DMOs promote the five common dishes: *Seafood, Nasi Lemak, Satay, Ngiu Chap*, and *Laksa.* There are thus three food classes to consider for each DMO promotion: (i) foods unique to the region (Sabah 10, Sarawak 38); (ii) foods common to both regions (5); and (iii) foods unique to the other region (Sabah 38, Sarawak 10). Accounting for the five (5) common foods, the combined list of DMO-promoted foods contains 53 dishes. Notably, the commonly promoted dishes are at odds with informal knowledge of what are strictly "local foods". Seafood is not considered to be a traditional food of the local people of either Sabah or Sarawak. STB actively promotes *Laksa* which is perceived as very strongly specific to Sarawak, whereas ST promotes *Ngiu Chap* which is perceived as moderately specific. Despite the overlaps in promoted foods, there is still a good overall separation between DMO promotions. The five (5) common foods constitute only 33% of STB's foods and just 12% of foods by ST. If we assume that all foods are equally popular, the distinction between DMO promotions is supported by a highly negative correlation (r = -0.77) between the list of foods for each region. However, the practical significance of the overlap in promotion will only be seen by the number of reviews for these common foods versus region-specific dishes, which will be determined by data mining presently.

3. Materials and Method

The basic outline of our TA data mining system is shown in Figure 6. Custom Python code was written to crawl and scrape restaurants and reviews for a given list of regions and foods. In this case, the regions were Sabah and Sarawak and the list of foods was from the DMOs (states and food lists). Within each review, individual sentences for foods were extracted and subject to SA. Reviewer origin (nationality of the reviewer) was estimated by comparing the reviewer's location with lists of towns in both Sabah and Sarawak. Food review and SA statistics were then compiled for reviews according to region and reviewer origin.

The particular SA algorithm used was VADER (Valence Aware Dictionary for Sentiment Reasoning) in its freely available Python implementation (Hutto & Gilbert, 2014). VADER can achieve an F1 score of 0.96 on social media text and is a highly cited algorithm (Hutto & Gilbert, 2014). It should be noted that like most SA algorithms, when given a sentence to analyze, VADER will output a value between -1 and +1 meaning strongly negative or strongly positive and with 0 indicating neutral sentiment. Scores of +1 or -1 are theoretical ideals and in practice, scores of around -0.3 and +0.3 are considered highly negative or positive for everyday day text.

A total of 2,294 restaurants were found on TA for Sabah and Sarawak, with approximately equal numbers for each region. All reviews for each restaurant were crawled and scraped from TripAdvisor and stored locally for analysis. In total, 22,387 reviews were extracted, again with approximately half for each region. Then, each review was processed to identify those which were about the foods promoted by each DMO.

4. Findings and Discussion

Overall Popularity of DMO Promoted Foods

The most basic level of popularity data required by a DMO would be the percentage of total reviews for their foods, both collectively as a set of promoted dishes, and individually to identify relative popularity within their promotion. This would be done compared to all other available foods (for example, Western, Middle Eastern, Japanese) which compete less directly compared to the other regional DMOs foods (direct competition).

Table 1 denotes 2,871 reviews in Sabah restaurants that appraised 15 STB foods, and 3,488 reviews in Sarawak restaurants that evaluated the 43 ST foods.

State	Restaurants	Reviews	Reviews containing foods promoted by State DMO
Sabah	1,169	11,954	2,871 (24%)
Sarawak	1,125	10,433	3,488 (33%)

Table 1: Number of Reviews for Sabah and Sarawak Restaurants on TripAdvisor

There is some degree of overcounting in the totals above since a single review may sometimes contain references to more than one food. This notwithstanding, it was evident that STB and ST-promoted foods are referenced in 24% and 33% of all restaurant reviews in their respective regions. One's expectations and goals for market share will determine how impressive these percentages are but, given the vast number of foods available in Sabah today, 24% of all region restaurant reviews for only 15 specific foods can be considered quite respectable. With 33% of reviews, ST foods are certainly found in a greater proportion of restaurant reviews, but this may simply be the result of having almost three times as many foods under promotion than Sabah.

These percentages can help DMOs estimate the overall popularity of their promoted foods versus all other available food choices (Western, Middle Eastern, Japanese). It is reasonable to want an exhaustive list of those other foods that account for the remaining 76% and 67% of food reviews. However, that data mining task is of a different type to the one conducted here and is known to be extremely difficult with current methods. Whilst it is relatively straightforward to find text containing known food types, determining a set of unknown food types is a problem of Named Entity Recognition which is still immature for open-ended domains like the current one. This will be the topic of future work. Therefore, the following analysis will only concern evaluating the relative popularity of the 53 DMO-promoted foods. It was noted earlier that there is overlap in the foods promoted by the DMOs and that this overlap defines three classes of foods: those unique to each region, those common to both, and those foods of the other region. It is useful to identify the distribution of reviews according to these three classes as shown in Table 2.

Table 2: Trip	ble 2: TripAdvisor Reviews broken down by DMOS								
State	Unique State DMO foods	Common DMO foods	Other state DMO's foods						
Sabah	449	2,422	244						
Sarawak	1,252	2,236	323						

Table 2: TripAdvisor Reviews broken down by DMOs

It was evident most reviews for both regions are about the five foods common to both promotions. In Sabah, these common foods account for 85% = 2,422 / (449+2,422) of total DMO reviews. In Sarawak, common foods account for only 64% of reviews (2,236 / (1,252+2,236) meaning that more uniquely ST foods are reviewed. Also shown is the percentage of reviews within region restaurants for foods promoted exclusively by the other DMO. For Sabah, uniquely Sarawak foods are of the same order of magnitude as uniquely Sabah foods. Sarawak has a similar number of reviews for uniquely Sabah foods, but this is offset by the greater number of reviews for region-only foods. Again, this may be due to the greater number of foods promoted by Sarawak. After this basic analysis of food popularity, DMOs might next want to study the distribution of reviews over individual foods and use SA to monitor customer perception of reviews.

Detailed Popularity of DMO Promoted Foods

The grouped review counts shown in Table 2 were broken down to show the individual popularity of the 53 promoted foods within each region. Each sentence containing a DMOs promoted food was subject to SA using the VADER algorithm and the mean sentiment for each food type was calculated. Also extracted was the mean TA rating for the reviews containing references to each food. The results are shown in Tables 3 and 4 for Sabah and Sarawak restaurants, respectively.

Sabah Tourism Promoted Foods

		# of	% of	Mean	Mean TA	Sabah	Sarawak

		Total 3,115	Total 100	Mean 0.22	Mean 0.55	Total 14/15	Total 19/43

Table 3: TripAdvisor Popularity and Sentiment for DMO promoted foods in Sabah Restaurants

As seen in Table 3, only 28 of the 53 DMO-promoted foods were reviewed in Sabah at all but nearly all of the 15 STB foods were reviewed, with only *Sanggar Pappek* (banana fritters served with spicy condiment) receiving no reviews. However, the popularity of these 14 foods is highly uneven. Seafood is overwhelmingly the most popular food, accounting for 63% of all reviews. Its high popularity is also found with a mean

sentiment of 0.34, which is impressively positive. In comparison, the next most popular food, *Nasi Ayam* (chicken rice), accounts for only 8% of reviews but it too has good positive sentiment. *Nasi Ayam* is the most popular food that is uniquely promoted by STB. Confirming the suggestion of Table II, it is evident that all five of the commonly promoted foods are in the top ten, and that the other unique promotions are far less popular. The unique foods *Pisang Goreng* (banana fritters), *UFO Tart* (local tart), *Beaufort Mee* (local noodles), and *Nasi Kuning* (yellow rice) are borderline unpopular by review count.

These manual observations can be quantified by calculating the correlation between the number of reviews for each food and the lists of foods promoted by each DMO. Overall, Sabah restaurant food review counts correlate with STB food promotion at r = 0.31, which is a moderate positive relation. Of course, cause cannot be conclusively determined by this analysis, since STB could simply be promoting what they already know to be popular, but this is still a respectable level of consistency.

Mean TA review ratings are also listed in Table III. These ratings have been transformed from the original range (0 to 5) to the range (-1 to +1) to allow comparison with the results of SA. Sentiment and rating are found to correlate at r = 0.35 which at a gross level is reassuring since total divergence between ratings and sentiment would be cause for concern. However, inspection reveals several differences between sentiment and rating that are missed in this overall correlation. These may reveal food-specific opinions that are missed in overall review ratings. In particular, review sentences about *UFO tart* were found to have a mean negative sentiment, but the overall ratings of the relevant restaurant reviews are still positive. On detecting such a divergence, a DMO can use our system to retrieve the original review text for manual analysis to confirm this finer-grained opinion. For *UFO tart*, it was found that some of the raw reviews featured negative opinions that are missed in the review rating, but detected by SA at a sentence level, as shown in Table VI below. This demonstrates the potential of aspect-based SA for better market awareness which can prompt DMOs to manage these negative opinions.

Overall TA Review Rating (0-5)	Specific Sentences on UFO Tart
3	"Do not order the UFO tart here even is Sandakan speciality."
2	"One of the most overrated UFO tarts I ever tasted"
5	"Unfortunately, they no longer offer UFO tarts"

After considering Sabah restaurant reviews about STB food promotion, a DMO can also study how they relate to direct competition. Sabah restaurant food review sentences correlate with ST food promotion at r = 0.02 which is close to uncorrelated. This result is achieved despite the high popularity of the five commonly promoted foods because i) ST has so many more foods and ii) most that are unique to Sarawak have few or no reviews in Sabah. So, for STB, this combination of moderate correlation with promoted foods but low correlation with ST foods can be considered a good result.

Sarawak Tourism Promoted Foods

The analysis for ST is shown in Table 5 below. While seven of the same foods are in the top 10 for both regions, these are distributed very differently in Sarawak. These include *seafood*, *nasi ayam* (chicken rice), *laksa* (spicy noodles), *nasi lemak* (fragrant rice cooked in coconut milk and pandan leaves served with condiments), *satay* (skewered meat), *Ngiu Chap* (beef noodles), *roti canai* (fried unleavened bread served with curry). Additionally, the exclusively Sarawakian dish *Kolo Mee* (dry-style noodles served with meat) is ranked highly only in Sarawak (14% versus 1% of sentences in Sabah). Similarly in Sabah, *Seafood* is the most popular promoted food, but in Sarawak, seafood accounts for far fewer reviews and is also slightly less positively viewed. Other foods are comparably popular with seafood. *Laksa*, which belongs strongly to Sarawak, is consumed almost as much as *Seafood* and nearly four times more frequently than in Sabah. *Kolo Mee* is also Sarawakian but very popular in Sabah.

Overall, Sarawak restaurant food review sentences correlate with ST food promotion at r = 0.10 which is a weakly positive relation. This is far lower than for STB and is likely to be due to the greater number of foods promoted. And, if DMO promotion drives rather than simply reflects food choices, then this weaker correlation may be due to the comparatively unfocused food promotion on the ST website. As for the competing region's promotion, Sarawak food reviews correlate with STB food promotion at r = 0.02 which is essentially uncorrelated. So even though there is considerable overlap in the most popular foods, the greater number of foods for Sarawak cancels this out overall. The low correlation between Sarawak food reviews and both STB and ST food promotions can be considered a mixed result for ST. The correlations between DMO-promoted foods and relevant reviews on TripAdvisor are summarised in Table 6 below.

by State					
	TA Restaurant Reviews for DMO foods				
	Sabah Restaurants	Sarawak Restaurants			
Sabah Tourism Foods	0.31	0.02			
Sarawak Tourism Foods	0.02	0.20			

Table 6: Correlations between DMO food promotions and restaurant reviews for DMO-promoted foods by State

Estimating DMOs Promotion Effectiveness

As discussed, the moderate positive correlation found between STB food promotions and Sabah reviews does not prove that the DMOs promotions drive the consumer behavior seen on TA. This cannot be established without a control group that has not been subject to the food promotions, which has never been formally done. However, some insight might be still found by analyzing differences in the foods chosen by locals and tourists. It is reasonable to assume that foreign tourists would be more exposed to DMO promotions than locals, with domestic tourists somewhere in between. If food choices by foreign tourists were found to be noticeably more in line with DMO promotions than locals then there is some evidence that the promotions are responsible. It is acknowledged that using locals as a control group is far from perfect since most locals differ significantly in knowledge and background from foreign tourists and are also far less likely to place reviews on TA. Nevertheless, some insight may be obtained.

To allow this kind of analysis, the origin of the reviewer for each review containing DMO foods was estimated, with results shown in Table 7. As might be expected, there are more total reviews by tourists but the proportion of multiple reviews by local reviewers is higher than that of the others due to extended access to local restaurants.

-			
	Origin	Reviews	Unique Reviewers
	Sabah	720	295
	Sarawak	1149	392
	Domestic	2261	823
	Foreign	2797	1425
	Total	6,926	2,935

Table 7: Reviewer Origin for DMO-promoted food reviews on TripAdvisor

When broken down by reviewer origin (foreign, domestic, local), the Sabah restaurant results from the previous section are shown in Table 8 below. To simplify the presentation here, only the top 10 foods are listed although the results are similar for the remaining foods not shown. The first set of columns displays raw review counts for each food with obvious differences by reviewer origin. However, since there are fewer locals than other types, the middle set of columns shows these counts as a percentage of the total number of sentences for that reviewer type. When normalized this way, the differences in choices are less stark but there are some worth noting.

Locals review TA notably less seafood than both types of tourists and have a slightly less positive sentiment towards it. Although foreign tourists have the highest positive sentiment towards seafood, domestic tourists

choose it more. Perhaps this is because domestic tourists have become more aware of seafood through everyday Malaysian life (anecdotally, Sabah is known for seafood among Malaysians even though it is not considered a traditional Sabah dish). Locals eat more of the generically Malaysian *Nasi Ayam* but think less of it, perhaps reflecting everyday eating that domestic tourists may seek to avoid when on holiday.

But perhaps surprisingly, there are no decisive differences between the DMOs-promoted foods chosen by foreign tourists and by locals. The minor differences observed can be considered only weak evidence that STB food promotion drives food choices.

	# revie	ws		% of ı	reviews		Mean	Sentimen	t
	For.	Dom.	Loc.	For.	Dom.	Loc.	For.	Dom.	Loc.
seafood	873	689	399	63	68	56	0.39	0.34	0.30
nasi ayam	109	72	82	8	7	11	0.35	0.26	0.20
laksa	84	54	26	6	5	4	0.36	0.34	0.31

Table 8: TripAdvisor Reviews and Sentiment for Top 10 DMO promoted foods in Sabah by Revi	ewer
Origin	

For Sarawak, the story is slightly different. A smaller proportion of local reviews are for foods in the top ten. Notably, the top 10 foods account for only 84% of local reviews versus 89% for foreign and 88% for domestic tourists. This indicates that more reviews by locals are about the less popular foods not chosen by domestic or foreign tourists. As in Sabah, seafood is less popular and less positively seen among locals, and this attitude also applies to the top 4 foods listed in Table 9.

	# reviews			% of	% of reviews			Mean Sentiment

 Table 9: TripAdvisor Reviews and Sentiment for Top 10 DMO promoted foods in Sarawak by Reviewer

 Origin

Findings provide slightly stronger evidence that food choices by foreign and domestic tourists are more in line with ST food promotion than those of locals. However, it is harder to reconcile this finding with the weak correlation found between reviews and ST promotion earlier and the less focused approach taken on the website.

5. Conclusions, Limitations and Future Work

The objective of this study was to use data mining techniques to determine the extent to which tourist food choices are in line with foods promoted by DMOs, and how distinct these choices are from a rival DMO's promotion. The specific dataset used was TripAdvisor restaurant reviews and the DMOs studied were STB and ST in Malaysian Borneo. Online foods promoted by DMOs were analyzed for each region and found to be highly distinctive with only five foods promoted by both. However, analysis of TA reviews showed that these commonly promoted foods were more popular in both regions than region-specific foods. In Sabah, common foods accounted for 33% of promotion and 85% of reviews for DMO foods. In Sarawak, common foods were 12% of promotion and 64% of reviews for DMO foods, showing that Sarawak had more reviews for regionspecific foods than Sabah. Significantly different distributions of food choices were found for each region and some small but potentially useful differences in food choice and sentiment between tourists and locals were also identified. Aspect-based SA revealed several discrepancies between TA review sentences concerning specific food types and overall review ratings, leading to potentially actionable information to manage food branding. Notably, the DMOs promoted foods did not include most of the indigenous dishes of Sabah or Sarawak. As such, it is essential that both popular local cuisines and indigenous dishes should be competently incorporated into destination marketing efforts with specific presence on DMO websites, and with 'places to eat' icons listed by district, suburbs, or streets in the city. Social media influencers such as bloggers and vloggers should remain as active ambassadors for DMOs as tourists continue to trust UGC. Moreover, there are plenty of local dishes that remain uncited in the literature and were not covered in this analysis. Food must be seen as a vital component of marketing efforts because local foods do impact visitors' perceived image of the destination. Notably, in 2021, Kuching in Sarawak gained the accolade of City of Gastronomy under the UNESCO Creative Cities Network and this will enhance its destination brand by linking farm to fork. Sabah is encouraged to consider food for thought as a supplementary destination image.

This study provides valuable insights into the distinction between projected and perceived images (Költringer & Dickinger, 2015; Lai et al., 2017) which might enhance food destination branding using data mining methods and SA for DMOs (Filho, 2020; Franzoni & Bonera, 2019). Findings contribute to the literature indicating support that local foods are used to form the destination brand in both regional DMOs and support destination marketing (Ellis et al., 2018; Choe & Kim, 2018; Björk & Kauppinen-Räisänen, 2016). However, findings also support the contention by Okumus et al. (2018) that local cuisines have not been skilfully integrated into the marketing efforts. For example, dishes are being promoted by DMOs that receive low or no reviews on TA. Findings also present a system with which DMOs can utilize data mining methods to integrate food into tourism marketing and SA to improve destination branding. Application of this data mining system would support suggestions by Filho (2020) and Franzoni and Bonera (2019) ensuring SA as projected by TA reviews is utilized for regional differentiation which could indeed uplift local gastronomy for destination marketing. Findings also support the work by Yu and Zhang (2020) that knowledge of customer feelings towards gastronomy is an important aspect of the dining experience. In this study, the novel system generates vital information for destination branding as it provides indications of reviews and sentiments for foreign and domestic tourists as well as locals based on UGC from TA.

The findings presented here are only early work but provide some level of insight that DMOs may find useful in monitoring their promotions and those of the competition. Both regions had some encouraging results and some areas to address. There are obvious limitations in using TA for business intelligence compared to commissioning a dedicated study. However, the data is free and requires little work if automation techniques from data mining are used. As stated earlier, a more comprehensive determination of foods in all region restaurant reviews would be an advantage but such an open-ended task is highly challenging for current Natural Language Processing and was beyond the scope of this current project. This will be addressed in future work. Also, the system developed here will be extended to process reviews in languages other than English. On

TripAdvisor, there are significant numbers of regional restaurant reviews in Malay and Mandarin which may modify the conclusions drawn here.

Exploring Factors Impacting Student Engagement and Performance Towards Work-Based Learning Among Culinary Students

Arnieyantie Abdul Hadi, Norfezah Md Nor*, Nur Syafiqah Mohd Yunus, Nur Athirah Najihah Mat Radzi, Teku Zariff Zaeimoedin, Amirul Hakim Zulkifli Faculty of Hotel and Tourism Management, Universiti Teknologi MARA Cawangan Pulau Pinang, Permatang Pauh, Pulau Pinang, Malaysia *norfezah420@uitm.edu.my Corresponding author: Norfezah Md Nor

Abstract: This study explored factors affecting student engagement and performance in Work-Based Learning (WBL) among culinary students at Universiti Teknologi MARA (UiTM), Cawangan Pulau Pinang Branch, using a qualitative approach. Semi-structured interviews with six (6) Diploma Culinary Arts students from the 2019 and 2020 WBL programs were analyzed through thematic analysis. The findings revealed crucial factors influencing engagement and performance. Positive aspects included a strong knowledge base, high discipline, effective time management, and proactive behavior. However, significant barriers such as sexual harassment and unfair treatment by supervisors were identified. The study also highlighted the importance of industry involvement and feedback for successful WBL experiences. To improve the WBL program, it is recommended to enhance collaboration with industry partners, systematically gather feedback, and adopt flexible program designs. Addressing these issues could significantly boost learning outcomes, performance, and overall student engagement in the WBL program.

Keywords: Student engagement, performance, work-based learning, Culinary Students

1. Introduction

The hospitality industry has experienced significant growth and remains a key driver in the advancement of the tourism and food service sectors, primarily due to the exceptional skills and competencies of its workforce in delivering high-quality services. This expansion necessitates that Higher Education Institutions (HEIs) develop comprehensive educational frameworks that align with market demands and the need for well-trained, competent employees (Wei, 2018). The intense competition within the hotel industry underscores the need for culinary programs that equip students with the necessary skills to meet industry standards (Farmaki, 2018).

Effectively balancing supply and demand in the hospitality sector and differentiating between students' experiences and expertise within both educational settings and the hotel industry is crucial. As many countries modernize their infrastructure and technology to meet international standards, a skilled workforce becomes increasingly essential (Schuh et al., 2015). Employers must prioritize gualifications to meet these standards, and internship programs are vital in preparing students for future careers. HEIs play a pivotal role by offering practical internship opportunities that simulate real work environments and meet employer expectations (Hughes et al., 2013). To produce well-rounded, entrepreneurial, skilled, and knowledgeable graduates, the Malaysian education system introduced Work-Based Learning (WBL) in 2007 (Mimi et al., 2021). Work-based learning (WBL) was initially introduced to enhance the education and training system within Malaysian Technical Vocational Education and Training (TVET) institutions. As part of TVET, the WBL program has successfully attracted a skilled workforce to Malaysia with minimal government investment. In 2011, the Malaysia Centre for Tourism and Hospitality Education (MyCenTHE) incorporated WBL into its hospitality education curriculum. The program aims to provide students with practical industry experience during their tertiary studies and to prepare them for the workforce by immersing them in real-world hospitality settings. This initiative aligns with the Malaysia Education Blueprint 2020-2025, which seeks to develop industry-led curricula to improve graduate employability and address skill mismatches.

Moreover, WBL programs are centered on the concept of student engagement and provide a dynamic method for integrating academic knowledge with real-world experience. This engagement manifests in various forms, all of which are crucial to the success of WBL initiatives. Scholars have positioned student engagement within a broader motivational framework, such as the self-system model of motivational development (Connell &

Wellborn, 1991; Skinner et al., 2008), to theorize its precursors in students' learning environments and psychological processes.

Many scholars have demonstrated that declining levels of student engagement are strong predictors of early withdrawal from education and training, particularly in secondary education (Lam et al., 2016; Lamote et al., 2013; Rotermund, 2010). Understanding this phenomenon requires viewing student engagement as a process through which students progressively disengage from education, aligning with the notion that early leaving from education and training (ELET) often represents the culmination of this gradual disconnection (Finn, 1989).

Student engagement is crucial for academic achievement, resulting in attention, class participation, and learning motivation (Fredricks et al., 2004). Engagement influences student retention, learning, achievement, and graduation (Nelson Laird et al., 2008). Coates (2006) identifies student involvement as crucial for developing students' sense of belonging to their institutions. The level of engagement can significantly impact a student's performance and the overall success of the work-based learning (WBL) experience.

Through the practical context of work-based learning, the application of theoretical knowledge can be seen as a comprehensive measure of student performance (Ossenberg et al., 2020). Theoretical and practical learning heavily influence this method, which enables students to apply their academic knowledge in real-life hospitality situations leading to increased engagement and skills development (Sudjimat et al., 2019). Performance evaluations are based on professionalism, skill development, involvement in one's learning process, academic success and feedback assimilation; practical experience promotes job competencies and positive learning environments (Ossenberg et al., 2020; Sudjimat et al., 2019). The technical as well as soft skills proficiency, participation in complex activities, reflective practices use and mentors' feedback are preconditions of success (Ossenberg et al., 2020). In conclusion, WBL performance reflects on outputs such timely completion of projects and attainment of competencies thus equipping students with future jobs as well as improving educational outcomes and skills (Ossenberg et al., 2020).

Work-based learning (WBL) at UiTM Penang is an integral component of the university's curriculum, designed to bridge the gap between academic learning and real-world industry experience. Therefore, the first cohort of culinary students from WBL was discharged from the UiTM Penang Branch in 2019. Students are required to spend two semesters (1 year) within the industry, gaining exposure to real-world work environments within well-established food and beverage organizations across the country. In this WBL program, students are required to complete four main modules namely *Culinary Production, Cold Kitchen, Malaysian Cuisine* and *Hospitality Procurement* that focus on culinary skills, while also providing in-depth knowledge in food production, safety, entrepreneurship, and organizational management throughout the course.

An interview with UiTM WBL Coordinator Teku Zarif shed light on critical factors that contribute to the success of the WBL program, including exposure to new industry experiences and job opportunities that follow the WBL module. Teku Zarif (2023) noted that approximately 100 students underwent industrial training from 2021 to 2022, with a minimal failure rate of 1%. Although this percentage is quite low, it highlights underlying issues in the effectiveness of the WBL program. While the majority of students completed their studies on schedule, some faced challenges that caused delays, impacting both student achievement and the faculty's objective of achieving 100% on-time completion. Understanding the factors influencing student engagement and performance in WBL programs is crucial for improving these programs and ensuring timely completion. Despite increased interest in research on student involvement, it remains relatively underdeveloped in comparison to the growing number of students participating in such programs and the policy focus on lifelong learning. Therefore, this study aims to explore challenges faced by UiTM P. Pinang Branch culinary students during the WBL program, specifically focusing on the challenges and problems affecting engagement and performance in WBL programs.

2. Literature Review

Overview of Work-Based Learning (WBL) in Malaysia

WBL stands for "work-based learning." Lewis (2004) defines work-based learning as a learning approach that provides students with firsthand experience of the realities they will encounter in the workplace. In other words, work-based learning is a process that integrates the needs of the employment sector with on-the-job learning and learning through work (Wazli et al., 2015). Work-based learning is commonly linked to the field of education, but it is not yet implemented across all institutions. Currently, the WBL program is acknowledged as a key approach for bridging the gap between education and the workforce. Furthermore, the WBL program is a teaching and learning method that involves students, particularly those in their final semester before graduation, and requires the employee overseeing this aspect to be responsible for both teaching and evaluating the students (Wazli et al., 2015).

Further, the WBL Program gained significant attention when the Malaysian Qualifications Agency introduced guidelines for its implementation across higher education institutions, industries, students, trainers, and other stakeholders involved. These guidelines offer initial insights into the design and methods used in the WBL program (Malaysian Qualifications Agency, 2016). Following this introduction, the guidelines have been adopted by two Public University programs: the Bachelor of Entrepreneurship with Honors at Universiti Malaysia Kelantan (UMK) and the Bachelor of Plantation Management at Universiti Putra Malaysia (UPM). While both institutions follow the same foundational concept, they implement it differently based on their specific timelines, utilizing the 2U2i study model.

The Significance of WBL for Higher Education and Hospitality Industry

WBL offers numerous benefits that positively affect both higher education and the hospitality industry. One key advantage of the WBL program is its ability to enhance students' knowledge and practical skills within the hospitality sector, effectively bridging the gap between theoretical learning and real-world application. During the WBL phase, students have the chance to put their academic knowledge into practice. Additionally, the WBL program supports lecturers in developing students with both creative and technical expertise, aligning with the current demands of the hospitality industry. As the hospitality field evolves rapidly, there is a growing need for individuals with critical thinking skills to thrive in this sector. The WBL program serves as a valuable stepping stone for graduates entering the hospitality industry, with many hotels actively seeking skilled staff who can drive advancements and contribute to the future growth of the industry (Mimi et. al., 2021).

In real-life scenarios, WBL can boost students' confidence in their abilities, deepen their commitment to their education, and enhance their professional knowledge. The outcomes show that these advanced WBL strategies foster students' professional development by providing opportunities to engage in real-world situations and gain practical experiences. This, in turn, strengthens their practical skills and prepares them for their future careers (Stalheim, 2020).

Academics, businesses, and WBL programs face diverse challenges. Academics accustomed to traditional teaching methods struggle with the shift to advising, mentoring, and coaching required in WBL programs. Additionally, organizational culture gaps between external employers and higher education institutions (HEIs) can complicate WBL collaborations. Internal challenges within HEIs, such as organizational structure and resistance to change, further complicate the implementation of WBL programs. Cultural differences between academic institutions and the commercial sector may lead to conflicts between academic standards and practical business needs. Improving communication and fostering a collaborative culture, rather than a competitive one, can help HEIs better align interdisciplinary programs with employer demands and manage these challenges effectively (Doherty et al., 2019).

WBL is a crucial component of culinary arts education, bridging the gap between theoretical knowledge and practical application. The WBL program immerses students in professional kitchens, offering hands-on experience that extends beyond the classroom and aligns with planned learning outcomes achieved through work positions. Self-reflection plays a vital role in this program, allowing students to recognize and learn from their job experiences.

The physical layout of the culinary workspace, the mentor-student relationship, and the overall environment play a crucial role in student engagement. Modern kitchen facilities, well-organized training programs and opportunities for hands-on experience are key factors that positively influence engagement levels (Johnson et al., 2020). On the other hand, Brown et al. (2019) found that insufficient resources, poor mentorship, and disorganized work settings can hinder students' immersion in the learning process.

Several studies have explored the potential link between extensive work commitments and the risk of incomplete studies among culinary students involved in WBL. Sobri et al. (2022) found a notable correlation between increased work hours during culinary internships and a higher likelihood of academic difficulties, such as missed assignments and exams, which can lead to a greater risk of program non-completion. Additionally, the demanding nature of the fast-paced culinary industry, with its irregular hours and high-pressure environment, has been identified as a factor that complicates students' ability to balance work and academic responsibilities (Brown et al., 2019). Maintaining a balance between gaining practical experience and achieving academic success is particularly challenging in culinary education, where students face the rigorous demands of hands-on learning in professional kitchens. To enhance the effectiveness of WBL programs, flexible scheduling, and academic support services to reduce the risk of incomplete studies among culinary students.

Although WBL has been heralded as a revolutionary approach to skill development in culinary education, its effects on the learning progress and completion rates of culinary students have work-based learning programs in culinary education, thereby guaranteeing the comprehensive development and readiness of future culinary professionals.

Student Engagement During the WBL Program

Smith (2012) highlights that active participation is a core element of WBL involvement. By engaging in workplace activities, contributing to projects, and participating in discussions, students can apply theoretical knowledge to real-world situations and gain a comprehensive understanding of their field. Jones (2020) further notes that goal-setting is a crucial factor, with a positive correlation between setting clear learning goals and student motivation. Students who define their objectives are more likely to be engaged in WBL activities and effectively focus their efforts.

Conversely, Brown et al. (2019) argue that reflective activities are essential for bridging the gap between theoretical knowledge and practical application. Regular reflection enhances students' understanding of theoretical concepts in real-world contexts, supporting lifelong learning and skill development. Additionally, Turner and Smith (2022) stress the importance of effective communication skills in professional settings. Their research examines how strong communication abilities impact teamwork and positive workplace relationships, with engaged students developing these skills through their WBL experiences (Smith & Smith, 2024).

Student Performance During the WBL Programme

A comprehensive assessment of student performance during work-based learning (WBL) involves evaluating how effectively students implement and apply their knowledge in real-world contexts (Ossenberg et al., 2020). According to Sudjimat et al. (2019), both theoretical and practical learning significantly impact student performance in WBL. This approach allows students to apply their academic knowledge in real-world hospitality scenarios, enhancing their skills and fostering engagement. It also provides opportunities for gaining insights and improving skills, which are crucial for successful learning and growth.

Performance is assessed using various criteria, including professionalism, skill development, engagement, academic achievement, and the ability to integrate feedback (Ossenberg et al., 2020). Sudjimat et al. (2019) note that WBL offers practical experience that not only develops job-specific competencies but also creates a positive learning environment that motivates students to excel. Success in WBL is measured by how well students apply theoretical knowledge to industry-relevant challenges (Ossenberg et al., 2020).

Proficiency encompasses both technical and soft skills, such as communication, teamwork, and problemsolving, which are vital for professional success (Ossenberg et al., 2020). Increased engagement in WBL

activities and active participation leads to better learning outcomes and skill development (Ossenberg et al., 2020). Additionally, reflective practices and feedback from supervisors are crucial for enhancing student performance (Ossenberg et al., 2020). Professionalism, demonstrated through a strong work ethic, also contributes to performance (Ossenberg et al., 2020). Ultimately, assessing WBL performance involves evaluating outcomes like timely project completion and the achievement of set competencies, which prepare students for future career development (Ossenberg et al., 2020). Greater interaction during WBL activities is linked to improved learning outcomes and skill growth (Ossenberg et al., 2020).

3. Methodology

This research employed a qualitative methodology, gathering data from various sources, including both primary and secondary materials. Interviews were conducted with participants who had experienced WBL in the 4–5-star hotel industry across the state of Malaysia. Prior consent was obtained from all respondents before they participated in the study. The interview protocol instrument was used to gather specific information pertinent to the study's objectives, employing both primary and secondary data collection methods (Wilcox et al., 2012). In 2019, a total of 115 students completed WBL, while 62 students did so in 2020, across Malaysia. Data saturation was achieved by the sixth respondent, after which the interviews were transcribed, coded, and analyzed.

4. Results and Discussion

The demographic profile of the six students from the Work-Based Learning (WBL) program provides valuable insights into their backgrounds and experiences. Aged between 23 and 25, these informants fall within the typical age range for students approaching the completion of their diplomas or advancing their education. They come from various regions across Malaysia, highlighting the program's broad geographic reach. Table 1 below shows the demographic information of the informants.

Code	Age	Home Address	Organization during WBL	Current Activity
WBL 1	24 years old	Kulim, Kedah	Park Royal Penang	Doing an internship for her degree.
WBL 2	23 years old	Nilai, Negeri Sembilan	Lexis Port Dickson	Working at FnB restaurant
WBL 3	23 years old	Georgetown, Penang	Cititel Penang	Doing an internship for his degree.
WBL 4	23 years old	Kulim, Kedah	Ombak Villa Langkawi	Internship for his degree.
WBL 5	23 years old	Permatang Pauh, Pulau pinang.	Ixora hotel Pulau Pinang.	Working at Ixora hotel Pulau Pinang.
WBL 6	25 years old	Seberang Perai, Pulau Pinang.	Ixora hotel Pulau Pinang	Works in a factory canteen.

Table 1: Informants' Profile

The results indicated that all informants completed their WBL at various esteemed hospitality establishments (4 and 5-star hotels), such as Park Royal Penang, Lexis Port Dickson, Cititel Penang, Ombak Villa Langkawi, and Ixora Hotel Pulau Pinang. This range of placements reflects the program's strong industry connections and the diverse learning environments it provides. Currently, the informants are involved in a mix of further education and professional roles. Two are interning for their degrees, one works at an F&B restaurant, one continues at Ixora Hotel Pulau Pinang, and one is employed in a factory canteen. These roles highlight the practical application of their training and the program's effectiveness in aiding their career transitions. Overall, the demographic profile illustrates the WBL program's success in offering varied, valuable industry experiences and supporting students' academic and professional growth.

Factors Impacting Student's Engagement and Performances Towards Work-Based Learning (WBL) among Culinary Arts Students

Table 2 below effectively summarizes the qualitative findings, linking key themes with supporting quotes from the participants.

Table 2: Summary of Qualitative Research Findings on Work-Based Learning (WBL) in the Hospitality Industry

Industry Theme	Key Findings	Informant's response
Understanding of WBL	Extensive knowledge is crucial. It	Informant 4
Module	reflects the depth of understanding	"From what I understand, 4 of the modules
house	and the practical skills that students	consist of Malay cuisine, cold kitchen,

Based on the themes retrieved, the inter-rater reliability table was used to establish the first category, which pertains to the factors influencing Work-Based Learning (WBL) Programs. Further to the process, a set of codes is developed, e.g., into a codebook, often by an individual moving back and forth between the data and a working set of codes, merging, renaming, redefining, or removing codes along the way. The codes are then heavily informed by prior literature and thereby largely deductively derived; informed by the data and literature in a cyclical approach and thereby largely abductively developed; heavily informed by the data and thereby largely inductively discovered; or the approach may be at some intermediate position between these distinct points. A sample of the data is then coded by multiple researchers independently before the consistency of their coding is assessed (Stuart et al., 2002).

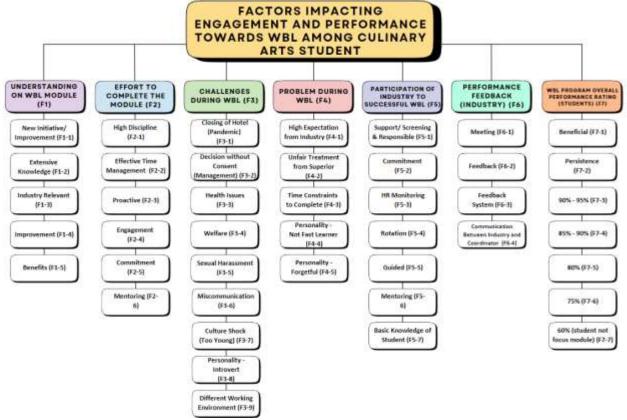

Figure 1 above showed that extensive knowledge was the most frequently reported factor by informants, with 83% indicating its significance. Feedback was the next most common factor, mentioned by 67% of participants. Additionally, both unfair treatment from superiors and performance-related meetings during WBL were each reported by 50% of the informants. The lowest reported factor, at 16%, represented the least frequently mentioned issues impacting the WBL program. A mind map was created using data coded and themed from an inter-rater reliability table, focusing on the factors affecting the WBL program.

Results identified seven factors impacting student engagement in the WBL program, with four factors most frequently cited by informants from the Diploma in Culinary Arts Management at UiTM Pulau Pinang Branch. Extensive knowledge emerged as the highest-rated factor, voiced by 83% of the informants, indicating its critical importance. The WBL program has also implemented strategies to support students' professional growth by providing opportunities to engage in real-world situations and gain practical experience (Stalheim, 2020). Among the six informants, three identified high discipline, effective time management, and proactivity as key factors in completing the WBL module.

According to Smith and Johnson (2021), active participation is the fundamental aspect of WBL involvement. Additionally, Jones et al. (2020) found that goal-setting is a guiding factor, with a positive relationship between goal-setting and student motivation. Students who clearly define their learning goals are more likely to engage in their WBL activities and effectively direct their attention and efforts (Handajani et al., 2024). In this research, the feedback method used to gather performance information was the second most frequently mentioned factor, with a frequency of 67%. However, many informants reported experiencing unfair treatment from superiors in the hospitality industry, with this factor being highlighted by 50% of participants. Additionally, while completing the WBL module, informants faced challenges that led to discomfort, including instances of sexual harassment, this was supported by Sobri et. al., 2022 that found students' negative work-based learning experiences are less likely to deter them from continuing their careers in the hospitality industry.

Moreover, as the hospitality industry expands, so does the demand for educational frameworks that align with market needs and produce skilled professionals. Based on the literature discussed, the essential role of WBL in bridging the gap between theory and practice, emphasizing the importance of a dynamic learning environment, strong mentorship, and adequate resources. The findings indicate that a well-structured WBL program enhances student engagement, learning outcomes, and preparedness for the hospitality industry. Research shows that the quality of the learning environment significantly impacts WBL engagement and performance, with higher levels of engagement linked to modern kitchen facilities, well-organized training programs, and positive mentor-student relationships.

Besides that, challenges such as insufficient resources, inadequate mentoring, and inconsistent work environments can hinder student success. To maximize the benefits of work-based learning and reduce the risk of incomplete studies, the study underscores the importance of addressing these challenges through initiatives like mentorship programs, flexible scheduling, and academic support services.

5. Conclusion

In conclusion, this study provides valuable insights into the factors affecting WBL engagement among culinary arts students. By understanding and addressing these factors, educational institutions can enhance the design and implementation of WBL programs, ensuring the thorough preparation and development of future culinary professionals. These findings contribute to the broader discussion on improving WBL programs, ultimately supporting the growth of the hospitality industry by producing skilled and well-prepared graduates.

The Perception of Health Belief and Vaccine Valence Towards Domestic Tourist Intention to Travel during COVID-19 Pandemic

Rozilawati Shaari¹, *Wan Rusni Wan Ismail², Nor Hafizah Mazlan², Wan Ilinajwa Wan Mustaffa², Norliana Hashim² ¹Tourism and Hospitality Department, Politeknik Tuanku Syed Sirajuddin, Malaysia ²Faculty of Hotel and Tourism Management, Universiti Teknologi MARA Cawangan Pulau Pinang, Malaysia rozilawati@ptss.edu.my, *rusni.wi@uitm.edu.my, hafizahmazlan@uitm.edu.my, wanilinajwa@gmail.com, norli1974@uitm.edu.my Correspondence Author: Wan Rusni Wan Ismail

Abstract: This research investigates health risk perception and vaccine valence as factors that affect Malaysian intention to engage in domestic vacations. An online survey was created with Google Forms and distributed to a sample of 265 domestic travellers at least 18 years of age in May and June 2021; this is when the nationwide vaccine program started in Malaysia. The result indicates that vaccine valence risk perception was a significant factor in affecting domestic vacation intention. Only perceived behavioural control and subjective norms mediated the relationship between health risk perception and domestic vacation intention. Overall, vaccine valence risk perception tested significantly with all constructs in this study due to the various factors, especially the timing of data collection where the data collection was carried out amid the national vaccination program. Hence, the vaccine is now perceived as a hope for many as the solution to the current pandemic problem. It indicates that domestic vacationers will return once vaccinated and when tourism sectors are open for business and resume their regular operation. These findings extend the body of knowledge for the theory of health belief and theory of planned behaviour in predicting tourist intention to travel during a pandemic. Findings also indicate the positive impact of vaccine valence on the tourist's intention to travel, which provides a glimpse of future tourist behaviour when facing similar uncertainties.

Keywords: *COVID-19*, *Health risk perception, domestic vacation intention, vaccine valence*

1. Introduction

Recently, the tourism industry has been affected by the pandemic. The fluctuation in COVID-19 cases throughout the year has created unrest feelings among locals; coupled with the movement control orders, the growth of Malaysia's tourism and hospitality industry has reached a screeching halt (Foo et al., 2020). Such development will only create more problems for the industry, which is struggling to survive. Consequently, the COVID-19 pandemic significantly influences domestic tourists' psychology in this study's scope in Malaysia (Khan & Hashim, 2020).

According to the Department of Statistics Malaysia (2020), Malaysia's domestic tourism expenditure experienced a significant drop, RM 40.4 billion. As a result, 131.7 million domestic visitors were recorded in 2020, with a decrease of 44.9 per cent compared to the previous year in 2019. Consequently, this domestic travelling trend caused unprecedented negative disruption to the tourism economy due to the travel restrictions in the country. Understanding tourist behaviour and the intention to vacation, especially domestic tourism, is essential for tourism management.

This research is a replication of a previous study by Bae & Chang (2020), using the Health Belief Model (HBM) and Theory of Planned Behaviour (TPB) as mediators to investigate travel intention during the pandemic. This study also has integrated vaccine valence as a new dimension into this study to investigate how the introduction of vaccines will change the perception of risk and intention to travel. Currently, Malaysia received the first vaccine in February 2021. The vaccination implementation process under the National COVID-19 Immunisation Program encompasses enrolling target individuals according to the phase's priorities.

2. Literature Review

The Theory of Planned Behaviour (TPB): evolved from the Theory of Reasoned Action (Fishbein & Azjen, 1975). Specifically, the main objective of this theory is to try to understand and predict factors that influence

individual behaviour by looking at people's intentions (Ajzen & Madden, 1986). This theory was applied to the present study to investigate factors contributing to travel intention during a pandemic. In TPB, intention acts as the direct behavioural determinant, and with an accurate measurement, the intention may serve as the best predictor of behaviour (Girish & Lee, 2020).

The TPB has been widely used in different areas, including psychology, nursing, marketing, physical education, and tourism (Gstaettner et al., 2017; Sánchez-Cañizares et al., 2020a). However, researchers tried incorporating additional variables in the TPB to improve their explanatory capacity to predict actions more accurately. For example, variables such as authenticity, the picture of the destination, travel restrictions, the location, and the features of tourists have been introduced to increase understanding of tourism behaviours (Girish & Lee, 2020). In addition, risk-related variables have recently been added to improve the TPB. For example, Quintal et al. (2010b) addressed the effect of perceived danger and perceptive ambiguity on the intention of Korean, Chinese, and Japanese tourists to visit Australia. They have reported that perceived danger affects visitors' attitudes in Korea and Japanese tourists' behavioural management. TPB have three main variables namely attitude, subjective norms, and perceived behavioural control.

Attitude (ATT)

The TBP is one of the most prevalent psychological models for understanding and predicting human behaviour (Chaulagain et al., 2020) and is widely used and tried in various contexts, disciplines, and countries. For example, Ajzen (1991) found that a person's intention to participate in behaviour is decided by their attitude (personal belief and feelings towards that conduct) and the subjective norm (perception of the individual of the success of their prominent references). However, the action largely depends on willpower, which refers to the willingness of the individual to conduct the behaviour. Attitude is the effect of feeling (scary or valence) for the overall evaluation of behaviour. Previous studies have identified several factors that influence tourist attitude involved in decision-making for travelling and the researcher found that the level of attitude plays a significant role in determining travel perception and behaviour (Chien et al., 2017) was widely discussed, only a few scholars have studied the effects of COVID-19 on domestic travel intention.

Subjective Norms (SN)

Subjective norm is the perceived social pressure to engage or not to engage in behaviour; it results from how the person perceives the pressures placed on them to perform or not to perform the behaviour (Ajzen & Fishbein, 1975). The crucial role of subjective norms as a predictor of intention has been well recognised (Bae & Chang, 2020; Han et al., 2020; Quintal et al., 2010a). Furthermore, these studies showed that adding a causal association between the normative and attitudinal factors into the TPB made the system more parsimonious, ultimately reinforcing the theory. Based on these findings, the researchers found that today's travellers appear to believe more in peer reviews when choosing tourism products and services rather than business knowledge. With the rise of communication technologies such as the internet, various views on hotels, tourist destinations, and even travel services are shared on the internet from customer usage.

Perceived Behavioural Control (PBC)

The last factor influencing behavioural intention in TPB is perceived behavioural Control (PBC). Perceived behavioural control (PBC) is the degree to which a person believes in controlling personal or external influences that can support or hinder a particular behaviour (Ajzen & Madden, 1986). Ajzen (1986) applied the 'perceived behavioural regulation' construct to his theory of everyday actions as a determinant for both behavioural and behavioural purposes. On a conceptual basis, the perceived behavioural regulation has similar effects for both mechanisms apply to the person's perception that behaviour is governed by it. However, sometimes the ease or complexity of the behaviour is assessed operationally as perceived behavioural control (e.g., 'three times a week I find it difficult to exercise'), and the self-efficiency is operationalised. Like Ajzen's expected behaviour theory, such as Schwarzer et al., (1999) have incorporated perceived behavioural control as a central deciding factor in the motivation and the determining factor for health behaviour.

Health Risk Perception Theory and Tourism: Health risk perception theory consists of environmental risks and cognitive factors (Janmaimool & Watanabe, 2014). While cognitive factors concern the impact of the

surroundings or the environment towards health, cognitive factors, on the other hand, are more focused on the internal conflict individuals face when deciding whether to engage in certain activities. In tourism research, health risk perception is found to be one of the most common predictors of vacation intention as it reflects on how health risk is viewed as a threat to the travellers and whether the exposure to the danger is according to the appropriate level of risk tolerance (Bae & Chang, 2020). Furthermore, the application of health risk theory can be seen in a recent study by Huang et al. (2020), where tourists' health risk perception significantly influences their intention to travel to Tibet and China due to the threat of the COVID-19 pandemic. Other than an intention to travel, this theory is also commonly found in many destination image studies, as perceived safety is one of the common indicators of overall destination image measure (Albattat et al., 2018; Zhu & Deng, 2020).

From the cognitive and internal evaluation standpoint, previous scholars have divided travel risk into two dimensions: overall cognitive and affective risk (Bae & Chang, 2020; Li et al., 2020). For instance, Bae and Chang (2020) investigated the relationship between COVID-19 health risk perception and behavioural intention and suggested that health risk perception is the antecedent of attitude. The pandemic has caused dramatic changes in how tourists view travel and vacation due to the potential exposure to the pandemic and the rapid spread of the disease. A new term such as "intact tourism", for instance, has been introduced in previous research and has become another extension in the health belief model to explain the need for social distancing during vacation, hence leading to an increase in "travel fear" and reduce in intention to engaged in travel vacation and future travel (Zheng et al., 2021).

Risk perception is crucial in shaping protective behaviours, particularly in travel contexts. Studies underscore that health risk perception is a crucial concern for travellers, influencing their decisions. Research by Maulana et al. (2022) identifies health risk perception as the second-highest priority concern for travellers. This perception encompasses worries about potential dangers like terrorism, political instability, or health risks at a travel destination.

The impact of health risk perception on travel behaviour was notably heightened during the pandemic, as evidenced by research in Brazil, which found a negative influence on travel intentions. Conversely, studies in European and Asian contexts have shown that health risk-related variables strongly predict travel intentions (Golets et al., 2023). Study by Zhou et al. (2024) further detail that while perceived susceptibility had minimal impact, health risk perception and risk aversion significantly affected travel intentions. Thus, it indicates that health risks are a significant factor in tourism engagement, with travellers' perceptions of risk playing a pivotal role in their travel decisions.

Vaccine Valence Risk Perception and Vacation Intention: The world is anxiously awaiting a COVID-19 vaccine, the best option for reverting to a "normal" state before the pandemic hits. The use of vaccines to overcome illnesses known to modern medicine has become part of the strategy used to eradicate most of the modern known illnesses. Hence, introducing a vaccine can be seen as a game-changer for international and domestic travellers as it ensures the travellers' safety (Radic et al., 2021). Therefore, the attitude of the travellers towards vaccines will significantly determine the speed of recovery for the hospitality and tourism industry (Akarsu et al., 2020). Valence refers to the level of attractiveness and the averseness of a particular situation, event, or object (Cancino-Montecinos et al., 2018). A previous study on tourist valence suggests that positive valence is associated with the perceived benefits received by tourists exceeding their expectations (Xuefeng et al., 2021). In the case of vaccine valence risk perception, the emotion related to whether the vaccine taken will help to protect tourists and travellers against the pandemic will determine their intention to engage in future travel and vacation. The valence towards the vaccine recently introduced is quite unclear due to various issues surrounding the pandemic. For instance, despite the world's reliance on the vaccine in the past. which has proven to be effective, many uncertainties surround the current situation due to the magnitude of the infection and the rapid evolution of the virus that can potentially lead to the ineffective vaccine (World et al. Office for Europe, 2017). Apart from that, ongoing input about the pandemic from social media has created travel anxiety, potentially leading to negative valence and avoidance towards future travels (Radic et al., 2021). A study by Golets et al. (2020) has presented evidence suggesting that individuals with high or positive valence will respond more strongly to threats regarding COVID-19 and engage more with prosocial self-isolation to prevent the spread of this virus.

Vaccination in post-pandemic plays a pivotal role in meeting health standards and addressing the Health Minister's requirements in Malaysia. Before the pandemic, factors such as perceived vaccine levels and the intention to travel were significant considerations. Further, according to a study by Tay & Chan (2023) Vaccination can play a decisive role in reducing travel risk and rebuilding travel confidence. The study revealed that elements like vaccine trust, travel confidence post-vaccination, travel intention, and actual travel behaviour did not significantly influence travel behaviour. This finding indicates that although vaccination can boost travel confidence, it alone cannot revive the tourism industry in its early stages.

Conversely, the study's findings indicate that subjective norms and perceived risk are critical predictors of attitudes toward COVID-19 vaccines. The results reveal that individuals with a greater desire to travel experience a more substantial influence of their attitudes toward COVID-19 vaccines on their vaccination intentions. The study's findings indicate that travel desire can encourage COVID-19 vaccination intentions (Ekinci et al., 2022). Therefore, it can be argued that vaccination completeness might give them lower pandemic-related risk perception and might significantly alleviate their negative emotions, such as anxiety toward the destination (Nie et al., 2022) A study conducted in Iran found that the effectiveness of Covid-19 vaccination has a significant impact on travel intentions. The study showed that vulnerable vaccination leads to more extreme problem-focused coping, influencing tourists' adaptive behaviours during crises, highlighting the importance of COVID-19 vaccination on travel intention (Qezelbash et al., 2024).

Domestic Vacation Intention: Domestic tourism has also been significantly affected by the COVID-19 pandemic, as the restriction is not only confined by the international borders, but the activities within the domestic has also stopped abruptly. Vacation intentions can be described as the subjective likelihood that a client will or will not take certain tourist-related acts or activities that people want to do or plan during the holiday (Altinay Özdemir, 2020). Previous tourism research in the context of pandemic crises has primarily focused on analysing the impact of infectious disease impact on international travel intention (Altinay Özdemir, 2020) and psychological changes (Li et al., 2020), determining the relative willingness of people to engage in rural tourism in the context of the epidemic (Zhu & Deng, 2020). However, there is minimal information on vacation intention in the coronavirus crisis for domestic tourism-related travel risks.

The spread of the COVID-19 virus, safety concerns, and global travel restrictions led to a change in travel during this time. The results show that the respondents resigned, especially from going abroad for security reasons, choosing to instead stay in the country and other places that, from their point of view, were safer places to rest on a case study in Poland (Jęczmyk et al., 2023). In the same vein, Fan et al. (2023) found that constructs from the Theory of Planned Behavior (TPB) positively impacted respondents' intentions and actions regarding domestic travel. This research highlighted that TPB can provide insights into why people travel. Positive attitudes, motivation, social norms, and perceived behavioural control were linked to increased travel behaviours or intentions in China during the COVID-19 recovery period. Hence, it implies that attitudes towards travel, perceived behavioural control, and subjective norms all had a significant influence on promoting domestic travel. The research discovered that plans to travel within the country were inversely linked to risk perception. Therefore, if people believe that there are more significant risks involved in travelling, they are less likely to be willing to travel within their own country.

Research by Mohamed et al. (2023) indicates that, following the COVID-19 pandemic, university students in Malaysia are much more inclined to travel, both locally and internationally, in the upcoming year. Similarly, a study on Chinese residents' outbound travel intentions after the pandemic, grounded in the Theory of Planned Behavior (TPB), found that attitudes, subjective norms, perceived behavioural control, and previous travel experiences significantly boost their intention to travel (Liu et al., 2021). Thus, the intention to take domestic vacations plays a crucial role in shaping tourist behaviour.

Relationship Between Health Risk Perception and Vacation Intention: Even though perceived health risks have been used in various vacation intention studies, the COVID-19 pandemic is unique due to its impact on the worldwide tourism industry. Hence, current information about vacation intention does not reflect the current situation as previous studies focus more on infectious diseases on tourist arrivals and movements. However, the focus is more on the specific region than the worldwide threat (Wasiul Karim et al., 2020). Given the magnitude of this pandemic and its spreadability, it is still unclear how the attitude and behaviour of future

tourists are affected by these issues. Apart from that, strict lockdowns imposed on worldwide and domestic travellers should also significantly impact future travellers' behaviour. The restriction may cause deepened fear towards the pandemic, leading to reluctance to travel, or the strict lockdown can fuel the extreme need to go out or travel even more than ever. At this point, only speculation can be made, as a worldwide pandemic such as this is considered unprecedented and has never been encountered before in this modern time. Thus, when it comes to intention, it is still vague whether tourist trust can be fully restored, as in the pre-pandemic state, due to the self-protection behaviour found among tourists (Essam Janahi, 2011). The literature review section must be analysed and address relevant previous and current studies related to the focus of the research.

Health risk perception can influence individuals' vacation intentions during the post-pandemic era. A study found that COVID-19 has affected tourists' travel habits in the post-pandemic period. Hanafiah et al. (2022) revealed that perceived health risks can negatively impact travel attitudes and decrease future travel intentions in Malaysia. Conversely, Susanto et al. (2021) found that cognitive and affective perceived risks do not significantly influence travellers' attitudes towards post-pandemic travel. Thus, this indicates that contrary to expectations, these perceived risks might not be crucial in shaping travellers' post-pandemic travel attitudes. Similarly, a case study in Vietnam, conducted in the post-COVID-19 context, suggests that once the pandemic is under control, perceived risks, although present, have an insignificant effect on the public's travel intentions (Nguyen et al., 2021). Therefore, it is believed that the perception of health risks influences tourists' behaviour when considering vacation intentions.

Conceptual Framework and Research Hypothesis

This conceptual model tested in this study is adopted from Bae and Chang's (2020) work with the extension of vaccine valence risk perception to investigate whether tourist behaviour has shifted favourably towards vacation intention after vaccination. It is imperative to study the importance of vaccine valence due to the success rate of vaccines in treating other diseases before the COVID-19 pandemic. Thus, the proposed conceptual framework for this study is as follows:

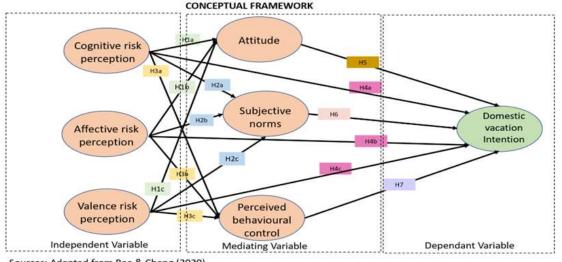

Figure 1: Conceptual Framework

Sources: Adapted from Bae & Chang (2020)

Based on the research framework, seven hypotheses have been developed in this study:

H1a: There is a relationship between cognitive risk perception (CRP) influence on attitude (ATT) towards domestic vacation intention (DVI).

H1b: There is a relationship between affective risk perception (ARP) influence on attitude (ATT) towards domestic vacation intention (DVI).

H1c: There is a relationship between vaccine valence risk perception (VVRP) influence on attitude (ATT) control towards domestic vacation intention (DVI).

H2a: There is a relationship between cognitive risk perception (CRP) influence on the subjective norm (SN)

towards domestic vacation intention (DVI).

H2b: There is a relationship between affective risk perception (ARP) influence on the subjective norm (SN) towards domestic vacation intention (DVI).

H2c: There is a relationship between vaccine valence risk perception (VVRP) influence on the subjective norm (SN) towards domestic vacation intention.

H3a: There is a relationship between cognitive risk perception (CRP) influence on perceived behavioural control (PBC) towards domestic vacation intention (DVI).

H3b: There is a relationship between affective risk perception (ARP) influence on perceived behavioural control (PBC) towards domestic vacation intention (DVI).

H3c: There is a relationship between vaccine valence risk perception (VVRP) influencing perceived behavioural control (PBC) towards domestic vacation intention (DVI).

H4a: Cognitive risk perception (CRP) will exert an influence on behavioural intention.

H4b: Affective risk perception (ARP) will exert an influence on behavioural intention.

H4c: Vaccine valence risk perception (VVRP) will exert an influence on behavioural intention.

H5: Attitude (ATT) will exert a significant relationship to behavioural intention.

H6: Subjective norm (SN) will exert a significant relationship on behavioural intention.

H7: Perceived behavioural control (PBC) will exert a significant relationship to behavioural intention

3. Research Methodology

This study adopts a quantitative research design that aligns with the positivist point of view. The present study employs an online survey method of data collection based on the purposive sampling method. An online survey questionnaire created with Google Forms was distributed to Facebook Groups for travel interests, namely 'Cuti-Cuti Malaysia with 66,160 followers, Kaki Travel Malaysia with 77,000 members and Travel Budget and Backpacker Malaysia with 75,000 members. The target population for this study is domestic travellers in Malaysia. A total of 265 usable responses were obtained. The survey questionnaire was composed of four sections: (a) demographic profile, (b) domestic vacation intention, (c) health risk perception and (d) behaviour. In the four sections, responses were collected using a five-point Likert-type scale. The constructs used in this scale are based on previous research (Bae & Chang, 2020; Watson & Clark, 1985). This study utilised a content expert panel to verify all the items in terms of validity.

Meanwhile, Cronbach's Alpha coefficient was used to measure reliability. Cronbach's alpha coefficient results showed that all items were reliable, ranging from $\alpha = 0.753$ to $\alpha = 0.971$. More specifically, the value of domestic vacation intention was $\alpha = 0.937$; cognitive risk perception was $\alpha = 0.913$; affective risk perception was $\alpha = 0.893$, positive valence risk was $\alpha = 0.831$, negative valence risk was $\alpha = 0.902$, the attitude was $\alpha = 0.941$, the subjective norm was $\alpha = 0.971$, and perceived behavioural control was $\alpha = 0.753$. The current study employed SPSS (v.20) for primary data screening and preliminary analysis and SmartPLS (v.3.2.6) for measurement model and structural model mediation analysis for data analysis. The non-response bias test is covered in this chapter after the response rate. The following section provides a descriptive analysis of the discussed latent constructs. The current study's preliminary analytical results using PLS path modelling are then reported. The first section covers convergent validity and discriminant validity to examine measurement model dependability. Next, the following section describes the structural model assessment, which includes assessing the endogenous latent construct's variance explained, effect size, and predictive significance. Finally, the whole model PLS-SEM analysis was provided for the mediating influence between independent and dependent variables.

4. Results

Demographic Profile: The sample (n=261) comprised 36.8 per cent of the respondents who were male compared to female (63.2%). Most respondents were aged 31 to 35 (22.2%) and 36 to 40-year-old (23.0). Most respondents were Malays (88.9%) and married (67.8%). Regarding academic qualifications, most respondents (33.7%) had a bachelor's degree and worked in government sectors (52.1%). Most respondents were also from the B40 group, with an income of less than RM5000 a month.

Measurement Model: In this study, the research model that has been developed was tested using the partial least square (PLS) technique. The software that has been used to analyse the data is Smart PLS software version 3.2.6 (Hussain et al., 2018). Figure 2 portrays the assessment of the structural model using the SmartPLS 3.2.6.

Convergent Validity: To ascertain the convergent validity, the researcher used the average variance extracted (AVE) of each latent construct per the recommendation of Fornell and Larcker (2016). In comparison, Chin (1998) specified that the AVE value of 0.50 or greater indicates the convergent validity of a latent construct. Table 1 indicated that the AVE values of all latent constructs AVE values had exceeded the minimum criteria of 0.50.

After the assessment of the structural model path coefficients, the most widely used measure to assess the structural model is the coefficient of determination, also called the R-squared value (R2 value) (Sarstedt et al., 2020; Hair et al., 2014; Henseler et al., 2009), however, Falk and Miller (1992) suggest 0.10 as a minimum acceptable level of R-squared value. Chin (1998) recommended that PLS-SEM's R-squared values (R2 values) of 0.67, 0.33, and 0.19 can be measured as substantial, moderate, and weak. Table 4.2 provides the R-squared values of the endogenous latent construct of the current study.

Convergent Validity: To ascertain the convergent validity, the researcher used the average variance extracted (AVE) of each latent construct per the recommendation of Fornell and Larcker (2016). In comparison, Chin (1998) specified that the AVE value of 0.50 or greater indicates the convergent validity of a latent construct. Table 4.3 indicated that the AVE values of all latent constructs AVE values had exceeded the minimum criteria of 0.50. Thus, the current study exhibits the adequate convergent validity of the latent constructs (Chin, 1998).

Latent Variable	R Square	R Square Adjusted
Attitude	0.119	0.109
Intention	0.324	0.308
PBC	0.093	0.083
Subjective Norms	0.150	0.14

Table 2: Variance Explained in the Endogenous Latent Variable

As shown in Table 2, the current study research model explained 11.9 per cent of the total variance in the attitude, 9.3 per cent of PBC and 15.0 per cent of subjective norms. Later, the model also explained the 32.4 per cent variance of domestic vacation intention. Therefore, this recommends that the sets of exogenous latent and mediating variables of the current study collectively explain 32.4 per cent of the domestic vacation intention. Therefore, based on the recommendations of Falk and Miller (1992) and Chin (1998), the endogenous latent variable of the current study showed an acceptable level of R-squared value, which was also considered moderate. The construct cross-validated redundancy (Q2) statistics for the four endogenous latent variables of the current study were more significant than zero, signifying the model's predictive relevance.

Discriminant Validity: The current study used these two approaches to ascertain the discriminant validity issues. First, Fornell and Larcker (2016) used the AVE values to determine the discriminant validity. Table 3 exhibits that the AVE values should be greater than the square root between pair constructs. The square root of the AVE is not greater than the correlation among latent constructs, signifying adequate construct discriminant validity (Fornell & Larcker, 1981). Second, the heterotrait-monotrait ratio of correlations (HTMT) criterion was used in the current study to assess the discriminant validity proposed by Henseler et al. (2015).

Table 3: Latent Variable Correlations and Square roots of Average Variance Extracted

According to Henseler et al. (2016), the HTMT estimates the factor correlation, and to discriminate between two factors (constructs), the HTMT value should be lower than 1. Therefore, if the HTMT value is lower than 1, the correlation between the two factors (constructs) is different; hence it should have differed. Moreover, if the HTMT value is more significant than this threshold, there is a lack of discriminant validity. In addition, some scholars recommended a threshold of 0.85 (Clark & Watson, 2019; Kline, 2015), while others suggested a threshold of 0.90 (Gold et al., 2001; THS Teo et al., 2015). Table 4.4 exhibits the HTMT values for the discriminant validity of the current study constructs. According to Henseler et al. (2016), the HTMT estimates the factor correlation, and to discriminate between two factors (constructs), the HTMT value should be lower than 1. Therefore, if the HTMT value is lower than 1, the correlation between the two factors (constructs) is different; hence it should have differed. Moreover, if the HTMT value is more significant than this threshold, there is a lack of discriminant validity. In addition, some scholars recommended a threshold of 0.85 (Clark & Watson, 2019; Kline, 2015), while others suggested a threshold of 0.90 (Gold et al., 2001). Table 4.4 exhibits the HTMT value is hould have differed. Moreover, if the HTMT value is more significant than this threshold, there is a lack of discriminant validity. In addition, some scholars recommended a threshold of 0.85 (Clark & Watson, 2019; Kline, 2015), while others suggested a threshold of 0.90 (Gold et al., 2001). Table 4.4 exhibits the HTMT values for the discriminant validity of the current study constructs.

Valence	0.124	0.382	0.137	0.439	0.738	0.345	

Table 4: HTMT Correlation Matrix for Discriminant Validity

Lastly, the Chin (1998) criterion was used to determine the discriminant validity by comparing the indicator's loadings of each construct with the cross-loadings of other constructs of the current study. Based on the recommendation of Chin (1998), the indicator's loadings should be greater than cross-loadings to achieve adequate discriminant validity (Grégoire & Fisher, 2006). Table 5 compares the indicator's loadings with other construct loadings. Each construct indicator's loadings were more significant than the cross-loadings, thus representing the suitable construct's discriminant validity.

Table 5: Cross Loadings

Assessment of Significance of the Structural (Inner) Model: After the measurement (outer) model assessment, the current study evaluated the structural model, also called the inner model. The current study used the standard bootstrapping procedure with 5000 bootstrap samples and 261 cases to estimate the significance of the path coefficients, as per the guiding principles of (Hair et al., 2017; Hair et al., 2014; Henseler et al., 2009).

Assessment of Variance Explained in the Endogenous Latent Variable: Table 6 provides the R-squared values of the endogenous latent construct of the current study. As shown in Table 6, the current study research model explained 13.6 per cent of the total variance in the attitude, 10.6 per cent of PBC and 15.6 per cent of subjective norms. Later, the model also explained a 32.8 per cent variance in travel intention. Thus, the sets of exogenous latent and mediating variables of the current study are recommended to explain 32.8 per cent of the travel intention. Therefore, based on the recommendations of Falk and Miller (1992) and Chin (1998), the endogenous latent variable of the current study showed an acceptable level of R-squared value, which was also considered moderate.

Table 6: Variance Explained in the Endogenous Latent Variable

Latent Variable	R Square	R Square Adjusted
Attitude	0.136	0.123
Intention	0.328	0.309
PBC	0.106	0.092
Subjective Norms	0.156	0.143

Relationship between Predictors and Mediating Variables: The assessment of the structural model revealed the structural model path coefficients for the relationships of the current study. The findings presented in Table 7 and Figure 2 disclosed that affective risk (B = 0.104, t = 1.457, p > 0.05) and cognitive risk (B = 0.029, t = 0.315, p > 0.05) failed to display a significant relationship with attitude. However, vaccine valence risk perception (VVRP) significantly predicted attitude (B = 0.335, t = 5.934, p < 0.01), supporting H1c. Likewise, the results, as shown in Table 6 and Figure 2, indicated a significant effect of affective risk (B = -0.127, t = 1.974, p < 0.05) and vaccine valence risk perception (B = 0.0.348, t = 5.957, p < 0.01) on subjective norms and successfully support H2a and H2c. Lastly, only vaccine valence risk perception showed a significant relationship with PBC (B = 0.300, t = 5.222, p < 0.01) and supported H3c.

Table 7: Assessment of Structural Model Direct Relationships and Trav	el Intention
---	--------------

Hypoth	iesis	В	T Statistic	Sig.	Decision
H1b	ARP -> ATT	0.104	1.457	0.146	Not Supported
H1a	CRP -> ATT	0.029	0.315	0.753	Not Supported
H1c	VVRP-> ATT	0.335	5.934	0.000	Supported
H2b	ARP -> SN	-0.127	1.974	0.049	Supported
H2a	CRP -> SN	-0.031	0.367	0.714	Not Supported
H2c	VVRP-> SN	0.348	5.957	0.000	Supported
H3b	ARP -> PBC	-0.008	0.097	0.923	Not Supported
H3a	CRP -> PBC	-0.027	0.233	0.816	Not Supported
H3c	VVRP -> PBC	0.3	5.222	0.000	Supported

Testing of Mediation Effect: The assessment of the structural model revealed the structural model path coefficients for the relationships of the current study. The findings presented in Table 7 and Figure 2 disclosed that affective risk perception (ARP) (B = 0.104, t = 1.457, p>0.05) and cognitive risk perception (CRP) (B = 0.029, t = 0.315, p>0.05) failed to display a significant relationship with attitude (ATT). However, vaccine valence risk perception (VVRP) significantly predicted attitude (B = 0.335, t = 5.934, p<0.01), supporting H1c.

	Relationship	Beta	T statistic	Sig.	
H4a	ARP -> DVI	-0.119	1.864	0.063	Not Supported
H4b	CRP -> DVI	0.078	1.025	0.306	Not Supported
H4c	VVRP -> DVI	0.261	4.279	0.000	Supported
H5	ATT -> DVI	0.104	1.856	0.064	Not Supported
H6	PBC -> DVI	0.161	2.302	0.022	Supported
H7	SN -> DVI	0.213	2.805	0.005	Supported

Table 8: Assessment of Structural Model Direct Relationship	and Travel Intention
rubie of fibbebolitent of bit actural fibuer bit ett iterationom	and mater incontion

Likewise, the results, as shown in Table 4.8 and Figure 2, indicated a significant effect of ARP (B = -0.127, t = 1.974, p<0.05) and VVRP (B = 0.0.348, t = 5.957, p<0.01) on SN and successfully support H2a and H2c. Lastly, only VVRP showed a significant relationship with PBC (B = 0.300. t = 5.222, p<0.01) and supported H3c. Furthermore, the structural model was also assessed, including the mediating variable (value and satisfaction) using the SmartPLS 3.2.6 (Ringle et al., 2015), as shown in Figure 2. According to Table 8, only three predictors showed a significant relationship with travel intention. The significant predictors were vaccine valence (B = 0.261, t = 4.279, p<0.01), PBC (B = 0.161, t = 2.302, p<0.05) and subjective norms (B = 0.213, t = 2.805, p<0.01). These findings only supported H4c, H6 and H7. Besides that, Figure 2 showed that vaccine valence significantly predicted PBC (B = 0.300, p<0.01), fulfilling path 'a' (IV to MV). PBC also significantly correlated with intention (B = 0.161, p<0.05) in path 'b'. In path 'c', vaccine valence had a significant relationship between vaccine valence and intention (B = 0.048, p<0.05). These results have indicated that PBC partially mediated the relationship between vaccine valence and intention.

To assess the PLS path model's predictive relevance, Stone Geisser's Q2 was estimated (Hair et al., 2017). Estimates were employed using the blindfolding technique to supplant actual data points recursively at an omission distance of 7 (the default omission distance in SmartPLS). Furthermore, the Q2 values were obtained using the cross-validated redundancy approach as per the recommendation of Hair *et al.* (2017). According to Hair *et al.* (2017), "the cross-validated redundancy approach builds on the path model estimates of both the structural model and the measurement model of data prediction" (p. 207). Thus, prediction via cross-validated redundancy fits the PLS-SEM approach perfectly (Hair *et al.*, 2017). Furthermore, according to Henseler *et al.* (2009) and Chin (1998), in a structural model, the Q2 values greater than zero for an endogenous latent variable indicate the path model's predictive relevance. Table 9 presents the construct cross-validated redundancy (Q2) test results of the current study.

Table 9: Construct Cross-validated Redundancy				
Total	SSO	SSE	Q2 Statistics (1-SSE/SSO)	
Attitude	1,044.00	948.688	0.091	
Intention	1,044.00	778.881	0.254	
PBC	1,044.00	984.681	0.057	
Subjective Norms	1,044.00	916.776	0.122	

Table 9: Construct Cross-Validated Redundan	cv
--	----

As indicated in Table 9, the construct cross-validated redundancy (Q2) statistics for the four endogenous latent variables of the current study were more significant than zero, signifying the model's predictive relevance in line with Henseler *et al.* (2009) and Chin (1998).

Discussion

The findings revealed that only perceived behavioural control and subjective norms mediated the relationship between health risk perception and domestic vacation intention. In the tourism industry, COVID-19 is a disruptive factor that influences how travellers perceive the safety of their trip. Therefore, domestic travellers might not perceive travel during the pandemic as a risky decision and a vital decision-making activity in this study. Vaccine valence risk perception is the internal factor, and domestic tourists perceive the benefit of the vaccination program. The decision to travel might change despite the threat of pandemics as the vaccines are viewed as hopeful future travellers travel safely without contracting this disease. Tourists with high vaccine valence risk perception tend to make the decision confidently. Based on the participants' characteristics, they were adult tourists. In this way, the perceived risk did not influence the judgments taken. In this case, decisions were taken considering their maturity, experience, and high vaccine valence risk perception in decisionmaking, among other factors.

Besides that, attitude in this study was related to social risk and did not capture the whole dimension of risk. The findings differed if the full dimensions of risk, such as security, finance, privacy, performance, time and psychology, were used. Perceived attitude was not an issue for tourists because travel, such as visiting family, has become necessary. It can be concluded that if the domestic vacation tourist perceives the behaviour as risky, there will be hesitation when deciding to travel. Theoretically, if the resisting behaviour were high, the domestic tourist would depend on their vaccine valance decision-making sources. The study showed that PBC and subjective norms influence the relationship between vaccine valance and domestic vaccine travel intention. Theoretically, PBC and subjective norms strongly influenced domestic vacation intention. In this study, if the tourists perceive the decision as risky, it may lead to less confusion. It showed that when the PBC and subjective norms are more significant, vaccine valance dependence on intention is high.

This study sheds light on the impact of COVID-19 on the behaviour of tourists during this unprecedented pandemic. Based on timely data collection and analysis, tourist behaviour has shifted favourably toward vacation intention after vaccination. This study offers several theoretical implications. First and foremost, this study is an academic effort to contribute to tourist literature by evaluating the current worldwide issue that has created significant upheaval in global society and the lives of individuals. It considers the COVID-19 vaccine the best option for reverting to a "normal" state before the pandemic. The findings of this study will be helpful for future longitudinal studies monitoring tourists' short- and long-term behaviour changes, as Bae and Chang (2020) suggested. Secondly, this study applied the extension of vaccine valence risk perception, the emotion related to whether the vaccine taken that helps to protect tourists and travellers against the pandemic has determined their intention to engage in future travel and vacation. However, prior research has focused on vaccine valence risk perception, a protective behaviour based on the health belief model. This study discussed vacation intention after vaccination to indicate a 'new normal' tourism behaviour, allowing people to travel even during a pandemic while reducing perceived health risks. Vaccine valence risk perception significantly predicted tourists' attitudes, subjective norms, and perceived behavioural control toward vacation intention. This health-protective behaviour could be an avenue for future research in post-corona. Third, this study expanded the health risk perception theory with the vaccine valence risk perception variable. In addition, it confirmed the mediating role of attitude, subjective norm and perceived behaviour control between health risk perception and domestic vacation intention. The findings might have differed if the study had been conducted before or after the MCO and the COVID-19 situation had relaxed. Although not all tourists' behaviour factors did not mediate the effect of health belief on vaccine travel intention, it was found to be a significant mediator in the equation. Finally, the issue of safety and risk will be continuously argued. More research on travel intention is expected to be carried out by considering different factors, such as environment, situation, and context.

5. Conclusion

This study offers practical implications for the tourism industry in Malaysia and the global tourism market. From a manager's perspective, this research offers valuable insight; tourism agencies should concentrate on the causes of travel intention, such as information about the risks of travelling. Tourism agencies and the government should refrain from giving unnecessary information or using jargon when introducing a travel spot as some of the technical terms may not be understood by tourism. Therefore, travel agencies must learn to

convey information about their products or brands more straightforwardly and effectively to tourists. Travel agencies and Tourism Malaysia also need to consider vaccine valence risk perception, subjective norms, and perceived behaviour control in travellers' decision-making during travel. The ability to influence the vaccine travellers may help them market the spot and increase travel intention during the pandemic. Tourists may refer to a risk assessment for advice or information hence, travel agencies should provide a convenient and conducive atmosphere to attract tourists and their friends/peers to travel and visit the place and search for the correct information about the services offered. One of the strategies to reduce the tourist fear of travelling was to narrow down the risk of infection from COVID-19 by providing a hygienic and safe travelling spot. Also, travel agencies must explain the function and the importance of each attribute of safety measures taken for the traveller. Besides that, travel agencies can also create a website that provides information to address travellers' risks. If the travel agent fails to take any measure to address the issue of safety and risk, domestic vaccine travellers might experience confusion about the risks and dangers of travel. Addressing domestic travellers' may be time-consuming, but it could be a fruitful approach in the long run.

Limitation of study: This study has several limitations, one of which is that the study was correlational and not causal. As a result, a genuine cause-effect relationship could not be established. Future research should use an experimental design to establish causality, where data can be collected multiple times during the research period. In this way, changes in perception and behaviour related to decision-making can be better understood. Another limitation relates to the generalisability of the results due to the setting and sample selection. Since this study was conducted online, the results may need to be generalisable to other respondent groups in Malaysia. Using the online survey could also compromise the validity of the results. For one, the halo effect could occur. Also, the study could suffer from agreement bias, where participants tend to agree with the questions asked. As this study focused on domestic vacation intention, demographic factors were not highlighted. Future research should consider demographic factors, especially when incorporating a new environment. Previous studies on vacation intention indicated that demographic factors influence vacation intention. Therefore, this study should use these factors as controlled variables. The type of participants is another limitation of this study. The participants of this study were from various industries and backgrounds. Their responses could have been different if the study had been conducted on tourists from the specific industry. Future researchers may study other industries, such as health services, education, agriculture, and airlines. Also, future research should include other ethnic groups to understand how different ethnicities address tourist valence and vacation intention. Other ethnic groups should be considered to reflect the diversity of the Malaysian population.

The Development of Halal Well-Being Experience Quality: A Conceptual Framework

Rasmee Islam, *Ann Suwaree Ashton Graduate School of Tourism Management, National Institute of Development Administration, Thailand rasmee.i@chandral.ac.th, *suwareeashton@hotmail.com Corresponding author: Ann Suwaree Ashton

Abstract: In recent years, the hospitality and tourism industry has increasingly focused on enhancing the wellbeing of guests by providing tailored experiences that address their physical, mental, and spiritual health. This shift has spurred the development of Halal well-being experiences, specifically designed to cater to Muslim travelers by aligning services and facilities with Islamic principles. Halal well-being experiences include a range of services such as Halal-certified food, prayer facilities, gender-segregated wellness amenities, and activities promoting spiritual health. These offerings are vital for Muslim travelers who seek destinations and accommodations that respect and cater to their faith-based needs. To address these challenges, a comprehensive framework for Halal well-being experience quality is essential. This framework should include clear guidelines for service provision, training programs for staff, and effective marketing strategies. This research aims to explore the current state of Halal well-being experiences in the hospitality industry, identify the key challenges and opportunities, and propose a framework for enhancing service quality. The study provides insights and recommendations for developing and promoting Halal well-being experiences that cater to the needs of Muslim travelers. The research underscores the importance of seven dimensions of tourism experience quality (TEQ) in influencing tourist well-being: Halal hedonism, Muslim-friendly involvement, local culture friendliness, refreshment experience, meaningfulness experience, knowledge experience, and novelty experience. These dimensions collectively enhance the physical, mental, social, and spiritual well-being of Muslim travelers, promoting a holistic approach to well-being in the tourism sector.

Keywords: Halal Well-Being, Halal Experience, Tourist Experience Quality, Halal Friendly Tourism

1. Introduction

Nowadays, Halal-friendly tourism become one of the modern trends in a fast-growing global market (Kusumaningtyas, Latifah, Suprihandari, & Syauqi, 2021; Som, Masutani, & Ahmad, 2016) and continues to evolve, catering specifically to Muslim travelers' needs by ensuring all services and facilities comply with Islamic principles (Halal Trip,2024). Moreover, while the current trend of wellness tourism has seen a significant increase with numerous studies exploring various aspects (Bočkus, Vento, & Komppula, 2024; Chi, Chi, Deng, & Price, 2024; Wang et al., 2024). This trend has given rise to the development of Halal well-being experiences, which cater specifically to the needs of Muslim travelers by ensuring that services and facilities align with Islamic principles (Crescent Rating, 2023). The development of Halal well-being experience quality not only addresses the religious and cultural requirements of Muslim tourists but also contributes to the broader goal of inclusive and sustainable tourism.

Halal well-being experiences encompass a range of services, including Halal-certified food, prayer facilities, gender-segregated wellness amenities, and activities that promote spiritual health (Halal World Institute, 2024). Especially, Southeast Asian countries are well-known for their diverse food and beverage offerings (Ngelambong et al., 2024). The integration of these elements into hospitality services ensures that Muslim guests can maintain their religious practices while enjoying a holistic well-being experience. The importance of such offerings is underscored by the increasing number of Muslim travelers who seek destinations and accommodations that respect and cater to their faith-based needs (Mohsin, Ramli, & Alkhulayfi, 2022). Despite the growing demand, the development of Halal well-being experiences faces several challenges. One of the primary issues is the lack of standardized guidelines and certifications for Halal well-being services, which can lead to inconsistencies in service quality and guest satisfaction (Rahman, Aziz, & Sawani, 2023). Additionally, there is a need for greater awareness and training among hospitality providers to understand and effectively meet the unique requirements of Muslim guests.

Recent studies highlight the significance of incorporating Halal principles into well-being experiences to enhance the overall satisfaction and loyalty of Muslim travelers. For instance, Al-Ansi and Han (2022) found

that the provision of Halal-certified wellness services, such as spa treatments and fitness facilities, significantly impacts the perceived value and satisfaction of Muslim guests. Similarly, research by Zulkifli, Ab Halim, and Abdullah (2023) emphasizes the role of cultural sensitivity and the integration of Islamic values in creating a memorable and fulfilling well-being experience for Muslim tourists.

To address these challenges and capitalize on the opportunities presented by the growing Halal tourism market, it is crucial to develop a comprehensive framework for Halal well-being experience quality. Such a framework should include clear guidelines for service provision, training programs for staff, and effective marketing strategies to attract and retain Muslim guests. By doing so, the hospitality industry can ensure that Halal well-being experiences meet the highest standards of quality and inclusivity. This research aims to explore the current state of Halal well-being experiences in the hospitality industry, identify the key challenges and opportunities, and propose a framework for enhancing service quality. Through a combination of literature review, case studies, and interviews with industry experts, this study seeks to provide valuable insights and recommendations for developing and promoting Halal well-being experiences that cater to the needs of Muslim travelers.

2. Literature Review

Halal-Friendly Tourism Concept

Halal-friendly tourism has become a significant segment in the global travel industry, driven by the growing number of Muslim travelers seeking services that align with their religious beliefs and practices. Halal tourism refers to travel and hospitality services that comply with Islamic law (Sharia) and provide products and services according to Islamic teachings for Muslim use (Han et al., 2019). This form of tourism aims to meet the religious needs of Muslim tourists, ensuring that offerings align with their beliefs and practices (Sánchez & Moral, 2019). Designed to follow Islamic law (Sharia), halal tourism meets the requirements of Muslim travelers while remaining accessible to non-Muslims (Wahyudin et al., 2021). The concept has gained global traction, with both Muslim and non-Muslim countries recognizing its potential and developing this niche market (Satriana & Faridah, 2018). Halal tourism encompasses accommodations, attractions, facilities, services, and overall experiences that comply with Islamic principles (Parhan et al., 2021), creating an environment where Muslim travelers can comfortably practice their faith while exploring various destinations (Battour et al., 2021).

The primary components of Halal tourism include Halal-certified food and beverages to ensure that all food and drinks provided are Halal-certified, free from pork, alcohol, and any non-Halal ingredients (Henderson, 2022), prayer Facilities provide clean and private spaces for prayer, equipped with Qibla direction indicators and prayer mats (Al-Ansi et al., 2023), modesty and privacy as offering gender-segregated facilities such as swimming pools, spas, and gyms to maintain modesty (Stephenson, 2024), and halal entertainment as ensure that entertainment options do not conflict with Islamic values and principles (Battour et al., 2024). Thus, those are elements to ensure that Muslim travelers can maintain their religious practices while traveling (Battour & Ismail, 2022; Ekka, 2023). The availability of halal-friendly options can significantly enhance the good experience and improve the well-being of Muslim travellers (Henderson, 2022).

Halal Tourist Experience Quality

Tourists experience quality (TEQ) is defined as an individual's internal and subjective response to a company's product, service, or brand (Meyer & Schwager, 2007). However, defining customer experience is challenging due to its intricate nature and characteristics (Palmer, 2010). Knutson, Beck, Kim, and Cha (2007) state that customer experience is difficult to articulate because it is an 'elusive and ambiguous term. Various elements of what a customer experiences have been examined to understand it better. Palmer (2010) highlights two dictionary-based perspectives on customer experience: a cognitive one, which involves acquiring knowledge or skills through participation, and an emotional one, which involves feeling emotions or engagement during an event. The concept of tourist experience quality, including the seven dimensions of TEQ proposed by Kim and Ritchie (2014) and Kim et al. (2010), is considered appropriate for investigating key tourism experiences, as supported by several studies on the perceived quality of tourist experiences (Chua et al., 2015; Hosany & Witham, 2010; Huang & Hsu, 2009; Kwortnik, 2008).

The dimensions effectively address both specific aspects of tourist experiences and contextual factors such as emotions and traveler motives. The dimensions of Tourist Experience Quality (TEQ) are defined as follows: Hedonism: the pleasure and enjoyment derived from the experience (Seligman, 2011). Involvement: the level of personal engagement and interest in the activities (Zaichkowsky, 1985). Local Culture Friendly: the quality and impact of interactions with others, including locals and other tourists (Richards, 2018). Refreshment: the sense of rejuvenation and relaxation obtained from the experience (Seligman, 2011). Meaningfulness: the personal significance and value attributed to the experience (Seligman, 2011). Knowledge: the educational value and learning opportunities provided by the experience (Falk & Dierking, 2018) and Novelty: the perception of new, unique, or different experiences (Lee & Crompton, 1992).

This study adopts the TEQ dimensions consisting of Halal hedonism, Muslim Friendly involvement, Local culture friendly to Muslims, Refreshment experience, Meaningfulness experience, Knowledge experience, and Novelty experience (Kim & Ritchie, 2014; Kim et al., 2010) to describe tourist experience dimensions and evaluate their relevance in explaining different types of Muslim tourist experiences.

The Link Between Experience Quality and Well-Being Concept

Well-being theory involves both methodological and substantive diversity: positive emotion is a subjective variable defined by individual thoughts and feelings. Engagement, meaning, relationships, and accomplishment have both subjective and objective aspects because one might think they possess these qualities and still be mistaken. Thus, well-being is not solely a mental state; it combines feeling good with having purpose, meaningful relationships, and achievements. Our goal in life is to optimize all five of these elements (Seligman, 2011, p. 36). This approach suggests that Positive Psychology aims to enhance flourishing by increasing positive emotions, engagement, meaning, relationships, and accomplishments, thereby creating a more meaningful existence (Packer, 2008).

Moreover, well-being is often understood as a measure of the quality of life or the level of hedonic happiness (Fu et al., 2020; Sharpley, 2014). Subjective well-being or life satisfaction is commonly used as an indicator of happiness. Research has demonstrated that tourism or travel involves the pursuit of hedonic experiences, with tourists' happiness varying based on their personality, the types of destinations, and the nature of travel activities they engage in (Bimonte & Faralla, 2014; Chen & Li, 2018; Filep & Research, 2014). A high-quality experience during travel can significantly enhance overall happiness, with social interactions being one of the most critical factors contributing to this happiness (S. Chen et al., 2019). Therefore, well-being is conceptualized within Seligman's (2002) authentic happiness theory, which comprises the pleasant life, the good life, and the meaningful life. The pleasant life emphasizes maximizing enjoyable and positive experiences, involving positive emotions about the past, present, and future. The good life refers to engagement and the realization of one's potential through meaningful activities. A meaningful life involves a sense of purpose and the pursuit of activities that contribute to personal growth and the well-being of others.

In the context of Halal tourism, if stakeholders can provide a high-quality experience during a trip can significantly enhance the well-being of Muslim travelers. Ensuring that dietary needs are met with Halal service and creating an environment that respects Islamic values contribute to the physical, mental, social, and spiritual well-being of travelers (Battour & Ismail, 2016; Henderson, 2022). This research adopted the concept of experience quality that leads to well-being, aiming to develop a conceptual framework for future research adaptation.

3. Conceptual Framework

Figure 1 presents the conceptual framework developed for this study. This framework is based on a comprehensive review of the literature, focusing on examining the quality of the Halal experience and its impact on well-being improvement. It integrates the experience quality theory, which includes dimensions such as hedonism, involvement, local culture, refreshment, meaningfulness, knowledge, and novelty. These dimensions contribute to well-being, conceptualized as comprising a pleasant life, a good life, and a meaningful life.

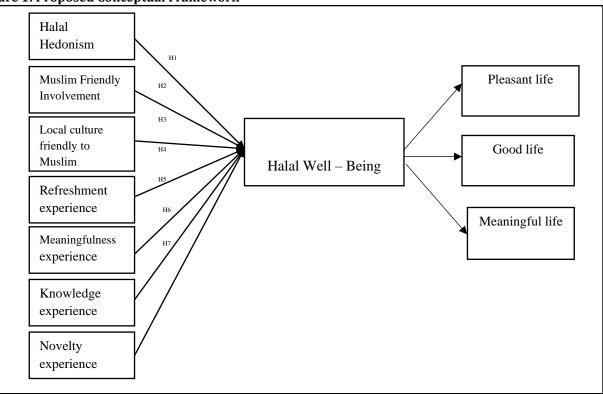

Figure 1: Proposed Conceptual Framework

Following a figure 1 can be explain about model of experience quality are; 1) Halal hedonism: representing the pursuit of pleasure and enjoyment in tourism experiences positively influences tourist well-being, 2) Muslim Friendly involvement referring to the level of engagement and participation in tourism activities positively that Muslim travelers value immersive and interactive experiences that allow them to actively engage with the destination and its culture 3) Local culture friendly to Muslim representing the authenticity and cultural richness of tourism experiences positively influences tourist well-being, 4) Refreshment experience representing the revitalization and rejuvenation experienced during tourism activities positively influences tourist well-being 5) Meaningfulness experience is a positive influence on tourist well-being, indicating that Muslim travelers value meaningful connections 6) Knowledge experience, representing the acquisition of new information and insights through tourism experiences, and 7) Novelty experience representing the uniqueness and halal friendly of tourism experiences.

Moreover, the Halal well-being context can be explained as a pleasure life that focuses on maximizing pleasurable and positive experiences, good life refers to engagement and the realization of one's potential through meaningful activities and meaningful life as involves a sense of purpose and the pursuit of activities that contribute to personal growth and the well-being of others.

Hypotheses of the study

This research aims to explore the current state of Halal well-being experiences in the hospitality industry, identify the key challenges and opportunities, and propose a framework for enhancing service quality.

- H1: Halal hedonism positively influences tourist well-being.
- H2: Muslim-friendly involvement positively influences tourist well-being.
- H3: Local culture friendly to Muslims positively influences tourist well-being.
- H4: Refreshment experience positively influences tourist well-being.
- H5: Meaningfulness experience positively influences tourist well-being.
- H6: Knowledge experience positively influences tourist well-being.
- H7: Novelty experience positively influences tourist well-being.

Directions for Future Research

This future research will focus on Muslim tourists. The study will employ a mixed-method research design, integrating both qualitative and quantitative data. Data collection will involve the use of self-administered questionnaires and in-depth interviews form. The qualitative will be used for content analysis techniques to apply for analyzing the data. Quantitative data will be analyzed using Partial Least Squares Structural Equation Modelling (PLS-SEM). The data analysis process will be conducted in two stages: first, data purification and descriptive analysis; second, statistical analyses will be performed, including evaluation of the measurement model, structural model, and hypothesis testing.

4. Proposed Outcome and Implementation to Develop Halal Well-Being Experience Strategies

The study emphasizes the necessity of a comprehensive framework to ensure high-quality Halal well-being experiences. This framework should encompass clear service provision guidelines, staff training programs, and effective marketing strategies to cater to Muslim travelers' needs. The research highlights seven dimensions that are critical in influencing tourist well-being: Halal hedonism, Muslim-friendly involvement, local culture friendliness, refreshment experience, meaningfulness experience, knowledge experience, and novelty experience. These dimensions collectively enhance the physical, mental, social, and spiritual well-being of Muslim travelers.

The findings of this study have several potential outcomes and suggest directions for future research in the field of Halal well-being experiences within the hospitality and tourism industry:

A. Enhanced Well-being of Muslim Travelers:

Halal Hedonism: By providing pleasurable and enjoyable experiences, destinations can significantly enhance the well-being of Muslim travelers. This could lead to increased tourist satisfaction and loyalty.

Muslim-friendly involvement: Facilitating immersive and interactive experiences that engage Muslim travelers with the local culture can foster deeper connections and enhance their overall well-being.

Local culture friendly to Muslims: Promoting authentic cultural experiences allows Muslim travelers to derive satisfaction from exploring and understanding cultural heritage and traditions.

Refreshment experience: Offering revitalizing and rejuvenating experiences can contribute to the physical and mental well-being of Muslim travelers.

Meaningful experience: Creating meaningful experiences that resonate with the values and beliefs of Muslim travelers can enhance their sense of fulfillment and well-being.

Knowledge experience: Providing educational and informative experiences can enrich the intellectual wellbeing of Muslim travelers.

Novelty experience: Offering unique and novel experiences can stimulate curiosity and a sense of adventure, contributing to the overall well-being of Muslim travelers.

B. Improved Service Quality and Inclusivity:

Developing a comprehensive framework for Halal well-being experience quality can ensure that services meet the highest standards of quality and inclusivity. This framework can provide clear guidelines for service provision, staff training, and effective marketing strategies.

C. Increased Market Competitiveness:

Destinations that successfully implement Halal well-being experiences can gain a competitive edge in the growing Halal tourism market. This can attract a larger segment of Muslim travelers and potentially increase revenue for tourism providers.

5. Conclusion

The quality of experiences plays a critical role in enhancing well-being. By understanding the various dimensions of experience quality and their impact on physical, mental, social, and spiritual health, service providers can design experiences that promote holistic well-being. Future research should continue to explore innovative ways to integrate well-being into the design and delivery of high-quality experiences across different domains. For example, previous studies have examined Muslim travellers' needs and concerns regarding halal-

friendly attributes when journeying to non-Muslim destinations (Al-Ansi and Han, 2019, Han et al., 2019, Said et al., 2020). Additionally, studies have examined inconveniences experienced by Muslim travellers in non-Muslim destinations (Al-Ansi and Han, 2019).

Additionally, the concept of well-being in Halal tourism is intricately connected to the ideas of a pleasant life, a good life, and a meaningful life. These concepts, rooted in positive psychology and adapted for Halal tourism, provide a comprehensive framework for understanding and enhancing the well-being of Muslim travelers. By incorporating these insights, the hospitality industry can further refine and enhance Halal well-being experiences to better serve the needs of Muslim travelers.

Acknowledgment: The author would like to extend sincere gratitude to the National Institute of Development Administration (NIDA), Thailand for supporting the scholarships in Ph.D. courses and providing financial support for this research.

Managing Complexities in Giant Freshwater Prawn Breeding Facilities in Perak, Malaysia: A Case Study

Rugayah Gy Hashim¹, *Zaidi Mohd Aminuddin¹, Zulkifli Mohamed², Mohd Hanif Mohd Ramli², Zuraidah Ismail¹, Janiffa Saidon¹, Wang Chaoqun³ ¹Faculty of Business & Management, Universiti Teknologi MARA, Puncak Alam, Selangor, Malaysia ²College of Engineering, Universiti Teknologi MARA, Shah Alam, Selangor, Malaysia ³Shandong Youth University of Political Science, Jinan, Shandong, China gy@uitm.edu.my, *zaidi220@uitm.edu.my, zul@uitm.edu.my, hanif@uitm.edu.my, zuraidah@uitm.edu.my, janiffa@uitm.edu.my, cloris_wang9110@163.com Corresponding Author: Zaidi Mohd Aminuddin

Abstract: Malaysia's aquaculture industry has seen significant growth in recent years, with the giant freshwater prawn (Macrobrachium rosenbergii) emerging as a key species of economic importance. This study examines the intricate challenges faced by hatchery owners' breeding facilities in Manjung, Perak, Malaysia as they strive to maintain and improve the brood stock production of this valuable crustacean. The research focuses on the multifaceted, operational aspects of managing giant freshwater prawn (Macrobrachium rosenbergeii) hatcheries. Through a combination of field studies guided by the qualitative methodology, the identification of primary obstacles encountered at the Manjung breeding facilities was evaluated via current management practices. The findings revealed that hatchery owners lack adequate managerial skills in handling operational matters such as budgeting, labor utilization, utilities, marketing, and networking. The most critical factor was the cost-effective sourcing of healthy, brood stock supply from local fishermen. Furthermore, the research underscores the importance of genetic diversity in broodstock populations as hatcheries struggle with inbreeding depression, necessitating the development of more robust breeding programs. From the socioeconomic standpoint, a holistic approach to addressing these issues, emphasizes the need for increased collaboration between research institutions, government agencies, and private sector stakeholders. The study provided a comprehensive overview of the complexities inherent in managing giant freshwater prawn breeding facilities in Malaysia. By identifying key challenges and potential solutions, it aims to contribute to the sustainable development of this vital sector of Malaysia's aquaculture industry. The findings have implications for policy-making, industry practices, and future research directions in the field of freshwater prawn (udang galah) aquaculture and food security agenda.

Keywords: Hatchery management, giant freshwater prawn, broodstock, aquaculture facilities

1. Introduction and Background

Aquaculture production has shown a significant increase after the pandemic lockdowns to meet the national agenda for food security. Specifically, the Malaysian aquaculture sector produced approximately 411,781 tons of total aquaculture production with an estimated economic value of USD 700 million in 2019 (Tan et al., 2024). Malaysia's giant freshwater prawns, locally known as udang galah (Macrobrachium rosenbergii), have always remained firm in demand. From aquaculture reports, udang galah farming is a lucrative endeavor resulting in many udang galah farming ventures, including hatcheries for larvae production. Introduced in the 1970s, this species has gained prominence due to its economic value and cultural significance in local cuisine. The industry has seen steady growth, particularly in states like Perak, Kedah, and Johor, where climatic conditions favor prawn cultivation. However, the sector faces numerous challenges, especially in hatchery management. These facilities, crucial for supplying quality seed stock, grapple with issues ranging from water quality management in Malaysia's tropical climate to disease control, particularly white tail disease and vibriosis. The government has recognized the industry's potential, implementing supportive policies through the National Aquaculture Development Plan and providing research backing via institutions like the Fisheries Research Institute. Despite these efforts, hatcheries continue to face complexities in areas such as nutrition management, genetic improvement to combat inbreeding depression, and adaptation to evolving market demands. Furthermore, the industry must navigate socio-economic hurdles, including labor shortages in rural areas and competition for resources with other aquaculture species. As Malaysia aims to solidify its position in the ASEAN prawn market, understanding and addressing these hatchery management challenges becomes crucial for the sustainable growth and competitiveness of the giant freshwater prawn industry.

Nonetheless, the supply of giant freshwater prawns has been limited for various reasons. *Udang Galah* farmers in Perak Tengah have faced the closure of their business project because of the need for more quality broodstock. Thus, the paper aims to provide insights into the complexities and challenges faced by hatchery owners in Perak Tengah.

2. Literature Review

Food sources and finding alternatives to shorten organic farming for a consistent supply chain of aquaculture products are essential to a country's food security balance. Hence, the aquaculture industry in Malaysia plays an essential role in ensuring supply continuity. Therefore, there is a need to ensure that these entities practice good management strategies for the longevity of the business and sustainable practices. In doing so, there are challenges in aquaculture farming. Thus, this paper aims to showcase the challenges in hatchery management in the *macro brachium rosenbergeii* broodstock production. Challenges abound With any business setup, much so for giant freshwater farming, which requires hatchery owners or managers to diligently ensure that profits are made to cover the operational expenses. (Tambalque et al., 2015).

Aquaculture for Socioeconomic Growth

Aquaculture farming has become critical to a country's economy and community well-being. Fish farming, whether freshwater or sea-based marine animals, has been an entrepreneurial project for decades, but the intensity of aquaculture farming has become prominent after the coronavirus lockdowns from early 2020 to late 2021. Aside from fish farming, other food sources from the water, such as prawns and crabs, have become popular among entrepreneurs. According to Liew et al. (2024), mud crabs, for example, are economically important for aquaculture entrepreneurs. Like other aquaculture production, the domestic seafood demand is higher than the supply making *udang galah* priced above other prawn species. (Liew et al., 2024). Realizing the market potential for giant freshwater prawns as a billion-dollar industry, Brazil's aquaculture production relies on small farms (Valenti et al., 2021). Also, Malaysia can emulate the strategy by pooling resources from small hatcheries in rural areas, such as Segari, Lumut, and Perak.

The potential of Udang Galah (Macrobrachium rosenbergeii) Farming for Sustainability and poverty alleviation

For decades, freshwater prawn farming has been shown to have a significant potential for sustainable socioeconomic Growth and food security (Yasmin et al., 2010). In tropical regions, freshwater prawns can be farmed year-long and outdoors. Hence, the profitability of prawn farming in other developing countries has evidence of economic and environmental success. (Yasmin et al., 2010). The potential for giant freshwater prawn farming has evidenced success for local farmers (Jalil, 2020; Mat Isa, 2022; Urana, 2021).

Agriculture and food production will remain the income staple for most rural communities. However, in the new normal, the Digital Era requires farmers to innovate using technology. For instance, e-commerce will provide pathways to sustainability for poverty, as evidenced in Sub-Saharan Africa (Cordes & Marinova, 2023). Utilization of the Internet and various social media platforms will assist with community inclusion and product marketing for the low-income population. Through digital engagement, rural communities will boost their entrepreneurship skills, innovate, and collaborate with other stakeholders that could provide potential benefits (Cordes & Marinova, 2023).

Many countries evidenced an increase in poverty after the COVID-19 pandemic. As such, it is vital for developing countries, particularly for reversals of fortune for poverty alleviation and shared prosperity. (World-Bank, 2020). Also, in the wake of COVID-19, the study's outcome is relevant to the United Nations Sustainable Development Goal (SDG) to end poverty in all its forms everywhere (UN-SDG, 2017; World-Bank, 2020). Poverty reduction plans and policies need rethinking, implementation, and monitoring of the projects as practiced in Hubei Province and Liupanshui City, China. (Duan et al., 2019). The literature shows that geographic considerations are crucial for wealth creation through the implementation of aquaculture projects in rural areas (Gilson et al., 2023; Singh et al., 2023). As noted by Aanesen et al. (2023), aquaculture's substantial increase in production is currently the fastest-growing food industry globally. Hence Malaysia should heed this strategy by expanding the country's aquaculture projects.

Challenges in aquaculture farming and hatchery management

Like other businesses, managing aquaculture projects is challenging (Liew et al., 2024). In the case of crab farming, some challenges include inadequate seed supply, cannibalism, disease outbreaks, and no commercially formulated feed for the Scylla mud crabs (Liew et al., 2024). As Zhang et al. (2023) pointed out, fish welfare in various aquaculture systems has garnered significant attention. Similarly, for this paper, giant freshwater prawns welfare has been brought to the attention of the relevant stakeholders, but with little effort made to assist rural hatchery owners through private investments. (Banu & Christianus, 2016), innovations and technological advances such as the Internet of Things (IoT) and artificial intelligence (AI) (Khairuddin & Majid, 2023).

The reproduction capacity of the indigenous river species, the *udang galah*, in Malaysia, depends on several environmental factors. Although there have been reports on the dwindling catches by fishermen in Malaysian rivers, the capacity to reproduce the non-indigenous Macrobrachium rosenbergii in estuaries of the Amazon Coast, north Brazil has been favorably sustainable (Iketani et al., 2016). This successful project showed that good environmental conditions would ensure a higher population of giant freshwater prawns in Malaysian rivers.

Another challenge that aquaculture entrepreneurs and hatchery managers must consider is climate change. (Galappaththi et al., 2020). Adapting to extreme weather changes such as global warming is crucial to the continuity of aquaculture projects. Coping mechanisms such as at the local level (for example, water quality management techniques), multilevel adaptive strategies (for example, changing culture practices), and management approaches (for example, adaptation planning, and community-based adaptions) will ensure limited losses. (Galappaththi et al., 2020). Again, in the digital era, technology, such as global information systems (GIS) and remote sensing, will provide the essential cost-effective tools for developing adaptation strategies and responses. (Galappaththi et al., 2020; Iliyasu et al., 2016). However, for rural hatchery owners and inland aquaculture entrepreneurs in Segari, Perak, the budgeting for these contingencies would be an added challenge.

About the district of Manjung, Perak, Malaysia

The Manjung district in Perak, Malaysia, is located in the middle section of the state (Figure 1a & 1b) (PDT-Manjung, 2021). There are five *mukim* (translated meaning township or administrative division) in Manjung, namely, Mukim Beruas (with ten villages), Mukim Lekir (with ten villages), Mukim Lumut (with 11 villages), Mukim Pengkalan Bharu (with 12 villages and, Mukim Sitiawan (with 14 villages) (see Figure 1b). The hatchery for this study is located in Segari, Mukim Lumut, Perak. Manjung's population is 246,977 people.

3. Research Methodology

Research design

For this study on managing complexities in giant freshwater prawn breeding facilities in Malaysia, a qualitative methodology would be appropriate to gain in-depth insights into exploring the complexities of the challenges and practices (Barclay et al., 2017; Thompson et al., 2024). The case study design justified the focus on specific, multiple hatcheries management practices and farming methods undertaken (Bjørkan & Eilertsen, 2020; Choudhury et al., 2017). To reiterate, the qualitative methodology would allow for a rich, contextual understanding of the complexities involved in managing giant freshwater prawn breeding facilities in Malaysia, providing nuanced insights that might not be captured through quantitative methods alone.

The data collection method for the qualitative approaches was through semi-structured interviews with hatchery managers or owners, discussions with local agency fisheries officials, and researchers from aquaculture-based institutions. Direct observations on hatchery operations were also done from repeated site visits. To ensure data viability, document analysis of hatchery records and industry guidelines obtained from fishery agencies and online were conducted. In addition, secondary data from the Fisheries Department and other available statistics were used to corroborate the research objective: to explore the efficiency of hatchery management in giant freshwater prawn broodstock production. Funding received under the Malaysian Social Innovation (MySI) grant permitted the conduct of the project implementation with the availability of hatchery owners or managers in Segari, Lumut, Perak and Kampung Hujung Rintis, Kota Setia, Perak. Consequently, these project scopes made this a case study investigation. Nonetheless, the goal of the funding is to infuse technology in *udang galah* broodstock farming in a hatchery and monitor the project's success (or failure) for two years. In addition, the study is guided by the theory of management consisting of four elements: planning, organizing, leading, and controlling, with a particular focus on aquaculture management concepts (Meade, 2012).

The sampling strategy used purposive sampling to select diverse hatchery operations varying in size, location, and management practices (Bendassolli, 2013). However, only two, rural located hatcheries in Segari, Manjung, Perak became the key informants for this study as many hatcheries were no longer in operation. Repeated interviews and focus group protocols were applied on-site where regular meetings were held. Open-ended questions covering key areas such as water management, disease control, nutrition, and genetic management were asked. Before these discussions, a pilot testing session of interview guides to ensure clarity and relevance was undertaken. The observational techniques on site involved non-participant observation of daily hatchery operations and the use of field notes and observational checklists

The data analysis from the interviews, documents, and observational notes were thematically analyzed to identify recurring patterns and themes. Before this, the coding of transcripts using qualitative data analysis software (e.g., NVivo). Consequently, the development of conceptual frameworks to illustrate relationships between the themes identified the complex challenges and management practices of the case study. In addition, the trustworthiness and validation of the outputs require triangulation of data sources and methods via member checking with participants to ensure accurate interpretation of their perspectives as well as peer debriefing with other researchers in the field of aquaculture.

In ensuring ethical considerations, informed consent from all participants was obtained earlier in the project timeline and assurance of the confidentiality and anonymity of the information gathered from the hatcheries and individuals adhered to the ethical guidelines for research involving human subjects.

It is important to note that the limitations and reflexivity of the study require acknowledging potential researcher bias and its impact on data interpretation including recognizing limitations in generalizability due to the qualitative and case study method of the project.

In summary, the primary or empirical data were collected through repeated interviews with a hatchery owner cum udang galah broodstock breeder in Segari, Lumut, Perak. The second respondent has a mini hatchery and field ponds at Kampung Hujung Rintis, Kota Setia, Perak. To supplement the aquaculture farming method and infrastructure, a tilapia fish farmer from Kampung Pulau Tiga, Kg. Gajah, Perak was also interviewed. From the

interviews, data saturation was achieved when similar responses were noted. The interview transcripts were read repeatedly, such as through content analysis, to identify themes or categories based on valid inference and interpretation. Also, the explorative process has incompleteness of inductive reasoning in organizational dilemma research projects, as in the case of this study. Ketokivi and Mantere (2010) suggested two practical reasoning strategies, idealization, and contextualization, which can lead to more effective argumentation and evaluation. "Appreciating the methodological incompleteness of both strategies helps distinguish between the method and the policy dimensions of organization-scientific debates" (Ketokivi & Mantere, 2010). Bendassolli (2013) also pointed out that the problem of induction refers to the difficulties involved in justifying experience-based scientific conclusions, which happened to this project. Although theory-building is not proposed for this study, the justification for using inductive reasoning is adequate for the assumptions of undertaking qualitative research methods (Walters, 2001) as the design allows for researchers to seek information from data gathered and analyzed yet do not proceed to a project looking for specific findings. In other words, the findings of this study are informative, with narratives to support the project's objective. Using the inductive reasoning approach, the researchers will genuinely learn from their subjects while remaining empathetic and reflective (Bogdan & Biklen, 1997; Walters, 2001).

4. Findings

The demographic breakdown of the respondents was 100% male owners aged 50 years and above. The hatchery operations are self-funded. The hatcheries were located in a rural area, far from the main road but close to the river. The hatcheries were built on the owner's land. The findings based on the research objective are shown in Table 1. The elucidation of each finding will be done in the next section.

Management element	Challenges	Comments
Planning	No proper strategic plan	Unrecorded and undocumented plans for hatchery operations
Organizing	Routine feeding and infrastructure upkeep	Hatchery owner's helpers include family members and intermittent interns
Leading	Manages hatchery as deemed fit	Self-led
Controlling	Has no control over broodstock supply	Hatchery depends on supplies from local, artisanal fishermen. Diseased <i>udang galah</i> broodstock cannot be used. Outsourcing for other broodstock means going outstation. Technical know-how; use of IoT and AI in the broodstock breeding process

Table 1: Hatchery management challenges

Discussion

During the starting phase of the project, the Movement Control Order (MCO) was mandated from early 2020 to late 2021 because of the coronavirus (COVID-19) pandemic (Bernama, 2021). The MCO took almost two years to break the chain of infection, making it impossible to cross the state borders and the hatcheries to operate normally.

The limitation of the study was the focus of two cases in one state. The study was impeded by the pandemic lockdown lasting almost eighteen months resulting in the closure of many hatcheries except for these two. The closure was due to weak operations management, and non-communication with externalities or broodstock suppliers, which led to losses. This is the risk that nobody expected, but after the pandemic, only two *udang galah* farmers continued with the project.

From the research objective, the four elements of management are considered. Firstly, the planning element where the findings showed that the hatchery owners do not have a formal strategic plan; however, the goal of

running the hatchery is to make enough profits to recover the capital expenses and expand the business. For the second element, the hatchery operations are organized daily for feeding and infrastructure upkeep. Family members made up the labor force; however, from time to time, local colleges would send students to intern at the hatchery. After the pandemic lockdowns, no interns were sent as the hatchery could not operate at standard capacity. The third management element is leading; the hatchery manager leads the operations as he sees fit, following the traditional way of running the entity. Lastly, the controlling element sees hatchery owners needing more control over the broodstock supply, which is the major problem for hatcheries to close down. This issue requires intervention from the local Fisheries Department and colleges or universities with marine studies to advise and assist with the supply. Outsourcing for udang galah broodstock from other locations requires proper logistics to keep the marine animals alive when they arrive at the hatchery.

To reiterate, hatchery management needs managers to have the four management skills and experience to plan, organize, lead, and control operations. The hatchery business type is a sole proprietorship. Therefore, the owner bears all the risks (and losses). It is recommended that hatcheries should operate and manage as a partnership or through collaborative efforts with other hatcheries, the private sector, the fisheries department, and the university.

In broodstock production, other external factors need to be considered, such as the consistent supply of healthy, free-range adult prawns. Having a formal agreement with the prawn providers or suppliers should be documented. Oral agreements are not binding as the artisanal fishermen have the right to sell their catches to the ever-ready markets.

Hatchery owners should also practice realistic management by operating within their capacity. There are seven essential control factors in udang galah breeding: water management, disease control, feeding and nutrition, larval survival rates, broodstock management, environmental sustainability, and market demand and pricing. (Hashim, 2023). These control factors can be efficiently and effectively managed using disruptive technologies like the Internet of Things (IoT) and artificial intelligence (AI). In fact, during the project timeline, Universiti Teknologi MARA's innovative contribution to the hatchery was by installing a device named SAMS-MKII. This device significantly enhanced the hatchery operations and increased larval production for a short period. SAMS-MKII was able to monitor the water quality (temperature, pH levels, dissolved oxygen, and ammonia levels) using IoT sensors deployed in the breeding containers. SAMS-MKII systems were linked to the server, and real-time data can be seen in a specially-innovated smartphone application with dashboards showing these conditions (see Figure 2). The IoT devices and AI algorithms enabled remote monitoring and control of the hatchery operations, giving the hatchery owner the freedom to travel outstation as he will receive alerts and make the necessary adjustments through a centralized dashboard or a mobile application. This capability allows for efficient management, reduced labor requirements, and prompt addressing of emergencies (Hashim, 2023). For the university project members, the predictive analytics from leveraging historical data on environmental conditions, feeding patterns, and growth rates, AI algorithms can provide predictive analytics to optimize the hatchery's operations. These algorithms can forecast optimal feeding schedules, prawn growth rates, and potential challenges; these insights allow hatchery managers to make informed decisions, streamline resource allocation, and improve overall productivity. (Hashim, 2023). However, SAMS-MKII capability cannot be fully utilized when no udang galah stock is in the containers from exhausted broodstock supply.

During the project's initial phase, implementing the Movement Control Order (MCO) due to the COVID-19 pandemic greatly affected the progress. The MCO, which lasted for nearly two years, aimed to curb the spread of the virus, resulted in restrictions on crossing state borders and disrupted normal operations of hatcheries (Bernama, 2021; Yusoff et al., 2020). This prolonged lockdown created limitations and challenges for the study, as it focused on only two cases in one state. The hatcheries needed help operating and communicating with external suppliers or broodstock providers, leading to financial losses. The unexpected nature of the pandemic made it challenging to recover and rebuild the business after the restrictions were lifted.

The research objective encompassed four management elements. Firstly, in terms of planning, it was found that hatchery owners needed a formal strategic plan. However, they aimed to generate sufficient profits for capital recovery and business expansion. Secondly, organizing the hatchery operations involved daily routine tasks such as feeding and infrastructure maintenance. Family members constituted the labor force, occasionally

supplemented by interns from local colleges. However, the pandemic disrupted the ability to receive interns, further affecting operations. The third management element, leading, relied on the hatchery manager's decisions based on traditional practices. Lastly, the controlling element revealed that hatchery owners had little control over broodstock supply, which became a significant challenge leading to hatchery closures. Moreover, when IoT and AI in aquaculture were introduced, the hatchery in Segari experienced electricity disruption and weak internet access. It is important to have sound control over electricity and seamless internet access. Addressing this issue requires intervention and assistance from the local Fisheries Department, colleges, or universities with marine studies and proper logistics for outsourcing broodstock from other locations.

To emphasize effective hatchery management requires managers with skills and experience in planning, organizing, leading, and controlling hatchery operations. As hatcheries typically operate as sole proprietorships, the owner assumes all risks and losses. It is recommended that hatcheries consider operating as partnerships or through collaborative efforts involving other hatcheries, the private sector, fisheries departments, and universities.

Additional factors must be considered in broodstock production, such as ensuring a consistent supply of healthy adult prawns from free-range sources. Establishing formal agreements with prawn providers or suppliers is essential, as informal oral agreements may not be legally binding, and fishermen can sell their catches in the market.

Hatchery owners should practice realistic management by operating within their capacity. Seven critical control factors in udang galah breeding include water management, disease control, feeding and nutrition, larval survival rates, broodstock management, environmental sustainability, and market demand and pricing (Hashim, 2023). These factors can be effectively managed using disruptive technologies like the Internet of Things (IoT) and artificial intelligence (AI). The introduction of the SAMS-MKII device by Universiti Teknologi MARA significantly enhanced hatchery operations briefly. SAMS-MKII employed IoT sensors to monitor water quality parameters (temperature, pH, dissolved oxygen, and ammonia levels) in breeding containers. Real-time data was transmitted to a server and accessible through a specially developed smartphone application with intuitive dashboards (see Figure 2). This IoT-enabled remote monitoring and control gave hatchery owners flexibility, allowing them to receive alerts and adjust from a centralized dashboard or mobile application. This capability improved efficiency, reduced labor requirements, and enabled prompt response to emergencies (Hashim, 2023).

Additionally, leveraging historical data and AI algorithms, predictive analytics can optimize hatchery operations by forecasting optimal feeding schedules, prawn growth rates, and potential challenges. Hatchery managers can make informed decisions, allocate resources effectively, and enhance productivity using these insights (Hashim, 2023). However, the full potential of SAMS-MKII cannot be realized when there is no *udang galah* stock in the containers due to the exhausted broodstock supply.

Lastly, aquaculture farming will continue to contribute to Malaysia's socioeconomic growth and population well-being. It is important to provide insights into the key challenges, government involvement, and the broader context within Malaysia and the region for aquaculture projects, specifically, farming giant freshwater prawns or *udang galah*. It sets the stage for further studies and a more detailed exploration of the complexities of managing giant freshwater prawn breeding facilities.

Figure 2: SAMS-MKII version 4 dashboard, 2023

5. Managerial Implications and Recommendations

Udang galah or giant freshwater prawns (Macrobrachium rosenbergeii) farming is lucrative if the hatchery is managed efficiently. Using technology to assist with farming will further enhance the business project. Developing a sustainable production system using new technologies, such as simple disruptive innovation, can increase productivity and improve the outputs for the domestic markets. For future studies, it is recommended that hatchery owners from other states in Malaysia be sampled. The comparative analysis of management and operational methods undertaken by these hatcheries would provide new insights into the success of other young, enterprising individuals embarking on aquaculture projects. The complexities in managing hatcheries can be overcome with financial backing from interested parties and to development of sustainable production using technology in collaboration with universities, relevant government agencies, industry partners, and private investors including telecommunication and utilities companies. In this case, the state government can also oversee the Segari, Manjung, and Perak hatcheries by providing adequate, continuous assistance, networking, and monitoring.

As in the discussion section and to reiterate, it is time that aquaculture farming makes use of technology to assist in dealing with the complexities. Another managerial implication of the project is the full utilization of the Internet of Things (IoT) and artificial intelligence (AI). Partnering with local universities and industries would be the way forward in the business project to be sustainable. Schedule visits with other successful prawn farming projects will also ensure new learning and shared experiences for the owners of this case study. From Figure 1.0, SAMS-MKII has been integrated with both IoT and AI. Other entities in aquaculture adopted technology in prawn hatcheries to enhance efficiency, productivity, and sustainability. These technologies are being applied to ensure (Khairuddin & Majid, 2023):

Water Quality Monitoring

- IoT sensors continuously monitor parameters such as temperature, pH, dissolved oxygen, and ammonia levels.

- AI algorithms analyze this data in real-time, predicting potential issues before they become critical.
- Automated alerts notify staff of any deviations from optimal conditions.

Feeding Systems

- IoT-enabled feeders dispense precise amounts of feed based on prawn growth stages and biomass.

- AI algorithms optimize feeding schedules and quantities, reducing waste and improving feed conversion ratios.

Disease Detection

- AI-powered image recognition systems can detect early signs of diseases by analyzing prawn behavior and appearance.

- IoT devices can collect and transmit data on prawn health indicators for rapid response to potential outbreaks.

Environmental Control

- Smart systems regulate lighting, aeration, and water circulation based on real-time data and predetermined optimal conditions.

- AI predictive models adjust these parameters in anticipation of changing environmental conditions.

Genetic Management

- AI algorithms can analyze genetic data to optimize breeding pairs for desired traits.
- IoT devices can track individual broodstock performance and health.

Energy Efficiency

- Smart systems optimize energy use in heating, cooling, and pumping systems.
- AI predictive maintenance schedules prevent equipment failures and reduce downtime.

Data Analytics

- AI-driven analytics platforms integrate data from various IoT devices to provide comprehensive insights into hatchery operations.

- These insights can inform decision-making on everything from production planning to resource allocation.

Automated Sorting

- AI-powered image recognition combined with robotic systems can sort prawns by size or quality, reducing labor costs and improving consistency.

Remote Monitoring

- IoT enables remote monitoring and control of hatchery operations, allowing managers to oversee multiple facilities or respond to issues off-site.

Predictive Modelling

- AI can create predictive models for prawn growth, market demand, and production outcomes, aiding in strategic planning.

While these technologies offer significant benefits, their adoption in Malaysian prawn hatcheries faces challenges such as high initial costs, the need for specialized training, and potential reliability issues in rural areas with limited connectivity. However, as these technologies become more accessible and adapted to local conditions, they have the potential to revolutionize hatchery management practices in Malaysia. (Siddeeg, 2016). Lastly, the way forward for *Udang Galah* hatcheries is to have proper policy initiatives to facilitate the entities towards efficient business processes for expansion and aquaculture commercialization towards a sustainable blue economy.

Conclusion

The objective of this paper was to provide insights through the exploration of the complexities and challenges faced by the giant freshwater prawn hatchery owners in Perak Tengah. The findings revealed that hatchery owners lack adequate managerial skills in handling operational matters such as budgeting, labor utilization, utilities, marketing, and networking. The most critical factor was the cost-effective sourcing of healthy, brood stock supply from local fishermen. Furthermore, the research underscores the importance of genetic diversity in broodstock populations as hatcheries struggle with inbreeding depression, necessitating the development of more robust breeding programs. From the socio-economic standpoint, a holistic approach to addressing these issues, emphasizes the need for increased collaboration between research institutions, government agencies, and private sector stakeholders. The study provided a comprehensive overview of the complexities inherent in managing giant freshwater prawn breeding facilities in Malaysia. By identifying key challenges and potential solutions, it aims to contribute to the sustainable development of this vital sector of Malaysia's aquaculture industry. The findings have implications for policy-making, industry practices, and future research directions in the field of freshwater prawn (udang galah) aquaculture and food security agenda.

An Integrated Circular Supply Chain Framework to Enhance Malaysian Business Performance

*Shariff Harun, Azhan Rashid Senawi Circular Economy of Logistics & Operations RIG, Faculty of Business and Management, Universiti Teknologi MARA Puncak Alam, Selangor, Malaysia *shariffharun@uitm.edu.my, azhanrashid@uitm.edu.my Corresponding Author: Shariff Harun

Abstract: Businesses rely on supply chain management to suit the needs of global and multigenerational consumers. However, the current linear manufacturing and distribution supply chain strategy has been regarded as the source of dangerous waste generation, environmental deterioration, and the global warming phenomenon. In mitigating this issue, circular supply chain management, a practical integration model, is seen as the solution as it helps to reduce material flows and supply chain waste. Unfortunately, the fundamental mechanisms that can support its effective execution have not been comprehensively examined, hindering its complete incorporation into company strategy. Thus, to overcome this knowledge gap and improve organizational understanding, this study uses the systematic reviews and meta-analyses extension for scoping reviews (PRISMA-ScR) procedure to investigate the characteristics, enablers, and barriers of circular supply chain management. The study found five interconnected key structures: government, industry stakeholders, corporate management, end users, and financial institutions, all of which play important roles in the successful implementation of a circular supply chain strategy. As a result, close collaboration across the five identified stakeholders is essential to enable successful implementation. This study's objective is to the United Nations Sustainable Development Goals (SDGs) 8, 9, and 12, which aim to promote peace and prosperity for people and the planet both now and in the future.

Keywords: Supply chain management, circular supply chain, scoping reviews, PRISMA-ScR, UN-SDGs

1. Introduction

In place of the unpredictable economic conditions, fierce rivalry in today's business world, and the effect of the COVID-19 pandemic aftermath, organizations are now becoming increasingly cautious when making decisions that could have an impact on their bottom line (Attinasi et al., 2022). These circumstances are further worsened by the rapid changes in consumer demands brought about by the current state of the marketplace due to the deficiency of raw materials. Therefore, to become more flexible, adaptive, and competitive, firms must reorganize their supply chain networks and strategies (Alshahrani & Salam, 2022). To tackle these challenges and the growing depletion of resources, scholars, decision-makers, and business leaders have advocated for the adoption of the circular economy agenda as a means of resolving this predicament (Howard et al., 2022). The implementation of Circular Supply Chain practices, an innovative supply chain structure that is part of the circular economy components is a workable solution to mitigating this problem. Its goal is to ease material flows and lower waste, and contamination generation across the whole supply chain network (Genovese et al., 2017). According to the Ellen MacArthur Foundation (2021), the objective of a circular supply chain is achieving zero waste which requires the integration of regenerative and restorative economic and commercial principles into the circular economy framework. Therefore, unlike the conventional paradigm of disposable goods, the used parts might undergo renovation or a total redesign to mimic the fresh condition of raw materials (Farooque et al., 2019). The integration of circular supply chain practices has operational and strategic benefits, as well as a huge potential for value creation in the economic, corporate, environmental, and societal realms (Jain et al., 2018). Circular supply chain integration is also predicted to enhance companies' attempts to contribute environmentally to the growth of a sustainable economy (Ayati et al., 2022).

Unfortunately, there is a notable dearth of empirical research about the circular supply chain practices adoption within the context of Malaysian businesses. Thus, it is imperative to understand the barrier and enabler underpinning the circular supply practices implementation to ensure its successful adoption, enabling Malaysian businesses to effectively embrace and implement its concept. Henceforth, an extensive empirical study especially within the academic literature on the best approaches to express circular supply chain management in corporate strategy is necessary. This study will conduct a systematic assessment of the current literature on the factors that influence the effective implementation of circular supply chains. Subsequently,

the identification of the factors hindering the expansion of circular supply chain practices will also help to provide critical knowledge and contribute to its future development.

This research is important as the effort is in tandem with the United Nations Sustainable Development Goals (UN-SDGs) which aims to promote peace and prosperity for people and the planet, now and into the future. Through the proposed framework, it is hoped that there will be a shift in the mindset of the industrialists and policymakers to implement the changes from the traditional linear supply chain model which has contributed to environmental degradation, pollution, and climate change to a healthy circular supply chain practice.

2. Literature Review

To meet the demands of today's transnational and multigenerational consumers, supply chain management is widely acknowledged as a critical driver of economic success by businesses (Alshahrani & Salam, 2022). Unfortunately, several studies have linked the existing linear manufacturing and distribution supply chain structures to issues related to hazardous waste, ecological degradation, and global warming (Khan et al., 2022). Circular supply chain management, a practical supply chain integration model is seen as the solution to address this problem. Its goal is to eliminate waste and contamination throughout the supply chain network while also mitigating material fluxes (Genovese et al., 2017). Circular supply chain practices are also predicted to help businesses contribute to the development of a sustainable economy while also encouraging participation in a socially fair society (Ayati et al., 2022).

The significance of circular supply chain practices further deepens with the latest move of Malaysia's biggest trading partners such as the United States, China, Singapore, Japan, and the European Union in translating their net zero pledges into reality. (PricewaterhouseCoopers, 2023). This development will require Malaysia to take immediate resolution in meeting the expectations of the trading partners to keep its competitiveness in trade with other nations in the region. This is because only a limited proportion of Malaysian businesses have progressed beyond waste reduction in their implementation of circular supply chains (Bassi & Dias, 2019). Despite being cognizant of the advantages of a circular supply chain, such as enhanced efficiency, reduced costs, and expanded market opportunities, Malaysian businesses frequently encounter obstacles in the form of financial constraints and talent deficiencies (Rizos et al., 2016).

There is also a shortage of academic studies on the practical methods and tools to support circular supply chain adoption by business entities (Howard et al., 2022). This phenomenon obscures their conceptual bounds and hinders circular supply chain management research and practice. Therefore, this study seeks to help the business to explore the possible methods and tools for managing uncertainty related to circular supply chain management practices. The study aims to bridge the knowledge gap by strengthening the conceptual understanding of circular supply chains and establishing implementation practices, particularly for Malaysian businesses. It is hoped that this study will provide a thorough understanding of the main factors that can improve the effectiveness of circular supply chain management methods. The proposed methodologies and tools will help Malaysian businesses shift away from traditional approaches that prioritize cost, quality, and output towards a new idea of zero waste production based on a regenerative and restorative business model. The strategies proposed will provide crucial components that contribute to the effectiveness of circular supply chain practices. As well as to provide the right tools and tactics to limit the negative implications that it might cause to the operations.

3. Methodology

This study aims to conduct a comprehensive investigation into the complex dynamics of circular supply chains and their adoption by businesses. To achieve these goals, the study uses the scoping review approach to comprehensively analyze published works about circular supply chain management. According to Tricco et al. (2018), a scoping review guarantees a meticulous, clear, and replicable approach at every phase of the review process and serves as an excellent instrument for assessing the extent and thoroughness of academic literature about a specific subject. The Preferred Reporting Items for Systematic Reviews and Meta-Analyses Extension for Scoping Reviews (PRISMA-ScR) were used as the review protocol in this investigation. The evaluation procedure consists of four clearly defined phases: identification, screening, eligibility, and inclusion. PRISMA-

ScR provides a thorough overview of the existing strategies employed by businesses, as well as the key factors that can affect the practical implementation of circular supply chains. It also facilitates the development of a strong and unified framework, backed by theoretical progress obtained from many data sources (Gibbert et al., 2008).

Through the exhaustive PRISMA-ScR search conducted over the Scopus and Web of Science databases, a total of 188 publications were initially included in the study. However, after a rigorous process of identification, screening, eligibility assessment, and inclusion, only 19 articles that satisfied the selection criteria were chosen and subjected to content analysis. This analysis enabled the study to effectively identify the main stakeholders, as well as the enablers and barriers of circular supply chain adoptions. Several recommendations were put forward, to guide the businesses in the successful implementation of circular supply chain practices to support their waste reduction strategy.

Table 1: Overview of articles fulfilling the inclusion criteria

The thematic analysis of the papers shows that the effective execution of circular supply chain operations is influenced by five interrelated important entities: government, industry stakeholders, corporate management, end users, and financial institutions. The support from these important entities is further divided into eight interrelated significant structures. The structures include laws and policies, tax and tariff, promotion and awareness, funding and incentives, strategic collaboration, resource sharing, synergistic partnership, and technology adoption.

4. Discussion

The structure described above encompasses a diverse array of factors that are crucial prerequisites for creating a functional circular supply chain practices environment. They serve as crucial components that require support from the government, industry stakeholders, corporate management, end customers, and financial institutions. The model shown in Figure 1 below illustrates the fundamental characteristics that make up the integrated circular supply chain practices framework, which are important for ensuring its successful execution.

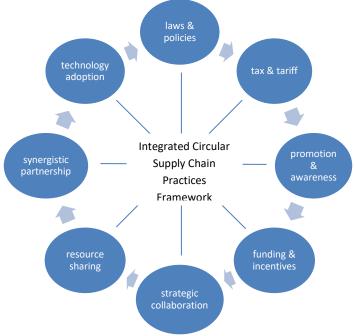

Figure 1: Integrated Circular Supply Chain Practices Framework

The research shows that the adoption of circular supply chain approaches depends on the efficient administration of five interrelated important entities: government, industry stakeholders, corporate management, end users, and financial institutions. Governmental practices involve the responsible party creating laws and regulations to encourage and assist their execution. This is because a lack of rule enforcement may hinder the development and adoption of circular supply chain permanent solutions. Thus, strong laws and policies are needed to set up effective tax rules and import tariff systems to implement the necessary actions.

In supporting the government effort, industry backing is also essential for successful circular supply chain implementation. Circular supply chain success requires strategic industrial and management solutions. These initiatives involve investing in smart facilities and technology and creating partner resource-sharing and communication platforms. The industry can improve company operations strategically and environmentally by using circular supply chain approaches. It will also lay the framework for industry participants to implement circular supply chain operations. Industry leaders and government agencies must educate, motivate, and teach stakeholders about circular supply chains' benefits.

The business management teams are the next key framework component. While top management makes key decisions, managers with an unclouded vision and precise goals will drive corporate transformation. Circular supply chain goals must be strategically embedded in the organization's practices to ensure organization-wide adoption. By upgrading technology and improving knowledge and abilities, businesses can accomplish circular supply chain targets. This is because advanced technology improves product quality, reduces energy use, and reduces waste. Thus, equipping workers with technology skills and knowledge is essential for resource efficiency.

In terms of end-user roles, integrating knowledge, and social, cultural, and marketing impacts will help them adapt and adjust their thinking because circular supply chain strategies only function if they are accepted. Customers should be encouraged to buy and refurbish eco-friendly things to foster circular supply chain activity. They should be informed about circular thinking and waste minimization, which can efficiently treat managed waste in the manufacturing and supply process while keeping product integrity and preventing obsolescence. Consumers must be made aware that environmental practices save precious resources and the environment.

The final resource in ensuring the successful adoption of circular supply chain practices is funding. This is because the deployment of a new business strategy will affect the financial commitment of a business. Grants from relevant agencies are an effective way to get industry and business management support. Funding will allow the industry and businesses to invest more in intelligent facilities and technology and build partner resource-sharing and communication channels. This financial support will also enable businesses to begin smart and ecological corporate transformation and smart circular supply chain relationships.

5. Conclusion

This study is important for both academics and practitioners as it is the way to understand the significant contribution of circular supply chains to businesses. The framework developed signifies the important contribution of five interrelated parties, which are the government, industry stakeholders, corporate management, end users, and financial institutions. The integrated circular supply chain practices framework set up in the study was construed through a rigorous and well-structured scoping review methodical procedure aided by the utilization of PRISMA-ScR procedures. This study can help businesses in improving their operations while promoting sustainability to cut costs. Hence, the development of the integrated circular supply chain management practices framework is necessary and timely to ensure service deliveries meet industry standards. This prevents business providers from abusing their position and ensures that services meet customer and industry needs.

The findings offered in this study serve as a basis for future research efforts and promote further intellectual discussions focused on enhancing and examining the suggested propositions. More research is needed to verify and enhance the suggested conceptual framework. Hence, future research can integrate qualitative and quantitative research methodologies to investigate the relationship between the elements. To ensure the precision of the conceptual model, future research should incorporate viewpoints from both practitioners and academia.

Acknowledgment: Financial support provided by the Geran Penyelidikan Fakulti UiTM Cawangan Selangor (DUCS-Fakulti): 600-UiTMSEL (PI. 5/4) (110/2022) in accomplishing the study objectives is gratefully acknowledged. The authors are also thankful to the editors and reviewers for their invaluable contributions.

Social and Finance Security on Gig Workers' Well-being with Occupational Satisfaction as an Intervening Variable

Abdul Mutalib Mohamed Azim¹, Nazruzila Razniza Mohd Nadzri^{1*}, Nurulbahiah Awang², Tuan Fatma Tuan Sulaiman¹ & Mohd Shahril Nizam Md Radzi³ ¹Faculty of Business and Management, Open University Malaysia, Malaysia ²College of Continuing Education, National Energy University, Malaysia ³Faculty of Law, National University of Malaysia, Malaysia abdulmutalib_ma@oum.edu.my, *nazruzila@oum.edu.my, nurulbahiah@uniten.edu.my, tuanfatma@oum.edu.my, shahrilnizammr@ukm.edu.my Corresponding Author: Nazruzila Razniza Mohd Nadzri

Abstract: The rise in unemployment, digitization, and the flexibility of gig workers have propelled the growth of Malaysia's gig economy. However, the well-being and occupational satisfaction of gig workers can be impacted by social and financial security concerns. This study looks at the well-being of Malaysian gig workers through the role of occupational satisfaction as a mediator, while social and financial security as independent variables. The results of a structured survey administered between November 2023 and February 2024 to 135 gig workers indicate that the well-being of Malaysian gig workers is rather low. This study found that occupational satisfaction acted as a mediator in the relationship between social and financial security and gig workers' well-being. These results highlight how important it is to have both social and financial stability to enhance employee occupational satisfaction and thus, improve gig workers' well-being.

Keywords: Occupational Satisfaction, Social Security, Finance Security, Well-being

1. Introduction and Background

There are signs that the workplace of the future will be more and more mediated by digital platforms, with a variety of new and emerging work arrangements (Duggan, Sherman, Carbery & McDonnell, 2020). One arrangement is gig employment, which is rising at a rate of 41% between 2016 and the first quarter of 2023 and is developing globally (World Bank report Sept. 2023). As per the September 2023 report "Working Without Borders: The Promise and Peril of Online Gig Work " by the World Bank, the global online gig workforce stands between 154 million and 435 million individuals, constituting 4.4% to 12.5% of the total global workforce. The presence of 545 online gig platforms globally reflects the growing need for flexible work arrangements facilitated by digital technologies. In the case of Malaysia, gig workers make up about 18% of the labor force in the nation. The expansion of Malaysia's gig economy has been facilitated by the adaptability of gig work, which often entails brief or task-based engagements, technology advancements, and an increase in the unemployment rate in the traditional labor market (Uchiyama, Furuoka & Akhir 2022).

Put another way, there were about 4 million gig workers in 2020 who brought in MYR 254 million (Uchiyama et al., 2022). More specifically, a broad spectrum of individuals in Malaysia acknowledge the existence of ondemand app gig labor. E-hailing services like Grab and MyCar (GOJO) and online meal delivery services like Foodpanda and Grab Food support a large portion of gig employment in Malaysia (Lim, 2021). As of 2019, 42 platforms are officially recognized for e-hailing services, whereas there are about eight platforms for online food delivery (Choong & Lai 2019; Lau & Ng 2019). This technology change provides a new online-based, flexible, and yet possibly precarious form of employment (Huang et al., 2020). The workplace is evolving and may become even more digital in the future, which could have a big impact on employees' perceptions of their jobs from a well-being standpoint. In today's more technologically advanced workplace, this study defines worker well-being as the totality of a worker's satisfaction and health as influenced by their tasks, expectations, stress level, and work environment. In the process, this study focuses on the well-being of low-skilled gig workers in the service industry and takes into account important factors that could affect their well-being. In this context, 'low-skilled' refers to low-barrier-to-entry gig work that is service-based.

Although low-skilled platform-based gig employment is inherently unstable, the literature analysis highlights a deficiency in attention to the well-being of this particular subset of workers (Arnoldi, Bosua & Dirksen, 2021). The literature underrepresents the well-being of gig workers and offers no recommendations for how social

and financial stability, in conjunction with occupational satisfaction as mediation, can enhance gig worker wellbeing. Therefore, it is imperative to address gig workers' well-being from a comprehensive standpoint, particularly in light of the post-worldwide pandemic and shifting employment and economic landscape. Choudhary and Shireshi (2022) noted that although gig drivers had a positive view of themselves, their life quality was low due to lengthy work hours and intense peer competitiveness. Drawing from the reasoning above, this article investigates the social and financial security aspects of gig workers' well-being before looking at the mediating function of occupational satisfaction. Employee retention is becoming an important parameter in assessing the success of an organization (Aguenza & Som, 2018). One of the most valuable dimensions in an organization is employee retention (Ivana & Chiripuci, 2020). For an organization to be competitive, it has to maintain an experienced and efficient workforce, and employee retention is affected by multiple factors (Kalyanatamitra et al., 2020).

Due to its growing population and longer life expectancy, Malaysia expects to increase healthcare expenditures to improve facilities and services (MIDA, 2020). Figure 1 shows that the number of companies and employees in the pharmaceutical industry continues to grow yearly.

2. Literature Review and Hypotheses Development

Social Security and Well-being: Changes in social security policies have the potential to impact mental wellbeing through mechanisms operating on both collective and individual scales (Lundberg, Fritzell, Åberg Yngwe, & Kolegård, 2010). Earlier, Ouweneel (2002) studied the role of social security on the well-being of the unemployed in 42 countries and found the welfare of the unemployed declined somewhat in countries that cut back on their social security benefits, but they did not get any better or happier in countries where social security benefits were increased. Rohwedder and van Soest (2006) discovered compelling proof that individuals who overestimated their Social Security benefits experience lower levels of well-being in retirement across various indicators. According to Gnatenko et al. (2020), social security is depicted as a fundamental element of an advanced society, ensuring its citizens' essential requirements, ranging from material necessities to the capability to pursue well-being autonomously. Furthermore, people who engage in many insurance plans or have social insurance are happier (Pak, 2020); social insurance is typically funded by organizations. In this study, it is assumed that when gig workers perform their jobs, they are subject to additional hazards, like car accidents or any uncertain situation. In this case, social insurance can offer gig workers perceptions of security that might influence their feelings at work and their well-being. Thus, the following research hypotheses are put out in this paper:

H1: Social security positively impacts gig worker well-being.

Finance Security and Well-being: The literature commonly defines financial security by assessing the adequacy of an individual's current income, liquidity, and assets to meet both present and unexpected needs. Munyon, Carnes, Lyons, and Zettler (2020) specified financial security as a subjective state indicating the sufficiency and stability of monetary resources compared to financial obligations. This interpretation integrates personal perceptions of income, access to credit, savings, and other assets (e.g., Howell & Howell, 2008), and evaluates their adequacy for current and future financial challenges (Gorgievski-Duijvesteijn, Bakker, Schaufeli & Van der Heijden, 2005). Consequently, individual assessments of financial security implicitly consider current financial holdings, liabilities, as well as anticipated future risks or opportunities that may affect this state (Brief & Atieh, 1987). Brief and Atieh (1987) proposed that financial security plays a crucial role in work-related stress processes, especially as events threaten or enhance financial stability. Binet, Zayas del Rio, Arcaya, Roderigues, and Gavin (2022) theorized that financial insecurity serves as one mechanism through which gentrification could negatively impact health. Additionally, Nelson and Kaminsky (2020) suggested that financial insecurity has led to heightened levels of anxiety, depression, and post-traumatic stress disorder. Consequently, this paper presents the following research hypotheses.

Social Security and Occupational Satisfaction: Social safety and security constitute a crucial concern, with its definition varying across perspectives. Skrabacz and Sulowski (2012) define it as safeguarding the fundamental aspects of human existence, ensuring the fulfillment of individual needs (both material and spiritual) and life aspirations through the creation of conducive conditions for employment, education, health

care, and pension provisions. Such-Pyrgiel and Dzurzyński (2015) emphasize social security as a shield against economic and social hardships, encompassing various social risks such as illness, aging, unemployment, and other circumstances hindering individuals from meeting their needs through work earnings. They argue that social security aims to maintain societal harmony and order, thereby averting conflicts, anomie, and social disintegration within the state. Brusa and Bahmani-Oskooe (2020) discovered that social security enhances employee satisfaction, while Gunawan & Naninsih (2018) demonstrated a significant positive impact of labor social security on satisfaction among employees of PT. Kallarent in Makassar City. Similarly, Patil and Jadhav (2022) observed a notable correlation between social security benefits and satisfaction. This paper posits a positive association between the social security measures provided by companies and the level of occupational satisfaction among gig workers.

H3: Social security positively impacts gig worker occupational satisfaction.

Finance Security and Occupational Satisfaction: Financial security stands apart conceptually from financial need, which delineates the extent to which employees depend on financial compensation to sustain their livelihoods (e.g., Hastert et al., 2019). Locke (1969) posited that occupational satisfaction mirrors employees' ability to achieve their objectives in the workplace. Consequently, employees tend to derive greater satisfaction from their jobs when they accomplish personal and professional goals (Huo & Jiang, 2021). Given that a significant portion of employees pursue work to meet financial needs (see Ochnik & Arzenšek, 2021, for relevant discussion), this study expects that achieving financial security will heighten employee occupational satisfaction. Research indicates that employees perceive occupational satisfaction when their organization ensures financial security, manifested through competitive salary packages or job stability (Sokoya, 2000). Munyon, Carnes, Lyons, and Zettler (2020) proposed that financial security plays a constructive role in bolstering occupational satisfaction. Conversely, the failure to attain financial security may diminish occupational satisfaction as employees find themselves unable to attain this desired state despite their efforts in the workplace. Hence, we posit:

H 4: Financial security positively impacts gig worker occupational satisfaction.

Occupational Satisfaction and Well-being: Occupational satisfaction refers to an individual's contentment with their career achievements, encompassing factors such as overall success, progress toward goals, income, and skill development (Judge, Cable, Boudreau & Bretz, 1995). Assessing occupational satisfaction is based on the alignment between job design and an individual's growth needs within their profession (Greenhaus Parasuraman & Wormley, 1990). Empirical evidence predominantly indicates a positive association between satisfaction and overall well-being (Ortan, Simut & Simut, 2021), albeit the magnitude of this correlation is generally modest. This phenomenon aligns with the spillover hypothesis proposed by Wilensky (1960), suggesting that emotions or attitudes from work spill over into non-work domains of life, implying a positive correlation between satisfaction and well-being. Drawing from previous research findings, Khan, Elahi, and Abid (2021) and Dreer (2024) identified a robust correlation and mutual influence between occupational satisfaction and well-being. Consequently, this paper advances the following research hypotheses. **H 5**: Occupational satisfaction positively impacts gig worker well-being.

Occupational Satisfaction as a Mediator: Satisfaction represents an internal state experienced by individuals, reflected in their behavior and responses. Those with high occupational satisfaction levels often display patience and resilience in the face of adversity and stress, demonstrating a strong resolve to confront crises and maintain optimism even in challenging circumstances, striving for personal improvement (Dreer, 2024). Overall satisfaction significantly impacts an individual's work and well-being and has garnered considerable attention from researchers in management and behavioral sciences (Khan et al., 2021; Xu, Guo, Zheng & Zhang, 2023). Meeting employees' needs in organizations is widely regarded as a critical factor in fostering satisfaction.

In the context of this study, gig workers experiencing fair social and financial security are expected to enhance their occupational satisfaction, consequently improving their well-being. According to the expectancy disconfirmation theory, when actual results exceed expectations, positive disconfirmation occurs, leading to satisfaction, whereas lower-than-expected results result in negative disconfirmation and decreased satisfaction (Petrovsky et al., 2017). Fairness preference theory posits that individuals inherently seek fairness (Fehr & Schmidt, 1999). When perceived fairness in social and financial security aligns with or surpasses

expectations, gig workers are likely to evaluate these services positively, contributing to greater occupational satisfaction. Conversely, perceptions of unfairness in social and financial security may lead to negative disconfirmation, disappointment, and dissatisfaction, thereby affecting overall satisfaction and well-being. Based on these insights, it is hypothesized that social and financial security influence occupational satisfaction, subsequently impacting well-being.

H6: Occupational satisfaction mediates the relationship between social security and gig worker well-being.H7: Occupational satisfaction mediates the relationship between finance security and gig worker well-being.

3. Research Methodology

Sample and Data Collection Procedure

The objective of this research is to examine how social and financial stability influences the well-being of gig workers, with a focus on how occupational satisfaction mediates this relationship. The study utilized a sample of 135 gig workers for analysis. Convenience sampling was chosen as the most suitable method due to its cost-effectiveness, simplicity, and efficiency, as noted by Jager, Putnick, and Bornstein (2017). While convenience samples are known for their limited generalizability compared to probability samples, they are commonly employed in social science research for their practical advantages. The inclusion criteria targeted individuals involved in the gig economy, specifically those active on either Grab Malaysia or Food Panda Malaysia platforms, aged 18 or older, who had completed platform training and commenced actual work. Respondents were required to be currently engaged as gig workers for Grab or Food Panda, excluding former workers.

Data Analysis Procedure

Various software programs were employed for data processing, including Microsoft Excel 2016, SPSS 24, and SmartPLS. Microsoft Excel was utilized for data coding and filtering purposes, while SPSS facilitated descriptive analysis. SmartPLS was employed for conducting structural equation modeling (SEM), allowing for the integration of factor analysis and multiple regression analysis, as outlined by Lowry and Gaskin (2014).

Measurement and Scale

A five-point Likert scale was employed to gauge participants' agreement levels with the measurement items. Respondents were instructed to indicate their agreement level with each statement, ranging from strongly disagree (1) to strongly agree (5), with a midpoint representing neutral agreement. Well-being was assessed using three items sourced from Diener, Emmons, Larsen, and Griffin (1985), encompassing both subjective and objective well-being aspects (α = .87). Occupation satisfaction was evaluated using two items devised by Zhao (2020), yielding a Cronbach alpha coefficient of 0.89. Social security measurement utilized a questionnaire based on Qi's (2021) instrument to acquire foundational information about social security (α = .78). Lastly, financial security (α = .71) was measured through a single-item scale adapted from Lawrence Halbesleben and Paustian-Underdahl (2013).

4. Results

In this segment, we performed a descriptive analysis of demographic factors including gender, age, educational background, and income. The findings are presented in Table 1.

CATEGORY	PERCENTAGE %
Man	88.1
Women	11.9
Between 26-35	16.3
Between 36-45	46.7
Between 46-55	27.4
56 above	9.6
SPM	35.6
Certificate	7.4
Diploma	28.1
Bachelor's degree	25.2
	Man Women Between 26-35 Between 36-45 Between 46-55 56 above SPM Certificate Diploma

Table 1: Demographic Analysis

Information Management and Business Review (IMBR) Vol. 16, No. 3(S), Sep 2024 (ISSN 2220-3796) 3.7 Master Income 500-100 6.7 1001-2000 23.7 2001-3000 38.5 3001-4000 18.5 4001-5000 9.6 5001 above 3.0

It can be seen from Table 1 that the distribution of this survey met the requirements of the sampling survey. In general, the gig workers were mainly middle-aged men, quite well educated, and can be considered low-income. Specifically, the gender results show that men accounted for 88.1% and women accounted for 11.9%. The age results show that most of them were in the age range of 26–50, among which the number of workers aged between 26 and 35 accounted for 16.3%, followed by the workers aged between 36 and 45 (46.7%), and then between 46 and 55 (27.4%), and over 56 (9.6%). Education results show that the number of workers with a certificate and Diploma accounted for 71.1%, and workers with a bachelor's degree or above only accounted for 28.9%. Income results show that the income of the workers was generally low, with most of the monthly incomes reaching less than MYR 4000, and only 12.6% had incomes of MYR 4000 and below.

Well-Being Evaluation Results

Table 2 indicates that gig workers expressed satisfaction with their social security, with an average score of 3.74. However, the average scores for financial security, occupation satisfaction, and overall well-being were lower, at 2.24, 2.66, and 2.92, respectively, suggesting notable dissatisfaction with financial security, occupation, and well-being, with an average score of 2.61. Hence, there is a pressing need to enhance the protection of rights and interests for this demographic.

Variables	Ν	Minimum	Maximum	Mean	Std. Deviation
Social Security	135	1.00	5.00	3.7407	.81692
Finance Security	135	1.00	5.00	2.2444	.93415
Occupational Satisfaction	135	1.00	5.00	2.6630	1.02183
Well-Being	135	1.00	5.00	2.2185	.89819

Correlational Analysis

Analyzing the connections among social security, financial security, occupational satisfaction, and well-being revealed a significant positive correlation. The relationship between social security and well-being (r=.642, p<.001), as well as a direct correlation between financial security and well-being (r=.360, p<.001). Additionally, there was a strong correlation between occupational satisfaction and well-being (r=.667, p<.001). These findings indicate that higher levels of social security, financial security, and occupational satisfaction correspond to elevated levels of employee well-being (refer to Table 3).

Table 3: Correlation between Social Security,	Finance Security,	Occupational	Satisfaction an	d Well-
being	-	_		

Variables	Social Security	Finance Security	Occupational Satisfaction	Well-Being
Social Security	1			
Finance Security	.348**	1		
Occupational Satisfaction	.697**	.447**	1	
Well-Being	.642**	.360**	.667**	1

Note: ** denotes p < 0.01

Table 4 displays the path coefficients and significance levels among the variables under study. It was observed that social security had a positive effect on well-being (β =0.188, t=2.245, p<0.05), thus confirming H1. Additionally, the direct impact of financial security on well-being was statistically significant (β =0.311, t=3.106, p=0.002), providing support for H2. Furthermore, there was a significant association between social security

and occupational satisfaction (β =0.168, t=2.015, p<0.05), supporting H3, as well as between financial security and occupational satisfaction (β =0.669, t=10.169, p=0.000), supporting H4. Hypothesis 5, which posited a positive relationship between occupational satisfaction and well-being, was also upheld, with occupational satisfaction exhibiting a significant influence on well-being (β =0.457, t=4.488, p=0.000).

No.	Relationship	Original Sample (0)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (0/STDEV)	P Values
H1	Social Security \rightarrow WB	0.188	0.188	0.086	2.245	0.035
H2	Finance Security \rightarrow WB	0.311	0.301	0.100	3.106	0.002
H3	Social Security \rightarrow OS	0.168	0.168	0.083	2.015	0.044
H4	Finance Security $\rightarrow 0S$	0.669	0.669	0.066	10.169	0.000
H5	OS→WB	0.457	0.466	0.102	4.488	0.000

Table 4: Hypothesis Testing on Direct Effect

Note: OS=Occupational Satisfaction; WB=Wellbeing

4.3. Reporting Mediation Analysis

The bootstrapping analysis revealed that both indirect effects (H6 and H7), with β values of 0.177 and 0.306, respectively, were statistically significant, as indicated by t-values of 2.730 and 4.023. The 95% Boot CI Bias Corrected intervals for the indirect effects, [LL = 0.018, UL = 0.298] and [LL = 0.006, UL = 0.426], do not encompass zero, suggesting mediation (Preacher & Hayes, 2008). Therefore, we can infer that the mediation effects are statistically significant, thereby supporting hypotheses 6 and 7. Detailed results of the mediation analysis can be found in Table 5.

Table 5: Hypothesis Testing on Mediation

No.	Relationship	Std.	Std.	t-value	LL (BC)	UL (BC)	Decision
		Beta	Error				
H6	Social Security→OS→WB	0.177	0.044	2.730**	0.018	0.298	Supported
H7	Finance Security→OS→WB	.306	0.076	4.023**	0.006	0.462	Supported
			1 111 11	1.025	0.000	0.102	bupp

Note: *p< 0.05, **p< 0.01, BC = Bias Corrected, UL = Upper Level, LL = Lower Level

Discussion

The findings demonstrated a positive and notable association between social security and the well-being of gig workers. Put differently, an improvement in social security levels was linked to enhanced well-being among gig workers. This outcome can be elucidated by the pivotal role of social security in bolstering the well-being of gig workers. Social security plays a crucial role in the well-being of these workers as it fosters a sense of security, thereby empowering them to lead better lives. In Malaysia, gig workers benefit from various social security programs financed by themselves, such as the Self-Employment Social Security Scheme (SESSS) and the Employees' Provident Fund (EPF) through i-Saraan.

In this study, the correlation between financial security and well-being was found to be both statistically positive and significant. This suggests that gig workers who feel financially secure, regarding income and savings, tend to experience higher levels of well-being. For gig workers in Malaysia, financial security encompasses having the necessary financial resources to lead a stable and secure life. Additionally, maintaining a sense of stability and sufficiency in income is crucial for enhancing well-being. Similar findings can be observed in the literature, as demonstrated by Binet et al. (2022), who underscores the significance of financial security in fostering good health and overall well-being.

The findings also reveal a positive correlation between the social and financial security of gig workers and their occupational satisfaction. Put simply, higher levels of social and financial security among gig workers are associated with increased satisfaction in their occupations. Social and financial security are regarded as foundational prerequisites for establishing the rights of gig workers. Achieving this involves empowering gig workers with both social and financial security, enabling them to plan and act effectively, whether for their benefit or that of their families. The essence of gig workers' lives hinges on the amalgamation of rights and freedoms they are entitled to, safeguarding them from adversities and threats while upholding their dignity and value. This serves to ensure their economic and social well-being, as emphasized by Patil and Jadhav (2022)

and Munyon et al. (2020), who underscored the role of social and financial security in shielding individuals from unforeseen disruptions in their work environment and providing stability in terms of income and savings, ultimately enhancing gig workers' satisfaction in their occupations.

The findings also reveal a positive correlation between well-being and occupational satisfaction among gig workers in Malaysia. This underscores the importance of prioritizing satisfaction aspects among gig workers, as they have the potential to enhance overall well-being. Occupational satisfaction pertains to the level of contentment or satisfaction experienced regarding one's work, representing a positive emotional response felt by employees during their job tasks or while present at work. This study concludes that gig workers who experience occupational satisfaction are likely to influence their health, including their overall well-being positively. Furthermore, these results are consistent with Dreer's (2024) research, which underscored a positive and statistically significant relationship between occupational satisfaction and well-being among employees.

The study's findings suggest that occupational satisfaction, acting as the mediating variable, plays a role in mediating the positive relationship between social and financial security and well-being. This indicates that occupational satisfaction enhances the connection between social, and financial security and well-being. This aligns with previous research by Munyon et al. (2020) and Patil and Jadhav (2022), which identified social and financial security as factors influencing employee occupational satisfaction. Ortan et al. (2021) study also reached a similar conclusion, emphasizing the moral impact of occupational satisfaction on well-being. It can be inferred that gig workers who perceive their financial and social security as assured are more likely to experience occupational satisfaction, thereby enhancing their overall well-being.

In this context, platform firms or governments need to create conditions that foster occupational satisfaction among gig workers, including providing a sense of security in terms of social and financial aspects. However, in Malaysia, gig workers lack legal protection under the Social Security Organization (SOCSO), although they can contribute to the Self-Employment Social Security (SESSS) scheme. Additionally, employers do not contribute to the Employment Provident Fund (EPF), but gig workers can contribute to the Voluntary Contribution with Retirement Incentive (i-Saraan) scheme.

With the expansion of the gig economy, which offers increasing employment prospects globally, there arises a heightened concern regarding the safeguarding of workers. As highlighted by Ghorpade, Abdur Rahman, and Jasmin (2023), addressing many of these concerns entails acknowledging and leveraging the synergies between public and private insurance mechanisms. This involves making thoughtful adjustments to the design features of social insurance programs to render both contributions and benefits better suited to the requirements of gig workers, alongside enhancing outreach efforts to bolster participation in such programs.

5. Conclusion

This study investigated the influence of social and financial security on occupational satisfaction and well-being among gig workers in Malaysia, making a unique contribution to the gig economy literature by examining these factors. The research revealed that both social and financial security significantly impact gig workers' well-being directly. Moreover, occupational satisfaction fully mediates the relationship between social and financial security and well-being. These empirical findings underscore the importance of social and financial security in the gig economy, highlighting their critical role in enhancing gig workers' occupational satisfaction and well-being. To ensure the well-being of gig workers, platform providers or governments must address issues related to social and financial security. In Malaysia, various initiatives have been implemented, such as the Malaysia Digital Economy Blueprint, the MYR 75 million grant for the "Penjana gig," the Social Security Organization (SOCSO) scheme, and the Employee and Retirement Incentives (i-Sarran) Employee Provident Fund (EPF). However, despite these efforts, only a small percentage of gig workers are registered with the self-employment social security scheme, and the regulatory and protective framework for gig workers remains inadequate. This underscores the need for further government action to ensure the protection and well-being of gig workers.

Future research should focus on enhancing our understanding of how social and financial security impacts gig workers' occupational satisfaction and well-being within this specific context. Additionally, exploring how

social and financial security influence gig worker occupational satisfaction could lead to stronger relationships between platform providers, government, and gig workers, ultimately benefiting all parties involved.

Acknowledgment: This research was supported by the Centre of Research and Innovation, Open University Malaysia (OUM) through Internal Research Fund (Ref: OUM-IRF-2023-021).

Medicine Wastage in Private Clinics: Drug Suppliers' Perspective on the Causes and Measures to Reduce It

*Calvin Cheng, Sheung Man Yuen, Shun Mun Helen Wong

College of Professional and Continuing Education, The Hong Kong Polytechnic University, Hong Kong, China *calvin.cheng@cpce-polyu.edu.hk, simon.yuen@cpce-polyu.edu.hk, helen.wong@cpce-polyu.edu.hk Corresponding Author: Calvin Cheng

Abstract: This study examines the issue of medicine wastage in private clinics from the perspective of drug suppliers in Hong Kong. Medicine wastage refers to unused or expired medication along the supply chain, and it poses significant challenges to healthcare systems worldwide. In the private healthcare sector of Hong Kong, there is a notable issue of medicine wastage, resulting in considerable economic costs and environmental hazards. The paper explores the causes of medicine wastage, including the inefficient business model of private clinics, the frequent use of general medicines, the decline in medical tourists, disruptions in the supply chain due to the COVID-19 pandemic, and the lack of medicine recycling policy and facility. Additionally, the paper suggests implementing a centralized medicine procurement and inventory management system, separating medicine prescribing and dispensing, and developing a medicine recycling policy to reduce medicine wastage in Hong Kong.

Keywords: Medicine Wastage, Private Clinics, Drug Suppliers, Hong Kong.

1. Introduction

Medicine wastage refers to any medicine that remains unused or expired anywhere along the medicine supply chain (West, Diack, Cordina, & Stewart, 2015). It includes any drug products, including those dispensed by physicians or pharmacies or those purchased by patients over the counter, that are not consumed eventually (Abou-Auda, 2003). Medicine wastage could occur at different levels (prescriber, patient, pharmacist, or even clinic level). For instance, doctors may prescribe excessive quantities of drugs to patients. Sometimes, patients may intentionally or unintentionally fail to take medications as prescribed, thereby resulting in accumulated unused drugs (Bekker, Gardarsdottir, Egberts, Bouvy, & Van den Bemt, 2018). There are also cases in which medicines are wasted because they are left to expire in pharmacies and clinics due to excess inventory. Medicine waste is one of the big challenges to the healthcare system of countries and cities worldwide, including Hong Kong.

Hong Kong has led the world in healthcare and has long been reputed to have one of the best healthcare systems in the world (Kong et al., 2015; Mok, 2001). With a population of 7.4 million, the city's total expenditure on healthcare reached HK\$168 billion in 2018. Hong Kong's healthcare system currently operates on a dual-track basis consisting of the public sector and private sector. The public healthcare sector is managed and financed by the Hong Kong government through its Health Bureau (HB). The private healthcare sector is provided by around 5,000 private clinics/hospitals and over 7,500 registered private doctors. However, due to the lack of a centralized procurement and inventory management system for medicines in the private healthcare sector, there are over HK\$22 million of medicine wasted in private clinics in Hong Kong each month (Yuen, Cheng, & Wong, 2023).

The medicine wastage in private clinics not only leads to tremendous economic costs to Hong Kong but also poses a hazard to the environment. Many private clinics dispose of their medicines through garbage, toilets, or sinks, creating a high risk of environmental pollution. A study conducted by Hong Kong Baptist University found that leachate from landfills in Hong Kong contained human antibiotics originating from medical wastes (Legislative Council Secretariat of the HKSAR Government, 2021). Besides, some media reports highlighted that medical wastes were found on beaches in Hong Kong, posing a threat to human health in the long run.

This study aims to investigate the causes of medicine wastage in private clinics in Hong Kong from the drug suppliers' perspective. It also explores the possibility, challenges, and worthiness of implementing a centralized medicine procurement platform for private clinics in Hong Kong. Further, it provides suggestions to the Hong Kong SAR Government for reducing medicine wastage in Hong Kong.

2. Literature Review

Medicine waste is a common problem in both developed and developing countries worldwide (Gebremariam, Gebregeorgise, & Fenta, 2018). For example, in New Zealand and the United States, more than 20% of medicines are wasted and returned to pharmacies each year. In Tanzania, over 50% of medicines dispensed are wasted eventually. In the United Kingdom, the annual costs associated with unused medicines are estimated to be £300 million (Bertie & Ross, 2015).

Past studies have identified numerous factors that contribute to medicine wastage. In developed countries, medicine wastage is mainly due to poor compliance, side effects, discontinuation or switching of medication, death of patients, or expiration (West, Diack, Cordina, & Stewart, 2014). In developing countries, medicines are usually wasted due to deterioration or expiration resulting from poor and inefficient medicine supply management systems (Kagashe, Makenya, & Buma, 2014). Medicine wastage also results from the overstocking of medication and the selection of medicines not using reliable data or supporting evidence (Alemu, Ibrahim, & Argaw, 2023). Other main contributing factors include the provision of near-expiration medicines to clinics or patients, non-participation of clinicians in the quantification and selection of medicines, abrupt change in treatment practices, and lack of accountability for the wastage of medicines.

Studies found that medicines frequently wasted varied across countries. In the United Kingdom, the most commonly wasted medicines were gastrointestinal (12.4%), skin medicines (11.2%), pain medicines (10.5%), and cardiovascular medicines (10.3%) (Trueman et al., 2010). In Egypt, the most frequently wasted medicines were antibiotics (20.2%), gastrointestinal medicines (16.3%), and gastrointestinal medicines (10.7%). In Ethiopia, anti-infective medicines (including antibiotics) were the most wasted medicines (58.3%), followed by endocrine medicines (16.0%) and gastrointestinal medicines (9.1%) (Alemu et al., 2023).

3. Research Methodology

This study employed a qualitative research approach by adopting an in-depth interview technique for the data collection and a content analysis technique to analyze the data. Sales representatives of one of the largest drug suppliers which supply medicines and medical products to private clinics in Hong Kong participated in the in-depth interview. The in-depth interview has several advantages over other data collection methods. First, it allows the respondents to talk freely and express their feelings and beliefs about the topic in detail (Webb, 1992). Second, it helps engage the respondents to share about sensitive or personal topics (Robson & Foster, 1989). Third, it allows greater control over the selection of respondents (Cassell & Symon, 2004). Lastly, it yields higher-quality data because of the opportunity to build rapport and trust with the respondents (Webb, 1992).

4. Results

Based on the interview results, there are several reasons why medicine wastage has become a common issue in private clinics in Hong Kong in recent years.

Inefficient business model of private clinics

Private clinics are medical facilities financed and owned by a healthcare professional (Karadayi-Usta & Bozdag, 2020). In Hong Kong, a private clinic in tradition is owned and run by one practicing doctor. It has to provide both medical consultation and medication to patients. Given that private clinics are operating by themselves and without any support from the Hong Kong government, private clinics have to purchase and manage the inventory of the medicines and drugs themselves. In addition, there is no central procurement or sharing platform in the private clinics market in Hong Kong. Private clinics therefore usually stock more than enough drugs in their clinics to ensure that each patient can get the medication needed after his or her visit. The overstock of drugs causes medicine wastage once the medicines pass their expiry date. The problem has become more serious when the demand for private clinics decreases due to population decline in Hong Kong.

Frequent use of general medicines by private clinics

Medicines fall into two main categories, namely general medicines and specialty medicines. General medicines

are medications that are used to treat common illnesses and symptoms, for example, headaches, colds, flu, and fever. Specialty medicines are medications used to treat complex and chronic conditions, such as cancer, hepatitis C, growth hormone deficiency, and HIV. In Hong Kong, general medicines are not prescription drugs. They also do not require special handling, storage, or disposal procedures. General medicines are usually more frequently prescribed for patients than specialty medicines. Therefore, private doctors in Hong Kong bulk purchase general medicines for their private clinics to achieve lower per-unit costs. Many of those unused general medicines end up becoming waste.

Decline in the number of medical tourists

Medical tourist refers to a person who travels overseas for health care services. The number of worldwide medical tourists has grown rapidly since the late 1990s due to the uneven health resources among countries, the expansion of global travel, and easier access to medical and health information and services. The main sources of medical tourists are people from countries like the United States, China, the United Kingdom, and the Middle East.

With its well-developed and sound private medical system, Hong Kong has long attracted medical tourists from around the world, in particular from China. Each year, many mainland Chinese medical tourists visit private clinics in Hong Kong for vaccination, body check, delivery, and treatment. However, the recent socio-political instability and travel restrictions have significantly affected the medical tourism market, resulting in fewer medical tourists coming to Hong Kong. Therefore, drugs and medical products have become in excess for those private clinics targeting mainland Chinese medical tourists. This eventually leads to medicine wastage.

Disruptions in the supply chain of medicines by COVID-19

The healthcare supply chain is vital in ensuring the availability of medicines and medical products in the private clinic market. The high-performing healthcare supply chain can save budgets and positively influence the quality of private clinics. In Hong Kong, the transportation of medicines for private clinics is mainly carried out by four big logistics companies, namely DKSH, Kerry Logistics, Li & Fung, and DCH Logistics. As these logistics companies have resource advantages, extensive global networks, and good collaboration with pharmaceutical companies, most practicing private doctors rely on them to handle their medical needs. However, the COVID-19 pandemic starting in 2020 in Hong Kong and worldwide has drastically affected the logistics industry and the operation of the four big logistics companies, resulting in an unstable supply chain of medicines in Hong Kong. Many private clinics have to procure excess medicines for just-in-case purposes. This leads to large quantities of medicines being disposed of and wasted.

Lack of Medicine Recycling Policy and Facility in Hong Kong

Many unopened or unusual medicines could be recycled and redistributed to those who need them. Medicine recycling is common and well-supported in Western countries where people can recycle medicines at recycling points or pharmacies. However, the Hong Kong government does not support nor provide facilities for the recycling of medicines in the city. There is no way for private clinics to recycle their excess or unused medicines even if the medicines are in good condition. This results in medicine wastage.

Research participants suggested several measures to reduce medicine wastage in private clinics in Hong Kong.

Introduction of centralized medicine procurement and inventory management system

The Hospital Authority in Hong Kong has adopted a centralized medicine procurement and inventory management system in public hospitals. The system helps to streamline the ordering and supply of medicines, reduce purchasing costs, and track and monitor medicine inventory in each public hospital. It can avoid unnecessary overstocking of medicines and thereby reduce medicine wastage due to expiration, spoilage, or incorrect storage. If a centralized medicine procurement and inventory management system can be introduced to the private clinics market in Hong Kong, it can greatly reduce the medicine waste generated by private clinics and benefit the environment in the long run. However, as the research participants pointed out, introducing such a system in the private clinic market in Hong Kong is not easy and faces various obstacles. First, it is extremely high cost to set up and maintain a good centralized medicine procurement and inventory management system. This requires many new hardware and software components, a secure network, modifications to existing systems, and technical support at each stage of the supply chain. No single drug supplier, distribution company, or private clinic can bear the cost. Second, a centralized medicine procurement

and inventory management system may involve the exchange of data and information about drugs, drug functions, drug formulas, prescriptions, stock levels, inventories, and patients among drug suppliers, distribution companies, and private clinics. Many of these data are sensitive and private, or even a business secret. Third, for a centralized medicine procurement and inventory management system to succeed, it requires the adoption by key drug suppliers, distribution companies, and private clinics. However, some of these players have already established their own procurement and inventory systems, e.g. Quality Healthcare and Town Health. It is not easy to convince them to abandon their system and switch to a new centralized system.

Separation of prescribing and dispensing of medicines

Unlike many other Western countries, in Hong Kong, the prescribing and dispensing of medicines are both done by private clinics. Patients are used to visiting a private clinic for both medical consultation and medication. Private clinics therefore need to stock both common and uncommon medicines for dispensing to their patients. If medicine prescribing and dispensing can be separated in Hong Kong, such that the doctors of private clinics provide medical prescriptions while the pharmacists of pharmacies provide the prescription medicines, private clinics will no longer need to keep and manage their medicines. It can avoid medicine wastage in private clinics and has the benefit of reducing conflicts of interest in medication choice for patients. However, as the research participants believed, it is difficult for Hong Kong to adopt the system of separation of prescribing and dispensing of medicines because most private clinics rely on medicine dispensing as their main revenue source. Many private doctors do not want to release their prescriptions to the pharmacists. They also worry that their prescriptions may be amended by the pharmacists.

Development of medicine recycling policy

The research participants found that part of the medicine waste generated by private clinics in Hong Kong consists of unused medicines. These medicines are unopened, not expired, not damaged, and in good condition. They can be collected and recycled for use by another patient in need. The research participants suggested that the Hong Kong government could develop and implement a medicine recycling policy targeting private clinics in the city. The policy may include a guideline on which medicines can be recycled, the recycling procedure, and the setup of medicine collection points. This could facilitate medicine recycling among private clinics and help reduce medicine wastage in the city. Those collected unused medicines could, later on, be reused and dispensed through the public hospitals. For the medicine recycling policy to be successful, the Hong Kong government could provide incentives, like cash rebates or financing for medical equipment, to those participating private clinics.

5. Conclusion and Limitations

Medicine waste in private clinics is an ever-increasing problem in the healthcare system of Hong Kong. On average, over HK\$22 million of medicine is wasted in private clinics in Hong Kong each month. The current study revealed that there are five reasons why medicine wastage is common among private clinics: (a) the inefficient business model of private clinics; (b) frequent use of general medicines by private clinics; (c) the decline in the number of medical tourists; (d) disruptions in the supply chain of medicine by COVID-19; and (e) lack of medicine recycling policy and facility in Hong Kong. To reduce the medicine waste generated by private clinics, it is suggested that a centralized medicine procurement and inventory management system similar to that used in public hospitals should be introduced to the private clinics market in Hong Kong. Such a system will allow private clinics to streamline their ordering of medicines and better manage their medicine inventory. Besides, it is suggested that the Hong Kong government should consider adopting the system of separation of prescribing and dispensing of medicines, thereby reducing the need for private clinics to stock and monitor medicines. This can avoid medicine wastage. Last but not least, the Hong Kong government should develop and implement a medicine recycling policy. With such a policy, unused and unneeded medicines from private clinics can be collected and reused by patients of public hospitals.

The limitation of this study is that it used only a qualitative method to collect information about the causes of medical wastage in public clinics and the measures to reduce it. Empirical research, i.e. survey with a larger sample size, can be conducted in the future to investigate different factors influencing medicine wastage in private clinics. In general, the study is sound for practitioners and governments to develop proper policies and

measures to reduce medical wastage in the private clinic market.

Assessment Audit: How Artificial Intelligence Affected Audit Quality of Sustainability Report Based on Auditors Perspective

*Rana Fathinah Ananda, Sari Nuzullina Rahmadhani, Aditya Amanda Pane, Naufal Helmi Wiratama Universitas Medan Area, Indonesia *rana@staff.uma.ac.id, sarinuzullina@staff.uma.ac.id, adityaamandapane@staff.uma.ac.id, naufal2003helmi@gmail.com Corresponding Author: Rana Fathinah Ananda

Abstract: This study aims to analyze audit assessment and the effects of artificial intelligence on the audit quality sustainability reports from the standpoint of auditors who provide audit opinions on audits that are conducted of sustainable financial reports. Certain audit tasks can now be automated by the audit profession thanks to technology. Artificial intelligence (AI) and big data analytics can be used to analyze huge data, one of the technological innovations that need more study than conventional data. The number of 85 auditors of Accountant Public Firms in Medan completed questionnaires that were used in this study to gather data. Following the collection of data from respondents, quantitative descriptive methodologies were used to analyze the data. The audit profession may improve the quality of audits by promoting the use of AI and big data analytics and by supporting auditors in developing their skills to stay current with new technologies. AI can improve audit quality, reduce costs, and eventually replace human workers. People are still required in the audit process, though, as AI cannot make decisions when it comes to providing audit opinions on financial reports. As a result, its contribution to the audit process is minimal. Therefore, it is hoped that this study will shed light on the potential applications of AI in the auditing process.

Keywords: Artificial Intelligence, Audit Quality, Sustainability Report, Auditors

1. Introduction and Background

Sustainability reporting has become a mainstream practice in the communication of corporate commitment to and performance on sustainability issues (Fonseca et al., 2014; Hahn & Kühnen, 2013; Junior et al., 2014; Perego & Kolk, 2012). Based on data obtained from one of the Big 4 Public Accounting Firms, PwC stated that in Indonesia, sustainability reports have been mandatory for financial institutions and public companies since 2019 and listed companies since 2020. However, due to COVID-19, its implementation has been postponed to 2021 In the second year of implementation, 88% of listed companies in Indonesia have submitted sustainability reports for 2022. In 2022, 80% of companies studied (in Indonesia) use GRI Standards for sustainability reports (PwC, 2023).

However, there has been a lot of criticism in the research regarding the validity and dependability of sustainability reporting (Cho et al., 2015; Gray, 2010; Milne et al., 2006; Moneva et al., 2006). Increasingly, assurance providers—which might be accounting or consulting firms—are verifying reports to allay these concerns and restore trust in corporate reporting. Since independent auditors, also known as assurance providers, share their conclusions about the quality and reliability of the information disclosed, it is assumed that the assurance process shows that sustainability reports and the reporting practices that support them have been verified (Dando & Swift, 2003; King & Bartels, 2015; Rasche & Esser, 2006).

With the start of the fourth industrial revolution, information and technology have grown more quickly, altering several professional fields, including auditing. Certain audit tasks can now be automated by the audit profession thanks to technology. Big data, which may be analyzed using artificial intelligence (AI) and big data analytics, is one of the technological advances that need more study than ordinary data. The audit profession may improve the quality of audits by promoting the use of AI and big data analytics and by supporting auditors in developing their skills to stay current with new technologies. Artificial intelligence (AI) could eventually replace human workers while also improving audit quality and reducing costs.

This article presents an analysis, based on the content analysis of a large sample of auditors, of the perspective of auditors regarding the audit quality of sustainability reports towards the assessment audit works by using AI.

2. Literature Review

The literature on AI for sustainability tackles environmental challenges and spans a wide range of disciplines and areas. This research and analysis are grounded in several theories and frameworks. The goal of agency theory is to align the interests of principals, like shareholders, and agents, like management, by analyzing their connection. This idea can be applied to audit quality to investigate how AI technologies can lessen information asymmetry, eliminate agency conflicts, and improve management oversight and accountability. The elements influencing people's acceptance and adoption of new technologies are examined using the Technology Acceptance Model (TAM) (Hamza et al., 2023). It can be used to look at the opinions and attitudes of auditors on artificial intelligence as well as their readiness to incorporate new technology into audit processes. The idea of diffusion of innovations can be applied to auditing to better understand the factors influencing the uptake and dissemination of AI technologies among auditing companies, regulatory agencies, and other audit ecosystem stakeholders. Control theory is concerned with the systems and procedures that guarantee an organization meets its goals. This theory can be applied to examine how AI technologies offer improved controls, like automated inspections, real-time monitoring, and data integrity verification, in the context of audit quality and technology adoption. It can look at how these technologies increase audit quality and fortify the control environment (Aitkazinov, 2024). In general, the application of TAM to audit quality has improved knowledge of the dynamics of technology adoption in the auditing industry and offered light on how to effectively integrate technological advancements to improve audit procedures and outcomes.

The Benefit of Artificial Intelligence on Audit Quality

Artificial Intelligence (AI) refers to the ability of computers to solve problems and accomplish tasks. When new technology is introduced and made available for purchase, it is not considered innovative until the intended audience accepts and makes use of it (Mlekus et al., 2020). Target users must be persuaded that new technology will make their jobs easier to complete and produce higher-quality work before they accept and use it (Stancheva, 2018). To do this, businesses should find out how their staff members feel about the new technology's ease of use and utility and make sure that staff members can modify their working methods to accommodate the new technology (Mlekus et al., 2020). Perceived utility (PU) and ease of use (PEOU) of AI by the auditor can be gauged using the components of the Technology Acceptance Model (TAM). According to Janvrin & Bierstaker, (2015), TAM is widely used to forecast technologies: PEOU and PU. The degree to which a potential user believes that adopting new technology will be simple, easy, and user-friendly is known as PEOU. Conversely, PU refers to the user's belief that new technology would improve output and increase productivity. According to Davis, (1989), PEOU and PU establish end users' attitudes and beliefs about new technology, which will determine its adoption and utilization.

The Challenges of Implementing Artificial Intelligence in Producing Sustainability Report

When the Brundtland Commission defined sustainability as "development that meets the needs of the present without compromising the ability of future generations to meet their own needs," the idea began to gain popularity in 1987 (WCED, 1987). According to Davidson (2010), McKenzie Stephen (2004), (Morelli, 2011), and Olawumi & Chan (2018), the three interconnected components that go toward attaining sustainability are the environment, economy, and society.

The quality of the audit may be impacted by the application of AI in the financial statement audit. For example, a board member of the Public Company Accounting Oversight Board (PCAOB) stated that auditors shouldn't rely too much on AI tools because they can't replace the auditor's expertise, judgment, and professional skepticism (Harris, 2017). For auditors, audit quality is vital; it conveys the auditors' credibility and represents objectivity. It is also regarded as the foundation of auditing standards that regulate audit engagements (Abdullah, 1982; Fanani et al., 2021; FRC, 2020). Because AI biases have the potential to affect audit quality, they can be viewed as a barrier to AI's use in audit processes. In the end, AI is composed of codes and is susceptible to reflecting the prejudices of the programmers. Furthermore, the limits of the neural network technology supporting AI's deep learning could magnify AI biases if the coding information is devoid of qualitative features (Janvrin & Bierstaker, 2015; Solaimani et al., 2020).

The Impacts of Audit Assessment by Using Artificial Intelligence Based on Auditor's Perspective

AI is being used in auditing to assist auditors in finding flaws and problems in financial reports more quickly, according to a study. (Gentner et al., 2018). Additionally, it's utilized to support auditors' prediction-making and pattern-finding in data. According to (Nwakaego, 2015), Artificial Intelligence (AI) is transforming the auditing process, and software with AI capabilities can perform complicated audits far more precisely and effectively than human labor can. Furthermore, compared to a human auditor, it can analyze massive amounts of data far more rapidly and efficiently. This implies that AI has the potential to be far more significant in the auditing process and that it will probably grow in significance over time. The application of AI to assist auditors in spotting and preventing fraud was the main topic of Chassignol et al. (2018) Study.

According to Stahl et al. (2017), audit companies are currently investing a lot of money in the creation and application of artificial intelligence. According to PwC, one of the four major audit firms, ongoing investments in artificial intelligence will generate \$15.7 trillion in economic development worldwide by 2030. According to reports, these improvements were facilitated by three different forms of AI (Munoko et al., 2020). The first type is referred to as "Assisted AI systems," which replicate jobs that humans now perform to help people make decisions or respond to various situations. Usually, pre-established protocols are followed in the implementation of these assisted AI systems. According to this viewpoint, humans make decisions and machines act. The term "mechanical intelligence" refers to assisted AI systems, which enable AI to do routine activities. (Munoko et al., 2020). The second type is known as "Augmented AI systems," wherein robots perform tasks but cooperative human-machine decision-making is necessary. These systems are referred to as having "analytical intelligence" since they can interact with their surroundings and pick up knowledge from the auditor (Guang-Huan, 2017). AI and auditors collaborate to make decisions in this context. Businesses can now accomplish goals that were previously unachievable thanks to this enhanced AI. (Munoko et al., 2020). We have "Autonomous AI systems" as the third form. These systems are capable of adapting to various situations and acting on their own without the need for auditor interaction (Kokina & Davenport, 2017). The auditor defers decision-making to AI in this scenario. Systems with autonomous AI exhibit "intuitive" as well as "empathetic" intelligence. The AI can adapt to novel circumstances in an inventive and efficient manner thanks to intuitive intelligence. However, empathic intelligence enables the AI to identify personal feelings, react appropriately, and have an impact on people. (Munoko et al., 2020).

3. Research Methodology

Data for this study is being gathered using a questionnaire survey. The questionnaire was divided into three sections: Contribution to Audit Quality (assisted, augmented, and autonomous AI systems); Obstacles of AI on Sustainability Report (weakness analysis, risk assessment, and professional reports); and Usefulness of AI (educational qualifications, professional certificates, and experience). To be more precise, the 21-item surveys are adapted from Davis (1989) and the FCR study on "The Use of Technology in the Audit of Financial Statements" (FRC, 2020), which is then measured and adjusted using two response choices (agree and disagree).

This method analysis is based on descriptive quantitative methods. An online questionnaire will be used to collect data from the research sample. 246 auditors from 20 Medan public accounting firms made up the study's population. Subsequently, the researchers used a purposive sampling strategy, limiting the sample to auditors with at least two years of work experience and those employed by the public accounting firms in Medan. 105 auditors were selected using the sampling technique, and 85 auditors provided input on the questionnaires that were distributed. The research employed data analysis techniques such as data summarization and percentage analysis of the values displayed on the Google form.

4. Results and Discussion

Respondent Characteristics

Variables	Description	Frequencies	Percentage
Gender	Male	58	68
	Female	27	32
Educational Qualification	Bachelor	63	74
	Master and above	22	26
Working Period	2-3 years	32	38
-	3-5 years	28	33
	More than 5 years	25	29

Table 1: Respondent Characteristics

Source: Survey Data, 2024

Based on the data above, the number of respondents consists of 68% male and 31% female, 74% with bachelor's degrees 25% master's degrees and above, 38% of respondents have a 2-3 years working period 38% whereas 33% of 3-5 years and 29% working period more than 5 years.

Table 2: Questionnaire Development For Perceived Usefulness of AI

No.	Items for perceived usefulness	Agree	Disagree
1	Using AI systems and tools in auditing jobs could enable me to accomplish tasks more quickly	82,3%	18,7%
2	Using AI systems and tools could improve job performance in auditing	85,7%	14,3%
3	Using AI systems and tools in auditing jobs could increase my productivity	91,3%	8,7%
4	Using AI systems and tools could enhance my effectiveness of the job in auditing	88,2%	11,8%
5	Using AI systems and tools impacts positive risk management and compliance efforts in auditing	76,4%	23,7%
6	I would find AI systems and tools useful in my future job in auditing	94,1%	5,9%
Source	e: Survey Data, 2024		

Table 2 explains that in general, more than 50% of auditors agree that AI provides usability and convenience in the audit process. Moreover, most auditors agree in total 94,1% that AI systems and tools are useful in their future job of auditing. So that the implementation process can produce a quality audit report. The percentage who answered disagree shows the statement that the usefulness of AI is not that significant in the audit process.

Table 3: Questionnaire Development For Perceived Obstacles of AI on Sustainability Report

No.	Items for perceived obstacles	Agree	Disagree
1	AI is useful for input, process, and output but not in developing analysis of sustainability report	71,4%	28,6%
2	The AI function does not yet cover all types of audits, particularly those that call for an examination of all relevant data, both financial and non-financial	85,7%	14,3%
3	AI function in data processing still needs to be maintained regularly to prevent data errors and loss	95,2%	4,8%
4	Using an AI system that groups accounts needs to be grounded on user logic, particularly for accounts about sustainable development	90,5%	9,5%
5	AI offers risk assessments only based on numbers but is unable to provide decisions regarding the company's sustainability for economic, social, and environment	91,7%	9,3%
6	If my organization has integrated AI technologies into our audit processes, I will indicate so. If not, I can articulate the main barriers to	63,5%	36,5%

	integrating AI in aud	diting.						
7	I can identify the	challenges	associated	with	implementing	AI in	41,1%	58,9%
	auditing processes.							

Source: Survey Data, 2024

Table 3 shows most of the auditors agree that apart from usefulness, AI also has obstacles to its implementation of audit sustainability reports. The highest percentage is 95,2% which is shown by the statement that data processing still needs to be maintained regularly to prevent data errors and loss. Therefore, using AI for the audit process to build an assessment audit, specifically still needs maintenance for a system and tools to get over data errors.

Table 4: Questionnaire Development For Perceived Contribution To Audit Quality
--

No.	Items for perceived contribution to audit quality	Agree	Disagree
1	Using AI systems and tools in auditing will automate routine audit processes and	95,2%	4,8%
2	procedures, allowing more time to focus on areas of significant judgment Using AI systems and tools in auditing will deepen my understanding of the entity and its processes	84,7%	15,3%
3	Using AI systems and tools in auditing will facilitate robust risk assessment through the analysis of entire populations	71,4%	28,6%
4	Using AI systems and tools in auditing will facilitate the focus of audit testing on the areas of highest risk through stratification of large populations	54,1%	45,9%
5	Using AI systems and tools in auditing will enable me to perform tests on large or complex datasets where a manual approach would not be feasible	74,1%	25,9%
6	Using AI systems and tools in auditing will improve consistency and central oversight in group audits	85,8%	14,2%
7	Using AI systems and tools in auditing will identify instances of potential fraud	83,5%	16,5%
8	Using AI systems and tools in auditing will identify unusual patterns and exceptions that might not be discernible using more traditional audit techniques	90,5%	9,5%

Source: Survey Data, 2024

Table 4 indicates on average more than 70% of auditors agree that AI contributes to audit quality, particularly in audit processes and procedures, audit testing, and identifying potential fraud. The research conducted by Rosli et al. (2012) Revealed that the acceptability and use of technological tools by auditors are influenced by their perceptions of the ease with which they can be integrated into their work and the perceived benefits of these technologies. Al-Ateeq et al., (2022) State that favorable TAM characteristics and technology adoption have been positively correlated with improvements in audit quality, which include increased data analysis efficiency and more successful risk assessments and decision-making processes.

5. Conclusion

The purpose of this study is to ascertain how well auditors comprehend artificial intelligence (AI) technologies and how they are applied in the context of their professional positions. Artificial Intelligence (AI) is a wide range of technologies that allow machines to perform cognitive tasks that humans perform, like learning, reasoning, and problem-solving. But knowledge of AI goes much beyond its simple definition and explores its many subfields, algorithms, and real-world applications. The practical uses of AI in auditing, such as data analysis, anomaly detection, fraud detection, risk assessment, and predictive modelling in audit financial reports and sustainability reports, should also be known to auditors. Strong knowledge of AI enables auditors to recognize its potential advantages, which include increased audit efficiency, enhanced risk identification, and improved decision-making based on insights from data. They are also aware of the difficulties in implementing AI, such as problems with algorithmic biases, interpretability, and ethical considerations.

In conclusion, auditors may confidently and skilfully traverse the constantly changing terrain of technologydriven auditing with a general understanding of AI. It gives them the ability to effectively use AI technologies and processes, which advances organizational resilience, innovation, and audit quality in the digital age. Furthermore, by using sophisticated analytics approaches, AI can help auditors discover fraud trends that were

previously unknown (Sharma & Kumar Panigrahi, 2012). Through the use of previous data, machine learning algorithms can recognize intricate fraud schemes and uncover questionable activity that conventional audit techniques would miss. With this proactive strategy, auditors can keep ahead of fraudulent activity and take prompt action. AI-based solutions can also instantly identify any fraud and continuously monitor transactions. Artificial intelligence (AI) systems can identify anomalous or dubious transactions in real time, allowing auditors to take swift action by utilizing methods like anomaly detection and predictive analytics. This prompt discovery improves the overall efficacy of audits and lessens the financial impact of fraud. The advantages of AI in auditing have been the subject of numerous research. Our results support those of Noordin et al., (2022), who found that artificial intelligence (AI)-powered methods, like machine learning and natural language processing, can enhance audit quality by boosting the efficacy of fraud detection.

The Role of Artificial Intelligence in the Halal Industry

*Fitriani Tobing¹, Hasfie Fauzan², Khairani Simatupang², Ryan Aulia¹ ¹Universitas Medan Area, Indonesia ²Universitas Islam Negeri Sumatera Utara, Indonesia *fitrianitobing@staff.uma.ac.id, hasfiefauzan1@gmail.com, khairanisimatupang59@gmail.com, ryanaulia1234@gmail.com Corresponding Author: Fitriani Tobing

Abstract: The halal industry has developed into a promising business opportunity in the industrial era, and many countries are interested in it. Artificial intelligence (AI) has been used in the halal industry to ensure production processes comply with halal standards, improving the safety and quality of halal products. AI can scan, inspect, and monitor any errors that may occur in a product, providing several potential benefits to the halal industry, including improving halal compliance, streamlining the supply chain, and increasing efficiency and productivity. The development of the halal industry in Indonesia shows a positive trend that is increasingly growing, due to awareness of the importance of halal products as a part of lifestyle. This awareness is not only shared by Muslims but also by non-Muslims. This high awareness of halal products will have a positive impact on business opportunities in the halal industry. The Indonesian government has been active in developing the halal industry to encourage the growth of the halal industry.

Keywords: Artificial Intelligence, Halal Industry, Halal Cosmetic, Halal Tourism

1. Introduction and Background

Halal is not just a new trend but has become a new paradigm. Halal is now considered a very important part of Muslim life. When people become more aware of halal products, this encourages businessmen to be more sensitive in running their businesses. Halal business is not only a matter of producing halal goods and services, but also a matter of building a strong business strategy (Utomo et al., 2020). According to a report from the State of the Global Islamic Report (2019), there are around 1.8 billion Muslims as consumers of the halal industry. Consumer opportunities in the halal industry increase by 5.2% every year with total consumer spending reaching USD 2.2 trillion. Indonesia has enormous potential in developing the halal industry. This is due to the large number of Muslim residents in this country. Indonesia accounts for around 12.7% of the total Muslim population in the world. It is estimated that the population in Indonesia reaches 273 million people, which means that around 87.2% of the total population in this country is Muslim (Fathoni, 2020).

The halal industry and artificial intelligence have a very strong relationship in increasing efficiency and productivity and ensuring the halalness of the products produced. Artificial intelligence is part of computer science or computing that produces expert systems, algorithms, and programs to imitate the human brain and make human-like decisions in various situations and circumstances (Dhamija & Bag, 2020). Previous studies have discussed the role of artificial intelligence in various industries. The influence of artificial intelligence in the halal tourism industry in South Korea (Marlinda et al., 2021), the food industry (Kakani et al., 2020; Mavani et al., 2022), the manufacturing industry (Lee et al., 2018), health industry (Gautam et al., 2022), the construction industry (Abioye et al., 2021), the accounting industry (Luo et al., 2018), and the oil and gas industry (Sircar et al., 2021).

Artificial intelligence in the halal industry has a very important role and prospects. Artificial intelligence systems can verify ingredients and products automatically, enabling the certification process to be more efficient. AI can be used to identify haram ingredients in products. Artificial intelligence (AI) can be used to monitor the supply chain of halal products, ensuring the authenticity and sustainability of products throughout the journey from producer to consumer. AI can help manufacturers develop new products that meet halal standards more quickly and efficiently, with analysis of consumer data and market trends.

2. Literature Review

Development of Halal Industry: The halal industry has the potential to make a significant contribution to the economy, especially in countries with large Muslim populations. In Indonesia, the halal industry is seen as a key sector for economic growth, and the government actively encourages its development through policies and regulations. The growth of this industry is also influenced by the awareness of the Muslim community which prioritizes halal products, as well as the increasing demand of non-Muslim consumers who are looking for halal options for health and other reasons. Nowadays, every Muslim is aware of the importance of the halal concept (Handriana et al., 2020; Aoun & Tournois, 2015). Halal assures customers that the product has followed all guidelines by the teachings of the Islamic Religion. The halal industry is not limited to food products but covers various sectors such as pharmaceuticals, cosmetics, tourism, fashion, finance, media, and entertainment.

Artificial Intelligence: Artificial intelligence is a system that can perform various tasks that usually require human intelligence when operated. Artificial Intelligence takes the form of a machine that can imitate human behavior developed with knowledge of human thinking and can carry out human thinking procedures (Disemadi, 2021). Artificial intelligence is divided into two categories, namely narrow artificial intelligence and general artificial intelligence. Narrow artificial intelligence is used to complete simple tasks such as managing business schedules and answering customer questions. Meanwhile, general artificial intelligence can handle complex problems such as driving cars, robotics, and overcoming language barriers (Dhamija & Bag, 2020). The role of Artificial Intelligence has been widely studied by several researchers in various industries, including the food industry (Kakani et al., 2020), Industry 4.0 Based Manufacturing Systems (Lee et al., 2018), Health Industry (Gautam et al., 2022), construction industry (Abioye et al., 2021), Accounting Industry (Luo et al., 2018), Application of machine learning and artificial intelligence in the oil and gas industry (Sircar et al., 2021).

No	Industry	The Role of Artificial Intelligence	Source

Table 1: Role of Artificial Intelligence in Various Industries

3. Research Methodology

This research is qualitative descriptive research that uses a content analysis approach using secondary data obtained from scientific articles and other relevant documents. The data obtained was then analyzed to produce descriptive explanations in the form of words, images, and symbols related to the object of this research.

Discussion

The Role of Artificial Intelligence in the Halal Food Industry in Indonesia

Artificial intelligence technology in the halal food industry to ensure production processes comply with halal standards (Peristiwo, 2019).

Assisting in the Halal Certification Process

In recent years, the awareness of halal food certification has increased, particularly from consumers' perspective. The increasing attention to halal food certification research is caused by increasing public awareness, concern, and knowledge about halal food (Ab Talib et al., 2017). Artificial Intelligence helps carry out risk analysis of raw materials, production processes, and supply chains to ensure product halal. Artificial Intelligence (AI) also helps the halal certification process by automating verification and validation, as well as speeding up the issuance of halal certificates. Through application development and synergy with related institutions, such as Bank Indonesia and educational institutions, the Halal Product Guarantee Administering Agency (BPJPH) of the Indonesian Ministry of Religion is exploring the use of AI technology for halal services. The application of AI in the halal industry can help reduce costs, improve product safety and quality, and predict trends to accelerate halal certification. (KEMENKOPUKM, 2023).

Monitoring Production Processes

The use of artificial intelligence (AI) in the food industry has experienced growth over the years due to various factors such as food sorting, grade smoking and parameter prediction, quality control, and food safety (Mavani et al., 2022). A knowledge-based system is a computer program that uses knowledge from various sources, information, and data to solve complex problems. There are three main categories in this system, namely expert systems, knowledge-based artificial intelligence, and knowledge-based engineering (Mavani et al., 2022). The food industry has used Expert Systems (ES) for various purposes because these systems have been proven to provide significant benefits, especially in the decision-making process. A knowledge-based expert system has been applied in white winemaking during the fermentation process for monitoring, intelligent control, and data recovery. Expert Systems (ES) can be used to monitor in real-time the food production process so that it remains by halal standards.

Detecting haram materials

Authenticity is an important food quality characteristic. Food mixing has varied from the addition of natural compounds to much more serious cases of contamination with dangerous substances (Syahariza et al., 2005). Many analytical methods have been used for the analysis of food additives such as differential scanning calorimetry (DSC), Fourier transform infrared spectroscopy (FTIR), gas chromatography (GC), high-pressure liquid chromatography or high-pressure liquid chromatography (HPLC), nuclear magnetic resonance (NMR), and DNA-based methods (Syahariza et al., 2005). Artificial Intelligence can be used to detect contamination of haram ingredients such as pork in food using computer vision techniques.

The Role of Artificial Intelligence in the Halal Fashion Industry

Predict Fashion Trends

Artificial Intelligence is used to predict future halal fashion trends based on historical data and Muslim consumer preferences. This helps Muslim fashion designers in determining appropriate designs (Katarya & House, 2022). Some ways to do this include: a) Collect historical data on halal fashion trends over the past few years. b) Analyze trend data such as models, colors, cuts, and textures that are popular each season. c) Studying Muslim consumers' preferences for Muslim clothing from survey results and product reviews. d) Utilize machine learning to analyze historical data patterns and consumer preferences. e) Machine learning then predicts halal fashion trends for the next season based on the detected patterns.

Production Process Automation

Artificial Intelligence can automate Muslim clothing production processes such as cutting, sewing, and quality control so that it is more efficient. Apart from that, AI can also help in production scheduling and logistics (Guo et al., 2011). Some examples of the use of AI in the halal fashion industry include; a) Computer Aided Design

(CAD) - designing clothing designs digitally using computer software. Helping Muslim fashion designers in designing clothing models. b) Cutting - AI and automatic machines are used to cut the fabric according to the desired pattern. Reduces fabric waste and is more accurate. c) Sewing - automatic sewing machines equipped with sensors and cameras can sew clothes automatically following a specified sewing pattern. Reduces stitching errors. d) Quality control - AI cameras and sensors can detect finished product defects such as stitching errors, stains, holes, and others. Ensure product quality is more consistent. e) Scheduling & logistics - AI can help optimize production scheduling and raw material logistics as well as finished product distribution to make it more efficient.

Virtual Try-on

Virtual try-on allows consumers to try on clothes digitally using photos of themselves. This is done by realistically mapping clothing images onto the user's body (Han et al., 2018). Virtual try-on proposes an end-to-end neural network architecture that can accurately predict the wear on the user's body. The result is that Virtual Try-on can place and adjust clothing images to the user's body very realistically in various body poses and types of clothing. VITON opens up the possibility of virtual try-ons for fashion e-commerce purposes, for example visualizing consumers wearing clothes they want to buy online.

Fashion Designing

Artificial Intelligence can analyze fashion trend data from runways, magazines, and social media to inspire themes and colors for new collections. Generative algorithms such as generative adversarial networks (GANs) and variational autoencoders (VAE) have been able to produce clothing designs automatically after being trained with fashion design datasets (Zhou et al., 2016). Fashion designers can determine design boundaries or criteria such as style, dominant color, or motif to the AI algorithm, which then produces hundreds of unique and creative clothing designs. AI can also help develop a fashion designer's initial design into hundreds of design variations by changing details such as materials, motifs, and clothing cuts. AI can also help develop a fashion designer's initial design into hundreds of design variations by changing details such as materials, motifs, and clothing cuts. The fashion design process becomes more efficient and productive with the help of AI, so designers can focus on design creativity and innovation (Zhou et al., 2016).

The Role of Artificial Intelligence in the Halal Tourism Industry

Chatbot for customer service

New technological advances powered by artificial intelligence (AI), such as virtual guides and virtual hosts, Chatbots, smart rooms, and digital personal assistants, have drastically changed the experience in the tourism industry (Battour et al., 2022). A chatbot is a software program often referred to as a robot or bot, which functions to carry out conversations with customers using natural language. This chatbot is a form of artificial intelligence that focuses on the user. The chatbot can answer tourists' questions regarding halal tourist destinations, halal food, and other facilities in real-time (Melián-González et al., 2021). This process can be carried out in text or voice format using special devices such as Google, Siri, Amazon Alexa, computers, and smartphones (Pillai & Sivathanu, 2020). Chatbots have several advantages, including saving time, building social relationships with consumers, building trust with users, and establishing emotional bonds between customers and companies. The great advantage of chatbots lies in their ability to set appointments, set reminders, book tickets, as well as provide up-to-date information about traffic and weather (Battour et al., 2022).

Personalized halal travel recommendations

Artificial intelligence (AI) algorithms can be used to provide personalized halal travel recommendations based on Muslim travellers' preferences and interests. The use of social media has also influenced the perception and reputation of halal tourism in Indonesia, which can be a data source for developing halal tourism recommendation algorithms (Mardiana, 2022). Artificial intelligence (AI) algorithms can be used to provide personalized halal travel recommendations based on the preferences and interests of Muslim tourists (Stephenson, 2014).

Translation of tourism content into various languages

Artificial intelligence (AI) can translate tourism content such as descriptions, reviews, and travel guides into various languages. AI can translate tourism content such as descriptions, reviews, and tourist guides into various languages (Mardiana, 2022). The use of AI in tourism content translation has several advantages, such as: a) Improve translation quality. AI can help create more accurate and relevant translations, taking into account the context and nuances of the original content. b) Reduce costs and time. AI can prevent human errors in the translation process, thereby reducing the time and costs required for this process. c) Improve translation quality. The use of AI in translating tourism content can help provide information that is more accurate and easier to understand for tourists, both local and foreign.

The Role of Artificial Intelligence in the Halal Cosmetics Industry

Cosmetics are any substances or preparations that are intended to come into contact with various external parts of the human body (epidermis, hair system, nails, lips, and external genitals) and with teeth or oral mucous membranes. Cavity with the sole or primary purpose of cleaning, scenting, changing the appearance, and/or protecting or maintaining good condition (Nohynek et al., 2010). The use of artificial intelligence (AI) has become very important in the halal Cosmetics industry. AI is used to ensure the halalness of the ingredients used, automate production processes, analyze consumer data, such as skin type, skin condition, and needs, and improve customer service. Artificial Intelligence can help understand consumer needs and preferences better. Apart from that, Artificial Intelligence can also be used to develop personalization features for halal cosmetic products, such as a color selection feature for cosmetic products that suits the consumer's skin color. With this feature, consumers can feel more satisfied with the products they use (Putu Wahyu Dwinata, 2023).

5. Conclusion

The halal industry can be considered as a new opportunity in the industrial world that is currently of interest to countries around the world. Artificial intelligence has been widely used in the halal food industry to ensure production processes comply with halal standards. Artificial intelligence has succeeded in improving the safety and quality of halal food products by ensuring that they are produced correctly and free from contamination from non-halal products. Artificial intelligence is capable of scanning, checking, and monitoring any errors that may occur in a product.

Artificial Intelligence (AI) provides several potential benefits for the halal industry, including improving halal compliance, streamlining supply chains, and increasing efficiency and productivity. In recent years, the development of the halal industry has shown an increasingly positive trend. This is due to awareness of the importance of halal products as part of a lifestyle. This awareness is not only shared by Muslims but also by non-Muslims. This high awareness of halal products will have a positive impact on business opportunities for business actors in the halal industry. In recent years, the Indonesian government has been active in developing the domestic halal food industry. This is marked by the government's efforts to encourage the growth of the halal industry.

A Review on Digital Zakat Management Research

*Ahmad Rafiki, Hery Syahrial, Silvi Andika Faculty of Economics and Business, Universitas Medan Area *hahmadrafiki@gmail.com, ry.syahrial@gmail.com, silviandika0@gmail.com Corresponding Author: Ahmad Rafiki

Abstract: Digital zakat management refers to the use of technology to facilitate the collection, distribution, and management of zakat, an Islamic tax on wealth. Digitalization can enhance zakat management by increasing efficiency, transparency, and convenience. However, digital zakat management also poses some challenges, such as the risk of zakat fund transfer failure, sharia compliance risk, and technological information risk. These risks can be addressed through global cybersecurity and fintech advancements. The main objective of this research is to review and analyze the use of digital zakat management research. It found that there are initial research had been done in emerging countries on digital zakat management, as well as authors from respective institutions. It is expected to have a clear view of the impact and benefit of using digital zakat management which then can be tested in empirical studies. An optimal collection of zakat funds is the aim as a result of an effective zakat management system.

Keywords: *Digital, Zakat, Management, Technology*

1. Introduction

Zakat is a worship that has two dimensions, apart from achieving pleasure and hoping for rewards from Allah SWT, zakat is a worship that has a social dimension. Therefore, in Islamic history, zakat has been widely used for social purposes. The manifestation of these social interests can be community empowerment, social security, education, health, and others. Zakat has a very noble social dimension, which indicates that Islamic teachings have thought about solutions to problems of inequality and unequal distribution of income in society (Akhyar Adnan & Barizah Abu Bakar, 2009).

Zakat is a fiscal instrument in economic practice that has been used since the Prophet Muhammad, and based on historical records, zakat has played a very important role in the income distribution mechanism in the economy (Amilahaq et al., 2021; Lubis & Azizah, 2018). This can be realized if the potential of zakat can truly be explored effectively and efficiently.

Digitalization has penetrated all aspects of human life, both from an economic perspective, political, social, cultural, and zakat management is no exception. There are at least three phases passed by zakat managers in all parts of the world, namely digitation, digitalization, and digital transformation (Mutamimah et al., 2021). Digitation means ownership of digital devices. Digitalization is defined as the process of converting physical data into digital data and the existence of digital standardization. Digital transformation is a whole action, process, or form of digital transformation so that the entire process is digitally integrated. Moreover, digital transformation in zakat management means digital integration of processes business to business models in managing zakat. It makes all aspects of zakat management starting from planning, collection, distribution and utilization, reporting, and control of zakat is carried out within the corridor digitalization gradually until being completed. It needs an exploration of research on digital zakat management which can be used as a reference for extensive or empirical research. It is also an exposure to the importance of digitalization in one of the Islamic social finance instruments which must be expanded due to the continuous impact on economic development.

2. Literature Review

Zakat holds significant importance in Islam for various reasons. It is a fundamental pillar of the faith, serving as an obligatory act of worship for Muslims to fulfill a religious duty. Zakat helps those in need by providing financial assistance for their necessities, promoting social justice, and reducing revenue inequality in society. Furthermore, Zakat fosters community bonds, encourages gratitude, and charitable giving, and serves as a way to earn rewards from Allah. It also emphasizes the balance between spiritual and material well-being, reminding Muslims of their accountability to Allah in using their wealth wisely and ethically (Saad et al., 2014;

Owoyemi, 2020). Overall, Zakat plays a crucial role in promoting compassion, social responsibility, and unity within the Muslim community while addressing economic inequality and empowering those in need (Cokrohadisumarto et al., 2020).

Zakat is a vital component of Islam, serving as the third pillar of the faith after the declaration of faith and prayer (Zakiy et al., 2023). It is a mandatory act of worship for Muslims who meet certain eligibility criteria, and its importance extends beyond spiritual growth to have a profound impact on both personal and communal levels (Hasan et al., 2019). The significance of Zakat is underscored in the Quran and Hadith, reflecting core Islamic values of compassion and social responsibility.

The case in Indonesia (one of the Muslim most populations in the world). There are challenges by the zakat institutions in collecting and distributing zakat funds (Kasri & Yuniar, 2021; Mawardi et al., 2023):

Aspect	Challenges
Planning	National zakat management planning is yet to be integrated completely with the Development Planning System National The lack of understanding of ongoing planning zakat by Amil Need more technical guidance regarding planning for provincial zakat institutions.
Collection	The lack of awareness among zakat payers. The number of unofficial zakat institutions is still high Unhealthy competition between Zakat institutions Security of data on digital platforms is still underdeveloped or needs a systematic and reliable system. Violation of the amil zakat's code of ethics which has an impact on the zakat payer's trust.
Distribution and Utilization	Collection and distribution are very dependent on economic and social conditions at a certain time, so they become very volatile. There is an opinion from some people that zakat distribution is carried out by some of zakat institutions which associated with illegal activities. Slowing economic growth and the emergence of new poor community classes due to potential natural disasters and climate change.
Controlling	Zakat institution's branding as a philanthropic institution is less competitive compared to other financial institutions. There is no comprehensive architecture and blueprint for zakat integration with other economic masterplans. Declining public trust in zakat institutions. Absence of binding regulations between zakat institutions and the government (local or central). Uncontrollable the extensive institutional network (zakat institutions) that oversight effective zakat implementation.
Reporting and Accountability	Less participation (not 100%) in national zakat management Amil's capability in using the Zakat integrated system is still minimal, thus requiring a continuous training program. Unaffordable to pay audit fees by zakat managers

Table 1: Aspects and Challenges of Zakat Fund Collection and Distribution

The gap between the potential and realization of zakat collection is room for improvement and acceleration of zakat management performance through various aspects of challenges that need to be answered. Thus, the results of zakat management performance are not only reflected through a single indicator.

Importance of Zakat in Islam

Zakat comes from the purification, growth, and blessing of one's wealth. One should give a set percentage (2.5%) of their wealth based on their yearly earnings and give that percentage to those in need. This is usually set aside as what one expects to give whether through donations to charities or their Masjid. Zakat is a fundamental teaching of Islam, and Muslims must work to ensure those who don't have the means to thrive are given what they need to survive. Generosity is a central theme in Islam that Allah gives to those He loves, and He guides us to refrain from attachment to material wealth.

The Zakat system currently faces several challenges that need to be addressed to ensure its effectiveness in alleviating poverty and supporting the needy. The challenges of zakat management in Muslim developing countries are numerous and complex. Some of the key challenges include (Mawardi et al., 2023; Kamal et al., 2024; Ardani & Pujiyono, 2021; Bin-Nashwan et al., 2020):

Lack of integration with government programs: There is a need for zakat programs to be integrated with government programs, particularly those aimed at poverty reduction, to maximize their impact

Low public awareness: Increasing public awareness about zakat is crucial for its successful implementation and acceptance by the community

Low reporting: Many zakat institutions do not report their zakat management activities, which makes it difficult to track and optimize the collection and distribution of zakat funds

Regulatory issues: The current Zakat Act does not yet integrate zakat as part of state finances, which needs to be addressed to facilitate its use as a source of state revenue

Socialization and community engagement: The community must be educated about the importance of zakat and its role in poverty alleviation

Instrumentation and institutional support: The government needs to establish institutions and instruments to collect and distribute zakat funds efficiently

Trust and transparency: Ensuring transparency in the collection and distribution of zakat funds is essential to build public trust and confidence in the system

Lack of staff and resources: Zakat institutions may face challenges in managing their staff and resources effectively, leading to inefficiencies in the distribution of Zakat funds. The education and training of amil zakat officers is crucial for ensuring professional and capable personnel to manage zakat activities effectively.

Political issues: The integration of zakat as an obligation in the law may raise political concerns, particularly regarding the perception of the country as an Islamic state

Corruption and mismanagement: Ensuring that zakat funds are not misused or misappropriated is a significant challenge, as it requires strong governance and accountability mechanisms

Technological limitations: The use of technology to improve the efficiency of zakat distribution and monitoring is limited, which can lead to issues in tracking recipient information and the distribution process

Governance of zakat institutions: Ensuring the transparency, accountability, and effectiveness of zakat institutions is crucial for maintaining public trust and confidence in the zakat system

To address these challenges, it is essential to strengthen the governance of zakat institutions, improve transparency and accountability, and increase public awareness and education about the importance of zakat in supporting the needy and alleviating poverty. Moreover, the development of zakat has been driven by its potential to address social issues and contribute to the SDGs. It is a significant form of philanthropy that has been adopted globally and has the potential to make a significant impact on poverty, inequality, and other social issues.

Digital technologies used in zakat management include:

Web-based applications: These offer several time-saving services in collecting, distributing, and utilizing zakat services, enhancing the efficiency of the zakat management process

Mobile applications: These can facilitate zakat management by providing online financial reports, online zakat calculators, and online payment facilities, making zakat more accessible and efficient

Blockchain technology: This can be used to create a more open, transparent, and secure online environment for zakat transactions, ensuring the integrity of the process.

Smart contracts: These can automate and simplify zakat management and collection, increasing transparency and accountability, and reducing administrative costs.

Artificial Intelligence (AI): AI can help zakat organizations improve the efficiency, accuracy, and impact of zakat collection and management by analyzing and interpreting data, recognizing patterns, and making predictions or recommendations.

Digital wallets: These can be used to accept and distribute zakat funds, enhancing the efficiency and transparency of zakat transactions.

Online payment services: These can facilitate zakat payments, making it easier for donors to contribute to zakat and for recipients to receive support.

Digital-based information systems: These can manage and track zakat funds, providing real-time updates on zakat collection and distribution, and enhancing transparency and accountability.

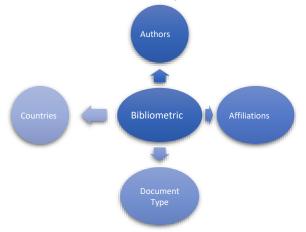

Zakat management systems link several organizations together. These can promote collaboration and address issues of information sharing and inefficient business processes, enhancing the overall efficiency of zakat management. These digital technologies have the potential to improve the efficiency, transparency, and accessibility of zakat management, ultimately enhancing the impact of zakat in addressing social and economic inequalities.

The zakat operator (amil) has its challenges for management zakat itself. Considering the high turnover of amil, this allows a management system The zakat that is built and implemented can change along with changes in the amil's human resources on duty. Thus, things related to prosperity, certainty career path, and merit system from Amil Zakat Management HR need to be completed immediately.

3. Method

This study's thorough bibliometric analysis sought to answer each of the predetermined research topics. Furthermore, bibliometric analysis reveals relationships between the publications. It also shows the development of research on the mentioned subjects in terms of document type, authors' productivity, affiliations, and countries. Below is the flow of bibliometric analysis for this study:

Figure 1: Flow of the Bibliometric Analysis

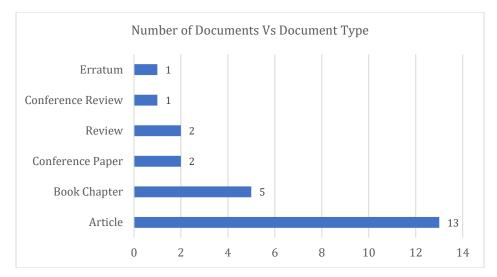

4. Results

Published Document Type

Figure 2 shows that the research output on digital zakat management is mostly written in articles (13 documents) rather than in books, even some published in conference papers. This means that the research on digital zakat management could be explored and become a research interest among academicians/researchers who will publish their outcomes in the research article.

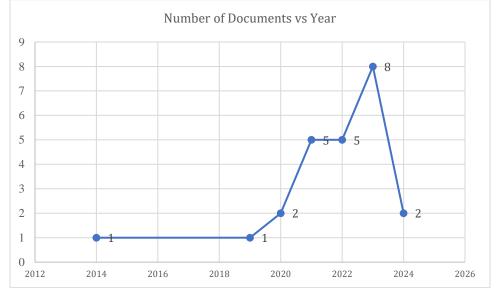

Figure 2: Number of Documents on Document Type

Number of Publications

Figure 3 shows the minimum number of publications appearing in the research of digital zakat management since the year 2014. The highest number of published documents is in the year 2023 with 8 documents. The interest of researchers on the subject is quite low due to the limited discussion by stakeholders on zakat management that see digitalization as one of the solutions to the effective collection and distribution of zakat funds.

Most Dominant Author

Table 1 shows the most dominant authors in digital zakat management. The highest published documents are at least 2 papers and mostly with 1 paper. Some opportunities should be filled up by initiating a plan to expand the research works. Both Beik, I.S. and Utami, P. have 2 published documents so far in digital zakat management.

Most Dominant Country

Figure 4 shows the most dominant countries with highly producing papers on digital zakat management, among others Indonesia and Malaysia with 13 and 9 documents respectively. Indonesia and Malaysia are known as the countries that implementing zakat management for quite some time. There are factors and challenges related to digital zakat management in both countries that need to be explored in continuous research works.

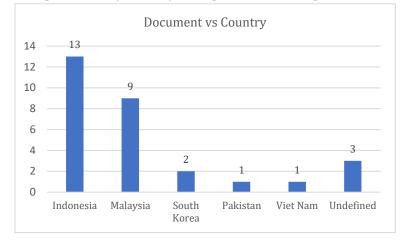

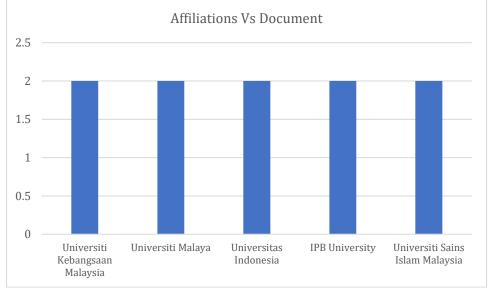

Figure 4: Documents published by Country on Digital Zakat Management

Most Dominant Institutions

Figure 5 shows the most dominant institutions that have published articles on digital zakat management. Five institutions have published 2 documents each. Most of them are located in ASEAN regions like Malaysia and Indonesia. This could be an example to other zakat institutions worldwide to see the best practices of zakat management in both countries as well as the research outcome on the subject.

5. Conclusion

Zakat management cannot be separated from professional human resources (HR). Aspects like planning, implementation, control, reporting, and activities accountability for collection, distribution, and utilization of zakat must be considered and implemented (Müller, 2017). HR is the most valuable asset because it determines a company's success in organization/work. The demands of changing times and policies are also encouraging zakat management to adapt through a more professional paradigm shift. Previously the traditional paradigm allowed zakat management activities to become side jobs, part-time jobs, and unpaid management, but now quality and reliable zakat operators are indeed very crucial. The existing management facilities are something that needs to be abandoned and changed to a modern paradigm. The modern paradigm in managing zakat is

making the amil a full-time profession, having a certain level of quality, and being paid appropriately, so that every potential and competent person is devoted to managing zakat professionally (Kamal et al., 2024).

The purpose of this research is to investigate the topic of digital zakat management through a comprehensive bibliometric analysis and a developmental map of the field. For example, the highest publication on digital zakat management started in 2014. The highest number of published documents is in the year 2023 with 8 documents. While mostly written in articles (13 documents) rather than in books, even some published in conference papers, most dominant authors in the digital zakat management have at least 2 papers and mostly with 1 paper. Greater initiatives should be considered to enhance more research work. Finally, the most dominant institutions that have published articles on digital zakat management are concentrated in two countries Malaysia and Indonesia. The findings demonstrated the most common contributors who have a major influence on digital zakat management and highlighted the growing attention of eminent academics and organizations worldwide in this area. The fact that this study used a single source or database for data collecting and synthesis is one of its drawbacks.

The Influence of E-Commerce, Motivation, and The Use of Accounting Information Systems in Decision-Making For Entrepreneurship in Accounting Students

*Sucitra Dewi, Fauziah Rahman Accounting Study Programme, Faculty of Economic and Business, Universitas Medan Area *sucitra@staff.uma.ac.id, fauziahrahman@gmail.com Corresponding Author: Sucitra Dewi

Abstract: In today's digital era, anyone can make buying and selling transactions easily. Buying and selling trade goods can now be done from young to old. Due to the access to conduct all-round transactions in terms of supply of goods, promotion, and finance is also easy. This is because the latest information technology makes it easy to transact efficiently and effectively. An example of current information technology that is developing is e-commerce. Apart from e-commerce, accounting information skills can encourage individuals to develop their businesses. However, the situation in Indonesia is that young people who are entrepreneurs are low. Therefore, this study aims to see whether the variables that have been determined such as E-Commerce, Motivation, and Financial Information Systems can influence decisions in entrepreneurship. The population in this study were accounting students at the Faculty of Economics and Business, Universitas Medan Area. The data used in this study is primary data by distributing questionnaires to respondents using a purposive sampling technique. The analysis used is multiple linear regression analysis. The results of this study are expected to be able to analyze more deeply the students' interest in entrepreneurship. The results of the study will also be presented through tables, figures, and graphs.

Keywords: Entrepreneurship, E-Commerce, Motivation, Accounting Information System

1. Introduction and Background

Based on data from the Badan Pusat Statistik in August 2023, the unemployment rate in Indonesia was 5.32% or approximately 14,000,000 of the entire Indonesian population. This is a decrease of 0.54% from August 2022. However, despite the decrease, the unemployment rate is a large number for a country. This is because many people in Indonesia, including young people, want to work in an institution. The Ministry of Cooperatives and Small and Medium Enterprises sees that the number of entrepreneurs is still around 3.47% as of 2022. This number is still far below the standard entrepreneurship ratio for the category of developed countries which has a minimum standard of 12% of the total population. Based on this data, we know that the ratio of entrepreneurs to the population in Indonesia is still far from the minimum number. The government continues to encourage an increase in this ratio so that economic growth will increase. New entrepreneurs are still needed in Indonesia because they are expected to open new jobs to reduce unemployment.

In the current era of digital development, the process of doing business is very easy. According to Marlinah (2020), the digital era makes the use of technology more advanced from year to year, but in Indonesia, this is still not fully utilized by the community. Technological advances should be utilized to start a business to improve the quality of life in the future. But this still cannot be realized because of the low interest of the Indonesian people in technology to increase competitiveness in the business world, one that is often used is Electronic Commerce (e-commerce). E-commerce can be used by entrepreneurs to create a web on the internet to market the products offered and does not require expensive costs to expand business promotion because it can utilize pre-existing platforms, such as social media. As in the concept of commerce, electronic commerce creates alliances between parties to provide services. The result of such alliances can give rise to rights and obligations that must be fulfilled by the parties involved. Electronic commerce is a model of a sales contract with characteristics that differ from the usual model of buying and selling transactions, especially with a scope that is not only local but also global (Muttaqin, 2011).

According to Mahrom (2022) entrepreneurship grows based on the motivation to earn their income and develop an entrepreneurial self. The emergence of motivation comes from within oneself and from others. Pressure to survive, develop, or show the existence of success can encourage entrepreneurial action. Especially if externally, there are many experiences of the success of others who take the same action. According to

Gerungan (Lubis & Maha, 2021), motivation is an impetus in humans that causes these humans to carry out an activity. So, with strong motivation, students are motivated and decide to become entrepreneurs. And of course, it will increase the number of young entrepreneurs in Indonesia. The level of entrepreneurial success depends on how much motivation is in the student. So, the greater the motivation a person has, the greater the effort to realize the desire for entrepreneurship.

When someone starts a business, they must have a supporting information system to run their business properly. Including the system used in managing finances. According to Nuraibah et al (2021), the most popular information system among entrepreneurs is the accounting information system. According to Rapika (2021), manual data processing is no longer relevant in the modern era as it is today, because there is openness and globalization which requires everything to be processed quickly and accurately. Errors caused by manual data processing can no longer be neutralized because the information produced can cause errors in decision-making. This is what makes the existence of accounting information systems increasingly important and main for a company.

2. Literature Review

Decision for Entrepreneurship

Entrepreneurship is the ability to hone something within oneself to be improved and utilized to be more optimal so that it can improve future living standards (Hendro, 2011). Entrepreneurship is the process of creating a new value in the use of time and effort required and receiving monetary rewards generated for freedom and personal satisfaction. Entrepreneurship is a person's efforts in the creation of a business or venture faced with the risk and uncertainty of profit in business development by exploring opportunities in utilizing the necessary resources (Suharyadi et al., 2007).

E-Commerce

According to Anugrah and Prianthara (2018), electronic commerce is the activity of buying and selling goods or services using the Internet network. Candra and Dadang (2013) explain that electronic commerce is a sales transaction activity or purchase of goods and services carried out between companies using computers with internet networks. Electronic commerce business is a business that has no boundaries between sellers or buyers and there is no distance between anything.

Motivation

According to Hidayat et al. (2023), motivation is defined as factors that direct and encourage a person's behavior or desire to carry out an activity which is expressed in the form of hard or weak effort. According to Alifia and Jojok (2019: 142), entrepreneurial motivation is "a psychological drive that arises from within and outside the individual to do something independently". With the encouragement that arises, the individual will be able to determine what business he will be involved in as well as determine future goals and expectations. Then as stated by Yunal and Indriyani (2013: 142) entrepreneurial motivation is "the driving force/encouragement within that gives rise to enthusiasm for the creation of an activity/job by looking at the opportunities that exist around, acting bravely in taking risks, carrying out innovative activities, and having an orientation towards profit". Then as stated by Maulida & Dhania (2012) entrepreneurial motivation is a state that encourages, drives, and directs the desire of individuals to carry out entrepreneurial activities, by being independent, believing in themselves, being future-oriented, taking risks, being creative, and highly valuing the desire for innovation.

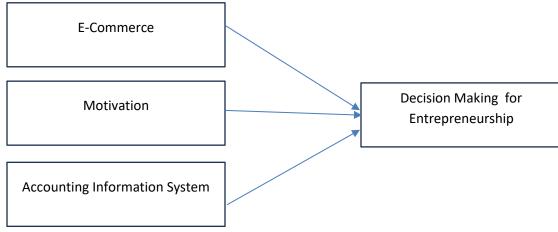

Accounting Information System

According to Kasmir (2020:4) Accounting Information System is a system that processes data and transactions to generate useful information for planning, controlling, and operating a business. Hall (2018) defines an accounting information system as consisting of three main subsystems, namely: a transaction processing system that supports daily business operations with several documents for users throughout the organization, a general ledger reporting system that produces traditional financial reports and a management reporting system that provides management with internal financial reports with specific purposes and information needed for decision making. Mulyadi (2018) Accounting Information Systems are records and reports that are coordinated in such a way as to provide the financial information needed to facilitate company management.

From some of the above definitions, it can be concluded that an accounting information system is a system that processes data and transactions to produce company financial reports in the form of records or reports that are coordinated in such a way as to facilitate company management.

Development Hypothesis

As for the formulation The hypothesis in this research is as follows:

- H 1: E-commerce has an influence on decision-making for entrepreneurship
- H 2: Motivation has an influence on decision-making for entrepreneurship
- H 3: Accounting Information System has an influence on decision-making for entrepreneurship

3. Research Methodology

The type of research conducted in this study uses a type of quantitative research in the form of an associative approach. Quantitative research is research based on the philosophy of positivism, used in research with certain populations or samples, data collection using statistical/quantitative data analysis, and research instruments with the aim of testing predetermined hypotheses (Sugiyono, 2019). The population in this research is all active students of the Accounting Study Program, Faculty of Economics and Business, Universitas Medan Area. The determination of the number of samples is measured using the Slovin formula with a confidence level of 90% and a value of e = 10% to get a sample size of 80 students. Data processing is using SPSS 25 for Windows software. The approach method used in this research is a quantitative research method, with data analysis consisting of classical assumption tests, multiple linear regression analysis, and hypothesis testing.

4. Results

Classical Assumption Test

One-Sample Kolmogorov-Smirnov Test		
		Unstandardized Residual
N		80
Normal Parameters ^{a,b}	Mean	.0000000
	Std. Deviation	1.56872997
Most Extreme Differences	Absolute	.122
	Positive	.100
	Negative	122

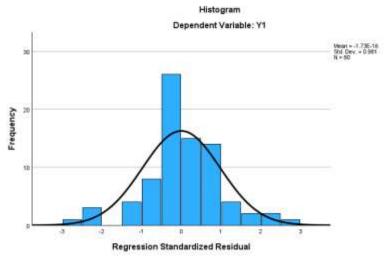

Normality Test

Test Statistic		.122			
Asymp. Sig. (2-tailed) ^c		.005			
Monte Carlo Sig. (2-tailed) ^d	Sig.	.005			
	99% Confidence Interval	Lower Bound .003			
		Upper Bound .007			
a. Test distribution is Normal.					
b. Calculated from data.					
c. Lilliefors Significance Correction.					

d. Lilliefors' method is based on 10000 Monte Carlo samples with a starting seed of 2000000.

Based on Table 1, it can be seen that the significant value is 0.05. It can be concluded that the data above is normally distributed.

Figure 2: Histogram

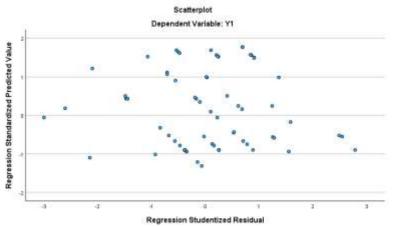

Based on the figure above, that data has normally been distributed.

Heteroscedasticity Test

The following is the data regarding the heteroscedasticity test:

Figure 3: Scatterplot Graphic

Based on the graph above, it can be seen that the dots spread above and below the number 0 on the Y-axis, so it can be concluded that there is no heteroscedasticity in the regression model.

Multiple Linear Regression Analysis

Multiple regression analysis was conducted to determine how much influence the variables of E-Commerce, Motivation, and Accounting Information Systems on the Decision to Go into Entrepreneurship.

		Unstandardized Coefficients	
Model		В	Std. Error
1	(Constant)	7.248	2.332
	X1	.052	.101
	X2	.145	.125
	X3	.471	.113

Based on Table 2, multiple linear regression equations can be obtained as follows: Y = 7,248 + 0,52X1 + 0,145X2 + 0,471X3 + e

Table 2: Multiple Linear Regression Analysis

The constant value of 7.428 means that without the variables of e-commerce, motivation, and accounting information systems, the decision to engage in entrepreneurship is 7.428.

The X1 regression coefficient value is 0.52, meaning that if the e-commerce variable increases, the decision variable for entrepreneurship will increase, and vice versa.

The X2 regression coefficient value is 0.145, meaning that if the motivation variable increases, the decision variable for entrepreneurship will increase, and vice versa.

The X1 regression coefficient value is 0.471, meaning that if the accounting information system variable increases, the decision variable for entrepreneurship will increase, and vice versa.

Hypothesis Test T (Parcial) Test

The following are the results of the t-test:

		Standardized Coefficients			
Model		Beta	t	Sig.	
1	(Constant)		3.108	.003	
	X1	.052	.513	.610	
	X2	.141	1.161	.249	
	X3	.497	4.156	,001	

Based on the t (partial) test results above, variables X1 and X3 are not significant with Y, but variable X3 is positive and significant with variable Y.

5. Conclusion

In the results of this study, the variable e-commerce and motivation does not affect the decision to entrepreneurship. However, the accounting information system variable has a positive and significant effect on the decision to engage in entrepreneurship. This means that young people in Indonesia will be interested in entrepreneurship if there is convenience in transactions and clear financial records.

Crucial Factors Influencing the Success of SMEs in the Digital Transformation Era

*Hery Syahrial, Linda Lores, Dahrul Siregar, Salma Nazwa Faculty of Economics and Business, Universitas Medan Area, Medan, Indonesia *herysyahrial@staff.uma.ac.id, linda@staff.uma.ac.id, dahrul@staff.uma.ac.id, salmanazwa2024@gmail.com Corresponding Author: Hery Syahrial

Abstract: Small and medium enterprises (SMEs) have an important role as the backbone of a country's economy. However, in the current digital era, there are many challenges faced by SMEs in adopting digital transformation. Assumed limited literature that discusses the success factors of digital transformation in SMEs. Therefore, this research aims to explore the important factors for the success of digital transformation in today's SMEs. The method used in this research is to search for articles relevant to the research topic using the Google Scholar database. The research results show that digital strategic planning, digital maturity, relationship capital, and collaborating with external digital innovation units are the keys to successful digital transformation in MSEs today. The results of this research will provide input to SMEs and the government in making decisions to achieve the success and sustainability of SMEs, as well as enrich the literature that examines digital transformation in SMEs.

Keywords: SMEs, Digital Technology, Transformation Era, Crucial Factors, Content Analysis

1. Introduction and Background

Small and Medium Enterprises (SMEs) have become an interesting issue to study to date (Chakma & Dhir, 2023; De Matteis, Elia, & Del Vecchio, 2023; Olazo, 2023; Suzic & Forza, 2023; Verma et al., 2023; Zahoor et al., 2024), plays an important role in the country's economy (Li et al., 2016; Ng & Kee, 2017; Srimulyani et al., 2023; Wattanakomol & Silpcharu, 2023). The contribution of SMEs can be seen in increasing income, employment, and economic growth (Hill et al., 2002; Mittal & Raman, 2021; Restrepo-Morales et al., 2019; Sarwoko & Frisdiantara, 2016), and important contributors in most industries (Li et al., 2016; Ng & Kee, 2017).

The increasingly widespread digital technology has caused rapid and radical changes in business and society today (Scuotto et al., 2021), including SME businesses. Competition is increasingly competitive as a result of globalization and dynamic markets (Ahmad et al., 2022; Huang et al., 2022). The future of SMEs depends largely on their ability to meet customer expectations and remain competitive in the market (Moeuf et al., 2018). Society and business are asked to respond to new circumstances, through flexibility, speed, and adaptability (Ragazou et al., 2022). Krempl and Pace (2001) stated that not responding to technology/globalization can cause failure to achieve important goals.

The digital era provides a new paradigm in managing the SME industry (Moeuf et al., 2018), digital technology can be utilized by SMEs to manage their business operations effectively and provide unique value to their clients in both local and international markets (Teoh, Ahmad, Abdul- Halim, & Ramayah, 2022), affects business processes, operational routines, and company capabilities (Ragazou et al., 2022). However, SMEs face several important obstacles, including a lack of access to information regarding the latest technology (Kergroach, 2020), how to optimally align business strategy with digital technology as a consequence of the ongoing digital technology revolution (Li et al., 2016), limited capital, qualified workforce, and modern technology (Gentile-Lüdecke et al., 2020).

The ability to access and align business strategies with technology is no longer an option but is a key factor for the success and sustainability of SMEs (Bouwman et al., 2019). A previous study conducted by Zhang et al. (2022) revealed that limited resources, capabilities, and the digitalization process of SMEs were relatively slow, and literature discussing digital technology for SMEs was still very limited. Therefore, to fill this gap in the literature, this research aims to find the key factors for the success of digital technology in SMEs.

2. Literature Review

Small Medium Enterprises (SMEs) in Economic Development: Facts show that SMEs are the backbone of the national economy in many countries (London, 2010), playing an important role in the industry in developed and developing countries in today's global economy (Naradda Gamage et al., 2020). However, globally there has been no agreement on the definition of SMEs. Each country has a different definition of SMEs. The common explanation used to explain the classification of SMEs refers to financial size and number of employees (Melo et al., 2023). For example, South American countries such as Brazil require SMEs to have 20 – 249 permanent employees (Melo et al., 2023). In the United States, the criteria for SMEs are determined by the number of employees being less than 500 (U.S.Small, 2018). In Europe, SMEs are defined as businesses that employ less than 250 people and must have an annual turnover of up to EUR 50 million (Malesios et al., 2021). The criteria for SMEs in China are to have 300 – 1000 employees and have a sales turnover of 20 – 40 million Yuan. SMEs in Indonesia have criteria of less than 100 employees, Malaysia with criteria of 5 - 150 employees and an annual sales turnover of 250 - 25 million RM (Abe et al., 2015).

Several pieces of evidence have been revealed by previous researchers that SMEs make many contributions, such as contributing to 90% of business forms and providing employment for 60% of the world's workforce (Munro, 2013), are the most dynamic businesses in the global economy and play an important role in developing human well-being in any country (Naradda Gamage et al., 2020), contributing to poverty alleviation and sustainable economic growth (Asare et al., 2015; Ayyagari, Beck, & Demirguc-Kunt, 2007; St-Pierre et al., 2015; Helping to eradicate poverty, inequality and unemployment in rural areas, helping people with disabilities, women, families, uneducated people and rural communities to contribute (Fiseha & Oyelana, 2015; Stuart, 2011). SMEs realize sustainable development through inclusive economic growth (Fonseca & Carvalho, 2019). SMEs utilize many local resources (Asare et al., 2015).

Contribution to Digital Transformation on SMEs: Digital transformation is a big topic in scientific studies today (Dörr et al., 2023). The term digital transformation is different from the concept of digitization (Melo et al., 2023). Digitization according to Verhoef et al. (2021), is the activity of changing manual information into digital without adding value to the activity. Meanwhile, the terms digital transformation and digitalization are terms that are often used interchangeably and have meaning in broad concepts that affect an ecosystem (Bedell-Pearce, 2018; Reis et al., 2018).

Digital transformation has given rise to a new paradigm in running a business, building relationships with consumers, suppliers, and stakeholders, and encouraging business model innovation and customer value creation (Chatterjee, Chaudhuri, Vrontis, & Thrassou, 2022; Stich et al., 2020; Yang et al., 2023). Digitalization is very important for SMEs in carrying out their role in contributing to a country's economy (Chatterjee et al., 2022; Hadjielias et al., 2022).

Previous research has shown the role of digital transformation in helping SMEs. Some of them; such as providing solutions for SMEs affected by COVID by forming new digital networks with consumers (Ragazou et al., 2022), and helping SMEs to survive by building new business models (Bouwman et al., 2019). Digitalization creates important innovations in marketing and financial performance which are very beneficial for the sustainability of SMEs, especially during the COVID-19 pandemic crisis (Chatterjee et al., 2022; Hossain et al., 2022; Hulla et al., 2021). The results of research conducted by Moeuf et al (2018) by collecting several previous articles revealed that digital transformation in SMEs increases flexibility, reduces costs, increases productivity, improves quality, and shortens delivery times.

3. Research Methodology

To answer the objectives of this research, it collected data/articles related to the topic "Crucial factors influencing the success of SMEs in the Digital Transformation Era" using the Google Scholar database. This is done with the consideration that data/articles that are reputable and easily accessible are generally also indexed on Google Scholar. The search strategy carried out on Google Scholar is as follows:

Strategi Searching Google Scholar		
Keywords	"SMEs in Digital Transformation"	
First Searching	205.000 results	
Unchecked Citation	172.000 results

Table 4: Success Factors for Digital Transformation in SMEs

Discussion

The research findings indicate an increase in the number of articles from 2019 to 2024 related to the factors of success in digital technology adoption in SMEs (see Table 1). Furthermore, Table 2 reveals that articles on the research topic have been published by leading publishers such as Elsevier, MDPI, and Emerald, which are the top three publishers. Although this research topic has been explored in several countries, the number of published articles is relatively small, with most studies conducted in Asia and Europe (see Table 3). Table 4 highlights digital strategic planning, digital maturity, relationship capital, and collaboration with external digital innovation as the four key factors for successful digital transformation in SMEs. Based on these research findings, the contributions of this study are: First, expanding the study of SMEs, particularly about digital transformation; Second, according to the authors' knowledge, this is the first study that aggregates the success factors of digital technology adoption in SMEs.

5. Managerial Implications and Recommendations

This study provides valuable insights for SME practitioners to focus on the key factors in adopting digital technology to improve SME performance. Additionally, we recommend that future research should broaden its scope to include other countries in Asia and Europe, given the current limitations in the number of available articles. It is also important to empirically evaluate whether the findings of this study can be generalized across different countries.

Conclusion

The results of the research conducted grouped the success factors for digital transformation in SMEs into 9 groups, namely: digital maturity, relationship capital, digital strategic plan, commitment, top management involvement, educational background, collaboration with external digital innovation units, environmental factors, and adaptive and innovative mindset. Of the nine groups, four groups are important for SMEs to adopt for successful digital transformation in their businesses, namely; digital strategic plan, digital maturity, relationship capital, and collaborating with external digital innovation units. The results of this research also

show that 1) there is an increase in SME studies from 2019 -2024, 2) \pm 80% of the studies conducted by researchers were published in large publishers (Elsevier, Emerald, MDPI, and IEEE), and 3) studies have been carried out in many countries such as Asia and Europe.

The Influence of Pentagon Fraud on Fraudulent Financial Reporting in Companies Registered on the IDX BUMN20 Indonesia Stock Exchange for the 2020-2022 Period

*Indah Cahya Sagala, Devi Ayu Putri Sirait, Rut Nopiyanti Sitorus Accounting Study Programme, Faculty of Economic and Business, Universitas Medan Area, Indonesia *indahcahyasagala@staff.uma.ac.id, deviputrisrt@gmail.com, ruthnoviantysitorus23@gmail.com Corresponding Author: Indah Cahya Sagala

Abstract: Financial Statement Fraud is fraud or manipulation of a company's financial statements to show the best condition of the company so that investors are interested and/or retain the funds owned by the company. This research is intended to analyze the influence of the factors in the fraud Pentagon theory on fraudulent financial reports in companies listed on IDX BUMN20 on the Indonesia Stock Exchange for the 2020-2022 period. The proxy variables used in this research are Pressure proxied by Financial Target and External Pressure, Opportunity proxied by Ineffective Monitoring, Rationalization proxied by Change of Auditor, Competence proxied by Change of Director, and Arrogance proxied by Frequent Number of CEO's Picture and Fraudulent financial reporting measured by F-Score. The data used in this research is secondary data obtained from the annual reports of companies listed on IDX BUMN20 on the Indonesia Stock Exchange for the 2020-2022 period. The number of samples used was 18 samples from companies selected through the purposive sampling technique. The data analysis used in this research is logistic regression analysis. The research results show that the partial test results do not influence each of the independent variables, namely financial target, external pressure, ineffective morning, change of auditor, change of directors, and frequent number of CEO's pictures on fraudulent financial reporting, but the simultaneous test results show that there is an influence the entire independent variable to the dependent variable is fraudulent financial reporting.

Keywords: Fraud Pentagon Theory, Fraudulent Financial Reporting, Fraud

1. Introduction and Background

According to the Association of Certified Fraud Examiners (2020), Fraud is from an abusive position To get profit through abusive sources of Power or organizational assets. There is the most detrimental fraud in Indonesia corruption, abuse report finances, and misuse of assets or state and corporate wealth (ACFE, 2020). Meanwhile, fraud acts are reported in finance and are called fraudulent financial reporting. Fraud in report finance is the thing that can bring loss of goods from facet finance and non-financial. Fraud can happen anytime and anywhere, individually or in a group, too with place and time. Fraudulent financial reporting is an act that violates laws implemented by the company for several goals, for example, to maintain and improve a good image for the company, so that investors believe for do investment in the company. Fraudulent Financial Reporting is no Action ethical manipulating companies report finance with on purpose (Prischayani, 2020). Fraudulent Financial Reporting can happen in various countries, including Indonesia. According to the results Indonesian fraud survey in 2019, several Lembaga or organizations are harmed by fraud among them are state companies (BUMN), namely 31.8%, and the following chart institutions or Organizations most harmed by fraud

Government	48,5%
state-owned enterprise	31,8%
Private Companies	15,1%
Non-Profit Organization	2,9%
Others	1,7%

Figure 1: Type of Organization or the institution that is most disadvantaged because of fraud (ACFE, 2020)

Whereas type The industry most harmed by fraud is industry banking that is amounting to 41.4%. Following the chart type most industries are disadvantaged Because of fraud

	Financial and Barning industry	41,4%
	Covernment	\$33,9%
Mising industry		5,0%
Health Industry		4,2%
Manufacturing Industry		4,2%
Others industry		3,7%
Transportation Indusry		3,5%
Musing Industry		1,7%
Education Industry		1,7%
mospitality and tourism industry		1,3%
Fisheries and Marine Industry		0,8%

Figure 2: Types of industries that are most disadvantaged because of fraud (ACFE, 2020)

Industry banking is the most disadvantaged industry due to fraud, according to data on companies registered on IDX BUMN20 6 (six) companies banks are included in the list, which companies the is company large banking sector in Indonesia. The IDX BUMN20 indexed companies are 20 (twenty) state-owned companies whose shares have become share choices between other state-owned companies.

There have been fraud cases in Indonesia Lots happened, like cases at the company banking There is a case of Century Bank and Citibank Indonesia, companies flight like Garuda Indonesia. Although the government has arranged through regulations and laws regarding fraud, such actions still occur and fraud occurs the consequence function implementation of prevention and detection is Still not enough (Annisya & Asmaranti, 2016).

In Fraudulent Financial Reporting, 5 (five) assumptions are always made in every case. Assumptions the found in the Fraud Pentagon theory. The Pentagon Fraud Theory is a theory put forward by (Howarth, 2011), and a theory that is developed from theories previously namely the fraud triangle and fraud diamond. The assumptions in question in Pentagon fraud theory, namely opportunity (opportunity), pressure (pressure), rationalization (rationalization), competence (competence) and arrogance (arrogance). So, there are phenomena and problems the researcher is interested In fraud report research finances that occur in state-owned companies registered on IDX BUMN20.

2. Literature Review

Fraudulent Financial Reporting

Connection theory with this research is see factor pusher somebody do fraud, because someone who will decide something behavior certain own intention and consideration certain (Ajzen, 1991).

Theory of Planned Behavior

Connection theory with this research is to see factor pusher somebody do fraud because someone who will decide something behavior certain own intention and consideration certain. (Ajzen, 1991).

Agency Theory

Agency Theory is connecting theory between agents with stakeholders, where in practice often happen differences in interest between them so will give rise to agency problems (Jensen & Meckling, 1976). The connection between agency theory and this research is how management as agents gets pressure from

stakeholders to increase performance finances, so the pressure will impact accountants, because accountants There is under control by management, the possibility of the occurrence of fraud in reports finance will the bigger.

Pentagon Fraud Theory

Pentagon fraud theory is a theory expressed by Howarth (2011). This theory identifies factors that push somebody to commit acts of fraud. The elements of the Pentagon fraud are pressure, opportunity, rationalization, competence, and arrogance.

Figure 3: Pentagon Fraud Theory (Howarth, 2011)

Pressure (Pressure), according to SAS No.99 in element sign several types of conditions cause someone to carry out fraudulent actions, namely financial targets, financial stability, and external pressure.

Opportunities, according to SAS No.99, are conditions that create opportunities for fraud namely nature industry, ineffective morning, and organizational structure.

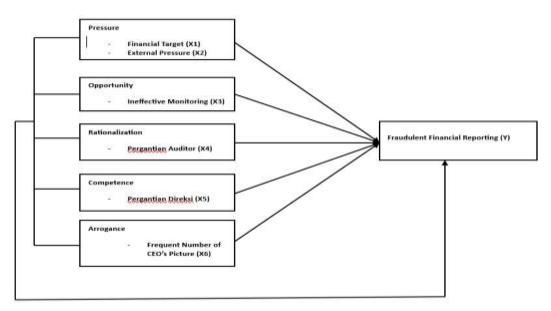

Rationalization, according to SAS No.99, rationalization be measured through changes in the auditor, the auditor's opinion, and also through the state of total accrual shared with the total assets company.

Competence (competence), this element is the ability of somebody to manipulate internal controls, creating strategies for profitability Alone (Howarth, 2011).

Arrogance (Arrogance), is the attitude of superiority of somebody. Elements of arrogance can be measured by the frequency emergence of CEO photos, the style of autocratic leadership, as well the existence of CEO duality (Yusof, 2016).

Development Hypothesis

Figure 4: Framework Draft (processed data,2024)

As for the formulation The hypothesis in this research is as follows:

H 1: Financial targets influence fraudulent financial reporting

H 2: External Pressure affects fraudulent financial reporting

H 3: Ineffective monitoring has an effect against fraudulent financial reporting

H 4: Change of external auditor influential against fraudulent financial reporting

H 5: Change of directors influential against fraudulent financial reporting

H 6: Frequent number of CEO's Picture is influential against fraudulent financial reporting

H7: Financial targets, External pressure, Ineffective monitoring, Change of auditor, Change of directors and

Frequent number of CEO's pictures are influential to fraudulent financial reporting.

3. Research Methodology

This research is a study method quantitative, to analyze the influence independent variable, namely Pentagon fraud against variable dependent namely fraudulent financial reporting. A deep sample of this research is reporting finances and reports annual BUMN companies indexed by IDX BUMN20 for 2020 to 2022. The method used is the purposive sampling method. 3 (Three) Criteria in the determination sample study First, the company listed on the IDX BUMN20 index for 2020-2022. Second, the company serves to report finances and reports annually in a way complete during 2020-2022, and third, companies that use Rupiah currency in reporting, so that the criteria measurement marks eye the money The same. So that can conclude this research uses a sample of as many as 17 companies for 3 years of observation. Deep data analysis This research uses analysis descriptive and analytical logistic regression i.e. consists of testing the feasibility of the regression model, testing the entire model, testing the significance of individual parameters (wald test), and using the SPSS application.

The following is a summary of the operational definitions and measurements of the independent and dependent variables in this research:

Variable Name	Scale	Measurement		
	Variable Dependent			
Fraudulent Financial Reporting	Nominal	Dummy variable, if F Score>1 is		
		coded 1, FScore<1 is coded		
		0(Agusputri & Sofie, 2019)		
	Independent Variable			
Financial Target	PRESSURE			
	Ratio	ROA = Net Profit/Total		
		Assets(Quraini, 2018)		
External Pressure	Ratio	Leverage = Total Debt/ Total		
		Assets(Bayagub et al., 2018)		
	OPPORTUNITY			
Ineffective Monitoring	Ratio	BDOUT = Number of Independen		
		Commissioners/Total Board of		
		Commissioners(Agustina &		
		Pratomo, 2019)		
	RATIONALIZATION			
Change of Auditor	Nominal	Dummy variable, number 1 if		
		there is a change in public		
		accounting firm, number 0 if		
		there is no change in public		
		accounting firm.(Agusputri &		
		Sofie, 2019)		
	COMPETENCE			

Table 1: Operational definitions and measurements

Change of Directors	Nominal	Dummy variable, number 1 changes directors, and 0 does not change directors(Agusputri & Sofie, 2019)
	ARROGANCE	
Frequent number of CEO's picture	Ratio	Frequent number of CEO's picture Ratio Total CEO photos in a company's annual report (Septriyani & Handayani, 2018)

4. Results

Analysis Statistics Descriptive

Table 1: Analysis Results Statistics Descriptive Amount company which has a risk of conducting Fraudulent Financial Reporting Fraudulent Financial Reporting

Fraudulent Financial Reporting				
Valid		Frequency	Valid Percent	
	Fscore <1	8	15.7	
	Fscore >1	43	84.3	
Carrier Jaka		024)		

Source: data processed by SPSS (2024)

Analysis results descriptive that shows score> 1 then the company own possibility risk carried out a high level of fraudulent financial reporting, whereas in Table 2 it was 84.3% of the total sample study is a company that owns the high risk of fraudulent financial reporting. Whereas If the score is <1 then the company's own possibility risk of low levels of fraudulent financial reporting, table 2 shows there are 15.7% who have low levels of fraudulent financial reporting.

Significance Test of Individual Parameters (Wald Test)

Tabel 2: Wald Test

		Wald	df	Sig.
	X1ROA	1,454	1	,228
	X2LEV	2,148	1	,143
	X3BDOUT	,057	1	,812
Step 1 ^a	X4CPA	,000	1	,999
	X5DCHANGE	,606	1	,436
	X6CEOPIC	1,629	1	,202
	Constant	3,203	1	,074
Source:	data processed	l by SPSS (2	2024)	

With the number of observations as many as (n=51) and the number of independent and dependent variables as many as (k=7), then the degree of freedom $(df) = n \cdot k = 51 \cdot 6 = 45$, where the level of significance $\alpha = 0.05$. The table can be calculated using the MS Excel formula with the insert function formula as follows:

t- table = TINV (Probability,deg_freedom)

t- table = TINV (0.05,45)

t- table = 2.014103

Based on Table 2, the results of hypothesis testing using logistic regression analysis can be obtained as follows: The first hypothesis (H1) is that Financial Target has a positive and significant effect on fraudulent financial reporting. The results of the Wald (t) test show that the t-count value is smaller than the t-table (1.454<2.0141)

and the probability value is greater than its significance level (0.228>0.05). Based on the test results, it can be concluded that the financial target states that it does not affect fraudulent financial reporting.

The second hypothesis (H2) is that External Pressure has a positive effect on fraudulent financial reporting. The results of the Wald test (t) show that the t-count value is smaller than the t-table (2.148 > 2.0141) and the probability value is greater than the significance level (0.143>0.05). Based on the test results, it can be concluded that external pressure does not affect fraudulent financial reporting.

The third hypothesis (H3) is that ineffective monitoring has a positive and significant effect on fraudulent financial reporting. The results of the Wald (t) test show that the t-count value is greater than the t-table (0.057<2.0141) and the probability value is smaller than the significance level (0.812>0.05). Based on the test results, it can be concluded that ineffective monitoring does not affect fraudulent financial reporting.

The fourth hypothesis (H4) is that the change of external auditors has a positive effect on fraudulent financial reporting. The results of the Wald (t) test show that the t-count value is greater than the t-table (0.000<2.0141) and the probability value is smaller than the significance level (0.999>0.05). Based on the test results, it can be concluded that the change of external auditors states that it does not affect fraudulent financial reporting.

The fifth hypothesis (H5) is that the change of directors has a positive and significant effect on fraudulent financial reporting. The results of the Wald (t) test show that the t-count value is greater than the t-table (0.606<2.0141) and the probability value is smaller than the significance level (0.436>0.05). Based on the test results, it can be concluded that a change of directors states that it does not affect fraudulent financial reporting. The sixth hypothesis (H6) is that the change of directors has a positive and significant effect on fraudulent financial reporting. The results of the Wald (t) test show that the t-count value is greater than the t-table (0.606<2.0141) and the probability value is smaller than the significance level (0.436>0.05). Based on the test results, it can be concluded that a change of directors states that it does not affect fraudulent financial reporting.

Simultaneous Significance Test (Omnibus Test)

		Chi-square	df		Sig.
	Step	13,572		6	,035
Step 1	Block	13,572		6	,035
	Model	13,572		6	,035

Table 3: Omnibus Test Results

Source: data processed by SPSS (2024)

With the number of observations as many as (n=51) and the number of independent and dependent variables as many as (k=7), then the degree of freedom (df1) = k-1 = 7-1 = 6 and (df2) = n-k = 51-6 = 45, where the level of significance $\alpha = 0.05$. Then F table can be calculated using the MS Excel formula with the insert function formula as follows:

F Tabel = FINV (Probability, deg_freedom1, deg_freedom2) F tabel = FINV (0.05,6.45) F tabel = 2.308273

Based on the table, the F count value can be obtained greater than the F table (13.572> 2.308273) with a significance level (0.03 <0.05), then H7 is accepted. Based on the table above, financial targets, external pressure, ineffective monitoring, Changes in auditors And directors, and the frequency of CEO pictures have a simultaneous effect on fraudulent financial reporting.

Discussion

The influence of financial targets on fraudulent financial reporting

Test result hypothesis (H1) shows that the pressure element is the proxied financial target through ROA value that is not influential against fraudulent financial reporting. These results are in agreement with research

conducted by (Sari & Sukirman, 2013) and (Henny et al., 2015) which shows that financial stability is not influential to fraud report finance.

The influence of external pressure on fraudulent financial reporting

Test result hypothesis (H2) shows that The pressure element is the external pressure that is proxied through leverage not influential against fraudulent financial reporting. These results are in agreement with research conducted by conducted by (Farmashinta & Yudowati, 2019), (Aprilia, 2017)and(Ulfah et al., 2017)

The Effect of Ineffective Monitoring on Fraudulent Financial Reporting

Test result hypothesis (H3) shows that The Opportunity element is proxied to ineffective monitoring with BDOUT no influential against Fraudulent Financial Reporting. These results are supportive of research conducted by (Irfan, 2022) and (Damayani et al., 2017).

Influence Change of External Auditor against Fraudulent Financial Reporting

Testing hypothesis (H4) shows that elements of Rationalization namely change of external auditor No influence against Fraudulent Financial Reporting. These results are in agreement with research conducted by (Damayani et al., 2017), (Quraini, 2018), and (Warsidi, 2018).

Influence Substitution Directors against Fraudulent Financial Reporting

Hypothesis test results (H5) via Wald test show that elements of competence, namely replacement directors Not influential against Fraudulent Financial Reporting. These results are in agreement with research conducted by (Quraini, 2018), (Irfan, 2022), and (Farmashinta & Yudowati, 2019).

The Influence of Frequent Number of CEO's Pictures on Fraudulent Financial Reporting

Test result hypothesis (H6) shows that Arrogance elements are measured with a Frequent Number of CEO pictures with no influence against Fraudulent Financial Reporting. These results are consistent with research conducted by (Agusputri & Sofie, 2019)and (Farmashinta & Yudowati, 2019).

Influence Financial targets, External pressure, Ineffective monitoring, Change of auditor, Replacement directors, and a Frequent number of CEO's pictures against fraudulent financial reporting.

Testing This hypothesis (H7) shows that in a way simultaneous Financial targets, External pressure, Ineffective monitoring, Change of auditor, Replacement directors, and Frequent number of CEO pictures are influential to fraudulent financial reporting. This concludes that if all over variable the done by someone the bigger indication of the occurrence of fraudulent financial reporting. This is also visible from coefficient test results in a way regression (Cox & Snell R Square and Nagelkerke R Square) i.e. of 0.568. That figure can be interpreted together as the independent variable is 56.8% influencing fraudulent financial reporting, meanwhile, the rest amounting to 43.2% was influenced by other variables not used in this research.

5. Managerial Implications and Recommendations

The results of this study indicate that if the independent variables are tested together against the dependent variable, it shows that there is an influence. So in this case, the researcher concludes that if a financial report fraud is not only influenced by one factor, but many factors can influence the occurrence of fraudulent financial reporting. So company management needs to carry out periodic monitoring and evaluation so that no gap for fraud can harm the company.

Conclusion

Research results show that No there is the influence of each variable independent to variable dependent If tested in a way partial, but when carried out tests Simultaneously, all variables independent namely financial targets, external pressure, ineffective monitoring, changing auditors, turnover directors, and frequent number CEO's picture can influence variable dependent fraudulent financial reporting. So you can conclude that Pentagon fraud can affect fraudulent financial reporting if all elements In the Pentagon, fraud is carried out on a massive scale somewhere company.

Factors Affecting the Intention to Receive Future COVID-19 Booster Vaccines in East Coast States in Malaysia

Che Nur Asmani Amira Che Mohd Nawi, Che Nur Asmani Amirah Che Mohd Nawi, *Zuhal Hussein Faculty of Business and Administration, Universiti Teknologi MARA Kelantan Branch, Malaysia 2021472434@student.uitm.edu.my, 2021243656@student.uitm.edu.my, *zuhal@uitm.edu.my Corresponding Author: Zuhal Hussein

Abstract: This conceptual paper is presented to study the factors affecting the intention to receive future COVID-19 booster vaccines in three East Coast states in Malaysia, which has become a concern to the government and health system in the country. It begins by reviewing the literature on associated factors and intentions against the booster vaccination. The Theory of Planned Behavior is used as the basis of the study. This study is driven by the low vaccination rates in Kelantan, Terengganu, and Pahang. Past studies have discussed the acceptance of COVID-19 vaccination in the country, but very few focus on these states. Due to the limited findings on the issues, this study, therefore, attempts to explore the factors influencing vaccination intention using a quantitative method. The survey distribution and data collection focus on the three states' residents. The findings are believed to be able to provide new insight and knowledge, especially to the healthcare providers and government to increase the vaccination rates in these states and prevent the severity of COVID-19 comeback.

Keywords: COVID-19, Booster, Intention, east-coast states, Malaysia

1. Introduction and Background

A severe respiratory disease called COVID-19 or Coronavirus disease has marked the world with an unforgotten memory where more than 300 million infected people and exceeded 6 million deaths have been recorded all over the world due to the rapid spreading and fatal infections (WHO, 2022). The disease pandemic not only affected psychological and physical health but also forced and drastically changed people's lives financially and socially including education and occupation (Yahaghi, et al., 2021). During the pandemic, vaccination against the virus was believed as the most effective approach to combating COVID-19 (Fan, et al., 2021). The development of the COVID-19 vaccine in a relatively short period and the administration for the masses around the world was proven to effectively help stop the spreading of the virus, slow down the transmission, and ultimately end the spreading through herd immunity (Duong & Antriyandarti, 2022).

The arrival of a new COVID-19 variant, a sub-variant of Omicron from China in late 2021 has led to the need for the third COVID-19 vaccine dose to previously vaccinated individuals. According to Thye et al. (2021), the administration of the booster dose was believed due to the wane of immunity and the weakening of protection provided by previous vaccines where the third dose is needed to boost immunity, restore the levels of antibodies and increase protection to the people for longer-term protection against the COVID-19. As per Wong et al. (2022), the COVID-19 vaccine booster was demonstrated to boost immunity and to have tolerable side-effect profiles. In mid-October 2021, Malaysia administered their booster vaccination to all vaccinated citizens, and by April 2024 more than 16 million people received at least their first booster dose.

World Health Organization (WHO) refers COVID-19 vaccine as a vaccine that can stimulate the immune system in the body in the instance of exposure to the virus and enables the body to react against COVID-19 infections. It is reported, that until December 2023, 13.64 billion doses of vaccines have been administered and 67% of the global population has been fully vaccinated (WHO, 2022). Malaysia, the National Vaccination program since the early 1950s and over the years has administered vaccines to protect people from vaccine-preventable diseases such as DTP (anti-diphtheria, tetanus, and pertussis vaccine) and BCG vaccine against tuberculosis (Khoo et al., 2020). The Malaysian National COVID-19 Immunisation Programme (NIP) was launched to curb the pandemic and aims to make sure that at least 80% of the adult population has been vaccinated by February 2022 by giving free vaccination to the people. Until August 2024, more than 27 million people (84.4%) had received the two doses of the primary series, and 16 million received their first booster dose. The success of the COVID-19 vaccine administration led the country to shift to the endemic phase from April 1, 2022, however, in recent years, the vaccination rate has shown a downward trend after the first dose, especially for first and

second booster doses (KKM, 2024). The World Health Organization declared that COVID-19 is not over, but it is circulating and, in some countries, the cases are on the rise again (WHO, 2022). Therefore, individuals need to be protected with at least two doses, and the booster dose is important to fight against the new variants.

There has been a great concern lingering on the people's attention especially around Kota Bharu to control and to create herd immunity in the population. Studies conducted from 2019 to 2022 in Malaysia reported a high intention to receive the primary COVID-19 vaccines between 83.3% to 94.3% (Alam et al., 2021; Wong, et al., 2022). Until March 2024, more than 27 million citizens received the primary vaccine. However, the COVID-19 vaccination rate among the people began to drop after the primary doses. Wong, et al., (2022) revealed that only 48.2% have the intent to receive the booster dose in the country. According to KKMNow, an official portal of the Ministry of Health reported that even after three years since the administration of the third dose, only 16 million people received the first booster and less than 1 million received the second boose dose. In addition, among 14 states in Malaysia, the east-coast states which are Kelantan, Terengganu, and Pahang are among the lowest vaccination rates in the country. As of 26 August 2023, Kelantan, Terengganu, and Pahang recorded only 17.8%, 28.3%, and 37.7% respectively for the first booster dose, whereby this percentage value is still comparatively low and far below the rate of global acceptance, which ranges from 54.8% to 88.6% (Jafar, et al., 2022).

The main focus of this study is to enlarge a literature review of factors affecting the intention to receive future COVID-19 booster vaccines in East Coast states in Malaysia. Through carrying out this study, the gap from the existing research can be filled by providing an extension of knowledge for the scanty number of studies on the intention to receive the future COVID-19 booster vaccine in east-coast states in the country. Most previous studies have explored the primary vaccine intention; however, it is essential to provide insight into this future booster dose according to the recent situation. In addition, it should be noted from the existing literature review, however, to the best of the author's knowledge, the local studies have not given great attention to utilizing the Theory of Planned Behaviour to understand these factors (attitude, vaccine knowledge, vaccine hesitancy, subjective norms, and perceived behavioral control) affecting the vaccination intention and this has motivated the present study.

2. Literature Review

Vaccine knowledge: Vaccine knowledge is defined as "detailed information regarding vaccine and immunization" (Voo, et al., 2021). People with adequate knowledge about in particular vaccine can better understand the vaccine's potential, advantages and importance, and this will lead to creating a positive belief about the vaccine at the same time increase trust in vaccination (Zheng et al., 2022). Zheng et al. (2022) also suggested that individual health knowledge and information serve as a significant foundation for the intention to perform health-related behavior such as vaccination. This is because, an individual with adequate knowledge of a certain vaccine can help to understand the vaccine's potential, benefits, and importance to create positive beliefs as well as to strengthen vaccination trust. Mohamed et al. (2021) in his study discovered that low educational background, source of information from peer members, and poor socioeconomic status are the factors contributing to poor understanding of the COVID-19 vaccine among Malaysians. Consistent findings from the research have shown that vaccine knowledge plays an essential role in the intention to get vaccinated for the COVID-19 vaccine (Asmare, et al., 2021; Fan, et al., 2021).

H1: There is a relationship between vaccine knowledge and intention to receive future COVID-19 booster vaccines in East-Coast states in Malaysia

Vaccine Hesitancy: Vaccine hesitancy is a common global phenomenon and is listed as one of the top ten threats to world health by WHO (WHO, 2022). In this paper, the term vaccine hesitancy is referred to as "delay in acceptance or refusal of vaccine regardless of the accessibility of vaccination services" (WHO, 2022). Farhart et al. (2022) further extended the term by suggesting that vaccine hesitancy includes those who receive a few vaccines, however, are still doubt their safety, importance, and effectiveness following the vaccination. Several studies have investigated vaccine hesitancy among Malaysians and have shown inconsistent and contradictory research findings. For example, research by Jian Ng et al. (2022) and Chan, et al. (2022) who explored the COVID-19 vaccine hesitancy found that Malaysian younger age groups are less inclined and hesitant to get vaccinated. In contrast, the study by Wong, et al. (2022) indicated that younger participants demonstrated a

higher acceptance of COVID-19 vaccine booster. Several studies have also consistently associated side effects, attitude, and knowledge can affect the intention to get vaccinated for the COVID-19 vaccine (Geers, et al., 2022; Voo, et al., 2021; Wong, et al., 2022). Vaccine hesitancy is revealed as the factor to reduce the intentions and shape negative attitudes toward COVID-19 vaccination (Lee et al., 2022).

H2: There is a relationship between vaccine hesitancy and intention to receive future COVID-19 booster vaccines in East-Coast states in Malaysia

Attitude: Attitude is defined as the person's attitude towards behavior and represents whether opinions about the behavior are favorable or unfavorable (Servidio, et al., 2022). In this paper, an attitude refers to an individual judgment whether getting COVID-19 vaccinated is positive or negative (Yahaghi, et al., 2021). Positive associations between attitude and intention to get vaccinated have been highlighted in several past studies. For instance, Asmare et al. (2021) in current studied the behavioral intention and its predictors toward COVID-19 vaccination in Ethiopia and concluded that attitude was significantly associated with intention to receive a vaccine, as people cultivate a positive attitude toward the vaccine, they may have great intent to accept it. Similarly, a systematic review and meta-analysis study in predicting vaccination intention against COVID-19 discovered that 92.68% of studies reported people's attitude toward COVID-19 vaccination was the most frequent TPB construct influencing vaccination intention (Limbu, Gautam, & Zhou, 2022).

H3: There is a relationship between attitude and intention to receive future COVID-19 booster vaccine in East-Coast states in Malaysia

Subjective norms: Subjective norm is the second most salient determinant of intention and drives to perform the behavior of interest (Khayyam, et al., 2022). In general, subjective norms are people's belief of what significant social others think about his/her engaging in a particular behavior, and whether or not they consider it acceptable (Husain et al., 2021). In this present paper, subjective norm (SN) refers to the extent to which people's willingness to receive the COVID-19 vaccine is influenced by whether their significant social others (i.e., friends, family, doctors) agree of them receiving the vaccine or not (Barattucci, et al., 2022). Regarding immunization in recent years, Jian Ng et al. (2022) suggested that social influence, where an individual's perception that those closest to them (friends, family, and members) think they should get vaccinated, can help to increase the intention to vaccinate. According to Mohamad Ismail et al. (2023), some of the most influential societal forces supporting vaccination are members of the short and long-term social networks as well as medical professionals. Alshurman et al. (2021) stated that, from the studies done, the findings consistently agreed that personal recommendations from close ones are the most efficient in convincing people to get vaccinated against COVID-19.

H4: There is a relationship between subjective norms and intention to receive future COVID-19 booster vaccine in East-Coast states in Malaysia

Perceived Behavioural Control: Perceived behavioral control means "the perceived easiness or ability to execute the desired behavior', where when a person has a high level of perceived behavioral control, hence the person will put a great effort into performing the intended behavior (Khayyam, et al., 2022). In the present study, perceived behavioral control would refer to "whether an individual perception of the difficulty or ease to get the vaccine" (Bowyer et al., 2014). Therefore, in other words, it could be understood that the probability of a person performing a particular behavior is higher when he or she has more control over the resources and opportunities (Ajzen, 1991). In real practice, however not all behaviors can be controlled by a person's will, instead, the person will be affected by their external objective environment or other resource constraints. In this study, for instance, the residents in east-coast peninsular may not be vaccinated due to the fear of the side effects from the vaccination. As per Yang et al. (2022) time, cost, and side effects from vaccinations can be reflected in an individual's perceived behavioral control towards receiving the vaccination.

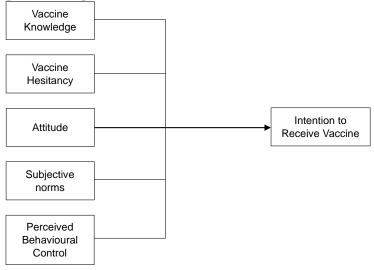

H5: There is a relationship between perceived behavioral control and intention to receive future COVID-19 booster vaccine in East-Coast states in Malaysia

3. Research Methodology

Conceptual Framework

The conceptual framework of the study is constructed as below:

Figure 1: Proposed conceptual framework

Sample

This study focuses on residents of East-Coast states in Malaysia including Kelantan, Terengganu, and Pahang. The target participants are those residents who are currently in the three states, aged 18 years and above and have completed two primary COVID-19 vaccinations. This study will employ a snowball sampling technique to identify and reach the targeted respondents for this study.

Measurement

The present study uses a set of validated self-administered questionnaires that were constructed based on related previous studies for data collection and to measure all variables to be tested in this study. The development of the items is by adopting and modifying existing questions to fit with the purpose of the current study identified from selected literature. The questionnaire consists of six sections, each section for each of the variables to be measured, and one section for socio-demographic profile. All questions for the independent variables will be measured by using a Five-point Likert scale where, 1= strongly disagree, 2= disagree, 3= neutral, 4= agree, and 5= strongly agree. Before boosting the survey, the researcher will conduct a pilot test to check the reliability of the instruments. The questionnaire will be distributed by using convenience sampling and prior data will be collected for analysis. The data collection is important to ensure the reliability of the instruments and method used before the actual research can be conducted.

4. Discussion

This study aims to explore the intention to receive future COVID-19 vaccine booster doses of three East Coast state residents in Malaysia who had completed two primary vaccinations required by the government and to identify the factors that potentially influence the intention. Studies from 2019 until 2022 among the Malaysian general and adult populations reported a high intention for former COVID-19 vaccinations between 83.3% to 94.3% (Wong, et al., 2022). For the booster vaccination, studies by Rajakumar et al. (2023), Khoo, et al. (2024), and Hwang et al. (2024) reported the acceptance rate for the booster vaccination from 55% to 87.6% among people. However, the number of COVID-19 vaccinations among the public began to drop after the second dose of vaccines. As of August 2024, the Ministry of Health of Malaysia, MOH reported the country has reached an 86.2% vaccination rate for the first dose, and 84.4% for the second dose as of August 2024. However, the booster dose uptakes remain relatively lower at 50.1% for the first booster dose and 2.5% for the second booster dose even after almost 3 years since the administration. Data from the official Ministry of Health portal report that three east-coast states recorded the lowest booster vaccination rates with below 40% and 2% for first and second booster doses (KKM, 2024). Shien Teh, et al. (2022) in his study also showed that the east peninsular states (Kelantan, Terengganu, and Pahang) had lower vaccination progress than the rest below 80%. Several factors were associated with influencing the COVID-19 vaccination intention in the country including knowledge, vaccine hesitancy, attitude, influential societal forces, and self-control.

5. Managerial Implications and Recommendations

Years passed by since the unforgotten hit from the COVID-19 pandemic, and the effects of the disease on the individual, society, and economy gradually treated to new norms. Although without the announcements and news regarding the current cases, infections, updates and urges to take vaccination against COVID-19 from the government, the virus is still there, living in the epidemic. According to the official COVID-19 portal of the Ministry of Health (MOH), KKMNow, there is an increase in local cases, with more than 50 confirmed daily cases recorded around the country. However, states on the east peninsular (Pahang, Terengganu and Pahang) had lower vaccination progress compared to other states. Even though full vaccination and boosters have successfully stopped the infections, prevented death and reduced the severity, the country has yet to achieve a full population vaccinated and protected to face the comeback of this virus. Therefore, it is vital for the government specifically to keep reminding and administering this vaccination from time to time. The findings from this study can help the government and healthcare providers to identify factors that contribute to the low vaccination intention among the eastern peninsular states residents to tackle the barriers and create better policies and regulations for COVID-19 vaccination. The implication of this study of the theory of planned behavior, this theory can provide a clear insight into the analysis of the attitude, influences of others, and selfcontrol of the residents toward the vaccination. Other than that, the data findings from this study can also contribute academically to the scholars for future research.

Conclusion

The objective of this paper was to assess the intention to receive future COVID-19 vaccine booster doses from three East Coast state residents in Malaysia who had completed the primary vaccination required by the government and to identify the factors that potentially influence the intention. This study chooses to explore the booster vaccine intention due to the low performance of vaccination rates in Malaysia, especially in the three east-coast states (Pahang, Terengganu, and Kelantan). According to previous research, the acceptance rate of the COVID-19 vaccine among Malaysians was high, however, the study may be in general and yet focus on the concerned states with low vaccination rates. This study, therefore, attempts to investigate the behavior, intention, and related factors that contribute to this situation, and to assist the government and related agencies to plan better vaccination campaigns to overcome this issue.

Exploring Factors Contributing Towards Purchase Intention of Yogyakarta's Fashion Goods via Digital Marketing

*Farahiyah Inarah Putri, Rosita Mohd. Tajuddin

Post-Graduate Studies, College of Creative Arts Universiti Teknologi MARA, Shah Alam, Selangor, Malaysia *farah0605@gmail.com, rositatajuddin@uitm.edu.my Corresponding Author: Farahiyah Inarah Putri

Abstract: To remain competitive in the VUCA era, Micro, Small, and Medium Enterprises (MSMEs) in Yogyakarta need to strengthen their digital sales strategies to reach a broader customer base. This research investigates the factors influencing local consumers' purchase intentions towards Yogyakarta's products through digital marketing. Grounded in the Theory of Planned Behavior and the Digital Marketing Mix model, data was collected via Google Forms using snowball sampling. The pilot test showed strong reliability (Cronbach's alpha = .97). Exploratory Factor Analysis (EFA) identified six key factors from 47 items: Digital Marketing Mix (28 items; loadings 0.794-0.934), Consumer Engagement (7 items; loadings 0.779-0.856), Perceived Behavioral Control (3 items; loadings 0.905-0.924), Attitude (3 items; loadings 0.858-0.886), Purchase Intention (3 items; loadings 0.847–0.884), and Subjective Norm (3 items; loadings 0.840–0.907). The findings confirmed the scales' reliability and highlighted the impact of digital marketing on consumers' purchase intentions. This study suggests that the Theory of Planned Behavior and Digital Marketing Mix are influential in assessing purchase intentions for Yogyakarta's fashion goods, providing insights applicable to the broader Indonesian market. Based on these findings, MSMEs in Yogyakarta should develop effective digital marketing strategies, optimizing their marketing mix to positively influence consumer purchase intentions. This is crucial for adapting to rapid technological changes that may alter consumer behavior and for ensuring business sustainability.

Keywords: Digital Marketing, Purchase Intention, Local Product, Exploratory Factor Analysis

1. Introduction and Background

A sustainability strategy needs to be carried out in a fluctuating and unpredictable global situation that causes volatility, uncertainty, complexity and ambiguity in the global economy, known as the acronym VUCA. Currently, we have entered the VUCA era, where change occurs very quickly, and these changes can create chaos in a system if the people managing it do not innovate in more creative ways (Alwi, 2018). This lack of clarity impacts the challenges of changing consumer behavior, disruptions in every sector, and a rise in competitors that are hard to predict. Tourism is one of the sectors currently facing significant uncertainty, having been greatly impacted by the COVID-19 pandemic since 2020. As an unpredictable global situation, the pandemic has caused the tourism industry to suffer the most, with widespread disruptions and challenges. This situation resulted in a large decrease in foreign tourists who made massive cancellations and local tourists who also experienced a decrease in bookings due to COVID-19 (Bahtiar & Saragih, 2020).

The decline in the tourism sector creates a ripple or multiplier effect, significantly impacting the purchasing power of local product sectors, which are primarily dominated by MSMEs. For example, in Yogyakarta, one of the regions whose economy is supported by the tourism sector, 20 thousand MSMEs in Yogyakarta's tourism and creative economy sectors have been affected, and some have even gone bankrupt (Wicaksono, 2021). Despite the challenges, tourism remains a labor-intensive sector, employing over 13 million workers (Sugihamretha, 2020). Therefore, during a pandemic that has an impact on reducing the number of tourists, MSMEs experience much pressure because their products are not selling well in the market, especially products that are less desirable during a pandemic, such as fashion, handicrafts, and the services sector (Tatik, 2021). However, the fashion sector is one of Yogyakarta's three most popular products. There are three products of micro and small businesses that produce local priority products of the Yogyakarta Government, which are food, craft, and fashion (Wicaksono, 2021). Fashion products are a priority in Yogyakarta because of the large number of MSMEs and batik artisans, so Yogyakarta is known as a city of batik. Fast decision-making is very important in setting the direction and goals of the company in an adaptable situation (Ritter & Pedersen, 2020).

The use of information technology in all fields has grown rapidly. Digitalization in a business is increasingly needed because consumers can make orders and purchases without limitation of place and time, being responsive to the latest information (Xiaohui, 2014). Business expansion has become more flexible, reaching a wider target market, cheaper and more interactive promotional media, clarity of operational cost transparency, digitization of products/services, and streamlining of distribution systems (Li & Hong, 2013). The high number of the internet and technology usage not only affects business activities with more efficient and effective marketing activities but can also affect customer behavior which has an impact on purchasing intention (Indahingwati et al., 2019)

2. Literature Review

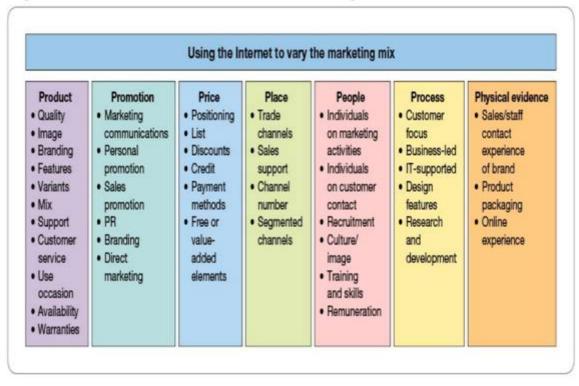

The situation during the pandemic made MSMEs experience a lot of pressure because their production did not sell well in the market, especially products that were less interested in the pandemic, such as the fashion, handicraft and service sectors (Ginting, 2021). So many MSMEs have switched to selling food products that are more desirable for consumers to survive (Ginting, 2021). The pandemic is the worst effect after the economic crisis in 2008-2009 and in the future, we cannot predict what the world economy will be like (Setiawan, 2020). Strategies and innovations that must be carried out in this situation are through digital transformation because local brands can reach more markets and attract new customers (Reichstein & Harting, 2018). if you are unable to keep up with the times and the market, it will certainly cause you to be left behind. Changes in customer behavior are important to respond quickly and be implemented in operational activities. However, adaptation to the digital market towards digital transformation in MSMEs has problems because only 17% of the total MSMEs have known technology to develop their business activities (Suyanto, 2020). On average, MSMEs in Indonesia come from the older generation, which finds it difficult to adapt to technology. (Faqir, 2021). Therefore, it is crucial to have a special study regarding the sustainability strategy in the cultural product fashion sector. The products in this sector contribute greatly to maintaining and preserving culture, especially in Yogyakarta which is a city of culture

Several previous studies have explored the relationship between the marketing mix and purchase intention across various industries and regions. For instance, research titles such as "The Effect of Marketing Mix Perception on the Intention of Online Merchant Financing (Karambut, 2021)," "Digital Marketing in Mexico: Exploratory Study of the Marketing Mix of SMEs with Trust Seal (Leefmans 2016)," "Assessment of Marketing Mix Associated with Customer Purchase Intention of Dairy Products in Bangladesh: Application of an Extended Theory of Planned Behavior (Farid, 2023)," and "Factor Marketing Mix on Purchase Intention: An Empirical Research in the Fashion Industry, Mojokerto Regency, East Java, Indonesia (Iqbal, 2023)," have investigated these aspects. However, a significant research gap remains. These studies have not focused on cultural fashion products and have continued to employ traditional marketing mix frameworks, such as 4Ps and 5Ps, without incorporating the digital marketing mix. This study aims to bridge this gap by applying more contemporary theories and frameworks, which will be discussed in the following sections.

Digital Marketing Mix on Purchase Intention The marketing mix is one of the elements used by marketers to promote their products and build consumers' purchase intention (Sulistijono & Kadarisman 2019). Initially proposed by Jerome McCarthy in 1960, the marketing mix was divided into Product, Price, Place, and Promotion, commonly known as the 4Ps. However, as the market environment evolved, particularly with the rise of the service industry, there was a need to expand this framework to accommodate the growing importance of customer-centric strategies. In the 1981s, Booms and Bitner added three more elements—People, Process, and Physical Evidence-expanding the marketing mix to the 7Ps. This expansion recognized that the interactions between consumers and service providers, the processes through which services are delivered, and the tangible aspects of a service experience are crucial to building strong customer relationships and driving purchase intentions.

In the context of today's rapidly changing digital landscape, the traditional marketing mix has further evolved to include digital elements, leading to what is now referred to as the digital marketing mix. This strategy is crucial for businesses aiming to remain competitive in an increasingly online market. Digital marketing mix strategies involve the integration of traditional marketing principles with digital channels, tools, and techniques. This includes leveraging social media, search engines, email marketing, and other online platforms

to reach a broader audience and engage consumers more effectively. As Chaffey and Chadwick (2019) highlight, continuously updating and evaluating the digital marketing mix is essential for businesses to capitalize on new opportunities presented by the internet, such as real-time customer feedback, personalized marketing, and the introduction of new product variations tailored to specific online markets.

Theory of Planned Behaviour on Purchase Intention The Theory of Planned Behavior (TPB) is an extension of the Theory of Reasoned Action (TRA), developed by Fishbein and Ajzen in 1975, to better explain behaviors over which individuals do not have complete control. Introduced by Ajzen in 1991, TPB highlights that the most immediate predictor of a person's actual behavior is their intention to perform it. This intention is influenced by three key factors: attitude, subjective norms, and perceived behavioral control. Attitude, or personal factors, refers to the individual's positive or negative assessment of performing the behavior, influenced by beliefs about its possible outcomes. Subjective norms, the social factors, consider the perceived social pressure from significant others, like family and friends, to either engage in or avoid the behavior. When an individual believes that important people in their life expect them to perform a certain behavior, they are more likely to form a stronger intention to do so. Perceived behavioral control, on the other hand, relates to the individual's perception of their capability to perform the behavior, taking into account the resources, opportunities, and potential obstacles they may encounter. The greater the perceived control, the stronger the intention to act. While intention is the primary predictor, TPB also recognizes that actual behavior may still be influenced by factors beyond the individual's control. In the context of consumer behavior, Kotler and Keller (2016) link these concepts to purchase intentions, defining it as the consumer's inclination to buy a product based on their experiences, usage, and preferences. The TPB framework helps explain how attitudes toward a product, social influences, and the perceived ease of purchase collectively shape a consumer's intention to buy.

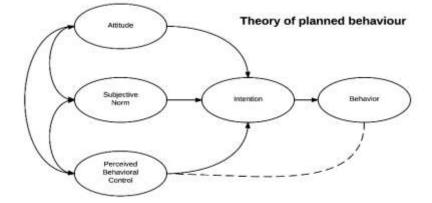

Figure 1: The Framework of Theory Planned Behaviour (Ajzen, 1991)

Consumer Engagement on Purchase Intention Consumer engagement is a relatively new concept in marketing that evaluates how consumers get involved in social activities related to cognitive, emotional, and behavioral aspects, which they perceive positively (Hollebeek et al., 2014). Cognitive engagement refers to the focus and mental effort consumers put into a particular topic, including their attention and deep understanding. Affective or emotional engagement relates to how consumers actively demonstrate their involvement, such as by sharing information, learning more, or recommending products to others (Istanto & Salsabila, 2022). Therefore, consumer engagement can be divided into seven sub-dimensions: Enjoyment, Enthusiasm, Attention, Absorption, Learning, Endorsing, and Sharing (Dessart et al., 2015). By understanding these seven aspects, MSMEs can develop more effective strategies to engage consumers and enhance their loyalty to the products or services offered.

3. Research Methodology

Sample and Procedure The data collection method used was quantitative. To validate the scale, a pilot survey of 60 respondents was conducted. The survey results conducted by the tourism department of the Special Region of Yogyakarta in (2021) showed that the highest number of domestic tourists visiting Yogyakarta came from Jakarta, Bogor, Depok, Tangerang, and Bekasi, collectively known as the JABODETABEK area. From these results, it was determined that only residents of the JABODETABEK area who had visited Yogyakarta and had made online purchases were eligible to participate as samples. Furthermore, residents of the JABODETABEK area were considered suitable as samples because they were highly capable of making online purchases, especially for fashion products (Hasibuan, 2020). Given the expansive nature of the sample population, a snowball sampling technique was employed to effectively reach and recruit participants. This technique allowed the study to leverage existing social networks, whereby initial respondents helped to identify and invite further participants within the target demographic. The measurement instrument used in this research was self-designed, initially formulated in English, and subsequently translated into Bahasa Indonesia to ensure clarity and cultural relevance for the final distribution. The questionnaire featured closed-ended questions, utilizing a Likert scale ranging from 1 ('Strongly disagree') to 5 ('Strongly agree'). In addition to the core research variables, demographic information was collected, encompassing gender, age, education, income, marital status, ethnicity, employment background, and living area. Participants were asked to select the most appropriate options to provide a comprehensive overview of their demographic profiles.

The self-developed measures included four (6) main variables based on digital marketing mix theory, consumer engagement theory, and Theory of planned behavior divided into four variables: attitude, subjective norm, perceived behavior control, and purchase intention. The six variables consisted of (28) items on digital marketing mix, (7) items on consumer engagement, (3) items on Perceived Behavior Control, (3) items on attitude, (3) items on Purchase Intention, and (3) items on Subjective Norm. The data were quantitatively analyzed using the Statistical Package for Social Sciences (SPSS) Version 25. To validate the self-developed measures, various analyses were conducted, including Exploratory Factor Analysis and Reliability Analysis.

4. Results

Exploratory Factor Analysis (EFA) is a statistical technique used to identify the underlying relationships between measured variables and to determine the number of factors needed to explain the data (Hair et al., 2010). In this study, EFA was employed to understand the structure of the data and identify the distinct factors that represent the key dimensions of the research. During this process, all measurable variables were linked to specific factors through the estimation of loading factors, which reflect the correlation between each variable and its corresponding factor. The EFA in this study resulted in six distinct factors: Digital Marketing Mix, Consumer Engagement, Perceived Behavioral Control, Attitude, Purchase Intention, and Subjective Norm. These six factors were identified based on their eigenvalues (λ), with all factors exhibiting eigenvalues greater than 0.5, indicating that they account for a significant portion of the variance in the data. An eigenvalue above 0.5 is considered a standard threshold in factor analysis, suggesting that the factor is meaningful and contributes to explaining the underlying data structure. Moreover, the results of the EFA demonstrated that all 47 items used in the analysis were clearly defined and logically associated with their respective factors. This alignment indicates that the items were effective in measuring the constructs they were intended to represent. For instance, items related to digital marketing strategies were grouped under the Digital Marketing Mix factor, while items concerning consumers' perceptions of their ability to make purchases were linked to the Perceived Behavioral Control factor. The clear definition and logical association of all items with their factors not only support the validity of the measurement instrument but also enhance the overall reliability of the study's findings. This means that the factors identified through EFA accurately represent the underlying constructs being studied, such as how digital marketing influences consumer engagement and purchase intentions. The detailed breakdown of the EFA results is provided in Table 3, which presents the factor loadings and shows how each item aligns with its respective factor, confirming the robustness of the factor structure in this research.

Reliability Analysis Reliability analysis is a statistical measure used to assess the consistency of a measuring instrument in evaluating the same phenomenon (Notoatmodio, 2005). It serves as an index indicating how reliably a set of items measures a particular construct. In this study, reliability testing was conducted using Cronbach's alpha to evaluate the internal consistency of the measuring instruments. A Cronbach's alpha of 0.70 was used as the benchmark, based on the recommendation by Nunally (1978), indicating that a value equal to or greater than 0.70 is sufficient to establish the reliability of the construct. The results of the reliability analysis in this research showed that all six factors achieved Cronbach's alpha values well above the 0.70 threshold, signifying high internal consistency for each factor. The first factor, Digital Marketing Mix, which comprised 28 items, obtained a remarkably high-reliability score of 0.99, indicating an exceptionally consistent measurement of this construct. The second factor, Consumer Engagement, consisting of 7 items, also displayed strong reliability with a Cronbach's alpha of 0.95. The third factor, Perceived Behavioral Control, consisting of 3 items, demonstrated excellent reliability with a score of 0.97. For the fourth factor, Attitude, which included 23 items, the reliability analysis revealed a Cronbach's alpha of 0.93, signifying that the items effectively captured the construct. The fifth factor, Purchase Intention, consisting of 3 items, achieved a reliability score of 0.94, indicating a high level of consistency in measuring consumers' intention to purchase. Lastly, the sixth factor, Subjective Norm, which comprised 5 items, also showed strong reliability with a Cronbach's alpha of 0.92. These results indicate that all six factors have Cronbach's alpha coefficients significantly above the 0.70 benchmark, confirming that the constructs are measured reliably. This high internal consistency suggests that the items within each factor are well correlated and provide a stable measure of the underlying constructs. Furthermore, the variance explained by each factor was also calculated. Factor 1 (Digital Marketing Mix) accounted for 53.68% of the variance, highlighting its substantial contribution to explaining the data. Factor 2 (Consumer Engagement) explained 12.46%, while Factor 3 (Perceived Behavioral Control) accounted for 5.69%. Additionally, Factor 4 (Attitude) explained 5.34%, Factor 5 (Purchase Intention) accounted for 4.12%, and Factor 6 (Subjective Norm) explained 3.03% of the variance. The standard deviations for these factors ranged from 24.21 to 2.30, indicating variability in responses across the different constructs. Overall, these findings demonstrate that the measurement instruments used in this study are highly reliable and capable of consistently capturing the intended constructs. The detailed breakdown of the reliability analysis, including Cronbach's alpha coefficients and the variance explained by each factor, is presented in Table 2, providing further support for the robustness of the research measures.

Factor 5	.94	4.12%	2.54
Factor 6	.92	3.03%	2.30

Discussion

This study aims to determine the influence of digital marketing mix on purchase intention towards Yogyakarta's local products. The findings indicate that digital marketing significantly affects all variables of the theory of planned behavior, which is a theory related to purchase intention. Based on the factor loading results, it is found that Yogyakarta local products with good quality, unique features, and attractive packaging have a significant impact on purchase intention. This aligns with previous research on local products for souvenirs, which found that product quality and uniqueness significantly influence purchase intention (Poli et al., 2015). Farid et al., (2023) applied the same framework to explore consumers' purchase intentions for dairy products

and found that the overall marketing mix could impact the theory of planned behavior, aligning with the results of this research. This study further reveals that consumer engagement plays a role in influencing purchase intention. The reliability tests also confirm that the self-developed scale is consistent and dependable in evaluating the effect of digital marketing on the purchase intentions of local people towards Yogyakarta's products. From the findings of this study, it is essential for MSMEs in Yogyakarta to develop digital marketing strategies, such as marketing mix, which can have implications on purchase intention, to sustain their business in the face of rapid technological advancements that may alter consumer habits. Previously, a study with a model like this had never been conducted in Yogyakarta. This research can not only be utilized to benefit Yogyakarta but also holds potential for other tourist cities in Indonesia that produce many local products

5. Conclusion

Local products from Yogyakarta, primarily produced by micro, small, and medium enterprises (MSMEs), play a vital role in both the local and national economy. With around 340,000 MSMEs in Yogyakarta (Deny, 2024), these enterprises face the need to develop innovative marketing strategies to remain competitive in the current uncertain environment. Previously, MSMEs significantly influenced tourism (Naeruz et al., 2022). However, they must now adapt to the digital marketplace, which offers consumers accessibility at any time and from any location (Biyantoro, 2023). This study's findings highlight that the digital marketing mix, consumer engagement, and the elements of the Theory of Planned Behavior positively influence the purchase intention of local products. For MSMEs in Yogyakarta, these insights underscore the importance of enhancing product quality, setting appropriate prices, devising effective promotional strategies, and ensuring proper placement. By focusing on these aspects, MSMEs can better attract and retain consumers. Additionally, the research offers MSMEs a deeper understanding of consumer preferences, which can guide them in developing new products that align with future market demands. Moreover, the study confirms that adopting a well-planned digital marketing strategy, such as optimizing the marketing mix, is crucial for sustaining businesses amidst rapid technological changes that may alter consumer behavior. This research fills a gap by applying contemporary digital marketing theories to Yogyakarta's MSMEs, providing a model that can benefit other tourist cities in Indonesia by producing local goods. Thus, embracing digital marketing not only supports the growth of Yogyakarta's cultural products but also contributes to the broader economic stability of MSMEs in the region.

Abstract: Different generations of employees have different characteristics and values that make them unique. Currently, there are four generations of employees at the workplace: Baby Boomers, Generation X, Millennials, and Generation Z. Millennials and Generation Z employees are said to be less loyal. The question is whether the incompatibility of their values and those of the organization makes them less faithful to their organization warrants further investigation. Therefore, the study's objective is to investigate the mismatch between individual values and those of the organization among different generations in the workplace. A focus group discussion (FGD) involving representatives from public and private organizations was organized. The input from the FGD was analyzed using content analysis, and the findings indicate that Millennial and Generation Z employees have differing values that should be given considerable attention by management, which is mainly represented by Generation X. Managerial and research implications are provided in the paper.

Keywords: Millennials, Generation Z, value congruent, work culture

1. Introduction and Background

Currently, the workforce in the organization can be categorized into four groups: Baby Boomers, Generation X, Millennials, and Generation Z. These groups of employees have unique characteristics. Research has identified common trends and characteristics associated with different generations. For example, traditionalists are often characterized by strong work ethics and loyalty (Barwińska-Małajowicz, 2022); Baby Boomers focus on career advancement (Altman et al., 2020); Generation X have a desire for work-life balance; Millennials prefer meaningful work (Pasla et al., 2021); and Generation Z is strongly inclined towards technology and social responsibility (Ho et al., 2022).

Numerous studies have investigated generational differences, including characteristics, values, and preferences. These studies can be grouped into a few categories based on their focus. The first category is workplace preferences, including factors like leadership styles, communication preferences, and attitudes toward work. In general, younger generations may prefer more collaborative and inclusive leadership styles, while older generations may be accustomed to hierarchical structures (Kuknor & Bhattacharya, 2022).

The second category of studies focused on technology adoption and usage. Younger generations, such as Millennials and Generation Z, are typically more comfortable with and reliant on technology, influencing their expectations for digital tools and communication in the workplace (Bredbenner, 2020). Older generations of employees are less technology savvy and risk-avoidant. They are always tagged as old school and prefer conventional work methods, including interaction and communication (McVey, 2022).

The third category of studies delves into the motivations and priorities that drive career decisions across generations. Factors such as job security, career advancement, work-life balance, and social impact are often examined to understand the varied preferences of different age groups. Newer employees prefer work-life balance and social impact, while older generations prefer job security and career advancement (Serviss, 2020).

The fourth category of studies investigates the level of organizational loyalty exhibited by different generations. Younger generations may be more prone to changing jobs for career growth, while older generations may value long-term commitment and stability (Ackerman & Kanfer, 2020). Younger generations keep searching for

career growth opportunities in the job market (Barhate & Dirani, 2022). That is why many Millennials and Generation Z employees move from one organization to another just for greener pastures.

The fifth category of research explores how the values of different generations contribute to the overall organizational culture. Not only that, but different generations might also create workplace conflict because of their differences (Rahim & Katz, 2020). Top management is represented by those from older generations and executives, and younger generations represent below-job positions. Understanding these dynamics is crucial for creating inclusive environments accommodating diverse perspectives and preferences.

Although there are abundant studies on generational differences, future research efforts must address gaps in the research. Many studies generalize generational traits, overlooking the considerable diversity within each generation (Rudolph, 2021). There is a need for more nuanced research that considers individual differences, cultural influences, and other factors that shape values within generational cohorts.

Limited attention has been given to intersectionality, which considers the overlapping effects of multiple social categories, such as gender, race, and socioeconomic status, alongside generational differences (Holman & Walker, 2021). Research should explore how these factors intersect and influence values in the workplace. In addition, many studies are conducted in specific cultural contexts, and findings may not be universally applicable (Durlak et al., 2022). More research is needed to understand how generational values manifest in diverse cultural settings and how organizational values may need to adapt accordingly.

Values are not static; they can change over time and in response to changing circumstances. Research should delve into the dynamic nature of generational values and how they adapt to shifting societal, economic, and technological landscapes (Miller, 2023). While there is research on the values of different generations, there is limited understanding of how organizations can effectively adapt and align their cultures to accommodate diverse values. Further exploration is needed in organizational strategies for managing generational differences.

Therefore, the present study used an exploratory research design to examine the mismatch between individual and organizational values among various generations of the workforce. The findings are expected to answer the existing research questions about different characteristics, expectations, attitudes, and other aspects of jobs. The findings of the present study provide some solutions to the problem that management can use to resolve conflicts among different generations of workers.

2. Literature Review

Previous studies have outlined some of the differing characteristics of different generations in the workplace. Traditionalists are said to have strong work ethics and loyalty (Barwińska-Małajowicz, 2022). Baby Boomers focus on career advancement (Altman et al., 2020). Generation X prefers work-life balance. Millennials demand meaningful work (Pasla et al., 2021). Generation Z employees strongly favor technology and social responsibility (Ho et al., 2022).

Those from older generations represent top management of the organization, and executives and below-job positions are represented by younger generations. This disparity could create conflict in the organization, involving different generations of the workforce (Rahim & Katz, 2020). The older generations have developed organizational values based on their values and expectations. When the younger generations of the workforce enter employment, they bring along their values, expectations, and preferences that differ from the values of the organizations. This scenario creates a mismatch between organizational and generational values that warrants further investigation.

Based on existing work on generational differences in the workplace, the present study aims to investigate the differences between individual and organizational values among different generations and propose potential solutions to the problem.

The mismatch between individual values and organizational values

The mismatch between individual and organizational values can be categorized into a few themes to facilitate discussion and understanding. This categorization is based on existing research on generational differences and includes work-life balance, communication style, approach to authority, technological proficiency, career expectations, and commitment and loyalty.

Work-Life Balance: The attitude toward work-life balance is the first factor differentiating younger and older generations. Younger generations, such as Millennials and Generation Z, may prioritize a better work-life balance and flexible work arrangements (Erkılınç, 2023; Serviss, 2020). This can be perceived as incompatible with traditional organizational values emphasizing long hours and dedication. Most organizations value employees who can follow the standard working hours and are physically present in the designated work area (Taheri et al., 2020). Less flexibility was given to employees until the recent COVID-19 pandemic hit the world.

Communication Styles: The second factor that characterizes employees of different generations is communication styles. Different generations may have distinct preferences in communication styles (Mahmoud et al., 2021). For example, older generations may prefer face-to-face communication, while younger generations may be more comfortable with digital communication (Janssen & Carradini, 2021). Older generations prefer detailed information on the task to be performed, but younger generations expect to be given the freedom to decide on the details of the assigned task (Szymkowiak et al., 2021; Warr, 2020). This difference can sometimes lead to misunderstandings.

Approach to Authority: The third factor differentiating older generations from younger generations of employees is their approach to authority. Younger generations, particularly Millennials and Generation Z, may be more inclined to question authority and seek a flatter organizational structure (Murvanidze, 2020). Older generations give full respect to authority and will not question any instructions from top management. Moreover, they value hierarchical structures as they portray the authority the top management holds. Previous studies acknowledge the existence of conflict among different generations and try to provide potential solutions to this occurrence (Gabrielova & Buchko, 2021; Rudolph et al., 2021).

Technological Proficiency: The fourth factor that separates older generations from younger generations is technological proficiency. Younger generations are often more tech-savvy and comfortable with new technologies and may expect organizations to adopt the latest tools (Bredbenner, 2020; Nawaz, 2020). Gen Z is the most proficient in technology compared to other generations (Basantes Andrade et al., 2020). However, they want the organizations to provide adequate rewards and recognition for their talent (Chopra & Bhilare, 2020). This can clash with organizational values that prefer established processes. Older generations are complacent with the existing ways of doing their work. They normally resist change. This is consistent with the adage that we cannot teach new tricks to old dogs.

Career Expectations: Career expectations are the fifth factor that sets older and younger generations of employees apart. Younger generations may prioritize career development, mentorship, and a sense of purpose in their work (Barhate & Dirani, 2022). Older generations prefer job security and stability, recognition and respect, work-life balance, and retirement planning (Serviss, 2020). If an organization does not align with the younger generations' values, it may struggle to retain and engage younger talent. Past research found that intrinsic and extrinsic factors determine Gen Z's career aspirations and Gen Z has well-defined career expectations and career development plans (Barhate & Dirani, 2022). Organizations must address these gaps if they want to create a harmonious work environment.

Commitment and Loyalty: The final factor contributing to generational differences is commitment and loyalty. Older generations of the workforce place a higher value on long-term commitment and loyalty to the organization. In comparison, younger generations are more inclined to change jobs for career advancement or personal development (Seifert et al., 2023). This will create a mismatch between the organizational values and those of younger workforce generations. The organization must create a suitable strategy to retain young talents from leaving. A study found that employee trust and satisfaction strongly impacted employee organizational commitment, and employee organizational commitment impacted employee loyalty (Azzam & Harsono, 2021).

3. Research Methodology

The research design used is qualitative research involving a focus group discussion (FGD). A few representatives from public and private organizations participated in the FGD. They are the National Archive (Arkib Negara) (1), the National Population and Family Development Board or *Lembaga Penduduk dan Pembangunan Keluarga Negara* (LPPKN) (2), Employee Provident Funds (EPF) or *Kumpulan Wang Amanah Pekerja* (KWSP) (1), the Credit Counselling and Debt Management Agency or *Agensi Kaunseling dan Pengurusan Kredit* (AKPK) (2), a legal firm (1), a hotel (1) and the People's Trust Council or *Majlis Amanah Rakyat* (MARA) (2). Altogether, ten individuals were involved in the FGD.

The FGD occurred at one of the famous hotels in Kuala Lumpur in March 2023, and experienced researchers from Universiti Teknologi MARA and Kolej Universiti Poly-Tech MARA moderated the discussion session. The participants were separated into two groups and asked a few questions about the values of different generations in the workplace, the mismatch between the values of different generations and those of organizations, and the strategies used by your organizations to reduce the mismatches between the generational values and those of the organization. The feedback given by the participants was recorded, transcribed, and presented according to the themes for easy understanding.

The data collected was analyzed using a thematic analysis. Thematic analysis helps identify, analyze, and report patterns (themes) within this qualitative data. It allows researchers to capture the essence of the discussions, highlighting key issues, concerns, and perspectives participants share. In addition, thematic analysis can effectively represent participants' voices by identifying recurring themes and directly incorporating quotes or specific language used by participants. This ensures the analysis remains grounded in the data and accurately reflects participants' perspectives.

4. Results and Discussion

Work-Life Balance

From the FGD findings, a few insights can be learned concerning work-life balance. When there is a mismatch between the organizational values and those of the individuals, regardless of the generations, employees are likely to take drastic action to resolve the issue. The representative from MARA said, "At that time, we faced a crisis because many teachers asked for an early pension because they could not cope. Teachers are used to traditional methods. When wanting to adopt a new method of learning, stress levels are high, and mental health is worrying. Teachers who are 50 years old and above become uncomfortable".

The participant from MARA also added, "Some also quit their jobs because they did not want to move even though they were allowed to be promoted. But when they were promoted to juniors, they became angry". It shows that younger generations prefer work-life balance, and older generations will also opt for early retirement when they cannot cope with the situation. The finding is consistent with the previous work that work-life balance is crucial for employees regardless of their generation (Erkılınç, 2023; Leslie et al., 2021; Lestari & Margaretha, 2021).

Communication Styles

The findings of the FGD also confirm a difference in communication styles between older and younger generations, aligning with the findings of Janssen and Carradine (2021) and Mahmoud et al. (2021). According to the participant from the National Archive, "Right now, Gen X and Baby Boomers need to adapt like their subordinates. For example, all departmental information must be in infographics to be shared on social media. Gen X and Baby Boomers need to follow Gen Y's lead because they are smarter in this regard. Gen Y is indispensable in this organization because Gen Z is too raw".

Due to differences in communication styles, conflict will arise. The representative from LKKPN said, "When there is a module manufacturing process, there will be a conflict between Gen Y and Gen X. The contradictions that occur are less professional when Gen Y questions why it is necessary to follow the old employees still and can be changed due to the passage of time, but Gen X gives the reason their actions are correct because they are more experienced. It is difficult to agree between Gen Y and Gen X". The findings are consistent with those

highlighted by previous studies (Gabrielova & Buchko, 2021; Leslie et al., 2021)

To further support the finding, the participant from the EPF stated, "The Strategy and Investment Group consists mostly of Gen Y and is managed by Gen X. The situation when entering this group area is always serious and focused. It is less in terms of humanity". Therefore, management must find a way to avoid having conflicts between different generations escalating into more significant problems (Rudolph et al., 2021).

Approach to Authority

Regarding the approach to authority, the staff from the National Archive stated, "Gen Y and Gen Z feel that Baby Boomers and Gen X should manage matters in the organization because they are more mature, and this needs to be overcome." It seems that there is an agreement regarding who should manage the organizations. However, there are some concerns regarding the attitude of the younger generations toward the older generations. He added, "Gen X is more respectful when dealing. The softness in Gen X causes Gen Z and some Gen Y to take advantage of".

To further illustrate the value incompatibility between these generations, the participant from the National Archive added, "It becomes the habit in the organization, showing 'good' in front of superiors only but showing a different attitude behind. This matter needs to be resolved to build good personal relationships". The findings confirm that younger generations, particularly Millennials and Generation Z, may be more inclined to question authority and show less respect to the top management (Murvanidze, 2020). Previous studies acknowledge the existence of conflict among different generations and try to provide potential solutions to this occurrence (Gabrielova & Buchko, 2021; Rudolph et al., 2021).

Technological Proficiency

The findings from the FGD also support the earlier assumption that younger generations are more IT savvy than older generations (Bredbenner, 2020; Nawaz, 2020). Furthermore, older generations are less flexible when learning new technology. This is evident when the representative from MARA said, "When there is a system change, a transition occurs. We accept that many teachers at MRSM have resigned because they are unfamiliar with the new system."

To further support the finding, the participant from the EPF said, "Small branches are directed to close and be converted using the 'account' system. Many are fighting on the grounds of unemployment [because they are reluctant to learn new skills]. EPF is parallel with rescaling and upscaling to ensure they can move to new tasks". The findings support the previous research evidence that technological proficiency is critical in organizations. Gen Z is the most proficient in technology compared to other generations (Basantes Andrade et al., 2020). However, they want the organizations to provide adequate rewards and recognition for their talent (Chopra & Bhilare, 2020).

Career Expectations

Regarding career expectations, the findings contradict the earlier expectations that older generations prefer job security and stability, recognition and respect, work-life balance, and retirement planning (Serviss, 2020). Younger generations also prefer job security and stability. The participant from the National Archive said, "Gen Y and Gen Z are not far-sighted and are willing to reject promotion because they do not want to move from their original workplace." He added, "What is happening in the organization now, when hiring, they [Gen Y and Gen Z] promise to be ready for all things that may happen, such as employment in Sabah/Sarawak, but when it happens in the real situation, they present various reasons."

The participant from the EPF provides a different view on career expectations. He said, "The young blood is all fast. They want to show the outcome. When they do not get the desired outcome, they get stressed and feel like they have not achieved anything. So, they skip work and blame old people for the toxic culture that old people do not want to change". The findings provide evidence of the similarities and differences between different workforce generations regarding career expectations. Past research found that intrinsic and extrinsic factors determine Gen Z's career aspirations and Gen Z has well-defined career expectations and career development plans (Barhate & Dirani, 2022).

Commitment and Loyalty

The final part of the findings is related to commitment and loyalty. It is a standard agreement that younger generations are less committed and loyal than older generations ((Seifert et al., 2023). The participant from the National Archive said, "Gen Y and Gen Z cannot be given a big job that involves commitment from outside and inside [of the organization] because it will not achieve the organization's own needs." This view is supported by the representative from the EPF who said, "Gen Y, on the other hand, seems to be objective, but they will look for other alternative ways to ease their work."

Regarding loyalty concerns, the participant from the EPF added, "Gen Z is now too driven by dopamine and wants instant gratification. If they do not see it in a short period, even if there is a 5% increase in salary, they will jump to other organizations." It is confirmed that younger generations of the workforce are less likely to be committed and loyal to their organizations than their older counterparts. The findings are consistent with those of a study in Indonesia that found that employee trust and satisfaction strongly impacted employee organizational commitment, and employee organizational commitment impacted employee loyalty (Azzam & Harsono, 2021).

Possible Solutions to Address the Value Mismatch in the Organization

The participants were also asked about potential solutions to the mismatch between organizational values and those of different workforce generations. They provided several potential solutions.

The participant from the National Archive suggested, "This matter needs to be managed by Gen X and also Baby Boomers regarding understanding in the organization." He added, "In terms of knowledge, things about work need to take time to learn, but in managing activities and programs, we need to train them; otherwise, they will not follow the standards that the organization wants to achieve."

He added, "An Integrity Unit must be established in the organization after Act 17(A) was established to ensure that employees are not involved in wrongdoing". The participant from the EPF supports it, "Integrity starts with giving awareness to the staff in the hope that the staff can understand it from time to time." He added, "We create a program to develop integrity to ensure people follow through. This program has a different approach for each Gen, but the goal is the same".

Regarding technology proficiency, the participant from the National Archive suggested, "We need to align with the government's digitalization wishes. So, the young need to teach Gen X so they can follow the new system. There is a stage where we need to talk with them to accept the current situation slowly".

To create a harmonious working environment, the participant from the National Archive suggested, "The culture of the current generation is very different from the past. Nevertheless, an older generation can still assimilate with the younger generation. Gen X is young at heart. There must be something like that so Gen Y and Z can feel together. There is still respect, just the way of communication".

To facilitate the process of assimilation between different generations at the workplace, the participant from the National Archive suggested, "In the organization, we still strive to build job satisfaction. Give credit even if there are mistakes. The importance of this award is that they are enthusiastic about work. We know that this young person still has shortcomings; in the process, we improve them". "The government created the AKRAB program to overcome the problem."

The participant from LPPKN also supported the view by citing his organization's practices," LPPKN established the Mentor and Mentee program to reduce the gap between new employees and old employees". The participant from the EPF also agreed with the earlier view, "Due to the difference in the environment of these two groups, the establishment of Team Building activities, training for them to come out of their work cocoons. There will be activities at the end of the month, such as sports, to combine the two groups". "This will not happen overnight and needs to be done continuously."

Regarding the approach to authority, the participant from the EPF said, "There are several things applied in leadership building. How to manage a junior who is older than you? How to manage without authority?". He

added, "There will be preparation for the transition from non-exec to exec, the application of management skills so as not to be surprised when it is necessary to manage people". "This program is mandatory for every staff who wants to be promoted to be prepared".

He also suggested, "The way we overcome this matter is by giving the lead to the younger one while we prepare the younger one to bring Gen X together in the journey. It is not easy". He further explained, "Leaders need to be ready to explain to Gen X. It's just that acceptance is required, maybe in stages. They will accept to a certain degree because this raises insecurities for them. After all, they feel victimized".

Concerning the communication styles used by different generations, the participant from the EPF said, "The skill that older people need to learn now is how to bring the conversation down to the other level. We cannot speak in the same way as those of our age. They cannot accept it. So, if we can bring the conversation level to the right level, they will accept it faster."

All these suggestions highlighted by the participants are potential solutions to the value mismatch between older and younger generations of the workforce and those of the organization.

5. Conclusion

Different generations have different values, which may be advantageous and disadvantageous to the organization. Different values may create healthy competition among the employees but may create conflicts among them. This present study sought to examine the mismatch between older and younger employees regarding values and provide some solutions to address this issue. Six themes have been identified to serve as the main topics of discussion: work-life balance, communication styles, approach to authority, technological proficiency, career expectations, and commitment and loyalty. The findings of the FGD confirm the earlier assumptions that younger generations have different values from older generations. The findings provide valuable insights for future researchers to explore the topic further. It is suggested that future research be conducted to confirm the present study's findings using a quantitative research design. In addition, the study's findings provide guidelines for the management of organizations to develop policies and practices to address generational gaps, especially concerning work-life balance, communication styles, approach to authority, technological proficiency, and career expectations. Proper training programs can also assist in reducing these gaps.

Trend-Driven Innovation for RTE Food Market: A Comparison Study Between Consumers from Malaysia and Indonesia

*Nur Hidayah Che Ahmat¹, Wan Rusni Wan Ismail¹, Rafidah Aida Ramli¹, Sri Handajani², Anderson Ngelambong¹ ¹Universiti Teknologi MARA, Cawangan Pulau Pinang, Malaysia ²Universitas Negeri Surabaya, Indonesia *hidayah.ca@uitm.edu.my, rusni.wi@uitm.edu.my, wanfidah@uitm.edu.my, srihandajani@unesa.ac.id, anderson@uitm.edu.my *Corresponding Author: Nur Hidayah Che Ahmat

Abstract: The ready-to-eat (RTE) food market is growing worldwide. Nevertheless, a limited study was found where researchers compare consumer behavioral intention toward RTE foods between countries. This study compares consumers in Malaysia and Indonesia regarding their food preferences and behavioral intentions toward RTE foods. Using a quantitative cross-sectional approach, the researchers developed an online survey and distributed the survey link to consumers aged 18 years and above from both countries via social media platforms. The dataset comprised 321 responses from Malaysia and 262 from Indonesia. Based on the analyses, findings reported some similarities and differences in consumer preferences and behavior intention between both countries. The highest percentages of Malaysian respondents were recorded for plant-based, genetically modified, gluten-free, and allergen-free foods. Interestingly, the highest percentage of Indonesian respondents reported for insect-based food than the Malaysians. More Malaysian consumers preferred ethnic foods from different cultures than Indonesians. About the same highest percentages of consumers from both countries preferred cell-cultured meat, 3D printed foods, and vegan foods. For Malaysian samples, attitude and subjective norms significantly influenced their behavior intention toward RTE foods. For Indonesian samples, subjective norms and behavioral control significantly influence consumer behavior intention toward RTE foods. Findings are relevant for food producers and marketers to explore the young consumer market and to identify new products to fulfill the market demand. This study broadens and deepens the current understanding of both countries' RTE food trends and consumer behavioral patterns. Food producers should promote RTE food products by highlighting their benefits through marketing channels.

Keywords: Ready-to-eat food, food preferences, behavior intention, Malaysia, Indonesia

1. Introduction and Background

Fast-moving consumer goods or consumer packaged goods are growing in the largest group of consumer products. Fast-moving consumer goods are products sold quickly and relatively cheaply (e.g., packaged foods and beverages). Some of the bigger multinational fast-moving consumer goods companies in Malaysia are Nestle, Unilever, DKSH, and General Mill, whereas, for Indonesia, examples of the fast-moving consumer goods companies are Indofood CBP Sukses Makmur, Wings Group, and Mayora Indah (Investinasia, 2023). Statista Research Department (2024) reported that one-fifth of Malaysian household consumption expenditure is spent on the fast-moving consumer goods segment, one of the most essential consumer goods sectors in the country, and the fast-moving consumer goods market is expected to continue growing due to the increase in purchasing power and population size (Statista Research Department, 2024). The improvement in consumer lifestyle, rapid urbanization, and high disposable income are increasing demand for on-the-go convenience foods, fueling the growth of RTE food. Innovative products with functional ingredients, convenience, organic foods, and packaging technology advancements are expected to provide future growth opportunities in the sector (Thakur et al., 2018).

Ready-to-eat (RTE) products are part of the fast-moving consumer goods product category, and the demand for these products is also growing due to the changes in the population structure and the convenience features offered by RTE products. Despite the growing demand for RTE foods and the constant changes in the market in the forms of changing consumer demand and hyper-competition, there is always the need for the food business to make specific changes or innovations to the products to ensure that the products stay relevant in the market. Trend-driven innovation and product development are considered part of the competitive factor for food producers as they give them the edge to stay ahead of the competition. According to Statista (2024a,

2024b), the revenue for RTE foods in Malaysia is expected to reach US\$2.15 billion in 2024, whereas for Indonesia is projected to reach US\$7.99 billion in 2024. The forecasted revenue for Indonesia is higher than for Malaysia, which may be influenced by the difference in total population between the two countries. As of July 2024, the total population in Malaysia is 34.1 million (DOSM, 2024) versus 283.8 million in Indonesia (Worldometers, 2024). Although the Indonesian market records higher projected revenue, Malaysia's predicted yearly RTE foods market growth rate is 6.75%, slightly higher than Indonesia's (4.72%) (Statista, 2024a; 2024b). Such a situation could occur due to increased RTE food choices and trends in Malaysia.

Nowadays, consumers spend more time in traffic and have longer working hours; hence, RTE products could make their lives easier (Anusha et al., 2020; Basurra et al., 2020). Several researchers confirmed that convenience is the primary motivation for consumers to purchase RTE food products other than saving their time for food preparation and having a variety of RTE food product options (Anusha et al., 2020; Azman et al., 2023; Basurra et al., 2020; Permana et al., 2023; Rosli & Sahak, 2024; Sierkierski et al., 2013). Due to lifestyle changes, the demand for convenience products like RTE foods is increasing. While the RTE foods market is expanding, a limited of research was found where researchers investigating consumer behavioral intention comparing between countries (Siekierski et al., 2013). Therefore, the study aims to (a) compare consumer food preferences between Malaysia and Indonesia and (b) investigate the behavior of consumers from both countries toward RTE foods. By applying the theory of planned behavior, this study will investigate consumer behavior intention toward RTE foods in Malaysia and Indonesia and develop a food profiling for consumers from these two countries.

2. Literature Review

RTE Foods Market

The RTE foods market is among the fastest growing segments as it fulfills the changing lifestyles of the general population. RTE refers to any food typically eaten in its raw state or any other food products that are precleaned, pre-cooked, pre-packaged, and ready for consumption with no or minimal preparation or cooking (Huang & Hwang, 2012). The expression 'further heating or processing' is not intended to include food preparation activities such as washing, slicing, chopping, portioning, or marinating carried out by the consumer by preference to an otherwise RTE food item (Food Standards Agency, 2011). Under this definition, several processed foods can be regarded as RTE products, including biscuits, crisps, bread, pies, sandwiches and rolls, dairy products (milk, cheese, spreads), prepared salads and vegetables, and fruit. The list can be extremely long, and with new products are not an invention, but the trend has been growing over the years due to the increasing consumer demand for a modern lifestyle that demands a quick and convenient meal. RTEs are available everywhere in Malaysia, from convenience stores to retail outlets. RTE foods often become a family choice because they are cheaper than dining in a restaurant (Basurra et al., 2021).

Research on RTE Foods

Several studies from various countries investigate consumer behavior patterns from multiple perspectives. A few studies examined consumer motivation to purchase RTE foods (Anusha et al., 2020; Foster, 2020). Sierkierski et al. (2013) compared the RTE food eating habits between consumers in two countries, and they found that consumers from Brazil preferred convenience and taste compared to consumers from Italy, who were concerned about tradition and health. Choi (2022) studied consumers' RTE food purchase behavior intention among college students in Korea and reported that the time for snack consumption and RTE food consumption was similar, which suggests that snacks might replace college students' meals as they consider RTE foods as snacks. In Thailand, Mahasuweerachai et al. (2023) reported that guilt and pride significantly influenced consumer decisions to switch their eating patterns from conventional meat to plant-based protein at restaurants. An earlier study by Thienhirun and Chung (2018) found that Thai consumers liked the RTE food packaging and design to be in a clear container with proper labels for them to see the food inside compared to the Japanese, who liked the colorful design of the food container. Additionally, they found that Japanese consumers favored an authentic Thai taste compared to Thai consumers who favored the adapted taste between Japanese and Thai flavors. Huo et al. (2023) found that consumers' purchase intention in China is positively associated with their attitude, subjective norms, perceived behavioral control, and trust. Meanwhile, Kabir (2023) reported that social norms, attitudes, perceived behavioral control, knowledge of the health

benefits of organic food, and the COVID-19 health crisis significantly influenced organic food consumption behavior among Bangladeshi consumers.

Foster (2020) studied Indonesian consumer intention to purchase RTE products, and they reported that turnaround strategy and packaging strategy influenced the increase in Indonesian consumer intention to purchase RTE products, which aligned with findings by Thakur et al. (2018). Damayanti et al. (2023) investigated the demand for food among Indonesian households. Food prepared at home and away from home are normal goods, but food away from home is more elastic than food prepared at home. More Indonesian households are found to consume food away from home. Another study in Indonesia by Permana et al. (2023) focused on Rendang as an RTE-type food product and found that aesthetic appeal, sensory appeal, quality appeal, and variety appeal affect consumer attitude toward rendang RTE, thus influencing their intention to purchase RTE rendang. Rahayu et al. (2023) reported high demand for RTE foods in Indonesia and evaluated the awareness of consumers toward healthy eating. They reported that from 2016 to 2020, the consumption of RTE foods increased, and consumers did not care about their daily nutritional intake. Therefore, Rahayu et al. (2023) suggest food producers offer healthier RTE products.

Several studies have been found on RTE food consumption in Malaysia. Basurra et al. (2020) examined the consumption practices and the perception of students and employees at one university in Kuala Lumpur. They found that most respondents consumed RTE foods twice to four times a week, mostly during lunch. Additionally, Basurra et al. (2020) found that consumer motivation to purchase RTE foods is convenience, followed by saving time for preparation. Regarding consumer perception towards RTE food, Basurra et al. (2020) reported that when buying RTE foods, consumers always pay attention to the store cleanliness rather than the ingredients of the products and compare the quality of the food packages and producer of the product. Another similar study conducted in Kuala Lumpur by Anusha et al. (2020) found that convenience was the primary motivation of consumers in purchasing RTE foods, and they purchased RTE foods more than twice a week and consumed them for lunch. Each consumer was willing to spend RM20.00 and below for RTE foods (Anusha et al., 2020). Azman et al. (2023) sampled consumers in Kuala Lumpur, Selangor, Melaka, Perak, Johor, and Penang, and they reported that the convenience of RTE foods significantly influenced consumer behavior in addition to health and taste orientation. The latest study by Rosli and Sahak (2024), who sampled 180 consumers in Kuala Lumpur, reported that convenience and price influenced their purchase intention toward RTE foods.

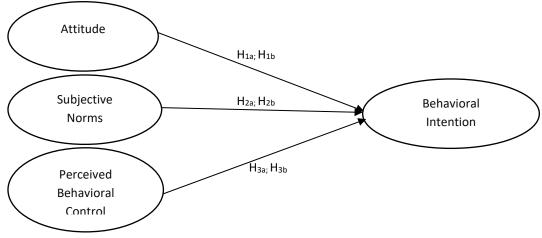

Consumer Behavior on RTE Foods

While there are studies found examining consumer behaviors toward RTE food products, a limited number of studies are found where the researchers utilized the theory of planned behavior in their studies (Sajjad et al., 2023) as more studies are found using descriptive research design (Anusha et al., 2020; Foster, 2020; Rosli & Sahak, 2024; Sierkierski et al., 2013). In consumer behavior literature, the theory of planned behavior is commonly used for examining consumer behavior in terms of attitude, subjective norms, perceived behavioral control, and behavior or purchase intention (Sajjad et al., 2023). An individual's behavior, resulting from intentions, is influenced by attitude, subjective norms, and perceived behavioral control (Aizen, 1991). Based on an individual evaluation, their attitude can be positive or negative, but a positive attitude is inclined towards behavioral intention. A systematic literature review by McDermott et al. (2015a, 2015b) posited that consumers' behavioral intentions are influenced by their positive attitudes and the perception of people around them. Perceived behavioral control refers to an individual perception of ease or difficulty in engaging in a particular behavior. Subjective norms are described as an individual perception of social influence, whether encouraging or discouraging them to be involved in certain behaviors. The theory of planned behavior is commonly used to predict an individual's behavior intention, potentially leading to an actual behavior. Based on the literature review on RTE foods research, a lack of studies has been found that use the theory of planned behavior to examine consumer behavior intention. In the current study, the researchers aim to compare the behavior intention of consumers in Malaysia and Indonesia towards RTE foods, hence justifying the use of planned behavior as an underpinning theory for this study. Acknowledging the importance of understanding consumer behavior intention towards RTE foods, we developed the following hypotheses: H1a: Attitude positively influences Malaysian consumer behavioral intention toward RTE foods. **H1b:** Attitude positively influences Indonesian consumer behavioral intention toward RTE foods. H2a: Subjective norms positively influence Malaysian consumer behavioral intention toward RTE foods.

H2b: Subjective norms positively influence Indonesian consumer behavioral intention toward RTE foods. **H3a:** Perceived behavioral control positively influences Malaysian consumer behavioral intention toward RTE foods.

H3b: Perceived behavioral control positively influences Indonesian consumers' behavioral intention toward RTE foods.

Figure 1: Research Model

3. Research Methodology

The study employed a quantitative methodology. The questionnaire technique was employed in this study to test the hypothetical research model built based on the study objectives. All variables for the model were established through a detailed literature review. Each variable is rated using a five-point Likert-type scale from strongly disagree (1) to strongly agree (5) and has more than two items measuring each construct. The items on all scales used in the questionnaire were originally in English. The experts then translated these items into Malay using the back translation procedures (Brislin, 1980). The researchers employed a scale created by Verbeke and Vackier (2005) to assess consumer attitude (four items), subjective norms (four items), perceived behavioral control (three items), and behavioral intention (three items). A web-based survey was developed using Google Forms. Web-based surveys are cost-effective and less time-consuming (Braunsberger et al., 2007). A consent form is included to ensure all the participants are 18 years old or older and agree to participate in the study.

A pilot study was conducted in August 2023 for 30 consumers. The Cronbach alpha values of all scales for the pilot study were above 0.70, which is considered reliable according to Nunnally (1978). For the actual data collection, the researchers used a non-probability convenience sampling method and distributed the survey link to various social media platforms between October 2023 and January 2024. Since the researchers did not have access to the target population (Etikan et al., 2016), convenience sampling is the best method to gather samples from the two countries that are willing to participate. Overall, the researchers obtained 321 usable questionnaires from Malaysian respondents and 262 usable questionnaires from Indonesian respondents. For Malaysia samples, attitude ($\alpha = 0.788$), subjective norms ($\alpha = 0.875$), perceived behavioral control ($\alpha = 0.884$), and behavioral intention ($\alpha = 0.916$). For Indonesia samples, attitude ($\alpha = 0.799$), perceived behavioral control ($\alpha = 0.689$), and behavioral intention ($\alpha = 0.714$).

4. Data Analysis and Results

Respondent Profiles

More females (Malaysia, 51.2%, n = 164; Indonesia, 87%, n = 228) answered the survey questionnaire than males (Malaysia, 48.8%, n = 156; Indonesia, 13%, n = 34) for both Malaysian and Indonesian samples. The study received the highest percentage of young consumers aged 18 to 26 (Malaysia, 61.3%, n = 196; Indonesia, 99.2%, n = 260). As displayed in Table 1, the highest percentages of Malaysian consumers selected "Yes" for plant-

based foods (66%), genetically modified foods (68.5%), organic foods (77.3%), gluten-free foods (65.7%), and allergen-free foods (62.6%). Meanwhile, for Indonesian samples, the highest percentage of respondents answered "Yes" only for insect-based foods (68.3%). Regarding ethnic foods from different cultures, more respondents from Malaysia responded "Yes" to Japanese (80.7%), Korean (80.7%), Philippine (61.4%), and Spanish (60.4%) foods, compared to the Indonesian samples. Most Indonesian samples answered "No" to all four ethnic foods (Japanese 92%, Korean 91.6%, Philippine 72.5%, and Spanish 78.2%).

Table 1: Food Preferences of the Respondents for Both Malaysia and Indonesia.

Regression Analysis for Malaysia and Indonesia Samples

The quantitative data from the study was analyzed using the SPSS program. The skewness and kurtosis values of the data were determined to be in the range of -2 and +2 (skewness) and -7 and +7 (kurtosis), which indicates the data is normal (Hair et al., 2010). Also, the sample sizes for this study are over 200; hence, they do not affect the skewness and kurtosis deviations from normality (Tabachnick & Fidell, 2013). Based on this information, the researchers used regression analysis to test the influence of independent variables on dependent variables for both Malaysia and Indonesia samples.

Based on the Malaysian samples in Table 2a, there are multiple correlations (R = 0.744) of the three significant predictors with the criterion (dependent variable). The factors influencing Malaysian consumer behavioral intention are attitude, subjective norms, and perceived behavioral control. These factors have a significant effect size, which explains 55.4% of the variability in behavioral intention. The adjusted R² shows that in the population, the three factors account for 54.9% of the variance contributing to the behavioral intention. Table 2b shows this regression is significant (F = 131.090, p < 0.001). Two of the three predictors of independent variables are significantly influenced by behavioral intention. Attitude and subjective norms positively influenced Malaysian consumer behavioral intention toward RTE foods, which supported Hypotheses 1a and 2a. The influence of attitude has the highest regression coefficient ($\beta = 0.481$, p < 0.001), followed by subjective norms ($\beta = 0.328$, p < 0.001). Perceived behavioral control does not significantly influence Malaysian consumer behavioral intention toward RTE foods; hence, hypothesis 3a is rejected.

Based on the Indonesian samples in Table 3a, there are multiple correlations (R = 0.415) of the three significant predictors with the criterion (dependent variable). The factors influencing Malaysian consumer behavioral intention are attitude, subjective norms, and perceived behavioral control. These factors have a significant effect size, which explains 17.2% of the variability in behavioral intention. The adjusted R² shows that the three factors account for 16.3% of the variance contributing to the behavioral intention in the population. Table 2b shows that this regression is significant (F = 17.916, p < 0.001). Two of the three predictors of independent variables are significantly influenced by behavioral intention. Subjective norms and perceived behavioral control positively influenced Indonesian consumers' behavioral intention toward RTE foods, which supported Hypotheses 2b and 3b. The influence of subjective norms has the highest regression coefficient ($\beta = 0.295$, p < 0.001), followed by perceived behavioral control ($\beta = 0.172$, p < 0.01). Attitude does not significantly influence Indonesian consumer behavioral intention toward RTE foods; hence, hypothesis 1b is rejected.

5. Discussion and Conclusion

The study was conducted to compare consumer food preferences between Malaysia and Indonesia and investigate the behavior of consumers from both countries toward RTE foods. The analyses show some similarities and differences between consumer behavioral patterns for the two countries. More Malaysian consumers preferred plant-based, genetically modified, organic, gluten-free, and allergen-free foods compared to Indonesians who preferred insect-based foods. In contrast, more Indonesians dislike plant-based, genetically modified, gluten-free, and allergen-free foods. The study found Malaysians like plant-based food more than Indonesians; perhaps the Malaysians are similar to Mahasuweerachai et al.'s (2023) study, where consumers feel responsible for switching their eating patterns from conventional meat to healthier options like plant-based and organic foods. In terms of similarity, many consumers from both countries dislike vegan foods, cell-cultured meat, and 3D-printed foods. Such results might be influenced by the negative perception of consumers towards vegans, and vegans do not eat any food products that come from animals (e.g., dairy products). Also, the term cell-cultured meat and 3D printed foods might affect consumer perception of the food's nutritional values and whether it is safe to consume such products. Health and taste orientation influenced consumer behavior (Azman et al., 2023).

Interestingly, the number of Malaysian consumers who like ethnic foods (Japanese, Korean, Philippine, and Spanish) is higher than that of Indonesians. Such findings reflected the emergence of various ethnic restaurants available in Malaysia, especially those serving Japanese and Korean cuisine. Wan and Yazdanifard (2021) reported that Malaysians are more interested in Korean food like ramen, *chigae*, and *chimek*, while Tey (2018) found that Malaysian consumers choose Japanese cuisine because the food is tasty. In contrast, Thienhirun and Chung (2018) reported that Thai consumers did not like Japanese RTE foods due to their taste and freshness. Based on the results, the demand for ethnic food in Malaysia is still growing; hence, Malaysian food operators could benefit from such findings. For the regression analysis, the findings revealed different results for consumer behavior patterns in both countries. The Malaysian consumer attitude and subjective norms significantly influence their behavioral intention toward RTE foods, and attitude was the main contributing factor. The Malaysians' positive attitude and belief about whether people around them approve of their behavior influenced their intention towards RTE foods. Generally, Malaysian consumers view RTE foods as convenience; hence, convenience is the most important motivational factor influencing RTE food purchase decisions (Anusha et al., 2020; Basurra et al., 2020; Rosli & Sahak, 2024).

On the other hand, for Indonesian consumers, this study found that subjective norms and perceived behavioral control significantly influence their intention toward RTE foods, and subjective norms were the main factor. Therefore, Indonesian consumers' perception of ease in performing their behavior and their belief that the people around them favor their behavior influence their behavioral intention toward RTE foods. In this study, attitude does not significantly influence Indonesian consumer behavior intention, which contradicted Permana et al. (2013), who stated that Indonesian consumer attitude toward Rendang as an RTE-type food product influenced their purchase intention. The current study has proven that the two countries' consumer behavior toward RTE foods is different. Nonetheless, consumers from both countries are similar in terms of their subjective norms when it positively influences Malaysian and Indonesian consumer behavioral intention toward RTE foods. In short, subjective norms are a vital construct influencing consumer behavioral intention in Malaysia and Indonesia. The similarities and differences in food preferences and RTE foods' behavioral intention intentions between consumers from the two countries are worth investigating. Cultural and societal

perceptions might contribute to such results. To the best of the authors' knowledge, this is the first crosscountry study using the theory of planned behavior to investigate the attitude, subjective norms, and perceived behavioral control on consumer behavior intention toward RTE foods between two countries (i.e., Malaysia and Indonesia), thus, justify the novelty of study contribution.

Theoretical and Practical Implications

The research data provides theoretical and practical implications for food producers, food marketers, and academicians working in literature. Firstly, this study developed food profiling for consumers from two developing countries: Malaysia and Indonesia. Secondly, this study offers comparative data between these countries regarding their food preferences and behavioral intentions toward RTE foods. For practical implications, stakeholders such as RTE producers may benefit from the findings to enhance their understanding of consumer behavior that keeps changing occasionally. The comparative data reported in this study benefit RTE food exporters, importers, and producers as they expand their market to potential consumers from the two countries. Findings will help the RTE producers in Malaysia and Indonesia find more opportunities to fulfill the market demand.

Limitations and Future Research Recommendations

This study is not without limitations. Firstly, the study reported consumer behavioral intentions from the two countries (Malaysia versus Indonesia); hence, the findings cannot be generalized to other countries. Therefore, including more countries in a comparison study would be valuable for more beneficial data. Secondly, the study measured how consumer attitudes, subjective norms, and perceived behavioral control influenced their behavioral intention. Other variables, such as consumer perception of food innovation and demographics, might have moderated or mediated the associations between these variables. With that, further studies are needed to investigate additional variables that could influence the associations between the study variables. Thirdly, the study only investigated the behavioral intention of RTE foods from consumer perspectives; thus, future research could explore from other stakeholders' perspectives, such as the RTE producers and marketers, to study the challenges and opportunities of exporting and importing RTE food products. Current and future research findings will also benefit both countries in developing policies related to RTE foods and education initiatives to promote the benefits of RTE foods products.

Acknowledgment: This study was fully supported by an International Matching Grant between Universiti Teknologi MARA, Cawangan Pulau Pinang, Malaysia, and Universitas Negeri Surabaya Indonesia [100-TNCPI/INT 16/6/2(012/2022)]. The authors would like to thank all individuals who participated in the study.

A Systematic Review of Organizational Resilience Through Digital Technology Adoption: Trends and Insights in a Decade

Nur Farhah Baharuddin^{1,2}, Wan Marhaini Wan Omar^{1*} ¹Faculty of Business and Management, Universiti Teknologi MARA Cawangan Kelantan, Kampus Kota Bharu, Kelantan, Malaysia, ²Corporatemind Advisory Sdn. Bhd, Jalan Sultan Yahya Petra, Kota Bharu, Kelantan, Malaysia farhahbaharuddin63@gmail.com, *whaini299@uitm.edu.my Corresponding Author: Wan Marhaini Wan Omar

Abstract: Numerous organizations have been compelled to adopt new ways of managing work and the environment because of the pandemic. Understanding the resilience dynamics during the adoption of digital technology is more important than ever considering challenges like terrorism, economic recessions, mass migration, cyberattacks, and a variety of other socio-political and economic trends. Reviewing publications that examine the connection between digital technologies and organizational resilience from 2014 to 2024 is the goal of this project. The PRISMA approach was used to conduct a systematic review. 47 relevant papers were found as a consequence of this, most of which came from the Scopus database. This implies that academics are engaged in the subject. The papers consistently cited the diffusion of innovation (DOI) theory and the technology-organization-environment (TOE) framework, with a bias towards quantitative research methods. Five major themes emerge from the analysis: digital transformation, organizational resilience, business performance, innovation, and adoption of digital technology. By providing new perspectives, the study closes gaps in the literature. It was believed that the Journal of Technological Forecasting and Social Change was a valuable source of information on studies on digital adoption. Based on the results, the report offers recommendations and points up directions for future research to increase organizational resilience by utilizing digital technology. Organizations may leverage digital technology to effectively overcome obstacles and prosper in a constantly changing landscape by implementing these suggested practices.

Keywords: Organizational resilience, digital technology adoption, systematic review, business performance

1. Introduction and Background

The concept of organizational resilience is particularly crucial in the current context, marked by rapid and frequent economic, social, and environmental changes on a global scale (Do et al., 2022). The capacity of an organization to bounce back from setbacks and adjust to change is known as organizational resilience (Akpan et al., 2022; He et al., 2022). Businesses and stakeholder groups need to adopt new practices and promote interdependencies to develop stability and adaptation against external shocks (Do et al., 2022). This is essential for systems resilience. Although SMEs are beginning to acknowledge the benefits of circular business practices in fostering resilience (Annarelli et al., 2020), there are still substantial obstacles to their continuous implementation that affect adoption rates. In response to these challenges, business owners are increasingly aware that enhancing organizational resilience can drive organizational growth and safeguard long-term success (Zhang et al., 2021).

To identify knowledge gaps in digital technology adoption and organizational resilience, especially in mediumsized enterprises (SMEs), a thorough study of the literature was conducted. This particular point has not received much attention in earlier research. For instance, Akpan et al. (2022) examined how dynamic capabilities and organizational resilience relate to Nigerian manufacturing enterprises. He et al. (2022) investigated the effects of digital transformation on workers and organizations during turbulent times, as well as how it influences organizational resilience. Xia et al. (2022) investigated how business networks could strengthen organizations' organizational resilience similarly. The relationship between the use of digital technology and organizational resilience is still not well studied despite these measures, especially when it comes to SMEs. To fill this information vacuum and comprehend this recently emerged field of research better, a comprehensive review of the literature was conducted. The present study was informed by the following research questions to create a pertinent systematic literature review as stated below:

• What are the trends of literature related to organizational resilience and digital technology adoption in a decade?

• What research themes will be generated based on the finalized articles on organizational resilience and digital technology adoption in a decade?

The study employs a thorough literature review technique to examine research on organizational resilience and the adoption of digital technologies. This approach is required to comprehend the trends and research results. A review approach called PRISMA Statement (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) was used to assemble the literature from 2014 to 2024. The study is presented, and then the literature on the connection between digital technology use and organizational resilience is thoroughly reviewed. Chapter 3 explains the research technique, while Chapter 4 presents the study's findings. The research topic categorization process is explained in detail in Section 5, and the study's conclusions and possible directions for future research are covered in Section 6.

2. Literature Review

Organizational Resilience

Organizational resilience can be defined as an organization that possesses the "ability to endure significant business disruptions caused by unexpected, unforeseen, or catastrophic events, allowing organizational systems to function beyond their planned capacities without major losses" (Zhang et al., 2021). The concept of resilience, in its various forms, has been increasingly adopted in other disciplines (Tengblad, 2020). For example, in ecology, resilience has become fundamental in understanding how ecosystems can withstand change and stress while maintaining their fundamental balance (Akpan et al., 2022). Over recent decades, experts in organizational and business studies have broadened the application of resilience concepts (Tengblad, 2020). Despite numerous studies on organizational resilience dating back to the 1970s, notably the significant work by Thomson and Lehner (1976), there is no universally accepted theoretical foundation for the concept (Molinillo & Japutra, 2017). Terms like adaptability, agility, flexibility, improvisation, recovery, redundancy, and robustness do not equate to organizational resilience (Molinillo & Japutra, 2017). Resilience refers to how organizations respond to adversity, emphasizing their ability to recover and thrive amid uncertainty, discontinuity, and catastrophe (He et al., 2022; Yang et al., 2021). Therefore, enterprises must take measures to enhance organizational resilience to maintain competitiveness and ensure sustained viability (Annarelli et al., 2020). Consequently, this paper aims to propose a method for evaluating the effectiveness of organizational resilience strategies and associated initiatives within the service sector (Marcucci et al., 2022). Within this broader context, businesses encounter a plethora of emerging digital technology adoptions that are gaining significance, particularly in areas of cybersecurity and digital transformation (Annarelli et al., 2020).

Digital Technology Adoption

Digital technology utilization by small and medium-sized enterprises (SMEs) entails incorporating digital platforms and tools into their operations to increase productivity, efficiency, and competitiveness in the current economic environment (Ayinla & Adamu, 2018). Digital technologies are helping small and medium-sized businesses (SMEs) expand their client base, optimize internal workflows, and enhance internal communications (Skare & Riberio Soriano, 2021). Essential components of digital adoption for small and medium-sized enterprises (SMEs) include digital marketing tools, cloud computing, data analytics, mobile apps, and e-commerce platforms. According to Figueiredo et al. (2021), these technologies aid SMEs in breaking through conventional growth barriers, breaking into new markets, and maintaining their competitiveness in a digitally driven economy. Additionally, digital technology gives SMEs the capacity to swiftly alter their company strategies, enhancing their adaptability, according to Saleem et al. (2023). The literature on innovation emphasizes this point (Egala et al., 2024). In a similar vein, recent research has examined an organization's readiness to adopt new technologies or to digitally modify its ongoing operations (Omrani et al., 2024).

Small and medium-sized enterprises (SMEs) need to be prepared for substantial interruptions to their routine operations, which might endure for several months or even years. The development of efficient procedures that boost productivity and promote sustainability, the production of value for significant stakeholders and consumers, and the broad adoption of data-driven technology-based systems can all lead to these disruptions. These are all aspects of digital transformation practices (Blichfeldt & Faullant, 2021). SMEs require managerial, financial, and technological capabilities to implement such new technology (Blichfeldt & Faullant, 2021).

3. Research Methodology

The Review Protocol - PRISMA

The study used PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses), as its review methodology (Figure 1). As stated by Sierra-Correa and Cantera Kintz (2015) and Shaffril et al. (2017), PRISMA has three primary benefits and is a widely used technique in management research. These advantages include the ability to specify exact research questions for systematic analysis, to establish clear inclusion and exclusion criteria, and to make effective use of scientific literature databases while working under time constraints. To get things started, specific study questions were established by the review methodology. Then, a rigorous approach was put into practice, incorporating rules for eligibility, screening, and identity. The suitability and applicability of the selected articles were then verified by a quality review. The collected data was carefully analyzed and validated once it was extracted from the source to guarantee its correctness and dependability.

Systematic Search Strategy

The papers came from two major bibliographic databases, Web of Science (WoS) and Scopus, and they spanned a decade from 2014 to 2024. The selection of these databases was based on their broad coverage of topics, which includes social sciences, business management, finance, economics, and allied fields. Large repositories of peer-reviewed abstracts and citations are known to be hosted by WoS and Scopus, and these resources are frequently used for systematic literature reviews (Durach, Wieland & Machuca, 2014). The articles that were obtained from these databases were screened and filtered using the UiTM e-database program. Based on previously published research, search terms were determined.

Database	Keyword used
Scopus	TITLE-ABS-KEY (("Organization Resilience" OR "Organization" OR "Resilience") AND ("Digital") AND ("Technology") AND ("Adoption") AND ("SMEs"))
Web of Science	TS= (("Organization Resilience" OR "Organization" OR "Resilience") AND ("Digital") AND ("Technology") AND ("Adoption") AND ("SMEs"))

Table 1: The search string used for the systematic review process

The identified list of keywords was used to create the search string in Table 1. Certain keyword combinations were used in the search process since the review questions were designed with titles and abstracts in mind. A total of 95 articles were produced using this strategy; 35 came from WoS and 60 from Scopus. Five records, however, had to be deleted from the dataset because they were duplicates. After that, the information was transferred to an Excel file for cleaning and sorting. Following an extensive analysis, an additional 20 publications were excluded from the dataset due to eligibility requirements (Table 2). Seventy pieces were thus kept for additional examination.

Criterion	Inclusion	Exclusion
Literature type	Journal article	Book series, books, book chapters, conference proceedings, editorials, non-research publications, reviews, and opinion pieces
Language	English	Non-English
Timeline	Between 2014 and 2024	<2014
Indexes	Social Science Citation Index, Business Management Citation Index (Web of Science)	Science Citation Indexed Expanded (Web of Science)

Table 2: The inclusion and exclusion criteria

Quality of Assessment

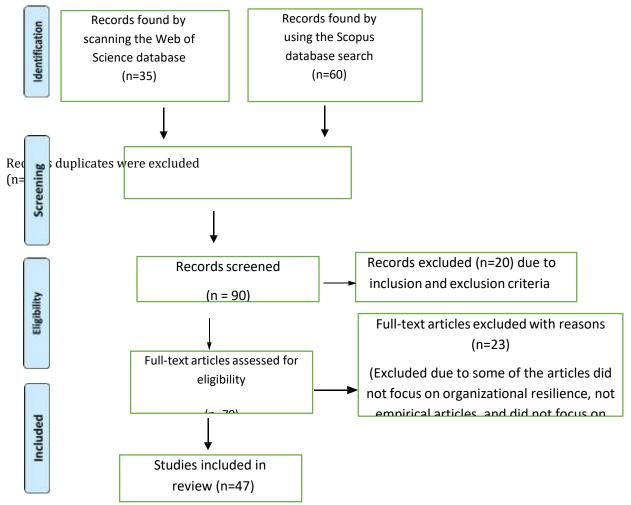

A mixed qualitative and quantitative research assessment method was used by two reviewers to examine 70 publications. After reading the articles, the reviewers classified their quality into three categories: good, mediocre, and poor. Reviewers' consensus over an article's quality led to its inclusion. In situations where there

was disagreement among the other reviewers, a third reviewer was assigned to evaluate the manuscript (Petticrew & Roberts, 2006). 23 studies were determined to be unsuitable for further investigation after this evaluation, leaving the remaining articles for examination.

Data Abstraction and Analysis

Evaluation and analysis were performed on the 47 papers that were still retrieved from Scopus and Web of Science (WoS). Reviewing the abstracts was the first step in the data extraction process. Next, the complete texts were carefully examined to find pertinent themes pertaining to organizational resilience. Researchers conducted a thematic analysis to uncover these themes by engaging in discussions to resolve any discrepancies or differing interpretations of the data until a consensus was reached on the identified themes. Subsequently, themes were refined and renamed as needed, and the details were presented in a structured manner. The classification of research themes is discussed in Section 5.

4. Results

An extensive and methodical review of the literature revealed a trend of increasing interest in the field of organizational resilience through the implementation of digital technologies. According to the results, 2023 will have the most articles published in this field. The year 2024, with 11 articles, comes next (Figure 2). In 2015, the research area of organizational resilience through digital technology adoption was just getting started, with only one article published. Organizational resilience (OR) is becoming more and more apparent to business owners as a means of expanding their enterprises and safeguarding their long-term viability

(Canhoto et al., 2021). For example, during COVID-19, numerous businesses were compelled to close their operations due to state-wide mandates from various countries across the world.

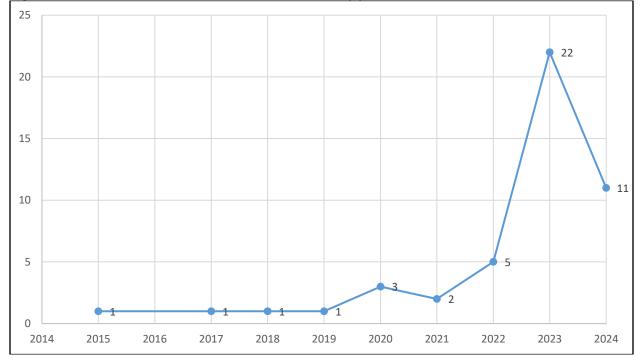

Figure 2: Publication distribution of reviewed articles by year

Recently, the Technology-Organization-Environment (TOE) paradigm has become the main underpinning theory in research. This theory was applied in a number of studies, including those by Giua et al. (2022), Branstad and Solem (2020), Makinde et al. (2022), and Skare and Ribeiro Soriano (2021). The information systems industry first developed the Technology Acceptance and Utilization for the TOE framework to illustrate how various factors, including the technology's features, the organizational context, and the external environment, affect new technology adoption and utilization (Ricci et al., 2021). Research on the adoption of digital technologies by Barrenho et al. (2021), Branstad and Solem (2020), Dearing and Cox (2018), and Makovhololo and Batyashe (2017) demonstrates the extensive usage of the Theory of Diffusion of Innovation (DOI) in the past 10 years. However, limited studies focused on organizational resilience. Details are presented in Figure 3.

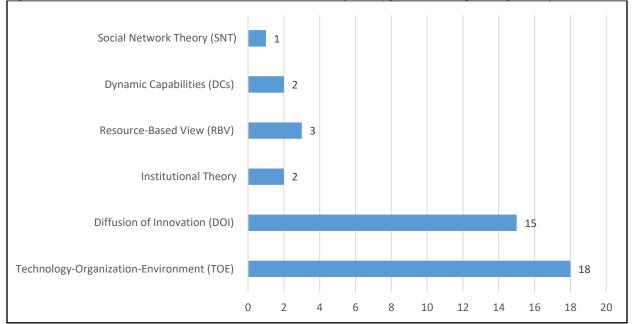

Figure 3: Publication distribution of reviewed articles by the types of underpinning theory

The research methodology distribution in the papers that were reviewed is shown in Figure 4. About 34 and 9 of the examined papers used qualitative and quantitative techniques, respectively. Only four of the study's publications used a hybrid method. Research examining technology readiness, e-commerce uptake, top management support, and SME performance has been known to employ the quantitative technique (Jiao et al., 2022; Omrani et al., 2024; Roundy et al., 2017).

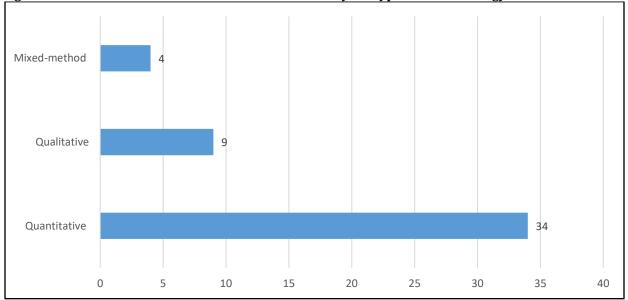

Figure 4: Publication distribution of reviewed articles by the types of methodology

The analysis of journals published on organizational resilience through digital technology adoption from 2014 to 2024 is shown in Figure 5. Based on the assessment, three publications from the Journal of Technological Forecasting and Social Change and two from the Journal of Business Research and Administrative Science indicated that the latter is a major venue for sharing research on digital adoption. Because of its specialized emphasis and established reputation in the field, the Journal of Technological Forecasting and Social Change

(JTFS) has become an essential forum for sharing research on digital adoption. JTFS gives academics a platform to disseminate their most recent studies on societal change, technology forecasting, and the uptake of new technologies. The multidisciplinary approach of the magazine facilitates the examination of several elements of digital adoption, encompassing both the technological and socio-economic dimensions. In addition, JTFS is well known for its comprehensive peer-review process, which ensures the validity and quality of the research that is published. Academics' regard for the publication contributes significantly to its status as a trustworthy platform for exchanging research on digital adoption. Branstad and Solem's 2020 study, which looked at the factors affecting SMEs' adoption of digital technology, demonstrates the significance of JTFS in this sector. Apart from contributing to the existing knowledge base on the topic, the research provided valuable insights into the opportunities and challenges associated with the use of digital technologies. Branstad and Solem (2020) made sure that a large audience of academics, policymakers, and business professionals interested in comprehending and helping SMEs implement digital technology could access their study by publishing it in JTFS.

Figure 5: Publication distribution of reviewed articles by journal

Discussion of Research Themes

The primary topics arising from the studies released between 2014 and 2024 are the focus of this section. The themes derived from the completed articles were produced through the application of thematic analysis. Five primary issues emerged from the review: organizational resilience, innovation, digital transformation, business performance, and adoption of digital technology. The findings offer a thorough examination of the adaptation strategies used in organizational resilience nowadays (see Figure 6). Details of the five major themes are discussed below.

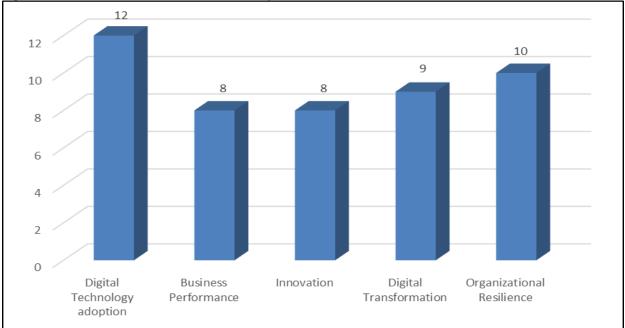

Figure 6: Distribution of reviewed articles by research theme

Digital Technology Adoption

Among the 47 studies reviewed, 12 specifically concentrated on digital technology adoption over the decade covered by the article, underscoring a strong interest in examining the dynamics, implications, and strategies involved in this area. Digital adoption refers to the process by which users, including employees and consumers, are trained to efficiently use new technologies—such as software, applications, and websites—so they can fully benefit from digital tools and solutions (Skare & Riberio Soriano, 2021). SMEs, or medium-sized enterprises, are frequently regarded as important players in both established and emerging economies. Information and communication technology (ICT) and e-commerce adoption hurdles have been studied previously in relation to organizational resilience, with a focus on industrialized nations (Makinde et al., 2022). SMEs can leverage digital technologies to modify and synchronize their business strategies.

Business Performance

Evaluating a company's performance is critical to determining if it has achieved its goals (Akbar et al., 2020) and plays a major role in investment choices (Ribau et al., 2017). Researchers frequently look at many aspects that affect the problems or success of businesses. Financial performance, operational efficiency, innovation, adaptability, and market performance are the main areas of attention when analyzing SMEs' performance. Cegarra-Navarro et al. (2016) state that although firm performance is an often-discussed subject, there isn't a single definition for it. In general, it may be seen as either the quantification of a company's operations that lead to goal accomplishment (Cegarra-Navarro et al., 2016) or as an organization's achievement measured against particular criteria (Eikelenboom & de Jong, 2019). Even after a great deal of research, performance is still viewed as a complicated, multifaceted phenomenon (Mubarak et al., 2019).

Innovation

Innovation is crucial for organizations to excel in a dynamic and competitive environment. Embracing innovation promotes growth, increases efficiency, improves customer satisfaction, and enhances overall resilience and market competitiveness (Aizstrauta et al., 2015). By emphasizing innovation, businesses can pave the way for sustained success and longevity. Existing literature highlights the substantial influence of ambidextrous innovation on organizational evolution and adaptation (Branstad & Solem, 2020). Ambidextrous innovation involves traits such as attentiveness to evolving markets, continuous learning and experimentation, and strategic realignment of resources, and capabilities during the innovation journey (Arunachalam et al., 2022).

Digital Transformation

Utilizing information, computers, networking, and communication technologies to integrate internal and external resources is a key component of an organization's digital transformation (Mergel et al., 2019). According to Verhoef et al. (2021), the purpose of this integration is to change the organization's vision, strategy, structure, capabilities, procedures, and culture to better match it with the rapidly evolving digital environment. Scholars have examined in considerable depth the connection between effective organizations and digital technologies. The development of business models (Ebert & Duarte, 2018) and the effect of technical improvements on organizational vulnerability (Verhoef et al., 2021) are often the two primary grounds of dispute when addressing digital transformation. Porfírio et al. (2021) state that experts support the adoption of digital transformation approaches to assist organizations in achieving long-term, sustainable goals by understanding the relationship between digital transformation and the external environment.

Organizational Resilience

However, organizational resilience was the subject of ten of the 47 studies that were examined overall. Organizational resilience is the capacity of an organization to endure significant disruptions in operations caused by unforeseen or catastrophic events. According to this skill, the company can continue functioning outside of its set bounds without suffering significant losses (Herbane, 2019). The idea investigates how companies respond to external risks including natural disasters, diseases like the COVID-19 pandemic, and downturns in the industry or economy (Akpan et al., 2022). The value of organizational resilience in a setting that is uncertain and changing quickly has received a lot of attention lately (Annarelli et al., 2020). Specifically, service organizations need this resilience to be sustainable since they are more likely to be affected by sudden changes in the external environment (Akpan et al., 2022). Consequently, organizational resilience has become an essential element for service-oriented businesses in the current unpredictable economic landscape.

5. Conclusion and Future Research Agenda

To better understand organizational resilience and digital technology uptake among SMEs, this research has thoroughly evaluated the corpus of existing literature. In today's fast-paced and cutthroat business world, understanding organizational resilience is becoming more and more important for a company's survival and growth. 47 pertinent articles have been found after a comprehensive investigation of two databases. The five primary research topics that emerged from the use of the theme analysis approach are innovation, business performance, organizational resilience, digital transformation, and adoption of digital technology.

According to Miranda et al. (2016), the adoption of new technology is often driven by the objective of "altering the organization's current state to pursue enhancements" to provide a product or service that fulfills consumer satisfaction. This is often done in an attempt to promote innovation. Process reorganization is a tactic that businesses are using increasingly frequently to enhance internal resources and achieve cost-cutting goals so they can maintain their competitiveness in the market. However, resilience is seen as a complex idea that deals with how a group of people and an organization react to uncertainty (Do et al., 2022). Most studies on resilience are based on two main viewpoints: (1) emphasizing fixed human qualities and skills, and (2) emphasizing a process marked by ongoing little improvements (He et al., 2022). As per Do et al. (2022), the initial perspective focuses on the present and defines resilience as the capacity to promptly return to pre-crisis performance levels following an unforeseen disaster. Personal qualities have an impact on this skill. According to the second point of view, organizations continuously evolve and become more capable of managing difficult situations by accumulating experiences and the knowledge that comes from those experiences.

Research on other topics including innovation, corporate performance, and digital transformation has been less focused in the last 10 years. Regarding digital transformation, Priyono et al. (2020) proposed that contextual variables might impact the degree to which SMEs adopt digital transformation. Three distinct paths were delineated by them: small and medium-sized enterprises (SMEs) possessing advanced digital capabilities expedite their shift towards fully digitalized operations; those confronting liquidity constraints but lacking digital maturity digitize solely their sales function; and SMEs with limited digital skills but robust social capital support opt for a different path. To boost business performance, Harini et al. (2023) stressed the need to foster entrepreneurial skills and e-commerce adoption for SMEs. They argued that leveraging e-commerce in operational and marketing domains can lead to enhanced SME performance. Lastly, in the realm of innovation, Zhang et al. 2021) underscored its significant impact on organizational growth and adaptation. Meanwhile, Arunachalam et al. (2022) highlighted innovation as attributes of essential elements, such as market responsiveness, continuous learning, and resource reconfiguration, in the innovation process.

While the significance of enhancing organizational resilience through the use of digital technology by SMEs is becoming more widely recognized, several study topics still require further attention. The body of research suggests that 34 papers are primarily quantitative, with 9 qualitative investigations and 4 using a mixed-method approach. Consequently, it is advised that more focus be placed on qualitative or mixed-method approaches in future research. It is necessary to go deeper into case studies and use other inductive or interpretive methodologies to comprehend how and why the adoption of digital technology might strengthen organizational resilience. A deeper investigation of organizational resilience can be accomplished using qualitative designs, which will produce new insights.

Corresponding Author: Noorihan Abdul Rahman

Abstract: Nowadays, digital technology has been an important element in assisting the community in their daily routine. During the COVID-19 era, The Special Committee for Ensuring Access to COVID-19 Vaccine Supply (JKJAV) has been initiated to assist the health and well-being of Malaysian citizens in recovering from the COVID-19 pandemic. *MySejahtera*, a healthcare application technology, has been used by Malaysian citizens for seeking vaccination information as well as updating their health status. While there are benefits to using the application, there is still a challenge in using the technology among senior citizens. This study aims to investigate digital barriers to using a healthcare application, known as *MySejahtera*, among senior citizens during the Covid-19 era. Convergent parallel mixed method research design is initiated to produce a sentiment analysis for identifying digital barriers issues and challenges among senior citizens in Kelantan. 5 respondents aged from 60 to 80 years old were interviewed to obtain their sentiments on using digital technology for vaccination information and Covid-19 news. This study highlights issues namely awareness of knowledge, misconception about digital technology, information quality and technology usage among the senior citizens in Kelantan. This study summarizes that there is a need to reduce digital barriers among senior citizens to ensure digital inclusion for their benefit in health and well-being.

Keywords: Digital Barriers, Senior Citizens, Digital Technology, Sentiment Analysis

1. Introduction

Nowadays, digitalization has been widely used in various sectors such as education, banking, manufacturing, telecommunication, entertainment, businesses, healthcare, and many more. Digital technology can help the community increase productivity, and improve communication and efficiency for better decision-making. While society is comfortable with using technology, there is still a challenge in adopting technology among senior citizens due to possible factors that may contribute to digital barriers (Kaushik, 2022). To elaborate, the digital barrier can be defined as a digital divide that prevents an individual from accessing information using technology (Calderón Gómez, 2018) whereas another study defines a digital barrier as the difficulty in accessing the resources and inability to use the content online or offline (Uzule & Verina, 2023). In 2020, during the COVID-19 pandemic, digitalization can be considered an important element for obtaining updates on COVID-19 news. In Kelantan, as reported in 16 Mei 2021 (Wahid, 2021), most of the individuals who were not present for the vaccination were senior citizens aged 60 and above thus has affected the wastage of vaccine doses in the community. The State Health Director, Datuk Dr Zaini Hussin has mentioned that the government at national and state levels needs to play its part in mobilizing their efforts towards making the vaccination program a success. Hence, this research will further investigate whether the vaccination information in Kelantan given by the government can be effectively disseminated among the senior citizens in Kelantan by using digital technologies. During the COVID-19 period, the Malaysian government required everyone in the country to install and use the MySejahtera mobile application as a digital communication tool to convey healthrelated information namely vaccinations, infectious disease tracker as well as their current location.

The focus of this paper is to emphasize the implication of digital barriers using the Digital Divide Theory (Coventry et al., 2022). Digital Divide Theory discusses how generational gaps in technology adoption create barriers, as many older adults grew up without digital devices, making them less familiar with modern technology. Their resistance to technology may lead to social isolation, limited access to information and

challenges in accessing essential services (Van Dijk, 2020) like healthcare (Reddy et al., 2022) which are currently increasing in online platforms. By exploring senior citizens' sentiments regarding digital technology, this paper can highlight possible digital barriers to using the *MySejahtera* application among senior citizens in Kelantan. To elaborate, sentiment analysis has grown rapidly in parallel with the development of the Internet.

It has been used not just among researchers but also among businesses, governments, and organizations (Sánchez-Rada and Iglesias 2019). Sentiment Analysis (SA) or Opinion Mining (OM) is the computational study of people's opinions, attitudes and emotions toward individuals, events or topics. These topics are most likely to be covered by reviews (Medhat et al., 2014). Sentiment analysis is widely used in many sectors. For instance, in marketing and customer service, they apply sentiment analysis in analyzing reviews, surveys, and social media to gauge customer satisfaction and identify areas for improvement. In the finance domain, sentiment analysis helps analyze news articles, social media, and financial reports to predict market trends and stock performance. For the healthcare sector, sentiment analysis evaluates patient reviews and feedback on healthcare services to improve patient care and service quality. The findings from this paper will be used to identify possible actions that will be taken to address the issue regarding digital barriers in Kelantan. While there are benefits in using *MySejahtera*, there is still a challenge in using the technology among senior citizens. Therefore, a study has been done to obtain a preliminary finding on the digital barrier situation among senior citizens in the selected area of Kelantan, especially during the COVID-19 pandemic. By producing sentiment analysis, this paper reveals lessons learned regarding the awareness of knowledge, misconceptions about digital technology, information quality and technology usage. Next, Section 2 provides an overview of sentiment analysis and related literature regarding possible factors that contribute to digital barriers to using technology.

2. Related Literature

This section consists of related literature on sentiment analysis and possible digital barriers according to the literature namely awareness of knowledge, misconception about digital technology, information quality and technology usage.

Digital barriers among senior citizens

According to the International Telecommunications Union (ITU), 4.1 billion people were connected to the Internet in 2019 and increasing (del Portillo et al., 2021). According to the Department of Statistics Malaysia (DOSM), the composition of the population aged 65 years and over increased from 7.2% in 2022 to 7.4% in 2023, encompassing 2.5 million people, indicating that Malaysia is experiencing population aging (DOSM, n.d.) while The Malaysian Communications and Multimedia Commission in its Internet Users Survey 2020 report (MCMC, 2020) showed that 11.3% of Malaysians were non-internet users. 51.8% of non-internet users were reported to be aged 60 and above. Based on the report, the common factors of not using the Internet were unconcern on the Internet, too old to learn the Internet and having no device for using the Internet. These factors have been discussed in the Senior Technology Acceptance and Adoption Model (STAM) (Renaud, K., Van Biljon, 2008) where different age factors influence older people's decision to use technology. The elderly population has difficulty in familiarizing themselves with and adopting digital tools and services (Vassilakopoulou & Hustad, 2023). However, a study (Niehaves & Plattfaut, 2010) that used the Unified Theory of Acceptance and Use of Technology (UTAUT) and TAM has reported that the elderly population can be encouraged to use digital technologies. In motivating the elderly population to use digital technologies, they need assistance, and encouragement from their support system to use user interface designs (Guner & Acarturk, 2020).

The digital divide can be described as the incapability to understand technology (Pinar, 2024) and this may lead to digital inequalities, especially in digitalized societies. Digital barriers may exist by gender, geographical location, age group, income and education (Acilar & Sæbø, 2023; Ndoya & Asongu, 2024; Pinar, 2024; Thomä, 2023; Zhao et al., 2023). By looking at the related literature regarding senior citizens and technology, hence, this paper highlights the existence of digital barriers issue which can impact unequal access to various information, and lack of education in a growing digital-based community and thus, this will lead to a feeling of ignorance or felling left out within the digital age.

Overview of sentiment analysis

Sentiment analysis is a research branch of text mining that can be used to analyze opinions from a text document. Sentiment analysis is carried out in many fields such as media social, e-commerce, e-business and many more. Sentiment analysis or opinion mining is subjective since it represents an individual's thoughts and presumptions about everything that occurs (Kumar et al., 2021). Another study mentioned that sentiment analysis is the process of determining an author's viewpoint on a specific subject and can be evaluated based on words, phrases, or texts (Nandwani & Verma, 2021). Various research implementing sentiment analysis has been carried out many times, including research conducted by (Fauziyyah, 2020) about the COVID-19 pandemic. Sentiment analysis is classifying a block of text as positive, negative, or neutral. It is also referred to as opinion mining, an approach to natural language processing (NLP) that identifies the emotional tone of the text. The main objective of sentiment analysis is to analyze people's opinions in a way that can help to improve the organization or process.

Awareness of knowledge

Awareness of knowledge can be defined as the consciousness of the mind about some issues (Collazos et al., 2002). In engaging individuals with health awareness, it is crucial to know the impact of COVID-19 on each individual and to understand how it can get worse. In this case, knowledge and attitude concerning the disease are useful for preventing, controlling, and mitigating infections during the outbreak (Razu et al., 2021). Therefore, the community members need to play their role in helping to reduce any health risks related to Covid-19. However, attitude can also have an impact on perceiving healthcare knowledge. A previous study done by (Frishammar et al., 2023) stated that negative attitudes and technology anxiety are the key barriers that are affecting technology adoption in healthcare technology and education activities are recommended to increase the trust and awareness in using digital healthcare platforms.

Misconceptions about digital technology

Digital and technological solutions are essential for better workplace safety and health outcomes (Gan & Seah, 2024). However, the community usually misunderstands and believes technology is only relevant for advanced medical procedures or specialized care, not daily health management or preventive measures. This misconception usually derives from a lack of awareness about using technology tools and their potential benefits to the individual's health status. There was an initiative made by The Australian Government that introduced an app-based contact tracing to prevent the spread of COVID-19 in April 2020. However, the download and use of the apps were not favorable due to privacy concerns (Thomas et al., 2020).

Information quality

Information quality can be defined as users' subjective judgment of whether the information characteristics meet their own needs and intended use (Jiang et al., 2021). According to Jiang et al., information quality refers to the user's assessment of whether the information meets their requirements and wants. In Malaysia, during the COVID-19 Movement Control Order, senior citizens utilized the Internet to search for relevant information regarding the different types of vaccines to determine which is the most suitable based on their body condition. This is a crucial aspect for them as providing healthcare to the elderly is always a top concern and they are the most vulnerable group because of their weakened immune systems. Consequently, a poor decision about healthcare could hurt their health (Lee et al., 2021).

Nowadays, the Internet has become a functional tool for communication and information searching and is not only used by young adults but also employed by senior citizens. According to (Ahmad et al., 2020), nine out of ten senior citizens use the Internet to get updates on current news rather than seeking health-related information. Previous research in the banking domain stated that fear of financial scams, lack of digital skills and lack of help are the reasons why senior citizens restrain themselves from using the Internet (Thomas et al., 2023).

Technology usage

In recent decades, significant technological advancements across various domains have profoundly enhanced the overall quality of life. The influence of digital technologies has notably improved efficiency in performing everyday tasks and increased awareness of individual health and wellness. Digital technologies offer various innovative solutions and benefits for senior citizens in maintaining and improving their health (Harris et al.,

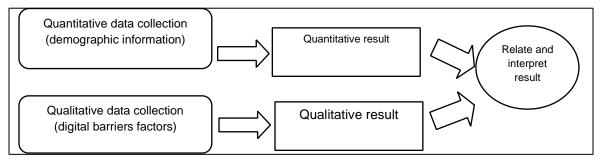

2022). The primary advantage of integrating technology into adult healthcare is remote health monitoring. Through technological innovations, senior citizens can now remotely monitor their health, allowing for the early detection of potential health issues and proactive management of chronic conditions. Utilizing wearable devices like smartwatches and fitness trackers, seniors can effortlessly track vital signs and activity levels, gaining valuable insights into their overall health status. This capability not only empowers older adults to take a proactive stance towards their well-being but also enables healthcare providers to intervene promptly and effectively when necessary (Fowe & Boot, 2022).

The second advantage is in terms of access to information and services. Technology serves as a valuable resource for health education and empowerment among senior citizens. Online health portals, mobile applications, and virtual support groups offer a wealth of information on health topics, disease management strategies, and preventive measures (Lai et al., 2023). By equipping older adults with knowledge and resources, technology empowers them to make informed decisions about their health and actively participate in their care. Furthermore, digital technology provides the best social support and engagement platform. Maintaining social connections is essential for seniors' mental and emotional well-being. Technology facilitates social support and engagement through social media platforms, online communities, and video communication tools. These digital channels enable older adults to stay connected with loved ones, participate in virtual social activities, and access peer support networks, thereby combating feelings of loneliness and isolation (Grey et al., 2024).

3. Research Methodology

This study has used a convergent parallel mixed-method research design to accomplish the research objectives. Figure 1 visualizes convergent parallel mixed method research design.

Figure 1: Convergent parallel mixed method research design

A convergent parallel mixed method research design is initiated to produce a preliminary sentiment analysis for identifying digital barriers issues and challenges among senior citizens in the selected areas of Kelantan such as Kota Bharu and Machang. The convergent parallel design occurs when the researcher uses concurrent timing to implement the qualitative and quantitative strands during the same phase of the research process (Rahman, 2014). This qualitative study that was conducted by using a sentiment analysis process was aimed to investigate digital barriers in using a healthcare application, known as *MySejahtera*, among senior citizens in the selected locations in Kota Bharu and Machang, Kelantan. By investigating digital barriers, this study can reveal a preliminary finding regarding the use of technology among senior citizens during the COVID-19 pandemic.

The research has its limitations in terms of the number of respondents obtained. With the challenging research environment during the Movement Control Order (MCO) in the year 2021, these respondents were selected by using consecutive sampling based on reachable and selected respondents' locations. First and foremost, this research has randomly selected 3 senior citizens located in a suburban area within the Machang area and 2 other senior citizens who are within the Kota Bharu area. Participation in the study was entirely voluntary. Before conducting the study, all respondents were aware of the purpose of the study and the confidentiality of the data. Each person participating in the interview was free to opt out of the session at any time. In this study, demographic data on 5 senior citizens has been quantitatively analyzed to obtain the relationship with the

qualitative result. For the qualitative data collection, 5 senior citizens have been interviewed regarding possible digital barriers that they have faced while using the application. The quantitative result and qualitative results are interpreted to produce a preliminary sentiment analysis for digital barriers during the COVID-19 pandemic. Using 5 structured interviews, 5 responses were obtained from five senior citizens aged over 60 years old from Machang and Kota Bharu which represented suburban and urban locations in Kelantan. The interviews were conducted based on a structured set of questions developed by using existing literature which consists of awareness of knowledge, misconceptions about digital technology, information quality and technology usage. The respondents were asked about their opinion towards Covid-19, vaccination information as well as their health status. Convergent parallel mixed method research design results sentiment on digital barriers among respondents during the COVID-19 pandemic. This study has methodological limitations which it has presented qualitative results based on only five healthy respondents and those respondents may or may not have any mobile phones.

4. Results and Discussion

This paper highlights a preliminary finding for identifying digital barriers based on age group, especially among senior citizens aged 60 and above. For sentiment analysis purposes, respondents were chosen from 60 years of age and older with three female and two male respondents. Two of the respondents did not use mobile phones while the remaining three respondents own a mobile phone with *MySejahtera* installed. Regarding the frequency of mobile usage, 2 out of 5 respondents used their mobile phones for less than two hours and the remaining three respondents used the mobile phone within two to eight hours. All of them spent around one to two hours seeking information about COVID-19. According to respondents' feedback, they agree that digital literacy affects awareness of Covid-19 however qualification may or may not influence the awareness of Covid-19 risks. The respondents were asked about their opinions regarding information dissemination on COVID-19. The authors have identified four categories related to digital barriers such as awareness of knowledge, misconception of technology, quality of information and information usage.

In this study, sentiment analysis was produced to quantify the amount of personal opinions, feelings, or personal views contained in the transcribed text from the interview session. The sentiment score and sentiment analysis result were reported as positive, neutral and negative scores. Figure 2 depicts steps to produce the sentiment score by performing the sentiment analysis process.

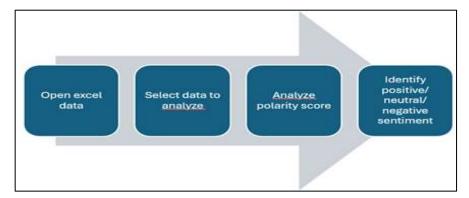

Figure 2: Sentiment analysis steps for producing sentiment score

According to Lohar et al. (2017), negative sentiment results score below 0.5, while sentiment neutral has a sentiment score equal to 0.5 and positive sentiment results in a sentiment score more than 0.5. By looking at the sentiment score, the study can conclude whether there are digital barriers issues that arose among respondents who have been selected in Kelantan.

Table 1 shows the awareness of knowledge regarding COVID-19 among the community. The questions in Table 1 have led to positive sentiments ranging from 0.69 to 0.97. From the interview session, the respondents felt positive and aware Covid-19 information can be obtained on television and social media platforms such as WhatsApp and YouTube application. Those respondents also agreed that vaccination can help to reduce the

Covid-19 effect. The respondents are also aware of the verified source of information on Covid-19. In summary, the respondents own the knowledge about Covid-19 based on their responses on Covid-19 symptoms and vaccination.

Table 1: Sentiment Polarit	y for Awareness of Knowledge
rubie il benennene i blai i	, for marchess of monieuge

Question	Sentiment Score	Sentiment
What is COVID-19? Do you know about COVID-19?	0.84	positive
What are the symptoms of COVID-19?	0.69	positive
How does COVID-19 influence the public?	0.78	positive
What is vaccination?	0.83	positive
What is the effect of vaccination?	0.77	positive
How does the vaccine affect the COVID-19 pandemic?	0.82	positive
Did you know where to get a booster shot?	0.73	positive
What are the things about COVID-19 and vaccines that	0.80	positive
attract public interest?		
Is television the source of information for rural areas?	0.97	positive
Are you aware that there are verified sources of	0.85	positive
information for COVID-19 on social media?		

Table 2: Sentiment Polarity for Misconception of Technology

Question	Sentiment Score	Sentiment
Give your opinion how to prevent from getting exposed to COVID-19	0.68	positive
Where does this disease come from?	0.76	positive
Is this vaccine necessary for improving health?	0.62	positive
How do you know whether information about COVID-19 information about vaccines is authentic?	0.66	positive
State your feelings when reading, seeing, and watching COVID-19 on social media/TV or radio.	0.38	negative

Table 2 reveals Sentiment Polarity for Misconception of Technology. This result shows the use of social media is useful in giving information on Covid-19. All the respondents understand and have negative sentiment, with a 0.38 sentiment score, after reading, seeing, or watching about COVID-19 on television or social media platforms. In summary, there is no issue with a misconception of technology since the sentiment on technology to obtain COVID-19 information is understood and the score indicates ranged from 0.62 to 0.76.

Table 3: Sentiment Polarity for Information Quality

Question	Sentiment Score	Sentiment
Did you understand the information given by the government?	0.71	positive
Do you know how the information is obtained?	0.69	positive
Did you trust the information given about COVID- 19?	0.72	positive
Do you think the information given is easy to understand?	0.78	positive

Table 3 concludes positive sentiment ranged from 0.69 to 0.78 regarding information quality on COVID-19 and vaccination. They believe that reliable information has been given to the public by using reliable channels on television. In investigating technology usage, the result in Table 4 shows positive sentiments toward the *MySejahtera* application, however, they have some difficulties in using QR code technology which yields a sentiment score of 0.45. This highlights that they accepted *MySejahtera* but they have limited knowledge of QR technology since the technology is new to them and they have no exposure to QR code. Generally, the technology usage is still within positive sentiment.

Question	Sentiment Score	Sentiment
Do you know what is <i>MySejahtera</i> ?	0.69	positive
How likely that you will be using a QR code in <i>MySejahtera</i> ?	0.45	negative
In your opinion, how social media can help to spread more news about COVID-19 and vaccines?	0.66	positive
Åre you aware that <i>MySejahtera</i> can be utilized for seeking health status?	0.66	positive

Table 4: Sentiment Polarity for Technology Usage

In summary, based on Table 1 to Table 4, the authors have elaborated on possible digital barriers among senior citizens. Firstly, in terms of awareness of knowledge, the senior citizens have previously heard about COVID-19, however, they did not know about the symptoms of the disease in detail. Secondly, in terms of the misconception of technology, the senior citizens mentioned that they only read or watch COVID-19 news on television as their news channel even though the social media platforms provide more options for seeking COVID-19 information. This is due to the inability to use and operate a smartphone by themselves.

In terms of information quality, the senior citizens were able to understand the content of the information obtained from either the television or from their family members whereas in terms of technology usage, the senior citizens understand the needs of *MySejahtera* application during the Covid-19 pandemic. However, they have insufficient knowledge regarding the QR code technology that is embedded in the application.

5. Conclusion

Nowadays, technology plays a major role in helping the community to gain information instantly. All generations including the senior citizens are inclusive in the technology adoption. However, there is still room for improvement in educating and supporting senior citizens to self-learn new technology. Proper guidance and tools must be prepared for them to allow ease of use for adopting technology in their daily life. The authors believe that currently there is no issue in accepting technology among senior citizens. Generally, they already understood why such technology is imposed in the current situation during the COVID-19 pandemic. Nonetheless, the caretaker or the community needs to be aware that senior citizens must also be continuously informed about the importance of using current technology such as QR codes to avoid digital barriers and feelings of ignorance. There must be a consistent effort by the community to educate senior citizens in using technology. In conclusion, this study summarizes that there is a need to reduce digital barriers among senior citizens to ensure digital inclusion for their benefit in health and well-being from time to time. There is also a plan to further investigate assistive technology for senior citizens to improve digital inclusion in society.

The limitation of this study is that it focuses on the general acceptance of technology among senior citizens without going into detail about the difficulties they encounter in real-world situations. Although the study highlights the value of educating and assisting senior citizens in adopting technology, it might not address individual differences in technological proficiency or the variety of demands of seniors with different levels of cognitive and physical abilities. Furthermore, the study's findings may be limited since it relied more on general observations and assumptions about senior citizens' understanding of technology during the COVID-19 pandemic rather than detailed, empirical data from a variety of senior citizen groups. The usefulness and accessibility of various assistive technologies, which are crucial to digital inclusion, are not given enough attention. Future work should aim to explore these obstacles and evaluate the effectiveness of various assistive technologies to enhance digital inclusion for senior citizens. This involves determining which tools and educational approaches are most effective in overcoming the digital barrier and enhancing usability. The study should also explore personalized support systems that consider individual differences in technological proficiency and accessibility requirements.

Unpacking the Link Between Big Five Personality Traits and Waqf Participation in The Malaysian Armed Forces

Mohd Johari Bin Hussain¹, Mohd Zawavi bin Zainal Abidin¹, Sallehuddin bin Ishak², Fahmi Zaidi bin Abdul Razak³, *Wan Hashridz Rizal bin Wan Abu Bakar¹ ¹Faculty of Islamic Studies, Sultan Ahmad Shah Pahang Islamic University (UnIPSAS), Malaysia ²Pahang State Secretary's Office, Malaysia ²Faculty of Management & Informatics, Sultan Ahmad Shah Pahang Islamic University (UnIPSAS), Malaysia *rizal@unipsas.edu.my, datininajoe75@gmail.com Corresponding Author: Wan Hashridz Rizal bin Wan Abu Bakar

Abstract: This research delves into the utilization of Personality Traits theory to comprehend the underlying motivations behind Waqf practices among military personnel. Implementing a structured questionnaire as the main tool for data collection, a total of 487 responses were secured. The research tools utilized in this study were derived from prevailing scholarly literature in the realm of personality psychology. The empirical findings of this study validate the substantial influence of personality traits, encompassing behavioral control and environmental components, on the inclination of military personnel to participate in endowment practices. This elucidates the complexities inherent in charitable contributions within this specific cohort. The discoveries underscore the importance of individual personality traits in shaping philanthropic behaviors among military personnel. Elements such as behavioral control and environmental factors play pivotal roles in molding the propensity towards Waqf practices within this distinct demographic. These insights harbor practical implications for policymakers, military institutions, and scholars, furnishing a more profound insight into how personality traits and environmental elements impact endowment behaviors. This investigation emphasizes the necessity of taking into account personality traits when scrutinizing charitable endeavors among military personnel. By comprehending these motivations, policymakers and military entities can more effectively endorse and bolster Waqf practices among their members. Furthermore, these results contribute to the wider discussion on the convergence of personality psychology and philanthropy, enhancing our understanding of charitable behaviors in specialized settings such as the military.

Keywords: Waqf, Personality Traits, Military Personnel.

1. Introduction and Background

Waqf has played a distinct role in the field of economics and consistently displays potential. It is perceived as a crucial economic institution that promotes economic activities while ensuring the benefits are directed toward a particular sector of the population. In Islamic tradition, Waqf denotes the practice of allocating resources or advantages for the betterment and welfare of the public, overseen by designated entities such as relatives or organizations to promote societal well-being (S. Ismail et al., 2023) and (Ayatina, 2023).

The evolution of Waqf practices within the Malaysian Armed Forces can be traced back to the inception of the Malaysian Armed Forces Religious Corps (KAGAT) in the year 1985 (Jalal et al., 2019). Nevertheless, according to Kamaruddin et al., (2022), obstacles exist in the execution of waqf reporting methodologies in Malaysia, as issues like the lack of uniform reporting criteria and restricted reporting avenues impact the effectiveness of waqf reporting within establishments. Studies by Sapir et al., (2023) and Abd Mutalib et al., (2019) show that the recognition of waqf in Malaysia, specifically cash waqf, is encountering obstacles attributed to a multitude of factors. Research demonstrates a deficiency in awareness and comprehension of cash waqf for the advancement of socio-economic aspects is associated with societal norms, insufficient promotion, and a deficient comprehension of this particular type of waqf. Despite the probable advantages of cash waqf in strengthening the Muslim economy, it is vital to deal with the awareness and application gaps to increase waqf acceptance in Malaysia.

2. Literature Review

The Big Five personality traits, regularly alluded to as the Five Factor Model, involve five unmistakable

dimensions: openness, conscientiousness, neuroticism, extraversion, and agreeableness (Stahlmann et al., 2023, Canales-Ronda, 2023 and Ji & Esqueda, 2022).

These characteristics play a significant role in various domains of life, encompassing civic participation, occupational performance, substance abuse, and phenomena such as phubbing. Scholarly investigations suggest that extraversion and conscientiousness wield notable influence in forecasting sales effectiveness and work conduct, whereas neuroticism tends to yield adverse consequences. Moreover, heightened neuroticism, diminished agreeableness, and reduced conscientiousness are frequently linked with substance misuse, with certain nuances in the impact of each trait on distinct forms of substance consumption. In addition, conscientiousness and intellect have been observed to exert a detrimental effect on phubbing conduct among young individuals. A profound grasp of these Big Five personality traits is imperative for grasping individual disparities and actions. The examination of the Big Five Personality Traits by Ismail, (2017) has been conducted in diverse settings, including Islamic financial planning, innovative work behavior within Islamic banks, and waqf commitment. Studies indicate that specific personality traits are influential in shaping behaviors associated with waqf and financial choices. Scholarly works on Islamic financial planning have proven that conscientiousness and openness to experience play a vital role as moderators in the relationship between Islamic financial literacy and financial planning. The results by Haris et al., (2021) imply that individual qualities, such as openness to new experiences, conscientiousness, and potentially additional traits specified in the Big Five model, might affect individuals' outlooks and decisions regarding waqf donations.

Therefore, we propose the following hypothesis:

H1: Extraversion will be positively related to waqf acceptance.

H2: Agreeableness will be positively related to waqf acceptance.

H3: Openness will be positively related to waqf acceptance.

H4: Conscientiousness will be positively related to waqf acceptance.

H5: Neuroticism will be negatively related to waqf acceptance.

Figure 1: Research Framework

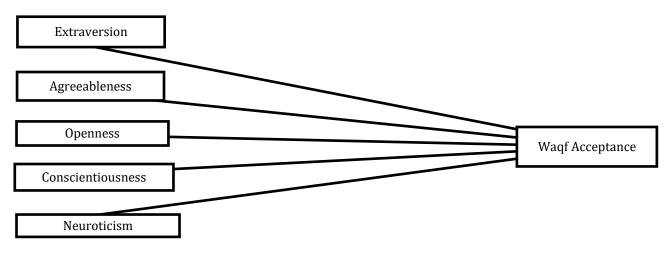

Figure 2: Research Model

3. Research Methodology

The present study examines the big five personality traits of Waqf acceptance among Military Armed Forces personnel in Malaysia. According to Wang et al., (2020) when the examiner chooses to achieve the research objective within a designated timeframe, they must employ a cross-sectional survey design. This approach facilitates an economical and concurrent assessment of the outcomes and exposures of the study subjects. As

asserted by Chang et al., (2010), to mitigate the common method bias, the participants were provided with an assurance of confidentiality and anonymity to elicit truthful responses. As recommended by Eichhorn,(2014), respondents' inclination to answer may be influenced if they encounter ambiguity while completing the questionnaire, which is an unfavorable situation. The current investigation utilized a five-point Likert Scale to gather data by grouping significant objects. In this specific research endeavor, the researcher employed a five-point Likert Scale to collect data, where the objects of substantial importance were brought together.

It is essential to underscore that within this range, a rating of 1 denotes a notable variation in opinions, whereas a rating of 2 suggests disagreement and a rating of 3 suggests impartiality. Conversely, a rating of 4 denotes agreement with the presented stance, and a rating of 5 signifies a strong endorsement or alignment with the viewpoint in question. The choice of the non-probability sampling technique was primarily determined by the absence of a sampling frame that the researcher could access. Moreover, it was also influenced by the confidentiality of the army personnel. The utilization of purposive sampling technique has been employed with great care to select individuals who are currently serving in the armed forces stationed at different camps throughout Malaysia. These selected individuals have been invited to participate as respondents in this research endeavor. Moreover, when considering the G*Power analysis, particularly about the F-Test in Linear Multiple Regression: Fixed model with R2 deviation from zero, it was concluded that a minimum sample size of 138 was advised for this specific research. Nonetheless, it is noteworthy that the investigator managed to recruit a total of 487 participants for the study, surpassing the recommended minimum necessity. The technique utilized for gathering information was Google Forms, which was employed to distribute the survey to the participants. The participants then completed the survey in an Excel spreadsheet, ensuring the exclusion of any inaccurate data and ensuring the accuracy and reliability of the collected data.

4. Results

The research model elucidates about 39 % of the determinants that exert an influence on the engagement of the Malaysian Armed Forces in waqf. The outcomes of the conjectures testing are laid out in **Error! Reference s ource not found.** The study conducted by H1 analyzed the relationship between extraversion and waqf acceptance, whereas H5 investigated the connection between neuroticism and waqf acceptance. The findings revealed that neither factor made a significant contribution to waqf acceptance. On the other hand, H2 investigated the relationship between agreeableness and waqf acceptance and was found to be significant (β = 0.266, p < 0.001); H3 was also found to be significant with an investigated openness relationship with waqf acceptance (β = 0.110, p < 0.05), alongside H4's conscientiousness relationship with waqf acceptance (β = 0.321, p < 0.001). It can be concluded that H2, H3, and H4 are supported, but H1 and H5 are rejected.

Variable	hypothesis	Beta value	T Statistics	P Values	R ²	Remark
Extraversion	Extraversion will be positively related to waqf acceptance.	019	414	.679		Not Supported
Agreeableness	Agreeableness will be positively related to waqf acceptance.	.266	4.619	.000		Supported
Openness	Openness will be positively related to waqf acceptance.	.110	2.046	.041	0.390	Supported
Conscientiousness	Conscientiousness will be positively related to waqf acceptance.	.321	4.820	.000		Supported
Neuroticism	Neuroticism will be negatively related to waqf acceptance.	001	032	.974		Not Supported

Discussion

As elucidated in the literature review section, numerous prior studies have also employed the big five personality traits variables about waqf acceptance. In this investigation, only three out of the five variables scrutinized displayed significant support. The findings support the study by Faturohman et al., (2020) and (Asni & Sulong, 2017) Which shows Agreeableness assumes a notable function in multiple facets concerning waqf. This emerging recognition implies that agreeableness, whether on an individual or societal scale, may impact perceptions towards novel variations of waqf, including cash waqf. The findings support the previous study (Tarchoun & Ghraieb, 2022) which indicates that openness exerts a noteworthy influence on the interconnection among economic advancement, charitable giving, and communal backing within Muslim environments. This finding is consistent with the study by Nordin & Khalid, (2022) which shows Conscientiousness is known to have a notable impact on a range of factors concerning socioeconomic development and personal conduct. Studies indicate a positive correlation between conscientiousness and thriving in the context of high school educators. Nevertheless, it is important to highlight that extraversion and neuroticism did not demonstrate statistically significant associations with Waqf acceptance within this particular framework. Despite the deviation of these results from initial assumptions, they emphasize the intricate complexity of personality effects and the requirement for additional investigation across various environments.

5. Conclusion

This study's ramifications go well beyond academic spheres, offering valuable insights for policymakers, military establishments, and researchers. By acknowledging the influence of individual traits on participation in waqf, policymakers and military organizations can develop specific approaches to effectively encourage and bolster charitable activities among military personnel. Moreover, this research contributes to the wider discussion on the intersection of personality psychology and philanthropy, enriching our comprehension of benevolent actions in specialized environments like the military. It emphasizes the significance of taking into account personal variations when examining and advocating for charitable initiatives. There exist numerous opportunities for forthcoming research to investigate such as conducting a replication of this research across various cultural settings or within diverse sectors of the armed forces has the potential to offer a more thorough analysis of the correlation between personality characteristics and the acceptance of Waqf. Longitudinal research endeavors can monitor alterations in individual characteristics and engagement with Waqf over a period, offering a valuable understanding of the evolving dynamics of these connections.

Social Media Content among MSMEs: A Content Analysis

*Marha Abdol Ghapar¹, Azyanee Luqman² ¹Arshad Ayub Graduate Business School, Universiti Teknologi MARA Cawangan Kelantan Kampus, Kota Bharu, Malaysia ²Faculty of Business and Management, Universiti Teknologi MARA Cawangan Kelantan Kampus, Kota Bharu, Malaysia *marha@uitm.edu.my, azyanee@uitm.edu.my Corresponding Author: Marha Abdol Ghapar

Abstract: This study provides a thorough content analysis of previous research and scholarly works on social media usage and its content by micro, small, and medium enterprises (MSMEs). Understanding the many viewpoints and insights found in the literature is crucial, given the growing impact of social media on business dynamics. This study intends to uncover recurrent topics, approaches, trends, and knowledge gaps regarding MSMEs' social media content strategy through a comprehensive review and analysis of previous research. The goal of this research is to provide a thorough understanding of the opportunities and problems faced by MSMEs in creating effective social media content by combining and critically analyzing the corpus of existing work. The analysis's conclusions not only synthesize the body of knowledge now available but also guide future studies and provide valuable suggestions for improving MSMEs' social media initiatives.

Keywords: Business performance, consumer engagement, content analysis, social media content.

1. Introduction

Micro, small, and medium enterprises (MSMEs) are utilizing social media in previously unheard-of ways as the global economic landscape rapidly changes. Innovation, agility, and the strategic use of digital technologies characterize the current social media landscape among MSMEs, which includes increasing sales and cultivating customer connections, as well as leveraging platforms to establish brand presence and engage with varied audiences. MSMEs all over the world are currently acknowledged to be utilizing a variety of social media channels, which offer a wide range of platforms and changing trends to establish their brand, broaden their audience, and prosper in a digital ecosystem that is becoming more interconnected by the day. Apart from that, MSMEs can also promote growth and competitiveness in the digital marketplace by strategically leveraging social media to level the playing field with larger competitors.

In a business environment that is rapidly shifting, MSMEs refrain from participating in the dynamic world of social media and run the risk of falling behind. Without a social media presence, businesses may find it challenging to build their brand, engage with their target market, and stay competitive in a time when digital connectedness is essential to consumer behavior. Loss of visibility, fewer channels for marketing and promotion, and lost chances for consumer interaction might arise from being absent from these platforms. MSMEs not utilizing social media may also find it difficult to adjust to shifting market dynamics as customer tastes continue to move toward online interactions and e-commerce, which could result in reduced market share and growth prospects. Alas, a business's capacity to engage with its customers may be hampered by its absence from the social media sphere, which ultimately jeopardizes its' long-term viability and expansion.

Content analysis is the process of methodically examining written, visual, or auditory material to find themes, patterns, and connections within the information. Therefore, this content analysis paper is part of the effort to understand the pattern of past studies regarding the social media landscape while uncovering the gap that requires further investigation by future researchers.

2. Literature Review

MSMEs' Performance in Malaysia

The COVID-19 pandemic has had a significant impact on Malaysia's MSMEs, causing them to be one of the sectors that have been struck the hardest (Department of Statistics Malaysia, 2023). Entering the endemic phase, in connection with the Micro, Small and Medium Enterprise (MSME) Week, which was held nationwide

from June 10 to July 4, 2022, SME Corporation Malaysia reportedly set a sales target of RM20 million, including through business matches, and anticipated that it would give business owners that have recently been impacted by the unpredictability of the world economy a chance to revitalize and restart ventures through a face-to-face and also online sales process, the MyAssist MSME platform (Bernama, 2022). With MSMEs accounting for 99.2% of all business establishments in Malaysia, food processing is the industry with the highest share of businesses, where micro businesses play a critical role in a nation's prosperity by creating jobs and fostering economic expansion (Zakaria et al., 2022). There are more than 1.15 million MSMEs across the nation, and they account for 97.2% of all business establishments in Malaysia and employ about 70% of the labor force (The Star, 2021).

Given the significant contribution of MSMEs to a nation's GDP, numerous previous research has been carried out to explore the elements that may influence their business performance. To cultivate lasting relationships and promote sustainable business expansion, MSMEs in Malaysia should strive to connect with consumers on a deeper level, extending beyond just sales and marketing efforts. As per Kechik et al. (2023), to successfully transform Malaysia into an entrepreneurial nation by 2030, it is highly encouraged for all MSME business owners to actively leverage ICT technologies, such as social media, to have a strong online presence for their firms. Salam and Hoque (2019) emphasized that MSMEs must prioritize social media to enhance their performance and ensure long-term success. SME Association national president Ding Hong Sing agreed with the government in The Star (2023) that the government is providing incentives and subsidies as part of its effort to prioritize MSMEs in the updated 2023 Budget to assist them in increasing their output and advancing towards automation and digitalization. Among the reasons MSMEs are behind in adopting digital transition is that most of the time, businesses must reconsider and develop new business models (Bouwman et al., 2019).

Additionally, Yin (2023) published in The Star that to reduce reliance on foreign capital, Malaysia should concentrate on growing domestic MSMEs through automation and digitalization which will help offset the decline in foreign direct investment (FDI). Moreover, since digitalization was a game changer in Budget 2023, both the public and private sectors have been urged to continuously work on digitalizing MSMEs, with an emphasis on high-growth industries (The Star, 2022). Budget 2024 also focuses on Malaysia's MSMEs' digitalization with multiple initiatives planned out by the government to increase technological adaptation, and an article in SME Magazine Asia (2023) urges MSMEs to take advantage of these chances by embracing digitalization, automation, and online platforms to turn obstacles into opportunities for development and innovation.

Social Media Content

Pal et al. (2022) agreed that small businesses had few options for promoting their brands before the advent of digital media, which prevented them from growing. The emergence of social media platforms has provided MSME players with exciting new possibilities and avenues for growth (Ikramuddin et al., 2021). Social media has become the modern platform not only for casual social conversations but also for a wide range of other purposes, one of them fostering meaningful interactions between customers and enterprises. Social media enables businesses to communicate openly with their customers, allowing them to have a deeper understanding of their customers' expectations. This understanding motivates businesses to promptly and efficiently address those needs (Tajudeen et al., 2018).

A common definition of content creation frequently emphasized as being extremely significant by numerous sources is content posted on social media networks. However, minimal research has been done to determine the time and resources required for content creation (Kraus et al., 2019). Yu et al. (2023) claimed that social media content attributes including credibility, personalization, informativeness, incentives, and entertainment have the power to impact consumer behavior and attitude, ultimately resulting in engagement. Social media offers businesses an excellent opportunity to connect with customers and build strong relationships. By using interactive content like polls, images, and videos, businesses can engage with their audience and enhance brand awareness and loyalty (Sharma et al., 2024). In the fashion business landscape, Hsiao et al. (2020) found that the popularity of the content creator has a positive correlation with the popularity of the post, indicating that private brand owners can and should leverage well-known content creators to market their products and labels.

Social media also provides a platform for promotion, publicity, brand development, and market research. As mentioned by Salam and Hoque (2019), MSMEs can improve performance through strategic and efficient social media use. In the meantime, Pal et al. (2022) testified that consumers, in general, participated in three categories of social media activities: producing content, contributing to the creation of content, and consuming brand-related content.

Uses and Gratifications Theory

According to Katz and Foulkes (1962), people select media that meets their requirements and satisfies their desires, which allows them to get rewards or compensation, social contact, enjoyment and relaxation, and knowledge improvement. The approach, known as the Uses and Gratifications approach (UGT), deviates greatly from the conventional wisdom which holds that the media may dramatically alter people's views, opinions, and behaviors. UGT is a theory of motivation that places users' goal-oriented behavior and socio-psychological requirements in the context of a technology platform (Maulida et al., 2023). Liu et al. (2023) added that UGT had been used extensively in past research to investigate people's media consumption behaviors and motivations, where people are likely to utilize the same form of media in different contexts and with varying degrees of satisfaction.

Kaur et al. (2020) contributed to an enhanced comprehension of the purchase habits of virtual items through an adaptation of UGT's framework. Dolan et al. (2019) categorized the social media content in their study based on UGT, looking into the impact on consumer engagement. Then, there was an earlier study by the same group of scholars rooted in UGT, on strategies businesses may use to encourage good interaction among social media followers while also discouraging negative engagement (Dolan et al., 2016).

Stimulus-Organism-Response Model

The Stimulus-Organism-Response (S-O-R) Model, discovered by Mehrabian and Russell (1974), explains how stimuli (S) can elicit emotional reactions in individuals or organisms (O), which in turn can result in either acceptance or avoidance behavioral responses (R). In the context of the current study at hand, the stimulus would be the social media content, while consumer engagement acts as organisms' emotional reactions, which ultimately encourage responses that impact organizations' performance.

There are an abundant number of past studies that have adapted the S-O-R Model in their studies. One of them was by Lingling and Ye (2023), who examine, from an S-O-R viewpoint, how digital empowerment affects open innovation. On top of that, Quan et al. (2023) also utilized the S-O-R Model combined with the Commitment-Trust Theory and found that airport service quality does affect customer satisfaction. Meanwhile, Lin and Shen (2023) established a structural model of the consumers' purchasing intents on community e-commerce platforms based on the SOR model.

According to Kumar et al. (2023), an environmental stimulus can affect a person's cognitive and emotional reactions, where the S-O-R framework is used to study how customers behave in response to different retail stimuli. Consequently, the S-O-R paradigm highlights that an organism's internal state acts as a mediator in the interaction between stimulus and reaction rather than a direct cause and effect. It implies that different people may react differently to the same stimulus depending on their innate traits, including personality, beliefs, attitudes, and life experiences. This model aids researchers and practitioners in understanding how different elements combine to affect human behavior.

3. Methodology

Research Question

The research question was developed to proceed with the content analysis in the subject matter: 'How Did Social Media Content and Consumer Engagement Influence Business Performance?'. The research question was formulated to uncover past studies conducted in the area and understand the patterns, findings, and contributions that relate to social media content, consumer engagement, and business performance.

Systematic Search Strategy

The Scopus database was utilized in conducting a systematic search. By including relevant potential synonyms,

the string search yielded 70 documents with the following keywords: 'social media', 'social media content', 'business performance', and 'consumer engagement'. The exact search string using Boolean operators such as AND and OR with wild card characters used where applicable was:

TITLE-ABS-KEY (("social media" OR "social media platform*" OR "social network" OR "social network site*") AND ("social media content*" OR "social media post*" OR "social media publishing*") AND ("consumer engagement" OR "engagement" OR "user engagement" OR "interactive*") AND ("business performance" OR "growth" OR "profit*" OR "sale*"))

However, some documents were unrelated in terms of language, area, and type. Thus, the researcher decided to further filter the search to include only relevant articles. There were 25 publications found when the researcher narrowed the search to include only articles in English on business, management, and accounting. Frequency analysis was done on all 25 articles to identify the keywords that stand out and the pattern of past studies related to the social media scene. The search string after the filter was:

TITLE-ABS-KEY (("social media" OR "social media platform*" OR "social network" OR "social network site*") AND ("social media content*" OR "social media post*" OR "social media publishing*") AND ("consumer engagement" OR "engagement" OR "user engagement" OR "interactive*") AND ("business performance" OR "growth" OR "profit*" OR "sale*") AND (LIMIT-TO(SUBJAREA, "BUSI")) AND (LIMIT-TO(DOCTYPE, "ar")) AND (LIMIT-TO(LANGUAGE, "English"))

Then, the articles were further filtered, and only articles related precisely to the area the researcher sought were selected. There were only ten articles selected for the final content analysis. Qualitative analysis of the articles was done manually, through thematic analysis that helped categorize the social media content. Results and findings were depicted in tables in the next subsection.

4. Results and Analyses

Descriptive Analysis

Figure 1 displays the selected articles' publishing year, where the majority of the articles, 10 of them, were published in 2023. Then three were published in 2022 and 2021, while two were published each in 2020, 2019, and 2017. Finally, one article was published in 2018, 2015, and 2013. Since there were limited related articles to begin with, the publishing year was not filtered in the string search.

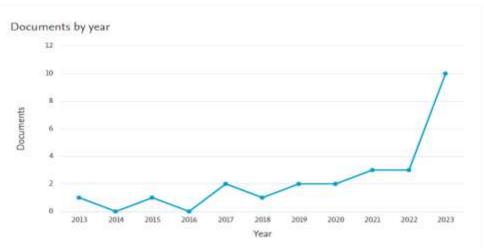

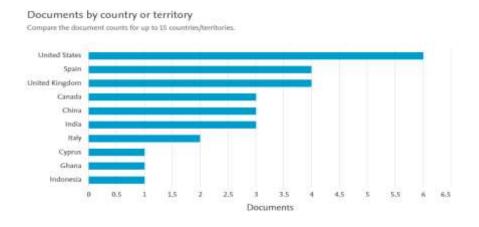

Figure 1: Articles published by year

Next, Figure 2 portrays the number of selected articles, divided by origin country or territory. Six articles originated from the United States, while four each came from Spain and the United Kingdom, three each from Canada, China, and India. Then, two articles came from Italy, and finally one each from Cyprus, Ghana, and Indonesia.

Figure 2: Articles published by country/territory

Frequency Analysis

From the systematic search done earlier, frequency analysis was done on all 25 articles found to analyze the trends of past studies. The frequency analysis summary is concluded in Table 1.

Code	Frequency of articles	Frequency of repetition in the articles
Social media platform(s)	13	82
Social media content(s)	9	92
Social media post(s)	7	100
Engagement(s)/engage	12	946
Brand loyalty	4	92
Business performance	3	8
Sale(s)	7	346
Consumer/user-generated content(s) (CGC/UGC)	5	366
Firm/marketer-generated content(s) (FGC/MGC)	4	272
SME(s)/MSME(s)	2	97
Stimulus–Organism–Response (S-O-R) framework	1	4
Heuristic/Systematic Model of Persuasion (HSM)	1	15

Table 1. Data analy	veis on social modia cont	tent, engagement, and busi	inose norformanco
I able 1: Data allar	ysis on social meula com	tent, engagement, and bus	mess per for mance

From the frequency analysis, it was portrayed that engagement(s)/engage has the highest frequency of repetition throughout all 25 articles, followed by consumer/user-generated content(s) (CGC/UGC), sale(s), and firm/marketer-generated content(s) (FGC/MGC). Social media articles were also on the rise as there was quite a high frequency of repetition in terms of platform(s), content(s), and post(s). Surprisingly, only two articles focused on SME(s)/MSME(s), which shows that past studies have only focused on big corporations, thus identifying the first gap in the area.

Next, most articles found were qualitative, which led to only two frameworks/models identified that were used by past quantitative studies. This finding identified the second gap, where the researcher needs to execute further detailed content analysis to pin a theory to work on for the study. Only ten articles that best suited the study were selected for content analysis.

Content Analysis

Table 2 presents the content analysis results conducted on ten selected articles chosen earlier. Major keywords from the articles were identified and organized through thematic analysis. When classifying the keywords related to social media content, a study by Dolan et al. (2019) perfectly fits the researchers' needs, presenting a model that illustrates the connection between social media content and engagement behavior. Hence, the

keywords linked to social media content and attributes were categorized into four main categories: informational, remunerative, entertaining, and relational. These four content types align with the essence of the Uses and Gratifications Theory (UGT), which explores how consumers select social media platforms to fulfill their gratifications (Dolan et al., 2019). The classification helps to better understand and analyze the different aspects of social media content affecting other variables.

AUTHOR(S)	(IV)	INFORMATIONAL	REMUNERATIVE (IV)			ENTERTAINING (IV)		RELATIONAL (IV)		ENGAGEMENT		BUSINESS PERFORMANCE (DV)	
	Product/Service	Functional	Sales campaigns	Contests	Excitement	Pleasure	Personalization	Reviews	Persuasive	MENT	Brand loyalty	Rating	Sales

Goh et al. (2013)	\checkmark							\checkmark	\checkmark				\checkmark

Table 2: Content analysis on social media content articles

However, the UGT only explained the categorization of the social media content. From the frequency analysis in Table 1, the researchers saw that the Stimulus-Organism-Response (S-O-R) model is the most suitable to explain the whole framework at hand. In this scenario, the social media content (informational, rewarding, entertaining, or relational) serves as the stimulus. The organisms' emotional reactions from consumers, such as likes, shares, and comments, are considered consumer engagement. Ultimately, these reactions would impact an organization's performance, including purchases, satisfaction, and word-of-mouth recommendations. The complete S-O-R Model adaptation is depicted in Figure 3.

Figure 3: S-O-R Model adaptation

To reiterate, as laid out in Table 2, out of the ten selected articles, only two did not focus on engagement, while seven used engagement as their dependent variable, which proves that past studies have been focusing on engagement for quite some time. Meanwhile, only one paper was dedicated to studying engagement as a mediator, calling researchers to conduct future studies in the area. Pal et al. (2022) emphasized that user engagement, which highlights the value of the interaction and the good parts of the experience that contribute to increased application usage, can be used to gauge how engaged users are with a post-reaction.

Apart from that, sales, ratings, and brand loyalty are the three main phrases used in the ten chosen papers to describe a company's performance. As portrayed, it is evident that past studies did not just focus on financial performance, but non-financial performance was also given the same attention.

Discussion

About the chosen related articles, the researcher discovered that previous studies might be categorized into two distinct patterns: those focusing on the influence of social media content on consumer engagement, and those examining the impact of consumer engagement on business performance. Since the researcher aims to look at the direct influence of social media content on business performance, there is still a lack of past studies about the matter.

Nonetheless, from a thorough observation, the researchers noticed a grey area regarding categorizing consumer engagement and business performance among the scholars. For instance, Senanu et al. (2023) included purchasing behavior as part of consumer engagement, while other scholars categorized it as business performance. Scholars in the past have always favored studying business performance because the results may help businesses make improvements. Previous research has employed various terms that ultimately conveyed the same notion: business performance.

Additionally, only Feng et al. (2020) utilized consumer engagement as a mediator, while other studies set it as the dependent variable. Xu et al. (2023) affirmed that to promote consumer engagement, numerous businesses are utilizing social media as a new avenue for marketing. Consumer engagement can be characterized as a mental state arising from consumers' interaction with the business (Kumala & Sijabat, 2022). A study by Liadeli et al. (2023) found that to increase engagement, material should be more emotionally charged; while content that communicates the benefits of a product and is more functional than emotive can increase sales. Measuring user engagement is a straightforward method of evaluating a caption for specific content on an online social media platform, aiding in determining the overall efficacy of a certain piece of promotional content (Pal et al., 2022).

As mentioned earlier in the frequency analysis subsection, only two studies focused on SME(s)/MSME(s), which proves that more future studies should be done on them as they are the spine of a developing nation. Salim et al. (2024) stated that the productivity of MSMEs is closely associated with economic growth, and studies have indicated that the economy's expansion influences the rise in MSMEs' productivity. Apart from that, over the past few years, Malaysia's MSMEs have proliferated, and in 2021, they accounted for 39.1% of the nation's GDP (Murdiati et al., 2023).

Technically, before social media, we are only familiar with marketer-generated content (MGC) or firmgenerated content (FGC). Back then, the content was only crafted by organizations to be viewed by consumers. However, as the virtual world evolves, one-way marketing also evolves, allowing two-way communication such as shares, reviews, ratings, parodies, and many more. It was discovered by Goh et al. (2013) that in terms of consumer purchasing behavior, user-generated content (UGC) has a greater influence as compared to marketer-generated content (MGC). The findings call for more future studies on UGC; however, the researcher decided to focus on MSMEs' MGC for now.

5. Conclusion

In a nutshell, this study's thorough content analysis has shown the relevance of social media content for MSMEs. Examining the wide range of content MSMEs post on different social media platforms has revealed important information about their marketing tactics, methods for engaging customers, and general online presence. The results highlight the critical role that social media plays in increasing MSMEs' competitiveness and exposure in ever-changing market environments while also raising consumer engagement. Additionally, this study provides a basis for further research to improve our comprehension of how MSMEs use the digital sphere to support innovation, growth, and sustainability, affecting their business performance.

While established corporations undoubtedly have a significant impact on the business world, it is important to pay attention to how MSMEs' social media posts impact business performance to comprehend innovation, market dynamics, resource limitations, and grassroots economic development. Furthermore, learnings from the study of MSMEs are frequently transferable to enterprises of all sizes, which makes it a vital field for further investigation. In light of the significant effects that social media practices have on customer engagement, digital inclusion, economic development, and business performance, this article proposes that MSMEs' social media strategy should continue to get attention.

Perez², Nusrah Samat³, Muhammad Ridzuan Abdul Aziz⁴ ¹Circular Economy of Logistics and Operations (CELO), Faculty of Business and Management, Universiti Teknologi MARA Selangor, Malaysia ²Mapua Malayan Colleges Mindanao, Philippines ³Open University Malaysia, Malaysia ⁴Faculty of Business and Management, Universiti Teknologi MARA Selangor, Malaysia *shahrul@uitm.edu.my, agoperez@mcm.edu.ph, nusrah@oum.edu.my, ridzuandba@uitm.edu.my Corresponding Author: Nor Shahrul Nizam Muhamad Nor

Abstract: This study focuses on a literature review examining the impact of Knowledge Management Capabilities (KMC) and Learning Orientation (LO) among hoteliers in Malaysia. The tourism industry, one of the fastest-growing sectors, was significantly affected by Covid-19. However, it is now beginning to recover, with tourists adopting different perspectives. To maintain a competitive edge, the industry, including hoteliers, must stay abreast of the latest market trends. This requires both top management and employees to be equipped with adequate and relevant knowledge. Despite this need, some hoteliers are still reluctant to adopt knowledge management practices. Additionally, some are unable to utilize knowledge as part of their learning orientation to address changing market trends and various challenges, both micro and macro, to remain competitive. This research aims to explore how learning orientation is influenced by knowledge management capabilities, based on empirical studies. The conceptual analysis from this study can pave the way for developing a framework and further research analysis.

Keywords: Knowledge Management Capabilities, Learning Orientation, Hoteliers, Tourism

1. Introduction

Tourism makes a significant contribution to the gross domestic product (GDP) of many countries, accounting for 10.4% of the total global GDP, which is USD 9.2 trillion, and generating 10.6% (334 million) of all jobs worldwide (WTTC, 2021). In Malaysia, the tourism industry attracted 13 million international tourists from January to August 2023 alone (Ganesan, 2023). This figure is more than triple the 4.33 million tourists recorded during the early stages of the COVID-19 pandemic in 2020 (Malaysian Tourism Ministry, 2021). This demonstrates that the tourism industry has been the fastest and largest growing sector for many decades, serving as a key driver of economic growth and social development (Yu et al., 2023). However, Syed Mohamad et al. (2023) and Weidenfeld (2006) have noted that the industry has reached a saturated market and needs to learn as well as adopt new segmentation strategies such as eco, religious, and nature tourism. Consequently, hoteliers are focusing on specific niche markets such as boutique hotels, Shariah-compliant hotels, and hotels catering to businesswomen (Nor et al., 2012). Bharwani and Mathews (2016) emphasized that the global tourism and hospitality industry has shifted from a product-focused approach to a customer-focused approach to meet tourists' demands and trends based on the learning orientation that is being adopted among them.

In the context of emerging markets, market trends, and tourist demands, knowledge is a crucial element for all companies within the tourism and hospitality industry, including hotels. This knowledge shapes how these companies respond to the needs and demands of their guests and tourists (Syed Mohamad et al., 2023; Muhamad Nor et al., 2019; Nor et al., 2012; Poloski-Vokic, 2008). To navigate changes in the business landscape and remain successful, companies must ensure that all their staff have access to sufficient and relevant knowledge (Mohamad et al., 2022; Poloski-Vokic, 2008). According to Mohd Zahari et al. (2013), the business is already in an era where knowledge is paramount, and employees must manage it effectively as part of their companies' strategies to sustain and thrive in a competitive market.

Syed Mohamad et al. (2023) and Guimaraes et al. (2017) emphasize that companies must strategically identify and develop knowledge to achieve sustainable competitive advantages over their competitors by nurturing learning orientation within their companies' environment. On a macro level, countries must also implement effective knowledge management systems to support progressive development (Albassam, 2019). Knowledge in the economic sphere needs to be generated, applied, and disseminated among the populace, providing them with a learning orientation that ensures the country's growth (Hamzah et al., 2020).

Problem Statement

The tourism and hospitality industry has reached a saturation point, highlighting the need to explore new markets. The dynamic global business landscape, characterized by rapid changes in consumer trends and preferences, underscores this necessity that needs to be aware of and learned by many industry players. Mohamad et al. (2022) and Payal et al. (2016) emphasized that the service industry depends on knowledge management for modern survival. Without adequate knowledge, skills, and capabilities, companies struggle to achieve and maintain competitiveness (Khan, 2019). Nor et al. (2019) also argued that the industry must explore and learn novel approaches to stay competitive and relevant in the evolving business landscape. One such approach is knowledge management, as noted by Syed Mohamad et al. (2023) and Poloski-Vokic (2008). Strategically implementing knowledge management practices enables the industry to respond effectively to changing customer and guest demands and preferences. Weidenfeld (2006) highlighted the importance of recognizing these changes to identify new market segments. In response to these shifts, Syed Mohamad et al. (2023) and Ngah et al. (2016) advocated for a strategic shift in the services industry towards adopting and implementing knowledge management practices. This strategic move is essential for the industry to learn to adapt and thrive in a highly competitive environment. Albassam (2019) extended this perspective by suggesting that nations, particularly those aiming to remain competitive globally, should establish effective knowledge management systems. A robust knowledge management system and learning orientation are crucial for sustaining competitiveness and aligning with the practices of developed nations.

Another critical issue is the timeliness with which companies adopt knowledge management practices and acquire intellectual resources to stay competitive in their respective industries (Alavi et al., 2005). In today's fast-paced business environment, the ability to quickly implement and integrate knowledge management systems is crucial for maintaining a competitive edge. Companies that are slow to adopt these practices risk falling behind more agile competitors who can leverage knowledge to innovate and respond to market changes more effectively (Chiu & Chen, 2016).

Gold et al. (2001) highlighted the significant challenges involved in establishing and sustaining knowledge management initiatives over time. These challenges can be multifaceted, including organizational resistance, the complexity of integrating new systems with existing processes, and the continuous need for updating and maintaining knowledge repositories. The initial implementation phase requires substantial investment in terms of time, money, and resources (Gotteland et al., 2020). Companies need to develop or acquire technology infrastructure, train employees, and create a culture that values knowledge sharing and continuous learning. Moreover, sustaining knowledge management practices over the long term is equally demanding. Organizations must ensure that their knowledge management systems remain relevant and useful, which requires ongoing assessment and adaptation (Syed Mohamad et al., 2023; Mohamad et al., 2022). This includes regularly updating the knowledge base to reflect the latest industry trends and technological advancements, as well as ensuring that employees remain engaged and motivated to use and contribute to these systems which could be tend to continuously learning orientation.

The dynamic nature of many industries adds another layer of complexity. Market conditions, technological advancements, and regulatory changes can all impact the effectiveness of knowledge management practices (Anjaria, 2020). Companies must be able to adapt their knowledge management strategies to keep pace with these external changes. Failure to do so can result in outdated or irrelevant knowledge and learning processes (Hindasah & Nuryakin, 2020), which can hinder decision-making and operational efficiency. Furthermore, the competitive advantage gained from effective knowledge management is not static. As more companies recognize the value of knowledge management, the bar for competitive advantage is continuously raised. What was once a cutting-edge practice can quickly become a baseline expectation (Hindasah & Nuryakin, 2020). Therefore, companies must not only implement knowledge management practices but also continuously innovate and improve these practices to maintain their competitive edge by nurturing learning orientation within the companies (Anjaria, 2020).

Implementing knowledge management over time can be particularly challenging for smaller companies, especially Small and Medium-sized Enterprises (SMEs). These businesses often operate with limited resources, making it difficult to invest in and sustain comprehensive knowledge management systems. SMEs must constantly adapt to market changes to remain competitive, and they typically do so by leveraging their existing knowledge, resources, and capabilities. According to Randhawa et al. (2020), SMEs tend to rely on what they already possess to respond to market shifts, rather than investing heavily in new knowledge management infrastructure. This approach can limit their ability to fully capitalize on the benefits of advanced knowledge management practices, further complicating their efforts to keep pace with larger, better-resourced competitors.

Preparing knowledgeable and skilled managerial personnel is crucial for achieving excellent performance and business success, particularly within the hotel and tourism sector (Sheresheva, 2016; Stephenson et al., 2010). This emphasis on managerial expertise underscores the pivotal role that capable leadership plays in navigating the complexities of hospitality operations and enhancing guest satisfaction.

Simultaneously, companies must recognize that all employees are essential assets. Poloski-Vokic (2008) emphasized the importance of investing in skilled individuals across all levels of the organization to improve overall performance in tourism and hospitality establishments. Tavitiyaman et al. (2012) further explored the profound impact of skilled employees on hotel management, highlighting their ability to streamline operations and elevate service quality. The recognition of a skilled workforce as a cornerstone for enhancing the standards and efficiency of hotel operations is widely acknowledged within the industry. This acknowledgment reinforces the notion that employees are integral to the overall success and competitiveness of businesses in hospitality. In this context, fostering a learning-oriented environment becomes crucial (Hamzah et al., 2020). By nurturing continuous learning and professional development among employees, organizations can significantly enhance their capabilities and adaptability. This proactive approach not only improves individual performance but also contributes to organizational agility and innovation. Sheresheva (2016) expands on this perspective by emphasizing the importance of striking a balance between investing in skilled employees and implementing developmental initiatives in developing countries' tourism and hospitality sectors. This balance is critical for these countries to effectively compete with developed nations that boast superior service standards designed to attract both potential and repeat guests to their hotels.

Despite the potential benefits of knowledge management in the tourism industry, its adoption faces resistance, particularly due to the industry's unstable environment (Cooper, 2006). The uncertainty and dynamic nature of the tourism sector make industry players hesitant to fully embrace knowledge management practices, which could otherwise contribute significantly to their adaptability and success. The tourism industry is characterized by fluctuations in demand, seasonal variations, and external factors such as economic downturns and political instability. These elements contribute to a highly unpredictable environment, making it challenging for businesses to commit to long-term knowledge management strategies. Industry players often prioritize immediate operational concerns over strategic investments in knowledge management, fearing that the returns may not justify the costs in such a volatile setting.

In response to these challenges, Tavitiyaman et al. (2012) emphasized the necessity for hoteliers to invest in providing their employees with knowledge. This investment is crucial not only for enhancing the skills of the workforce but also for creating a learning environment that fosters continuous improvement and adaptability. By equipping employees with the right knowledge and cultivating a conducive learning environment, hotels can significantly improve their performance (Hamzah et al., 2020). A well-informed and skilled workforce can better anticipate and respond to market changes, innovate in service delivery, and maintain high standards even during periods of uncertainty. Moreover, a strong emphasis on learning and development can help mitigate the initial resistance to knowledge management by demonstrating its tangible benefits (Meher & Mishra, 2022).

Implementing effective knowledge management practices can address deficiencies in compliance with industry standards and regulations, ensuring that operations run smoothly and efficiently (Meher & Mishra, 2022). Over time, as employees see the positive impact of these practices on their daily work and the overall success of the organization, the resistance to knowledge management is likely to diminish (Hamzah et al., 2020). Ultimately,

by prioritizing knowledge management and fostering a supportive learning environment, hotels can enhance their operational efficiency, improve service quality, and achieve a competitive edge in the market, even amid the inherent uncertainties of the tourism industry.

2. Literature Review

Knowledge Management Capabilities: Knowledge is widely recognized as a crucial asset for organizations, playing a vital role in achieving superior business performance and maintaining a competitive edge. This perspective is supported by various researchers, including Muhamad et al. (2022), Grover and Davenport (2001), and Barney (1991). Bolisani and Bratianu (2018) have defined knowledge as an abstract concept that takes on tangible forms in the real world, underscoring its importance as a valuable resource for organizations. Furthermore, Anjaria (2020) has expanded on this notion by defining knowledge management as a comprehensive array of methods, tools, and techniques that companies use to manage their processes. This definition enhances the understanding of knowledge management, highlighting it as a systematic approach to managing organizational knowledge effectively.

Steward and Waddel (2008) contextualize knowledge management by tracing its development over more than four decades by highlighting its origins and early implementation in organizational settings, emphasizing its evolutionary nature. This perspective underscores how knowledge management has evolved from its inception, blending theoretical insights from academia with practical applications in real-world business environments. The timeline that Steward and Waddel (2008) provided with suggestions for the gradual maturation of knowledge management as a discipline, gaining significant traction, especially since the late 20th century.

On the other hand, Al-Hawari (2004) offered a distinct perspective by defining knowledge management in terms of its practical utility within companies by portraying knowledge as something that can be systematized and utilized to achieve organizational objectives. This perspective shifted the focus from knowledge as an abstract concept to viewing it as a tangible asset that can be codified, understood, disseminated, and effectively applied. By defining knowledge management in this manner, Al-Hawari (2004) highlighted its role in enhancing organizational effectiveness and competitiveness. The combination of these viewpoints enriches the understanding of knowledge management as a dynamic field that bridges theory and practice, evolving to meet the changing needs and challenges of organizations in the modern era.

Syed Mohamad et al. (2023) and, Chiu and Chen (2016) characterized knowledge management capabilities as an ongoing and purposeful process aimed at generating knowledge within an organization. This perspective underscores the active and continuous role of knowledge management in organizational growth. Earlier, Alavi and Leidner (2001) contributed to this concept by defining knowledge management capabilities as encompassing the skills to create, transfer, integrate, and apply knowledge within an organizational framework. Their definition encapsulates the diverse dimensions of knowledge management, encompassing creation, transfer, integration, and application.

The concept of knowledge management represents more than just incremental change; it signifies a profound transformation that profoundly affects the foundational aspects of an organization, such as its assumptions, structures, and value systems. The objective is to reshape and rebuild these elements to foster a knowledge-driven organization. This transformative approach underscores the necessity of sustained organizational support for knowledge management, acknowledging its critical role in improving performance (Hindasah & Nuryakin, 2020).

Additionally, organizations must develop specific capabilities to effectively support knowledge management. It emphasizes that organizations should not only nurture these capabilities but also view them as opportunities for integrating knowledge. This perspective underscores that knowledge management goes beyond mere tools or systems; it requires a strategic and deliberate effort to embed knowledge within the organization. Thus, Zhang et al. (2018) classified knowledge management capabilities into three categories: technological, structural, and cultural. This framework acknowledges the diverse aspects of knowledge management, recognizing its reliance not only on technology but also on organizational structures and cultural dynamics.

This comprehensive approach suggests that successful knowledge management hinges on a blend of technological tools, supportive organizational structures, and a culture that fosters and values knowledge sharing.

However, Gold et al. (2001) and, Lee and Yang (2000) categorized knowledge management differently into two main areas: knowledge infrastructure and knowledge processes. This division underscores the interaction between foundational structures and the dynamic activities involved in managing knowledge. Knowledge infrastructure pertains to essential elements such as systems and tools, while knowledge processes encompass the ongoing workflows and activities central to effective knowledge management.

Knowledge Infrastructure: The concept of knowledge infrastructure can be understood through various definitions and components. According to Wu and Chen (2014), knowledge infrastructure serves as the foundational support that organizations establish to bolster their core operations, encompassing systems and services. This definition underscores the pivotal role of infrastructure in providing essential support for both operational and strategic business needs. In an earlier perspective, Lee and Yang (2000) characterized it as a blend of organizational structure, technology, and culture. This broader view recognizes that infrastructure extends beyond technological elements alone, encompassing organizational structures and cultural dynamics, highlighting their interconnected roles in supporting business operations. Furthermore, Gil-Padilla and Espino-Rodriguez (2008) highlighted the specific impact of technology infrastructure on performance within the hotel industry. They elaborated on how technology infrastructure has evolved into a crucial resource influencing organizational performance, underscoring its pivotal role in the competitive landscape.

The concept of knowledge infrastructure can be understood from various viewpoints regarding its definition and components. According to Wu and Chen (2014), knowledge infrastructure represents the foundation that companies establish to support their core business operations, encompassing systems and services. This definition underscores the essential role of infrastructure in providing crucial support for both operational and strategic aspects of a business.

In an earlier perspective, Lee and Yang (2000) portrayed knowledge infrastructure as a synthesis of organizational structure, technology, and culture. This broader interpretation acknowledges that infrastructure extends beyond mere technological components to encompass organizational structures and cultural dimensions, highlighting their interconnectedness in facilitating business functions. Furthermore, Gil-Padilla and Espino-Rodriguez (2008) drew attention to the specific impact of technology infrastructure on hotel performance within the industry by explaining how technology infrastructure has evolved into a pivotal resource influencing organizational performance, emphasizing its significance in the competitive landscape. In another perspective, Gold et al. (2001) provided a comprehensive perspective by emphasizing how social capital can be maximized within organizational infrastructure. However, the dimensions of structural, cultural, and technological factors that Gold et al. (2001) highlighted align closely with those identified by Lee and Yang (2000). Thus, Gold et al. (2001) suggested that optimizing social capital, crucial for organizational effectiveness, involves harmonizing organizational structure, culture, and technology.

As part of knowledge management capabilities' dimensions, Mohamad et al. (2022) and Mohannak (2011) examined culture as an integral part of knowledge management capabilities (KMC), highlighting its significant impact on the success or failure of organizational knowledge management initiatives. This underscores the crucial role of a supportive cultural environment in fostering effective knowledge management practices. Furthermore, Syed Muhamad et al. (2023) and, Gil-Padilla and Espino-Rodriguez (2008) emphasized the influence of technological infrastructure and cultural factors on hotel performance in the industry. Building on this, Mohamad et al. (2022) and Gold et al. (2001) expanded the discussion by illustrating how social capital within an organization's infrastructure can be optimized through structural, cultural, and technological dimensions. Furthermore, Gold et al. (2001) also discovered a significant and direct relationship between knowledge infrastructure, encompassing structural, cultural, and technological elements, directly enhances overall organizational effectiveness.

Knowledge Process: Meanwhile, knowledge processes are seen as leveraging organizational infrastructure to enhance performance. Syed Mohamad et al. (2023) and, Nonaka and Takeuchi (1995) characterized knowledge processes as involving the efficient capture, storage, reconciliation, and dissemination of knowledge within an organization. These processes are crucial for transforming knowledge into a competitive advantage. Additionally, Su and Lin (2006) defined knowledge processes as the organization's capability to identify core competencies, along with the corresponding knowledge categories, demands, and requirements. This encompasses identifying business core competencies and involves activities such as knowledge generation, dissemination, and application (Lee & Yang, 2000).

Wu and Chen (2014) provided an in-depth analysis of knowledge processes, categorizing them into creation, transfer, integration, and application. This holistic perspective treats knowledge processes as a cohesive system that fosters knowledge within an organization. Earlier, Gold et al. (2001) had identified key elements of knowledge process capabilities, such as knowledge acquisition, conversion, application, and protection. Thus, these studies highlighted a significant and direct link between knowledge processes and organizational effectiveness.

Learning Orientation: The concept of learning orientation within organizations can be understood from multiple perspectives. Sinkula et al. (1997) described learning orientation as an organizational commitment to learning, a shared vision, and open-mindedness. They further define it as a cultural aspect that promotes the continuous pursuit of new knowledge and ongoing improvement. Hindasah and Nuryakin (2020) added to this by depicting organizational learning as a comprehensive process that includes creating, integrating, learning business processes, and transferring knowledge and skills. These activities are essential elements of the organizational culture and contribute to overall organizational performance.

Furthermore, Anjaria (2020) presented a clear perspective on learning organizations, highlighting two distinct interpretations. Firstly, a learning organization is seen as 'organized learning,' focusing on education, learning, and pedagogy within the organizational context. Secondly, it is viewed as an entity undergoing a developmental process, emphasizing that learning is a dynamic and ongoing aspect within the organizational environment. Therefore, the multifaceted nature of a learning organization encompasses commitment, shared vision, open-mindedness, and a cultural dedication to continuous improvement.

The critical role of learning orientation for organizational survival and success, especially in competitive industries like hospitality and tourism, involves thriving and enduring amidst competition (Baker & Sinkula, 1999; Day, 1994). Ali et al. (2020) supported this view by identifying learning orientation as a key factor in enhancing business performance within the hospitality and tourism sector. From a customer-centric perspective, Su and Lin (2016) suggested that organizations can provide the highest quality products and services by better understanding their customers. This positive outcome is achievable when both organizations and their employees are capable and committed to continuous learning. Tajeddini (2009) concurred, emphasizing that learning orientation is essential for new service development and improving hotel performance.

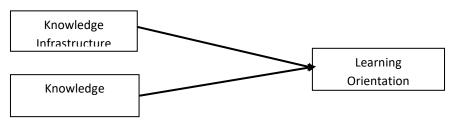

In volatile environments, Hoi and Ngui (2014) contended that learning orientation is essential for modern organizations to innovate, explore new opportunities, and maintain competitiveness. The dynamic nature of industries, particularly amidst uncertainty, requires an organizational culture that promotes continuous learning and adaptability. Moreover, Mohd Zahari et al. (2013) suggested that organizations must facilitate the sharing of knowledge and resources, both internally and externally, to enhance their effectiveness. Learning orientation extends beyond internal practices to include collaborative efforts that involve sharing insights and resources within and outside the organization. This makes learning orientation a critical factor for organizational success and competitiveness, particularly in dynamic and competitive industries such as hospitality and tourism. The positive impact includes improved customer satisfaction, new service development, and overall organizational effectiveness, highlighting the multifaceted benefits that a commitment to learning can bring.

3. The Relationship Between Knowledge Management Capabilities with a Learning Orientation

In the organizational context, numerous studies have explored knowledge management and learning orientation. Wi and Lu (2013) highlighted that learning acts as a mediator between knowledge sharing and tacit knowledge. Additionally, Antunes and Pinheiro (2019) proposed a conceptual link between knowledge management and organizational learning, which is connected to learning orientation within organizations. Moreover, Hindasah and Nuryakin (2020), Ngah et al. (2016), and Hooi and Ngui (2014) found that learning capabilities are positively influenced by organizational capabilities, such as human resources management and knowledge management, ultimately leading to improved organizational performance. This suggests that the effectiveness of human resources and knowledge management in enhancing organizational performance is further amplified by a strong learning orientation.

Similarly, Meher and Mishra (2022) emphasized the importance of individual learning orientation within an organization. They found that individual learning orientation significantly mediates the relationship between knowledge sharing and performance, especially in the service industry, such as IT companies. Their research suggested that the learning orientation of individuals within an organization, especially when influenced by peers, plays a crucial role in facilitating effective knowledge-sharing practices. However, for this research, the primary focus should be on learning orientation as the outcome variable, examining its direct impacts on knowledge management capabilities within the organizational context.

Figure 1: The conceptual framework

4. Conclusion

In the context of organizational research, numerous empirical studies have examined the variables of knowledge management and learning orientation from various perspectives, given their significant impact on organizational success. Consequently, this conceptual paper is a vital part of a doctoral research project that focuses on knowledge management and learning orientation among hoteliers in Malaysia. Specifically, the study aims to investigate the relationship between these two variables in three-star hotels and above nationwide. To ensure the study's relevance and accuracy, top management members from these hotels, including managers, managing directors, general managers, and chief executive officers, will be randomly selected to participate and represent their respective organizations.

The anticipated results of this study could have significant implications for hoteliers and companies across various sectors. By exploring the relationships between knowledge management capabilities and learning orientation, the study seeks to offer valuable insights to help organizations develop strategies to enhance their knowledge management and learning practices. This, in turn, can improve overall performance and increase competitiveness within the industry.

Contributions

The framework utilized in this research has been extensively applied by many scholars in previous studies to assess its relevance and applicability in various organizational contexts. However, this conceptual study aims to make a unique and significant contribution specifically within the hospitality industry. It seeks to enhance the existing body of knowledge on management practices and, ultimately learning orientation among hoteliers in Malaysia.

The dimensions of the variables under scrutiny—knowledge management and learning orientation—have the potential to offer a broader perspective on understanding these concepts. This research specifically aims to explain the elements of knowledge management, including knowledge infrastructure and knowledge processes, that significantly influence learning orientation. By exploring these dimensions, the study seeks to provide valuable insights and practical implications for industry professionals and academics alike.

The Influence of Social Media Marketing Features on Consumers' Purchasing Decisions of Tourism Products

Farah Nur Adilah Mohd Azizpuddin, *Melissa Shahrom Faculty of Business and Management, Universiti Teknologi MARA, Puncak Alam Campus, Selangor, Malaysia *melissa@uitm.edu.my Corresponding Author: Melissa Shahrom

Abstract: The prevalence of social media usage in Malaysia is apparent, as a substantial 78.5% of the population actively participates in online platforms. This provides the groundwork for an extensive analysis of the influence that social media marketing has on the decision-making process of consumers in the digital domain. Over ten million tourists visited Malaysia in 2022, indicating a steady recovery from the COVID-19 epidemic. This circumstance indicated the need for innovative strategies to strengthen the role of social media and digital marketing in the recovery and long-term growth of Malaysia's tourism industry. This research focuses on analyzing the influence of four specific aspects of social media marketing on consumers' purchasing decisions for tourism products. Interactivity, informativeness, entertainment value and perceived relevance are the elements that must be taken into account. The data was gathered from a diverse group of individuals who have extensive experience with social media. This was done through a thorough and structured online survey. The survey was completed by 142 participants in total and the data was analyzed using SPSS. The findings indicate that factors such as interactivity, informativeness and perceived relevance play a significant role in influencing consumers' purchase decisions. However, it was discovered that the impact of entertainment on purchase decisions is not significant. The findings of this study make an important contribution toward filling the gap in exploring how the tourism industry maximizes social media marketing features as digital marketing in knowing consumers' purchasing decisions. This study has shed some light on how marketers effectively manage and take advantage of social media platforms such as Instagram, Twitter, Facebook and Tik-Tok. Further research comparing with bigger data and other countries or regions will enrich the research findings.

Keywords: Tourism Products, Social Media Marketing, Social Media, Interactivity, Informativeness, Entertainment, Perceived Relevance, Purchase Decision

1. Introduction and Background

People have had plenty of exposure to social media because of the increased use of information and communication technology worldwide (Chetioui et al., 2021). The internet and its supporting tools have succeeded in changing how people communicate and socialize (Sharma et al., 2022). Over the past few decades, the use and popularity of social media continues to increase. Data on social media statistics for Malaysia in 2022 published by The Statista Research Department revealed that around 91.7% of Malaysia's population were active users of social media. With very broad coverage and low cost, social media is an appropriate and very powerful tool for connecting consumers and businesses on a regional, national and global scale even international (Almeida & Santos, 2020; Fraccastoro et al., 2021; Lacoste, 2016). Consumers are more likely to spend a significant amount of time on social media, participate in online discussions or share experiences with other consumers. This drives businesses to be more active in cyberspace to execute their advertising and marketing plans (Sharma et al., 2022). These platforms have emerged as a vital channel for information transmission and communication between customers and marketers (Shareef et al., 2019).

Tourism is one of the main service industries and has become an important driver of economic growth in the global economy (Camilleri, 2020). The impact of social media on the tourism industry growth cannot be disregarded, because today the internet and social media platforms are among the most popular information channels used by potential visitors and they have become one of the key sources of online travel information (Chu & Kim, 2018). The tourism industry is one of the right tools for improving the economic progress of the community at both the local and global levels. There is no denying that the tourism industry is an important economic sector because it has rapid growth compared to other economic sectors (Tian et al., 2021). This is also no exception to Malaysia's tourism industry which was affected by COVID-19. It is argued that in this environment, social media provides a cost-effective digital platform for attracting potential customers and

promoting tourism goods and services through direct consumer connections (Gozdegul Baser, 2020). Due to the rise of social media, tourism businesses now have the chance to reach a wider audience through their marketing campaigns (Katsikeas et al., 2020). Consequently, social media can be utilized by any component or aspect of the tourism industry.

Social media marketing implemented by businesses has the power to shape individuals' thoughts and ultimately influence the purchasing decisions of others on a larger scale (Aji et al., 2020). Consumer purchase decisions are likely influenced by their perceptions of a company's products and reputation. To be more precise, consumer choices are frequently impacted by their prior interactions with a company's goods and services (Melović et al., 2021). While some studies have explored the direct impacts of social media marketing, there remains a significant gap in understanding the intricate mechanisms through which specific features, like interactivity, informativeness, entertainment and perceived relevance can shape consumer purchase decisions. This lack of comprehension poses a significant challenge for marketers aiming to enhance their strategies in the dynamic tourism sector.

The foundation for the present study was built upon the UTAUT theory to test the effect of social media marketing on purchasing decisions. The UTAUT theory provides a robust framework for understanding how social media influences consumers' behavior (Venkatesh et al., 2003). Social media enhances performance expectancy by providing valuable information, increases effort expectancy by simplifying the decision-making process, exerts social influence through peer recommendations and influencers, and supports facilitating conditions with integrated tools and resources (Noor & Shahrom, 2021). The visual, interactive and social nature of tourism products makes social media a powerful tool in influencing purchase decisions in this sector.

This research aims to address the gaps in knowledge and gain a deeper understanding of the intricate relationship between social media marketing features and consumer purchasing decisions for tourism products in Malaysia. The outcome of this research contributes to the UTAUT model and provides further insights into how social media marketing features affect consumer behavior in this setting. The goal is to provide tourism marketers, lawmakers and businesses with useful and relevant information so that they can improve their social media strategy, customer experiences and digital adaptation.

2. Literature Review

Social Media Marketing Features

Interactivity: In the context of social media, interactivity denotes the interaction between consumers that facilitates the development of trust and relationships between the communicating parties and the social media platforms (Cheung, Pires, Rosenberger, et al., 2020). In literature, the predominant elements of interactivity are two-way communication, synchronicity and controllability (Shao & Chen, 2021; Mollen & Wilson, 2010). It allows consumers to engage with content, ask questions and dynamically receive instant feedback. Additionally, it has been reported that increased interactivity can increase user engagement which in turn results in more favorable purchasing outcomes as users feel more confident in their decisions. As a result, the following hypothesis was developed:

H1: There is a positive influence between interactivity and consumers' purchasing decisions.

Informativeness: Tourism products are often complex and require detailed information. Informativeness is the deemed depth of product knowledge or information offered through the shopping interface that can increase a consumer's trust, reduce uncertainty and provide consumers with related information to make informed purchase decisions (Kang et al., 2020). Analysis of the information's effectiveness in meeting customer preferences can be done using the concept of informativeness, which is defined as the capacity to inform consumers about different product categories (Ducoffe & Curlo, 2000). The positive influence of informativeness on consumers' purchasing decisions is evident through its ability to facilitate educated decision-making, build trust, address consumer needs, support comparison shopping, reduce buyer's remorse and enhance online visibility. The following hypothesis was constructed based on the idea that when consumers feel knowledgeable, they are more inclined to purchase tourism products:

H2: There is a positive influence between informativeness and consumers' purchasing decisions.

Entertainment: Entertainment refers to the extent to which social media content is emotionally stimulating, engaging and enjoyable for consumers (Muhamad & Shahrom, 2020). Social media platforms entertain by enabling service providers to create memorable experiences for their clients through the creation of humorous and amusing material that satisfies their enjoyment demands (Cheung, Pires & Rosenberger, 2020; Muhamad & Shahrom, 2020). Marketers employ social media as a means of entertaining consumers and satisfying their desire for enjoyment. They do so by sharing photos and news about products, such as Facebook brand pages with video snippets, pictures and stories, which can effectively capture consumers' attention (Cheung, Pires & Rosenberger, 2020; Gummerus et al., 2012). By including entertainment in their promotions, businesses may attract consumers' attention by enhancing the emotional appeals of tourism products, generating good attitudes and eventually drive purchasing behavior. Based on this, the following hypothesis was formulated: **H3:** There is a positive influence between entertainment and consumers' purchasing decisions.

Perceived Relevance

Perceived relevance refers to the extent to which social media advertisements are designed to fulfill the specific needs, interests and expectations of individual customers (Hanaysha, 2022). Based on Zhu and Chang (2016), perceived relevance is the extent to which customers believe a customized advertisement is relevant to them or helps them fulfill their beliefs and goals on a personal level. In online environments, perceived relevance is achieved by tailoring messages to the customers who are being targeted. It is built on its capacity to meet consumers' requirements and preferences, provide personalized experiences, solve problems, match the setting, establish trust and authority and foster emotional relationships. When consumers perceive content as highly relevant, they are more likely to consider it in their decision-making process and proceed to purchase. Consequently, the hypothesis was formulated:

H4: There is a positive influence between perceived relevance and consumers' purchasing decisions.

Consumers' Purchasing Decisions

Understanding the purchase decision is crucial for businesses as they strive to comprehend the intricate process consumers go through when making transactions in the marketplace (Sinoka & Ansari, 2019). Consumers go through a series of phases before making a purchase, which can be seen as the decision-making process (Hanaysha, 2022). These decisions are influenced by consumers' efforts to meet their needs and resolve current issues (Purba et al., 2021; Ramanathan et al., 2017). Understanding consumer purchasing behavior involves analyzing the complex process individuals go through when deciding whether or not to buy a specific product (Qazzafi, 2019). Figure 1 shows the conceptual framework for this study:

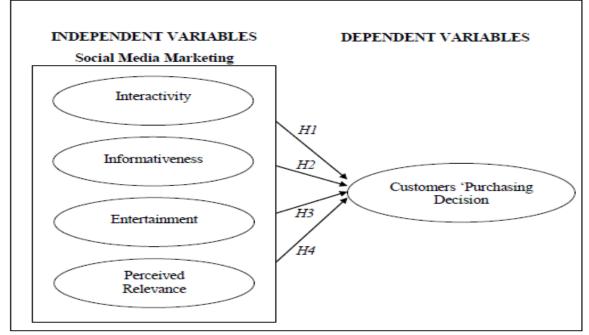

Figure 1: Conceptual Framework (Source: Hanaysha, 2022)

3. Research Methodology

The correlational study was used to study the influence between social media marketing features and consumers' purchasing decisions. The sampling frame for this study is active social media users (e.g., Facebook, Twitter, Instagram and TikTok) with an active usage of at least 1 hour a day. The study population comprises social media users residing in Klang Valley, Malaysia and a purposive sampling method was employed to obtain the sample. According to the result of the G-Power Calculation, the minimum sample size for this research is 129 respondents. The G*Power input parameters are set as follows: effect size is 0.15 (medium), alpha is 0.05, power is 0.95, and the maximum number of predictors is 4.

The questionnaire was developed based on a comprehensive evaluation of existing literature and verified through peer review by experts in academia and industry. Before distributing the questionnaire for the real study, a pilot study was undertaken to verify its relevance to the respondents. Through the use of an online self-completion questionnaire, a total of 142 individuals responded to the survey and the data were analyzed using the Statistical Packages for Social Science (SPSS) version 2.0. Descriptive statistics were used to determine the mean score and standard deviation of all study variables. Inferential statistics, including Pearson's correlation analysis and multiple regression analysis were employed to examine the relationship and the influence between the variables of the social media marketing features and consumers' purchasing decisions.

4. Results

Profile of Respondents

Table 1 shows data retrieved from Part A of the survey were analyzed by performing Descriptive Analysis (frequency) to determine the demographic characteristics of the respondents. 142 respondents participated in the survey.

Category	Sub-category	Frequency	Percentage
Gender	Male	66	46.5
	Female	76	533.5
Age	Below 20 years old	4	2.8
	20-29 years old	66	46.5
	30-39 years old	35	24.6
	40-49 years old	27	19.0
	50-59 years old	10	7.0
Ethnicity	Malay	80	56.3
	Chinese	31	21.8
	Indian	25	17.6
	Indonesian	2	1.4
	Bajau	1	.7

Normality Analysis

Table 2 presents the outcomes of the normality analysis of this study based on skewness and kurtosis values for each component in the independent variable and dependent variable. According to George and Mallery (2016), with most psychometric applications, a kurtosis and skewness value between ± 1.0 is desirable, although, in many circumstances, a value between ± 2.0 is also acceptable, depending on the specific application. Table 2 displays the values of Skewness and Kurtosis for each variable, as determined by the normality test results. Based on the results, independent and dependent variables were normally distributed, with Skewness and Kurtosis within the range ± -2 , from 0.024 to -0.484.

Table	2:1	Normality	Analysis
-------	-----	-----------	-----------------

Variables	Skewness	Kurtosis
Interactivity	-0.094	-0.101
Informativeness	-0.319	-0.405
Entertainment	0.024	-0.484
Perceived Relevance	-0.195	-0.375
Purchase Decision	-0.04	-0.209

Reliability Analysis

A reliability analysis was performed to confirm the reliability of the measurement used for data collection in this study. The value of Cronbach's Alpha (α) was used as a threshold to determine whether the items in a particular variable had good internal consistency. According to Sekaran (2003), Cronbach's Alpha value should be greater than .700 to indicate good and acceptable reliability. The results of the reliability analysis of each study variable are shown in Table 3 below. As shown above, all the variables are reliable because the values of Cronbach's Alpha for all variables were greater than 0.700. The value of Cronbach's Alpha for interactivity is 0.869 (good), informativeness 0.855 (good), entertainment 0.840 (good), perceived relevance (good) and purchase decision (acceptable).

Variables	Cronbach's Alpha	No. of Items
Interactivity	0.869	4
Informativeness	0.855	4
Entertainment	0.840	3
Perceived Relevance	0.851	4
Purchase Decision	0.797	4

Table 3: Reliability Analysis

Descriptive Analysis

Table 4 presents the mean and standard deviation scores for each variable of social media marketing features (independent variable) as follows: interactivity (M=4.1496, SD=0.54987), informativeness (M=4.3680, SD=0.49884), entertainment (M=4.0446, SD=0.57698) and perceived relevance (M=4.0827, SD=0.60121). Thus, all the variables of social media marketing features were high level. Besides, the mean score and standard deviation for consumers' purchasing decisions (dependent variable) were also at a high level (M=3.977, SD=0.55696).

Table 4: Descriptive Statistics

Variables	Ν	Mean	Std. Deviation	Level
Interactivity	142	4.1496	0.54987	High
Informativeness	142	4.3680	0.49884	High
Entertainment	142	4.0446	0.57698	High
Perceived Relevance	142	4.0827	0.60121	High
Purchase Decision	142	3.9771	0.55696	High

Pearson's Correlation Analysis

Table 5 displays the analysis of the correlation between social media marketing features and consumers' purchasing decisions. The findings show that there is a positive relationship between interactivity and purchase decision (r=0.580, p<0.01). It is also proven that there are positive relationships between informativeness and purchase decision (r=0.520, p<0.01), entertainment and purchase decision (r=0.487, p<0.01) and perceived relevance and purchase decision (r=0.690, p<0.1). All the relationships are moderate.

Table 5: Pearson's Correlation Analysis

Value of Pearson		
Correlation	P-Value	Strength of Association
0.580	< 0.01	Moderate
0.520	< 0.01	Moderate
0.487	< 0.01	Moderate
0.690	< 0.01	Moderate
	Correlation 0.580 0.520 0.487	Correlation P-Value 0.580 <0.01

Multiple Regression Analysis

Multiple regression was employed to examine the influence of social media marketing features (interactivity, informativeness, entertainment and perceived relevance) as independent variables and consumers' purchasing decisions as a dependent variable. The results of multiple regression between social media marketing features and consumers' purchasing decisions are shown in Table 6. The R² value of multiple regression analysis is 0.552 indicating approximately 55.2% of the variance in consumers' purchasing decisions can be explained by social media marketing features (interactivity, informativeness, entertainment and perceived relevance). The independent variable collectively plays a crucial role in making consumers' purchasing decisions.

Table 6 shows significant results (<0.01) which means all independent variables (interactivity, informativeness, entertainment and perceived relevance) simultaneously influence the dependent variable (purchase decision).

Table 6: Multiple Regression Analysis (ANOVA)

			ANOVA				
		Sum of		Mean			R ²
Model		Squares	df	Square	F	Sig.	
1	Regression	24.106	4	6.027	42.057	<.01	0.522
	Residual	19.632	137	0.143			
	Total	43.738	141				

From the path coefficient results, if the significance is lower than 0.05, it indicates that the independent variable influences the dependent variable. On the other hand, if the significance exceeds 0.05, it suggests that the independent variable does not influence the dependent variable. As shown in Table 7, interactivity positively influences consumers' purchasing decisions (β =0.255, p<0.001). Meanwhile, informativeness positively influences consumers' purchasing decisions (β =0.165, p=0.040). For perceived relevance, it also positively influences consumers' purchasing decisions (β =0.413, p<0.001). However, entertainment does not influence consumers purchasing decisions (β =0.040, p=0.569) because the significance is more than 0.05.

Table 7: Multiple Regression Analysis (Coefficients)

				Standardized		
		Unstandardized	Coefficients	Coefficients		
Model		В	Std. Error	Beta	t	Sig.
1	(Constant)	0.347	0.318		1.093	0.276
	Interactivity	0.255	0.072	0.252	3.563	< 0.001
	Informativeness	0.165	0.079	0.148	2.078	0.040
	Entertainment	0.040	0.071	0.042	0.571	0.569
	Perceived	0.413	0.074	0.446	5.548	< 0.001
	Relevance					

Summary of Hypotheses

Table 8 provides the results of the summarized hypotheses for analyzing the influence of social media marketing features on consumers' purchasing decisions for tourism products in Malaysia.

Table 8: Summary of Hypotheses

Hypothesis	Statement	Result	Decision
H1	Interactivity positively influences consumers' purchasing decision	<0.001	Accepted
H2	Informativeness positively influences consumers' purchasing decision	0.040	Accepted
H3	Entertainment positively influences consumers' purchasing decision	0.569	Not Accepted
H4	Perceived relevance positively influences consumers' purchasing decision	<0.001	Accepted

5. Conclusion and Recommendations

This study aimed to examine the influence of social media marketing features on consumers' tourism product purchasing decisions. In general, the three factors of interactivity, informativeness and perceived relevance have been found to have a beneficial impact on consumers' purchasing decisions. However, the influence of entertainment on these decisions is found to be statistically insignificant. The impact of perceived relevance on customers' purchasing decisions is most pronounced when people acknowledge the significance of targeting social media advertisements to match their requirements and expectations. Consumers exhibit a desire for

time-saving measures through their ability to ascertain their specific preferences. This research makes a meaningful contribution to the existing literature by expanding upon previous studies on social media marketing features and consumers' purchasing decisions. Specifically, it delves into the impact of social media marketing on consumers' purchasing decisions within the theoretical framework of the UTAUT theory (Venkatesh et al., 2003), focusing on tourism products. In the context of this study, the performance expectancy of UTAUT is closely related to informativeness and perceived relevance. Higher levels of interactivity on social media platforms, which impact consumer purchase decisions are supported by UTAUT through the effort expectancy construct. Conversely, social media content that is entertaining does not have an impact on its visibility and social influence. This aspect of the research contributes to the understanding of the features through which social media marketing influences the outcomes of consumers' purchasing decisions.

By establishing compelling context on digital marketing platforms, businesses may connect with a wider range of consumers. Thus, today's businesses should create ways to use social media marketing features that can motivate and urge future purchasers to purchase from them. This study focuses on several social media platforms, hence the impact of interactivity, informativeness, entertainment and perceived relevance can vary across different platforms. For example, visual-centric platforms like Instagram might emphasize entertainment more, while platforms like Twitter may focus more on informativeness. This study underscores the need for marketers, business owners, as well as tourism industry to craft and disseminate authentic social media marketing that will influence consumers' purchasing decisions and provide comprehensive information to the consumers. The current findings offer opportunities for the tourism industry to navigate challenges and provide strategies, especially using the right social media platforms to effectively reach and engage with potential consumers. It will guarantee that consumers have a memorable experience. In addition, the findings gained in this study will enhance the existing literature and provide critical evidence to marketers, business owners and tourism industry and other stakeholders by revealing the features of social media marketing that affect consumer purchasing decisions and offering essential guidance to refine marketing strategies as well as consumers' satisfaction.

Future Research

The current study employed quantitative methodology. The researcher utilized an online questionnaire as a survey method to collect the data. For future research recommendations, it may be beneficial to consider utilizing a qualitative data collection method. Various methods can be utilized, such as interviews, observations, focus groups or analysis of textual materials. This approach enables researchers to dig into intricate matters and acquire a more profound comprehension of the intricacies surrounding the research topics. Other than that, social media marketing features are not limited to these four features interactivity, informativeness, entertainment and perceived relevance. Other factors of social media marketing could include platform types, social media influencers and habits that could significantly influence purchasing decisions. In addition, future research may add mediating variables and moderating variables in their research to explore more for the topic. Lastly, expanding research to include larger datasets and diverse geographical areas, including other countries or regions, will enhance the depth and breadth of the research findings. Additionally, conducting subsequent analyses with a variety of populations and industries across different markets and consumer segments will provide a more comprehensive understanding and make new contributions to the related literature. All the recommendations may be used by the researchers for future improvements.

The Nexus Between Foreign Direct Investment and Economic Growth in Malaysia

Chong Siew Huay^{1*}, Najaa Aqilah Arabi², Chuah Soo Cheng¹ ¹Department of Economics and Financial Studies, Faculty of Business and Management, Universiti Teknologi MARA (UiTM), Puncak Alam Selangor, Malaysia ²Ernst & Young Tax Consultants Sdn Bhd, Malaysia *siewhuaychong@uitm.edu.my Corresponding Author: Chong Siew Huay

Abstract: In recent decades, Foreign Direct Investment (FDI) has become a significant factor in promoting economic growth. Recent years have witnessed significant discourse regarding the relationship between foreign direct investment and economic growth. This research employed the Autoregressive Distributed Lag (ARDL) methodology to analyze the long-run and short-run relationships between foreign direct investment and economic growth in Malaysia over the period from 1990 to 2022. The findings indicate that foreign direct investment has a positive impact on economic growth in both the short and long term. This aligns with the fundamental principles of endogenous growth theory, which posits that foreign direct investment enhances the transfer of skills that enrich the knowledge base of the host country in both the short and long term. The study provides policymakers with insights regarding the relationship between economic growth and foreign direct investment (FDI).

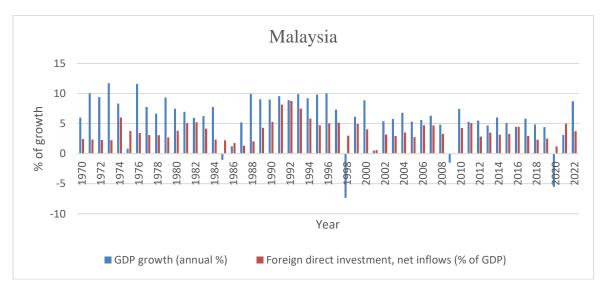

Keywords: Foreign Direct Investment, Economic Growth, ARDL, Malaysia

1. Introduction and Background

FDI is a global business approach wherein companies establish a physical appearance in foreign countries by acquiring a productive asset. In simpler terms, FDI occurs when the investor makes an investment in foreign countries to increase their returns, diversify the market for their products, and benefit from economies of scale. The importance of FDI can be seen from various aspects such as technological transfer, introduction of new skills and production techniques, increased competitiveness among domestic and international producers, both import and export including economic growth (Levine, 1997; Borensztein et al., 1998). Regardless of the pattern of FDI that has slightly changed over time, the FDI plays a crucial role in boosting economic growth in the majority of nations. In 2002, the UN's Organization for Economic Co-operation and Development (OECD) highlighted that nations with weaker economies regard foreign direct investment (FDI) as a crucial source of growth and economic modernization. Consequently, governments in developing countries are elected to attract foreign capital (Carkovic & Levine, 2002). Hansen & Rand (2004) assert that foreign direct investment (FDI) significantly enhances short-term economic growth, particularly in 31 developing countries.

Malaysia's economic strategies and policies serve as a yardstick for guiding its developmental journey, steering the nation's economy according to its distinct contours (Ibrahim, 2022). Starting from 1970, Malaysia has witnessed remarkable economic expansion which was accompanied by the adjustment in trade policies to lure FDI into the nation. The inflow of FDI to Malaysia has experienced a substantial increase from 4,453 million (USD) in 1980 to its highest 15,119 million (USD) in 2011 (Rasiah et al., 2017). FDI has evolved into a crucial component as part of the development strategies in the Malaysia Plan. Figure 1 shows that FDI has had a volatile movement and inconsistent trend since the year 1970 and will make unpredictable movements in the future. The graph also shows an inconsistent relationship between FDI and economic growth. The increase of FDI does not contribute to the increase of GDP. The decrease or inconsistent trend of FDI to Malaysia was primarily due to inadequate human capital, corruption, and low level of technological capacity (Abidin, 2010). Moreover, the financial impact of the COVID-19 pandemic outbreak on global economies has made Malaysia's inflow of FDI decrease from RM32.4billion in 2019 to RM13.3billion in 2020, according to the annual statistics of FDI in Malaysia from the Department of Statistics Malaysia (DOSM).

Figure 3: GDP growth and FDI inflows in Malaysia

Source: The World Bank (2023)

The 1990s marked a period of global economic liberalization and the emergence of economic blocs fostering free trade zones, a trend that extended to Malaysia. The country's engagement with these economic blocs is aimed at establishing a foothold and expanding its presence in the fiercely competitive global market. This involvement is expected to support Malaysia's economy by fostering the growth of local industries and products, avoiding direct competition on a global scale (Ibrahim, 2022). Foreign investments from countries like Japan and Taiwan have helped Malaysia's economy grow, especially when trade with Western countries slowed down (William, 1991).

The relationship between foreign direct investment (FDI) growth and countries has been a subject of being carried out academic debate for several decades. Recent research conducted by Azam et al. (2017) and Mustafa et al. (2021) demonstrates a positive and significant effect of foreign direct investment (FDI) on economic growth. Amyra and Siti (2022) found a negative correlation between FDI and economic growth. The inconsistent findings highlight the complexity of the relationship between foreign direct investment (FDI) and economic growth, suggesting that the impact of foreign investment on an economy is shaped by numerous influences and dynamics. Therefore, identifying the determinants of foreign direct investment (FDI) across various countries is essential.

The objective of this paper is to investigate the short-run and long-run relationship between FDI and economic growth, thus contributing to the existing literature that examines the Malaysian experience from 1990 to 2022. This paper begins with a literature review, followed by the research methodology, findings, and conclusion. The last section of this study will discuss the policy implications and recommendations.

2. Literature Review

According to De Jager (2004), FDI has the potential to increase labor and capital productivity through the introduction of new technologies, which results in more significant returns on investment and external labor growth. Among the others, Barro and Sala-I-Martin (1995) Illustrate a positive relationship between capital accumulation and production, however recent research by Herzer et al. (2008) establishes FDI's role in encouraging economic growth by boosting domestic investment.

Within the exogenous or neo-classical growth model, foreign direct investment (FDI) facilitates economic growth through capital accumulation and the incorporation of foreign technologies and inputs into the production processes of the host country. The neo-classical growth model highlights the role of foreign direct

investment (FDI) in enhancing both the volume and efficiency of investment in the host country, thereby facilitating economic growth. Unlike neoclassical growth models that view technological progress as an external factor, new growth models identify two primary drivers of economic growth: the accumulation of human capital and advancements in technology (Romer P., 1986, 1990; 1994; Lucas Jr, 1988). Nair-Reichert and Weinhold (2001) assert that long-term growth stemming from technological advancements is incorporated into contemporary endogenous growth models. The above-mentioned models provide a framework for FDI to constantly increase the host country's rate of economic growth by facilitating the diffusion, spillover, and transfer of technology. While both endogenous and exogenous growth theories emphasize the significance of capital accumulation for economic growth, they diverge in their approach to addressing technological progress. The first theory relates to the technological advancement as external to the model, whereas the second contends that advancements in technology occur naturally as a result of increased knowledge and innovation (Borensztein et al., 1998; De Mello, 1999; Elboiashi, 2011; Al Naseer, 2010).

The existing theories analyze the role of FDI and economic growth emphasizing the capacity of FDI to promote economic growth through direct and indirect channels. Most of the existing theories are consistent with endogenous growth theory where FDI can enhance the host country's economy by facilitating capital accumulation and the introduction of new products and foreign technologies (Edress, 2017). Furthermore, FDI also contributes to the concept of endogenous growth which facilitates the transfer of skills that improve the knowledge base of the host country (Elboiashi, 2011). Among the others, Herzer et al. (2008) emphasize the significance of FDI for the economic development of host countries through the enhancement of investable capital and the promotion of technology spillovers. Cahyadin and Sarmidi (2019) analyzed the interactions of foreign direct investment, labor, and external debt, emphasizing their individual effects on economic growth in Indonesia and Malaysia. Their research demonstrates a significant connection between labor, external debt, and economic growth. This connection indicates a comparable outcome in both nations. To enhance their efforts for economic growth, they propose two distinct solutions. The initial phase is the creation of a coordinated initiative to draw foreign direct investment inflows. The second aim is to cultivate a highly skilled workforce and human capital while effectively controlling external debt. According to the findings of Ajibola et al. (2018), the only factor that had a substantial positive influence on the economic growth of Nigeria was foreign direct investment in the communication industry. This was demonstrated by using data spanning from 1986 to 2017. The findings indicate that the only significant factor positively impacting Nigeria's economic growth was foreign direct investment in the transportation and communication sector.

A study conducted from 1990 to 2014 examined the relationship between foreign direct investment (FDI) and gross domestic product (GDP) in India, Malaysia, Bangladesh, and Indonesia indicates a persistent relationship between FDI and gross domestic product (GDP), while their Granger causality test yielded inconclusive results. The empirical study conducted by Masturah and Siti (2020) examined the influence of foreign direct investment (FDI) on Malaysia's economic growth from 1975 to 2015, utilizing the ARDL methodology. Their empirical findings demonstrate that foreign direct investment (FDI) has a positive and significant effect on the growth of Malaysia's economy. The conclusion supports the endogenous hypothesis, suggesting that foreign direct investment (FDI) inflows can enhance the economic development of a host nation by generating a spillover effect from foreign investment (Mohamed et al., 2013).

In contrast, an opposing viewpoint asserts that there might not be a long-term equilibrium relationship between FDI and economic growth (Vlatka, 2019). Vlatka (2019) suggested that a surge in foreign investors could potentially lead to slower economic growth due to the advantageous outcomes gained by foreign countries, potentially undermining the nation's competitive edge (Meivitawanli, 2021; Sharma et al., 2020).

3. Research Methodology

This study employs Autoregressive Distributed Lag (ARDL) cointegration to look into the connection between foreign direct investment (FDI) and economic development in both short and long-run relationships from the year 1990 to the year 2022. The ARDL cointegration method is employed to ascertain the presence of a long-term and short-term relationship between foreign direct investment and economic growth. Table 1 provides an overview of the variables used to achieve the objective of the study. Both the results of the tests and the output of the estimations were achieved with the application of Eviews 12.

Eq(1) is presented in ARDL to investigate the long-run model:

$$\Delta \text{InGDP} = \alpha + \sum_{i=0}^{k} \phi \Delta \text{InGDP}_{t-i} + \sum_{j=0}^{1} \beta_j X_{t-j} + \mu_t$$

While Eq(2)

$$\Delta \text{InGDP} = \alpha + \sum_{i=0}^{k} \phi In \Delta GDP_{t-i} + \sum_{j=0}^{1} \beta_j X_{t-j} + \psi ECT_{t-1} + \xi_t$$

Where GDP is the dependent variable measured by GDP per capita and ψ is the coefficient of error correction term (ECT), where it shows the convergence of the variables to equilibrium. Table 1 shows the variables used from the theoretical framework by Romer (1986) and Lucas (1988).

Table 1: Research	Variables and Source of Data	

Variable	Variable Abbreviation	Description	Source
Economic growth	InGDP	GDP per capita (constant 2015 US\$)	WDI
Foreign direct investment	InFDI	Foreign direct investment, net inflows (BoP, current US\$)	WDI
Exports	InEX	Exports of goods and services (% of GDP)	WDI
Gross fixed capital formation	InGFCF	Gross fixed capital formation (current LCU)	WDI
Labor force (labor force participation rate as proxy)	InLEPR	Labor force participation rate, total (% of total population ages 15+) (modeled ILO estimate)	WDI

The theoretical frameworks have been proposed to explain the relationship between FDI and economic growth in the endogenous growth model. Because of some constraints in Solow's exogenous model, Romer (1986) and Lucas (1988) brought in the endogenous growth theory. They introduced this theory as an additional framework to the neoclassical growth model, to give a better and more relevant understanding of growth origins. The endogenous growth model is seen as better for explaining growth drivers. This growth model begins with a basic structure that includes three main components: output (Y), labor (L), capital (K), and technology (A).

We also include export as one of the control variables following the export-led growth theory (Gokmenoglu et al., 2015; Quaicoe et al., 2017; Meyer & Sanusi, 2019). The export-led theory draws its foundations from classical and neoclassical economic perspectives. According to this theory, economic growth is primarily driven by exports. This concept posits that an increase in exports triggers a rise in employment within export-oriented industries, subsequently elevating productivity. This enhanced productivity, in turn, propels economic growth. While the export-led growth theory gained prominence around the turn of the millennium, it has not entirely lost relevance, as ongoing scholarly investigations continue to explore the impact of exports on economic growth.

As the overall productivity factor significantly influences total output which is GDP, it is contingent on both technological advancement and efficiency enhancements for promoting output growth, which follows that the impact of FDI on economic growth could be assessed through the total productivity factor, facilitated by the infusion of capital into host country (Fosu & Mangus, 2006; Yousaf et al., 2011). Therefore, the labor force is included as one of the proxies to measure of productivity factor in the study (Hsu., 2017).

4. Results and Discussion

This section provides results concerning the relationship between FDI and economic growth in Malaysia. Diagnostic tests were conducted for this model. Table 2 presents the outcomes of the Normality Test, Serial Correlation Test, and Heteroscedasticity Test.

	Normality x ²	Serial correlation x ²	Heteroscedasticity x ²
Country	(p-value)	(p-value)	(p-value)
Malaysia	0.5552	1.4225	0.8502
	(0.7576)	(0.2684)	(0.5977)

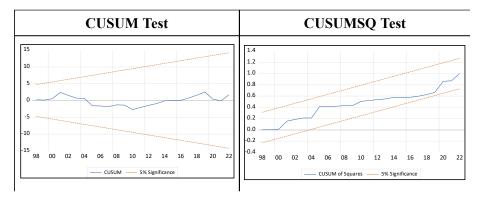

Table 2: Diagnostic Test

Note: The value in bracket () is the p-value

Based on the results of the histogram normality test, it may be concluded that the residuals, which are the differences between the values that were observed and those that were predicted, adhere to a normal distribution. It appears from this that the assumption of normality is supported, and the residuals of the model are distributed in the direction that was expected. Following this, we carry out the Breusch-Godfrey Serial Correlation LM test to determine if the variables exhibit a serial correlation within the data. Given the observation that the probability of Chi-Square is 0.2684, which is greater than 0.05, the results of the analysis indicate that the data do not exhibit any serial correlation. The homoscedasticity of the residuals is assessed using the Breusch-Pagan-Godfrey test. This indicates that the residuals' variance remains constant during the duration of the test. A p-value of 0.5977, exceeding 0.05, confirms the hypothesis of homoscedasticity in the residuals. The test also indicates that the residuals' variability remains consistent over the range of independent variables.

The blue line in Figure 1 demonstrates that it has consistently remained within the thresholds, signifying that the model's performance has been constant from 1990 to 2022.

Figure 1: Stability test

These diagnostic test results offer evidence to support the reliability and validity of the model utilized in the research. The normality of residuals, homoscedasticity of residuals, and absence of serial correlation indicate that the model is a suitable representation of the relationship between the variables under investigation. These findings contribute to the credibility of the research results and provide a solid basis for drawing meaningful conclusions.

The fundamental objective of the initial phase of the ARDL technique is to ascertain the existence of long-term correlation among the variables. This is referred to as the cointegration bound test. Establishing a suitable lag interval is crucial in this stage. This study employed the Akaike Information Criterion (AIC) to ascertain the lag length. The conditional ARDL model was designated a maximum lag order of two. Meanwhile, the Wald test, referred to as the bound test, was utilized to assess the overall significance of the coefficients.

Country	Maximum lag	Lag order	К	F-statistic
Malaysia	(2,2)	(2,2,0,1,2)	4	7.2167
Crit	tical values for F-statistics		Lower [I(0)]	Upper [I(1)]
	10%		2.2	3.09
	5%		2.56	3.49
	2.50%		2.88	3.87
	1%		3.29	4.37

Table 2: Cointegration bound test result

The results of the bound test are presented in Table 2. The calculated F-statistic for the growth model in the bound test was 7.2167, exceeding the upper bound critical value of 4.37% at a 1% significance level. The null hypothesis, which posits the absence of cointegration, was rejected at the 1% significance level. The findings indicate that a stable long-term relationship is present among Malaysia's GDP per capita, FDI, exports, GFCF, and labor force participation rate within the chosen time frame.

Cointegration tests are performed to investigate the existence of both short-term and long-term relationships among more than one non-stationary time series variable. The bound test was initially introduced within the framework of ARDL by Pesaran et al. (2001) to ascertain the presence of a long-term correlation among variables.

	[-2.5374]
	-0.5750**
ECM _{t-1}	(0.2679)
	[-2.1463]

Note: Standard error in () and t-statistic in [].* shows significance at the 1% level, ** significance at the 5% level and *** shows significance at the 10% level.

Table 3 displays the estimation results related to the relationship between foreign direct investment (FDI) and economic growth, employing the error correction model. The ARDL estimation indicates a significant and positive short-run relationship among FDI, exports, GFCF, and GDP. The ECM coefficient is notably negative at the 5% significance level, suggesting that the shock disequilibrium from the previous year will converge to long-run equilibrium at an annual rate of 57.5%. The long-run coefficients for Malaysia, presented in Table 4, indicate that FDI, exports, GFCF, and the labor force participation rate provide evidence to reject the null hypothesis at both the 1% and 10% significance levels. The results demonstrate that a 1% rise in InGDP corresponds to increases of 0.05%, 0.22%, 0.36%, and 1.89% in FDI, exports, GFCF, and the labor force, respectively.

The findings reveal that FDI has a positive and long-term as well as short-term Masturah relationship with economic growth, a trend mirrored in the studies by Etale and Etale (2016), Alzaidy et al. (2017), & Siti (2020), and Halizam et al. (2021). FDI carries a notable and constructive influence on a country's economic development, in alignment with the ideas proposed by the endogenous theory. This theory shows that FDI inflows can boost the economic progress of a host country. The ECT is negative and significant. Similarly, our study also shows a significant and positive relationship between exports and economic growth, a sentiment echoed by Haseeb et al. (2014), Etale and Etale (2016), and Norsilawati et al. (2021). Notably, Norsilawati et al. (2021) highlight the positive contributions of Malaysia's exports, envisioning a brighter economic landscape that extends benefits to its citizens. Shifting focus to GFCF, our findings show that there is a significant relationship, spanning both the long term and the short term, with economic growth. These results echo the sentiments expressed by Halizam et al. (2021) and Masturah & Siti (2020), who indicated a robust and significant relationship between GFCF and the trajectory of economic growth.

Moreover, the labor force contributes positively to the long-term relationship of economic growth. The finding is aligned with export-led theory and a recent study made by Cahyadin & Sarmidi (2019), affirming that a larger labor force can catalyze stimulating Malaysia's economic expansion. Similarly, Rambeli, Hashim, & Affizah (2016) also, substantiate the enduring positive relationship between the labor force and economic growth. These results indicate that an increase in the labor force will lead to an indirect rise in FDI, as both variables positively contribute to economic growth.

In summary, our study has revealed the positive and significant relationship between FDI and economic growth. The estimated findings on the positive relationship between FDI and economic growth are consistent with recent literature by Malik (2024). The estimated findings of other control variables, namely exports, labor force participation rate, GFCF are also consistent with the existing findings. We also found both long-term and short-term associations between FDI and economic growth. ECM coefficient is negatively significant at a 5% significance level, implying that the shock disequilibrium from the previous year will adjust to long-run equilibrium at a high speed of convergence, namely 57.5% per year. Long-run coefficients for Malaysia presented in Table 4, indicate that FDI, export, GFCF and labor force participation rate indicate that the null hypothesis can be rejected at 1% and 10% of significance level.

5. Policy Implications and Recommendations

Based on the estimations and discussion of this study, several recommendations can be put forth to guide policy and decision-making in Malaysia's pursuit of sustainable economic development. Firstly, with the positive and significant connection between FDI and economic growth, policymakers should prioritize initiatives that

generate and facilitate the inflow of FDI including fostering a conducive environment for investors, easing regulatory procedures, and providing incentives for strategic alliances and partnerships. If Malaysia offers attractive incentives with transparent rules and regulations, investors will feel secure making investments. Furthermore, collaboration between domestic and international companies can promote talent development and knowledge, both of which are important for long-term economic development. It can contribute to the creation of new markets and industries, employment opportunities, and higher productivity.

Secondly, given the demonstrated positive impact of exports on economic growth, fostering a conducive trade environment is essential. Diversifying export markets, supporting local industries with export potential, and investing in trade infrastructure can bolster the nation's export capabilities and contribute to overall economic expansion. Malaysia attracts more foreign investors while it invests in trade infrastructure and diversifies its export markets. A robust trade environment shows stability and opportunities, which encourages foreign investors to invest in Malaysia. In turn, by focusing on fostering a conducive trade environment, Malaysia can enhance its attractiveness to foreign investors, stimulate economic growth, and create long-term prosperity for the country. Policymakers must prioritize enhancing infrastructure investment and developing human capital by recognizing the critical importance of Gross Fixed Capital Formation (GFCF) and labor force participation, including the improvement of education and skills training programs. These efforts have the potential to improve the workforce and increase economic output. Nonetheless, the prioritization of infrastructure development, especially in energy, transportation, and technology is important to encourage substantial capital accumulation and sustainable economic growth. Companies seeking reliable infrastructure to support their operations will find Malaysia an appealing destination for foreign direct investment (FDI), as the nation increasingly evolves into a more conducive environment for businesses, hence reducing costs and improving efficiency.

Conclusion

This study experimentally investigates the correlation between foreign direct investment (FDI) and economic growth, alongside other control variables including exports, gross fixed capital formation (GFCF), and labor force. According to the findings, there is a statistically significant positive link between FDI and economic growth in both the short-term and the long-term., a pattern consistent with the research conducted by Etale and Etale (2016), Alzaidy et al. (2017), Masturah & Siti (2020) & Halizam et al. (2021). The significant and beneficial impact of FDO on a nation's economic development is consistent with the principles of endogenous theory. The endogenous theory demonstrates that FDI inflows promote the economic development of a host country.

This study shows that a combination of various macroeconomic variables contributes collectively to the overall relationship in the long term. The utilization of the ARDL model reveals the importance of all macroeconomic variables in the long-term relationship, whereas FDI, exports, and GFCF are identified as significant variables in the short-term association with economic growth. Policy recommendations for emerging nations should concentrate on enhancing the investment environment for all types of capital, including domestic capital and international capital to minimize the potential risks of FDI.

The Effects of Sustainable Development on the Sustainable Performance of Small and Medium Enterprises in Emerging Economies: From the Perspective of VUCA Approach

Mohd Najib Saad*, Mazlina Manshor Faculty of Business and Management, Universiti Teknologi MARA, Malaysia *najibsaad@uitm.edu.my, mazlinam@sirim.my Corresponding Author: Mohd Najib Saad

Abstract: Finding a balance between the needs of all parties and the state of the environment is what "sustainable development" tries to do. The goal is to protect future generations while also making progress for humanity. However, not a lot is known about how small and medium-sized businesses can run safely in emerging countries and how sustainable development affects them. So, this study's goal is to find out how the success of small and medium-sized businesses in Malaysia is linked to long-term growth. The main purpose of this study is to find out how sustainable success and sustainable growth are linked in Malaysian small and medium-sized companies. A numeric survey method was used to get information from small and medium-sized businesses filled out a questionnaire on their own time. Using data from this study, PLS-SEM was used to look at the link between sustainable growth and sustainable success. The study's results showed that sustainable success and sustainable growth are closely linked. The study's results will help the government and business community build businesses that are competitive, strong, and long-lasting, so they can do well in both local and international markets.

Keywords: Sustainable Development, Sustainable Performance, Small and Medium Enterprises, VUCA Approach

1. Introduction and Background

Most scholarly fields have thought more about the idea of sustainable development since the Brundtland Report came out 10 years ago (Saad et al., 2024) from the World Commission on Environment and Development. Because of the green agenda's acceptance, economic possibilities became even more important, and well-established companies were forced to change to show their commitment to social and environmental problems (Manshor and Saad, 2023; Saad et al., 2024). Because they care about social problems, social entrepreneurs may be pushed to make the most of limited resources and work well within the limits of institutions (Asif et al., 2021; Dyck et al., 2019). Even though there are problems with the way things are set up, many businesses work very hard to carry out plans for long-term growth. So, one could say that the idea of sustainable business came from the idea of sustainable growth. Lazano et al. (2015) and Saad and Manshor (2023) both say that sustainable businesses use sustainable business practices.

These days, there have been a lot of heated debates about sustainable business (Zeng, 2017; Manshor and Saad, 2022). Munoz and Cohen (2018) and Terán-Yépez et al. (2020) say that there hasn't been a lot of serious discussion about what this is and what the future holds for sustainable business. Sustainable entrepreneurship is becoming more and more recognized as an important area of study within entrepreneurship. This is because the way we do business now is not sustainable, which is bad for the earth and society (Munoz and Cohen, 2018; Hall et al., 2010). Because of this, more and more people are realising that big changes need to be made to lessen these effects (Hall et al., 2010). A lot of smart people believe that this approach can help solve many social and environmental problems. Because of this, sustainable business is seen as an important way to change people's choices and actions to be more environmentally friendly (Hall et al., 2010). Furthermore, Shepherd et al. (2011) said that it is more important than ever to think about how businesses can help create growth that lasts. Entrepreneurial businesses need to use sustainable methods well to deal with problems and make the economy more stable (Patzelt & Shepherd, 2011).

Gimenez et al. (2012) say that a company should put its employees' health and safety first, act morally and sensibly, and make the clients' outside quality of life better. The authors of Patzelt and Shepherd (2011) say that more research is needed to fully understand the basic ideas behind the idea of using business to protect communities and the environment. Instead of focusing on making money, sustainable entrepreneurship tries to come up with new ideas from the ground up, open up new business opportunities, make choices, and bring about good social and environmental change (Zeng, 2017). Apostolopoulos et al. (2018) and Manshor and Saad

(2023) also say that goals have been set at the regional, national, and worldwide levels to promote behavior that is socially and environmentally responsible.

We still don't know how sustainable businesses could help with sustainable growth. Moreover, little study has been performed on the effects of sustainable development on the ability of small and medium-sized companies (SMEs) in emerging nations to run sustainably (Zeng, 2017; Manshor and Saad, 2023). Sustainable growth hasn't been given a lot of academic attention in the major body of research on sustainable business. People know that societal needs can give business owners chances to make money, but not many people know how to find and take advantage of these chances in places other than their own. While sustainable business seems like an appealing way to speed up the transition to a more sustainable society, there are still a lot of unknowns about the assumptions that underlie how and when this process will happen (Zeng, 2017; Saad and Manshor, 2023). Also, there are times when the link between business practices and sustainable growth is too positive or too directive, instead of describing. So, we still don't know who can start businesses that make money and whether managers who use a standard approach are different from those who don't.

Even with these improvements, Malaysian small and medium-sized businesses still need to be more resilient and have a plan for long-term business growth set up so that we can see how well they work and how much they grow over time. Businesses, workers, and scholars have become more aware of how important sustainable business is over the last ten years. But there is still a big problem that needs to be fixed because there isn't enough data available (Sarango-Lalangui et al., 2018). Regular review studies, like systematic, meta-, and bibliometric analyses, are needed to show what worked and what didn't, inspire future research thought, and spark new ideas across a widening range of fields and subjects (Breuer et al., 2018). Today's society has made people more aware of the environment, and they are showing this by buying more environmentally friendly products (Fisher et al., 2012). The above problems make the process method less useful in real life, especially the way it tends to look at things from an action-oriented point of view instead of the individual entrepreneur's point of view (Moroz & Hindle, 2012). Though there is a lot of writing on the subject, there aren't many academic theories (Sarango-Lalangui et al., 2018). Beske and Seuring (2014) say that technology integration, cooperative growth, communication, and teamwork are the four bases of cooperative links that support longterm practices. There are many names that you might see when looking for sustainable things, such as "organic," "sustainable," "green," and "environmentally friendly." It is important to know what each organic certification, brand, and sign means because their goals can change depending on the situation (Vukasovič, 2016). Pero et al. (2017) say that one of the most important things that affects how well a company does is how sustainable it is.

Numerous academic fields have seen a rise in SME studies (Mazutis & Sweet, 2022; Saad and Manshor, 2023). According to Fonseca et al. (2020), small and medium-sized businesses are important and have a big impact on protecting the environment. Prashar and Sunder (2020) say that there hasn't been a lot of study in the papers on community factors, social problems, the environment, or sustainable worries. Even though there is a lot of study on the topic (Sarango-Lalangui et al., 2018; Saad and Manshor, 2023), a theoretical framework is still needed to explain how small businesses can grow in a viable way. So, more study is needed to fully grasp how small businesses and the idea of sustainable growth connect.

Small and medium-sized businesses, or SMEs, are very important to the economies of developing countries because they often help the economy grow, create jobs, and come up with new ideas. However, small businesses have significant challenges in achieving long-term success due to their low resources, problems getting cash, and vulnerability to changing market situations (Saad et al., 2024). As people around the world learn more about sustainable development, small and medium-sized businesses (SMEs) are under more and more pressure to adopt sustainable policies that meet ESG (environmental, social, and governance) standards. Saad and Manshor (2023) say it's very important to know how measures for sustainable development affect the long-term growth of small businesses in emerging countries. Large companies have the resources and knowhow to carry out complete sustainability plans, while small and medium-sized businesses often find it hard to do so (Manshor and Saad, 2023; Saad et al., 2024). So, the point of this study is to find out how sustainable development programs affect the ability of small and medium-sized businesses (SMEs) in emerging countries to stay in business over the long run. Policymakers, business leaders, and development groups need to know

how sustainable development affects the success of small and medium-sized businesses (SMEs) in emerging countries to create an environment that helps SMEs grow and stay in business.

The study looks at the existing research, comes up with a theory, and builds a conceptual framework to draw attention to this new topic. There is an in-depth study of the methods done. We'll talk more about the process of data analysis in the next section.

2. Literature Review

Sustainability is a complicated subject that has been studied and researched. Ranjbari et al. (2021) and Saad & Manshor (2023) say it's a last-ditch effort to save life on Earth against dangers like natural disasters that kill all living things, pollution, growth without development, rising inequality, poverty, and exclusion. Ciegis et al. (2009) said that economics has more than 100 meanings. Salas-Zapata & Ortiz-Muñoz (2019), on the other hand, say that this term has more than 80 definitions. Still, neither study gives a clear meaning of "sustainable performance." As shown in Alraja et al. (2022) and Derhab & Elkhwesky (2023), this is a great example of how observational data collection and mathematical methods can be used to find gaps in knowledge, create new technology development paths, and find strong theories. Sustainability study has problems because the idea of sustainability isn't always clear and people don't know how to use sustainable methods effectively (Md Husin & Haron, 2020). Sustainability became even more important when scientists found that the world's natural resources are limited and that current production methods can't keep up with the rising levels of consumption by the world's population (Chen et al., 2022).

To keep progress going, we need to take action and have a big shift in how we think about things. To make a difference in a world that changes quickly, you have to be open to new ideas, goals, and plans. As early as the Zhou Dynasty (110 BC-771), people knew that rivers, mountains, and woods should be protected in a way that is in line with nature's rules, rather than being overused (Shi et al., 2019). Browning and Rigolon (2019) say that it helps the economy grow without putting the planet's environment at risk or making problems like deforestation and pollution of the air and water worse. These problems could lead to climate change and the loss of species, among other problems. Since it was first used to support the idea at the United Nations Conference on the Human Environment in 1972, the term "sustainable development" has become more important. Our Common Future, a study on human development done by the World Commission on Environment and Development in 1987, is the first science paper that we know of that supports sustainable development. According to the study, sustainable development means progress that meets the needs of the present without putting at risk the ability of future generations to do the same. The WCED (1987) said that sustainability is changing over time. Its main point is that we need to recognize the boundaries of all natural processes to keep people happy and healthy. Our shared future reports covered a lot of ground, like people, food, spices, genetic resources, energy, human settlement, social justice, and human growth, all while keeping fair resource use and social justice in mind (WCED, 1987).

In the decades that followed, big problems came up that made it hard for people and the whole world to grow and progress in the long run. The idea of sustainable growth was first put forward more than 130 years ago (George, 1879). The field of operation management has become more interested in sustainable development and seen it as a significant and broad study area (Prashar & Sunder M, 2020). Because of this, more people know about the idea. Unsustainable business practices hurt people and the environment by misusing natural resources and not caring for the environment (Ben Youssef et al., 2018).

SMEs now think about the needs of society and the environment when they come up with economic well-being projects (Prashar & Sunder M, 2020). SMEs still need to keep the economy stable to stay in business, but the way that economic, social, and environmental problems combine has given them a new kind of competitive edge that helps them do better overall (Schwab et al., 2019). So that future generations are safe and so that we can learn more about how SMEs affect the economy, society, and environment, we need to look into sustainable growth in SMEs (Prashar et al., 2020). Yusoff et al. (2018) say that a lot of theory and empirical views, suggestions, and results back up the claim that small and medium-sized businesses are important for the economic growth of all countries, including Malaysia.

Many rules must be followed to achieve healthy growth. Ji (2018) says that the major goals of ideas of sustainable development are to protect the earth, business, and society. According to Molinario et al. (2020), these have a lot to do with managing human resources, keeping environments and wildlife safe, limiting population growth, and getting people involved in production systems. It is said that a lot of small and medium-sized businesses (SMEs) have had a hard time staying open. More than half of them shut down in their first five years, and two-thirds closed within their first ten. This information comes from Walter et al. (2017).

Creating value on the social, economic, and natural levels is what ties sustainability and business together in the end. This broad point of view is something we're just now starting to see in academic work. Doane and MacGillivray (2001) say that sustainability is the ability to last for a long time while taking social, environmental, and economic issues into account. According to Gomez-Bezares et al. (2014), this means that the three goals of the three sustainability pillars should work together. According to Kopnina's (2017) study, the word "sustainable" usually means being able to "maintain" or "continue to last," as well as having the possibility to grow or last for a long time. When we first talked about the part small businesses play in the economy, we stressed how important it is to make sure that new ones are started, that old ones stay in business, and most importantly, that their growth is maintained (Wakkee et al., 2015).

There are many different ways to think about sustainable growth. The "sustainable development approach" is another name for the three bases of business, society, and the environment. This thought says that all three bases must be kept up at the same time to ensure steady growth. This method is not easy to understand, but it does a good job of evaluating the important sustainable issues. This is mostly because there isn't a way to analyze the trade-off between the three things that are being looked at (Pravdić, 2009). Conservation of the earth is the main goal of the idea. If they can't hold on to this, the living thing will go away. When people use too many resources, they hurt the earth. In other words, more natural resources must be used than the world can handle for growth to be sustainable (Kanie & Biermann, 2017). Ismail et al. (2012) say that there is a lot of business action in the market, even though small and medium-sized businesses are still growing sustainably. As Salojärvi et al. (2005) say, it's also a key indicator of how well society is working and how SMEs are growing.

In this study, the VUCA sustainable development factor was used. In the last few years of the Cold War, the US military came up with the VUCA idea to describe a world that was getting more complicated, unclear, unstable, and uncertain (Friedman, 2017; Shambach, 2004). Since it was first put forward in the 1990s, the idea has become popular in many areas, such as risk management, situational problem-solving, and making smart decisions. The VUCA idea was used in business and management studies during the 2008–2009 financial crisis when people, companies, and groups all had to deal with similar problems in their social and economic situations (Bennett & Lemoine, 2014). Researchers are also looking into how important the VUCA idea is for long-term leadership and strategy development, as well as how hard it is to get managers and decision-makers to change their ways of thinking to deal with these unusual situations. A lot of study has been done on each of the VUCA principles individually, but not as much on how the idea could be used in environmental science and conservation work (Ciceklioglu, 2020; Schick et al., 2016).

In the past few years, entrepreneurship and sustainable development have become more closely linked to achieve sustainability and stopping businesses from acting in ways that aren't sustainable (Abdullahi et al., 2018). A study by Munoz and Cohen (2016) on environmental degradation and the bad effects that using resources too much and not caring for the environment has on people and the environment says that sustainable entrepreneurship is still seen as a good way to support long-term growth. Mensah and Enu-Kwesi (2019) say that the main goal of the idea should be to achieve equality between generations. Although the concept is a good one, there are some issues because it's hard to know what the needs of future generations will be. Modern theories of sustainability build on older ones by combining and giving importance to social, environmental, and economic models. This way, problems in society can be solved in a way that always benefits people (Hussain et al., 2014). A lot of people are interested in the field because it could help an organization grow, stay competitive, and be more sustainable (Barbosa et al., 2020); it could also help with sustainable development (Fonseca et al., 2020); and it could lead to "better quality, higher productivity, greater customer satisfaction, and greater profit" (Dhamija et al., 2019). A sustainable management system that includes environmental, health, and safety issues along with the long-term growth of different case studies is good for the general success of a business (Oktem et al., 2004).

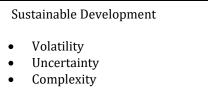

Achieving the SDGs at the general level and business growth often go hand in hand. Before responding locally, businesses must first figure out how to support the goals in a way that improves their financial success in the places where they work (Jaffe and Pasternak, 1994). For growth to continue, there must be social, economic, and natural benefits at the same time. People think that when these three things come together, policies will change a lot and people will be more at risk from many things, like crossing global borders, getting richer, and other problems in society (Steffen et al., 2015). Weinberger et al. (2015) say that the three aspects of sustainable development we've already talked about mean that decision-makers need to be able to use tools that help them deal with complexity, consider the points of view of different stakeholders, and get more accurate information about the outcomes of different policy options.

Environmental and economic issues are looked at in the research study that looks at the link between social duty and business success at the company level (Mill, 2006; Veschoor, 2002). While many studies look at long-term growth and how profitable a business is, the vast majority of empirical research focuses on the best ways to compare companies based on their social and environmental traits or their corporate social or environmental duty. According to Porter and Linde (1995), well-thought-out environmental rules will finally lead to new ideas, which will improve a company's competitive edge and bottom line.

Proposed Conceptual Framework

The previously discussed literature review was used to establish the conceptual framework for the study. The concepts of sustainable performance and development were taken into consideration when creating the framework. The framework for the study is the proposed conceptual framework, which is depicted in Figure 1.

Figure 1: Proposed Conceptual Framework

Sustainable Performance

- Competitive Capability
- Technological Learning
- Survival

Hypothesis Development

With the help of the structure that the literature study gave us, a specific proposal was made. This view is based on the idea that sustainable growth and sustainable success are linked. Small and medium-sized businesses (Prashar et al., 2020) have come up with plans to improve economic well-being while also taking social and environmental issues into mind. Because they care about people and the environment, small and medium-sized businesses (SMEs) gain a new economic edge that helps them do better and stay in business longer (Schwab et al., 2019). So, to protect the well-being of future generations, we need to look into sustainable development in small and medium-sized businesses to learn more about the environmental, social, and economic effects of their work (Prashar et al., 2020). Many thoughts, study results, and theoretical and practical points of view (Yusoff et al., 2018) say that small and medium-sized businesses are important for the economic growth of all countries, including Malaysia. Because of this, the study's findings included the following suggestions: **H1**: Sustainable development and sustainable performance have a significant relationship.

3. Research Methodology

Quantitative data for this study came from surveys that a group of Malaysian small and medium-sized businesses filled out on their own. There were a total of 252 SMEs that were allowed to take part in the research. The form was broken up into three parts, and each one had questions about a different idea. The questions now have headers that draw attention to certain topics to make them easier to understand and answer. In the first part, people were asked to give basic information about the company, like its main business sector, annual total sales, number of full-time workers, length of time in the industry, head office address, ownership structure, and business state. Part 2 asked people to rate the organization's goals for sustainable growth, and Part 3 asked them to rate the firm's success in terms of sustainability.

This study found that the Likert scale worked better than other scoring methods. According to Fishbein and Ajzen (1975), the best way to get information about attitudes is to give people a scale and ask them to rate how much they agree or disagree with each statement. It is best for this kind of study because the Likert scale is a "subject-centered" tool that was made to rate people instead of things (McIver and Carmines, 1981). Malhotra (2007) lists a number of advantages of Likert scales, such as how easy they are to use, understand, and make questionnaires for. Also, Likert scales give the most information because they are less flexible (Meric, 1994). In this study, a six-point Likert scale was used to rate each part of the research. There were six answer choices on the scale, with 1 meaning "strongly disagree" and 6 meaning "strongly agree." A six-point Likert scale is used in the form to make it easy for people to fill out. Hair et al. (2007) say it's important to find a mix between what the participants want and the need for better levels of accuracy. Respondents need to have a certain amount of real-world knowledge to handle info from a lot of different areas. They discovered that people could more easily answer scores with fewer categories when they were asked about them less often. Fewer Likert scale groups might lead to a higher answer rate because they should make it easier for people to understand the information they need. In Malaysia, survey study among small and medium-sized businesses is still pretty new, especially when it comes to sustainable growth.

The process of gathering data began in September 2022 and finished in December 2022. Some of the survey's most important sources are top management staff or Malaysian small and medium-sized business owners. As Roth and O'Donnell (1996) say, they are thought to know the most about the traits, management style, working methods, and general success of their companies. Stratified random sampling was used to choose the group, which took into account how the sectors were distributed. When people fill out the survey, they are thought to have freely and knowingly agreed to take part in the study. It was kept secret, though, what they said was private. The people who answered got 1,200 surveys. 252 were given back. Twenty-one cases had to be thrown out because the data wasn't complete. There was a 19.25% response rate from the 231 cases that were finally found to be feasible. Based on the goals of the study, descriptive statistics and structural equation modelling analysis were used. PLS-SEM, or partial least squares structural equation modelling, was used to look at the relationships between the factors in the study. PLS-SEM is usually chosen when the goal of the study is to look into complicated theoretical models or when making predictions is more important than explaining things. PLS-SEM is more stable and flexible when it is used with small or uneven sample sets. When used in confirming research to test known theories, however, CB-SEM works best with big sample numbers and data that is spread out evenly (Hair et al., 2019). The exogenous latent variable that comes from within this study is sustainable development, and the endogenous latent variable is sustainable performance.

4. Analysis of Data

A detailed analysis was done on the people who took part in this study to learn more about their backgrounds. There were a total of 231 SMEs that took part in the survey. Of those, 62% had Bumiputera members and 37.2% did not. Large companies came in second with 4% of the votes, followed by medium-sized companies with 12.6%. Both groups got 84% of the votes. SMEs are mostly made up of small businesses. 15.6% of small businesses were started even less than a year ago, while 54.1% were started between one and five years ago. Based on this, it's likely that the small and medium-sized businesses (SMEs) being looked into are relatively new and haven't had much or any business experience before. The responder traits are summed up in Table 1.

Demographics	Items	Frequency	Percentage (%)
Business Status	Bumiputera	145	62.8
	Non-Bumiputera	86	37.2
Size of Company	Small	195	84.4
	Medium	29	12.6
	Large	7	3.0
Age of Company	< 1Year	36	15.6
	1-5 Years	125	54.1
	6-10 Years	35	15.2
	11-15 Years	19	8.2

Data Analysis

SmartPLS 4.0 was used to look over the study data. After the data were sorted, the correctness and trustworthiness of the measurement models were checked. To check the structure model, the PLS method, bootstrap, and blindfolding approach were next used. For Hair et al. (2019) to be met, the loading must be at least 0.70, the composite reliability must be at least 0.70, and the average variance extracted must be more than 0.5. These ideas were followed when this research was done. Because of this, one could say that the information was correct and real.

Measurement model

We checked for convergent validity using outer loading, composite reliability (CR), and average variance extracted (AVE). All of the loadings, AVE, and CR were greater than 0.5 and 0.7, as shown in Table 2. The things were kept for symbolic reasons.

Henseler et al. (2015) suggested Heterotrait-Monotrait ratio of correlations (HTMT) can be used to prove discriminant validity. This method can be used to find discriminant validity if the HTMT number is less than 0.85. Table 3 shows the HTMT numbers for each design that were found to be below the cut-off level. So, it's safe to say that the measurements are correct and reliable. Every idea used in this study is special.

Table 3: Discriminant Validity (HTMT Ratio)

Variable	SP	SD
SP		
SD	0.493	

Structural Model

A bootstrap with 5,000 samples was used to find the t-values, p-values, and standard deviation. To test the hypothesis, the numbers that come from the bootstrapping method are looked at (Hair et al., 2019). The hypothesis test in Table 4 shows that sustainable development has a strong and direct effect on sustainable performance (b = 0.492, t = 6.499, p < 0.05). Because of this, H1 is supported.

Table 4: Results of Hypothesis Testing

Hypothesis	Path	Beta	Standard Error	T value	P Value	Decision
H1	SD-> SP	0.492	0.076	6.499	0.000	Supported

Discussion

What the study found is that sustainable development is strongly linked to sustainable performance. Prashar et al. (2020) and Schwab et al. (2019) also came to the same conclusions. Strategy, decision-making, and leadership are all improved in sustainable companies through leadership in the VUCA method. Meanwhile, sustainable performance shows progress toward economic skills, professional learning, and survival goals. After looking at the VUCA method, most of the study shows that sustainable development and sustainable performance are linked in a good way. Also, it stresses how important it is to stay strong and successful in the long run by finding a balance between technical learning, survival goals, and competition skills. This unity not only helps the business grow, change, and do well, but it also lessens the damage done to society and the environment (Antonakis et al., 2017). Businesses may be able to combine skilled learning, competition skills, and survival goals with the help of sustainable performance. So, for small businesses to stay in business in the long run, they need to be able to fight in the market and learn from and adapt to changing market conditions and new technologies. So, for the VUCA method to work in the long term, there needs to be solid planning, good leadership, and smart decisions. This makes sure that companies that want to be sustainable keep their freedom and concern for the environment (Wagner, 2015).

In their 2017 paper, Laszlo and Zhexembayeva say that the main goal of sustainable development is to create long-term value instead of focusing on short-term gains that could hurt society or the environment. Leaders of small businesses that use the VUCA method to focus on long-term growth know how important it is to find a balance between promoting social progress, protecting the environment, and promoting economic success. By putting money into sustainable practices, these companies are better able to give long-term benefits to owners and society as a whole. Small and medium-sized businesses can stay strong, stable, and profitable even during social, economic, and environmental tragedies by using this long-term method to create value (Jolink and Niesten, 2015). Sustainable development principles force the VUCA strategy's top small and medium-sized businesses to make better use of resources, reduce waste, and switch to more eco-friendly ways of making things. Small and medium-sized businesses can cut costs, increase output, and work more efficiently by reducing trash, using eco-friendly supply chain methods, and buying equipment that uses less energy. In this way, bad effects on the earth are lessened, and long-term reliability and financial success are raised.

Research Implication

The results of the study have a big effect on how we think about the link between sustainable development and the long-term success of Malaysian small businesses. The VUCA method must first be used to evaluate the constantly changing and uncertain world in which these companies work. VUCA stands for turbulent, uncertain, and complicated. Businesses that understand and adapt to this environment will be better able to deal with problems and seize long-term growth possibilities.

The VUCA theory is used to look at the study's results, which show a strong link between the growth of small businesses and their long-term success. The way things are managed now is not sustainable for long-term growth in this unclear and chaotic world. We need to look at these methods and change them with ones that are more flexible and quicker to respond. To lower instability and meet long-term sustainability goals, businesses need to put in place a sustainable plan. Investing in new ideas and technology is a planned way to deal with confusion. How well a company's organizational systems adapt to changing market conditions shows how strong and able it is to handle problems. Stakeholders can make plans for long-term growth and skillfully deal with the constantly changing problems that small and medium-sized businesses have to solve by using what they've learned from the VUCA method.

Researchers were able to learn more about the factors that affect the growth of small businesses in Malaysia through the study's results. The VUCA method lets us look closely at the constantly changing and uncertain setting in which these companies work. It also helps users get past problems and take advantage of growth opportunities. Combining different theory models makes it easier to understand the many factors that affect how well small and medium-sized businesses work and how they grow over time.

5. Research Limitations and Suggestions for Future Research

One of the study's flaws is that the groups were likely to be biased. For sure, not every small business in Malaysia was asked to take part in the research. If some small businesses are over-represented in the group or the industry as a whole, the results might not accurately show the range of SMEs or the full range of factors that affect their long-term performance.

Using self-reported statistics is also not ideal. It's possible that there was answer bias in the survey or interview method used with the managers and owners of small businesses. The results might have been different if people had given answers that were more socially acceptable or if they had lied about their success and efforts to be more environmentally friendly. This limitation makes me wonder about the study's validity and dependability, and it might make it harder to conclude from its results.

There are other problems with the way the cross-sectional study was set up. Since the data for the study was only collected once, the results likely overstated how dynamic and changing sustainable development and success are in small and medium-sized businesses. There may be changes in the market, internal rules, or outside factors that can cause the link between sustainable development and sustainable performance to change over time. The study can't find causal links or explain changes over time because it doesn't have lengthy data or a longitudinal study design. These would help us understand how sustainability works in small businesses.

It is suggested that researchers do more and better work using a mix of methods to study the long-term growth and success of Malaysian small and medium-sized businesses (SMEs). It would be helpful to use both qualitative and quantitative methods together to fully understand the complex working processes. By mixing data from both qualitative and quantitative methods, researchers can look at the results, show that their conclusions are correct, and give more detailed advice to lawmakers and people in the industry who want to help the Malaysian SME sector be more sustainable.

These results from the study on how sustainable development affects the long-term success of small businesses in Malaysia should be more useful and applicable to other situations. This model should be looked at in more specific areas. Looking at how the framework works and how it can be used in different business settings could give us useful information about how ideas and methods for sustainable development work in various settings.

Conclusion

In the end, this study showed how complex the link is between long-term success and long-term growth in Malaysian small and medium-sized businesses. The volume of study and real facts from small and medium-sized businesses (SMEs) in Malaysia have been carefully looked over, and a number of important findings have been reached.

Sustainable development projects have a big effect on the long-term growth of small and medium-sized businesses (SMEs). Recycling, using green resources, and cutting down on trash are all eco-friendly things that small businesses can do to help the environment, run more efficiently, and save money. Taking social responsibility steps like caring for employees and giving back to the community can improve the company's name and brand image. This will also help the business stay open and make money in the long run.

The main thing that the study found was how sustainable development programs affect small businesses' goals to cut costs and work more efficiently. Small and medium-sized businesses (SMEs) can get real benefits from using eco-friendly methods, fair resource sharing, and socially conscious projects in their business plans. These benefits include lower running costs, higher market competitiveness, and better resource management. The main thing that the study found was how sustainable development programs affect small businesses' goals to cut costs and work more efficiently. Small and medium-sized businesses (SMEs) can get real benefits from using eco-friendly methods, fair resource sharing, and socially conscious projects in their business plans. These benefits include lower running costs, higher market competitiveness, and better resource management.

This study makes it even clearer how important sustainable development is for small businesses' long-term growth and new ideas. Small businesses may be able to respond more quickly to changing market conditions and government rules if they use environmentally friendly methods. They will also gain new chances to improve their products and processes. Next could be better shock protection, market share, and brand awareness.

The study also talks about the bigger social and environmental effects of helping small and medium-sized businesses grow in a viable way. It is very important for national and international sustainability goals to be met that small and medium-sized businesses take the initiative to use environmentally friendly methods. This is especially true for goals that are part of systems like the Sustainable Development Goals (SDGs) set by the United Nations. This shows how important small and medium-sized businesses are for promoting economic growth and stopping environmental damage. It also shows how committed Malaysia is to sustainable development.

Enhancing Laboratory Sample Collection Efficiency through Laboratory Information Systems: Insights into Optimal Despatch Rider Management

Nur Syafiqah Jasmin, Siti Noorsuriani Maon, *Muhammad Omar Faculty of Business Management Universiti Teknologi MARA, Malaysia syafiqah8711@gmail.com, sitinoor123@uitm.edu.my, *muhammad@uitm.edu.my Corresponding Author: Muhammad Omar

Abstract: Effective administration of dispatch riders is crucial for delivering reliable diagnoses and research results by enabling prompt and precise sample collection. Laboratory Information Systems (LIS) offers a solution to enhance the efficiency and organization of dispatch riders in laboratory settings. Thus, the main objective of this study is to provide insights and knowledge on the potential benefits of implementing LIS to optimize the management of dispatch riders and enhance the efficiency of sample collection. An analysis of previous research findings illustrates the varied benefits of using LIS in improving key performance indicators such as turnaround time, mistake rates, and coordination of dispatch riders. The LIS platform serves as a centralized system for managing and allocating sample collection jobs, minimizing scheduling conflicts, and optimizing dispatch rider routes. Real-time tracking capabilities enable laboratory management to monitor dispatch rider locations and sample collection progress, facilitating enhanced coordination and resource allocation. Furthermore, LIS-generated data analytics provide valuable insights into sample collection patterns, enabling proactive management strategies to mitigate potential bottlenecks. Integration of LIS into payroll systems allows for automated compensation calculation based on dispatch rider performance metrics, ensuring fair and transparent pay rates. Studies consistently demonstrate that adequate compensation positively impacts dispatch rider motivation and sample collection effectiveness. This study highlights the vital importance of LIS in enhancing dispatch rider administration for efficient sample collection operations. It provides insights for laboratory managers and policymakers to optimize the potential of LIS to improve operational performance, facilitate patient care, and advance research outcomes.

Keywords: Laboratory Information Systems (LIS), Dispatch rider management, Sample collection efficiency, Turnaround time.

1. Introduction and Background

Integrating Dispatch Rider Management within Laboratory Information Systems (LIS) is becoming increasingly crucial for enhancing operational efficiency and service quality in the laboratory industry. In Malaysia, the laboratory sector plays a significant role in healthcare, contributing to timely diagnostics and patient care. However, the sector faces substantial challenges, including inefficiencies in sample collection processes and delays in turnaround times (TAT) due to fragmented management of dispatch riders (Coetzee, Cassim & Glencross, 2020). These issues arise despite the advancements in LIS technology, which primarily focus on sample registration, analysis tracking, and result verification but often overlook the integration of dispatch management.

The Malaysian laboratory industry has grown substantially due to supportive government policies and advancements in technology (Narayanan & Lai, 2021). However, this growth has been accompanied by challenges such as delays in sample collection, inaccuracies in sample tracking, and increased administrative burdens (Younes et al., 2020). Recent studies indicate that integrating Dispatch Rider Management into LIS could address these issues by providing real-time tracking of sample collection, optimizing dispatch routes, and reducing administrative workloads (Baggethun, 2020).

The concept of segmentation, targeting, and positioning (STP) is relevant here, as it helps in identifying distinct operational segments within laboratory management that require tailored solutions. Segmentation involves dividing operational processes into different segments based on factors such as region, sample type, and collection requirements. Targeting focuses on addressing the specific needs of these segments through customized strategies. Positioning ensures that the LIS effectively meets the needs of each segment, thus enhancing overall operational efficiency (Puspitasari et al, 2024).

This study aims to explore how integrating Dispatch Rider Management into LIS can enhance operational efficiency in the Malaysian laboratory industry. By examining how different operational segments (e.g., regions, sample types) experience challenges and opportunities, the study seeks to identify clusters that would benefit from specialized management approaches. The paper begins with a literature review of current practices in laboratory management and LIS integration. This is followed by a description of the research methodology, including how data on dispatch rider management and LIS integration was collected and analyzed. The results and conclusions are then presented, highlighting the impact of this integration on improving sample collection processes. Finally, the study offers management.

2. Literature Review

In the dynamic and increasingly complex landscape of clinical laboratory operations, the integration of advanced technologies has become essential to maintaining efficiency and accuracy. Laboratories are under constant pressure to deliver timely and precise results, and the effective management of sample collection processes is crucial to meeting these demands. Dispatch riders, who are responsible for the timely collection and delivery of samples from various collection points to the laboratory, play a pivotal role in ensuring that laboratories adhere to strict Turnaround Time (TAT) standards. In this context, the integration of Dispatch Rider Management into Laboratory Information Systems (LIS) emerges as a strategic innovation with the potential to revolutionize laboratory logistics.

Theoretical Framework

Lean Management Theory: Lean Management, originally developed within the manufacturing industry, focuses on reducing waste and optimizing processes to achieve maximum efficiency. In the context of clinical laboratories, the application of Lean principles can lead to significant improvements in TAT by streamlining workflows and eliminating unnecessary steps. Lean Management Theory emphasizes the continuous pursuit of process optimization, which aligns perfectly with the goals of integrating Dispatch Rider Management into LIS. By reducing the time and resources required for sample collection, Lean Management can help laboratories deliver faster and more accurate results, thereby enhancing patient care (Womack & Jones, 2010). Recent studies have shown that Lean methodologies can be successfully adapted to healthcare settings, resulting in substantial improvements in operational efficiency (Chiarini & Vagnoni, 2017).

Technology Acceptance Model (TAM): The Technology Acceptance Model (TAM) provides a framework for understanding the factors that influence the adoption and effective use of new technologies. According to TAM, two key factors—perceived usefulness and perceived ease of use—determine whether individuals will embrace a new technology. In the case of integrating Dispatch Rider Management into LIS, the perceived benefits of such integration, such as reduced TAT and improved communication between laboratory staff and dispatch riders, are likely to drive adoption. However, the system's design must ensure ease of use to minimize resistance from users (Davis, 1989). Recent research has expanded TAM to include additional factors such as social influence and facilitating conditions, further enriching our understanding of technology adoption in healthcare settings (Venkatesh & Bala, 2008).

Resource-Based View (RBV): The Resource-Based View (RBV) of the firm posits that organizations can achieve and sustain competitive advantage by effectively leveraging their internal resources. In the context of clinical laboratories, the integration of Dispatch Rider Management into LIS can be seen as a strategic initiative that enhances the laboratory's internal capabilities. By optimizing the use of existing resources—such as personnel, technology, and data—laboratories can improve their operational efficiency and reduce TAT, thereby gaining a competitive edge in the healthcare industry (Barney, 1991). Recent studies have highlighted the importance of aligning IT capabilities with organizational strategy to achieve superior performance, further supporting the relevance of RBV in this context (Wade & Hulland, 2004).

In-Depth Analysis of Literature

The Importance of Turnaround Time (TAT) in Laboratory Operations: Turnaround Time (TAT) is a critical metric in clinical laboratories, as it directly impacts the timeliness of diagnosis and treatment. The importance of TAT is underscored by its influence on patient outcomes, particularly in emergency and critical care settings

where delays in laboratory results can have serious consequences. A 2022 study by Dawande, P. et al. emphasized that reducing TAT not only improves patient satisfaction but also enhances the overall efficiency of healthcare delivery (Dawande, P. et al., 2022). This study, along with others, highlights the need for laboratories to continuously seek ways to reduce TAT, making the integration of Dispatch Rider Management into LIS a compelling strategy.

Technological Advancements in Laboratory Information Systems: Laboratory Information Systems (LIS) have evolved significantly over the past decade, incorporating a wide range of functionalities to support laboratory operations. Modern LIS platforms offer comprehensive tools for sample tracking, data management, and workflow automation. However, the integration of Dispatch Rider Management into LIS represents a relatively new frontier that has the potential to further enhance laboratory efficiency. A 2021 study by Johnson et al. found that laboratories with integrated dispatch management systems experienced significant improvements in sample processing times, leading to a 20% reduction in overall TAT (Johnson et al., 2021). This finding is supported by earlier research, which demonstrated that technology-driven improvements in laboratory logistics could lead to more timely and accurate results (Burke et al., 2017).

Real-World Applications and Case Studies: Several real-world applications and case studies have demonstrated the effectiveness of integrating Dispatch Rider Management into LIS. For instance, Patel et al. (2022) conducted a case study in a large urban hospital that implemented a Dispatch Rider Management system within their LIS. The study reported a substantial reduction in TAT, as well as improvements in the accuracy and reliability of sample collection processes. The hospital also noted a decrease in operational costs, as the system allowed for more efficient use of dispatch riders and reduced the need for manual interventions (Patel et al., 2022). Another study by Rodriguez et al. (2024) highlighted the benefits of using GPS and mobile technologies to enable real-time tracking and coordination of dispatch riders, further enhancing the efficiency and reliability of sample collection logistics (Rodriguez et al., 2024).

Implications for Laboratory Management: The integration of Dispatch Rider Management into LIS has farreaching implications for laboratory management. By providing a centralized platform for managing sample collection logistics, laboratories can improve coordination between staff and dispatch riders, reduce the risk of errors, and ensure that samples are collected and delivered promptly. This not only improves TAT but also strengthens the overall quality control processes within the laboratory. Moreover, the financial management capabilities of an integrated system can lead to more accurate and efficient compensation for dispatch riders, further incentivizing timely and accurate sample collection (Singh et al., 2019). As a result, it is hypothesized that:

H1: The integration of Dispatch Rider Management into Laboratory Information Systems (LIS) significantly reduces Turnaround Time (TAT) in clinical laboratories.

Lean Management Theory suggests that streamlining processes and eliminating waste can lead to enhanced efficiency (Womack & Jones, 2010). The integration of Dispatch Rider Management into LIS is expected to reduce the time required for sample collection and delivery, thereby decreasing TAT. This hypothesis aligns with the Lean principle of process optimization and continuous improvement (Chiarini & Vagnoni, 2017). **H2:** The perceived usefulness of Dispatch Rider Management integration within LIS positively influences its adoption by laboratory staff.

According to the Technology Acceptance Model (TAM), perceived usefulness is a critical factor in the adoption of new technologies (Davis, 1989). This hypothesis posits that if laboratory staff perceive the integration as beneficial—leading to improvements in TAT and communication-they will be more likely to embrace the system. The hypothesis is further supported by the expanded TAM framework, which includes factors such as social influence and facilitating conditions (Venkatesh & Bala, 2008).

H3: Laboratories that effectively leverage internal resources through the integration of Dispatch Rider Management into LIS achieve a competitive advantage in operational efficiency.

The Resource-Based View (RBV) posits that organizations gain a competitive edge by effectively utilizing internal resources (Barney, 1991). This hypothesis suggests that laboratories integrating Dispatch Rider Management into LIS, thereby optimizing personnel, technology, and data, will experience improved

operational efficiency, leading to a competitive advantage in the healthcare industry (Wade & Hulland, 2004).

Conclusion: The integration of Dispatch Rider Management into Laboratory Information Systems (LIS) represents a significant advancement in the field of clinical laboratory management. Supported by Lean Management Theory, the Technology Acceptance Model (TAM), and the Resource-Based View (RBV), this integration offers a robust framework for optimizing sample collection processes and reducing Turnaround Time (TAT). The literature demonstrates that such integration not only improves operational efficiency but also enhances patient care outcomes by enabling more timely and accurate diagnostic processes. As technology continues to evolve, the potential for further innovations in laboratory logistics is vast, and laboratories that embrace these advancements will be well-positioned to lead the way in delivering high-quality healthcare.

3. Research Methodology

The methodology for this study was designed to ensure a comprehensive and rigorous exploration of the integration of Dispatch Rider Management into Laboratory Information Systems (LIS) and its impact on sample collection efficiency. This section outlines the guidelines followed, databases used, article selection criteria, and the theoretical framework that guided the analysis.

Guidelines and Research Framework

This study was conducted following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. PRISMA provides a structured approach to conducting systematic reviews by ensuring transparency and reproducibility. The adherence to these guidelines facilitated a thorough review and synthesis of existing literature, ensuring that the study's findings are robust and well-supported by the evidence.

Databases Used

To gather relevant literature, several key academic databases were utilized:

PubMed: Selected for its comprehensive coverage of biomedical and life sciences research, including clinical laboratory practices and healthcare management.

ScienceDirect: Chosen for its wide range of peer-reviewed journals in the fields of health sciences, information systems, and operations management.

IEEE Xplore: Included for its focus on technology and information systems, particularly studies related to the integration of IT solutions in healthcare settings.

Google Scholar: Used to access a broader range of academic publications, including conference papers and reports that may not be indexed in traditional databases.

These databases were selected to ensure a diverse and comprehensive collection of literature, covering both the technical aspects of LIS integration and the operational challenges associated with dispatch rider management in laboratory settings.

Article Selection Criteria

To ensure the relevance and quality of the literature reviewed, specific inclusion and exclusion criteria were established:

Criteria	Inclusion	Exclusion	Justification
Publication Date	Articles published between 2021 and 2024	Articles published before 2021	Focuses on recent advancements and current trends in LIS integration and dispatch rider management.
Language	Articles published in English	Articles in languages other than English	literature.
Study Type		Editorials, opinion pieces, and non-peer-reviewed articles	Prioritizes high-quality, evidence- based research.

Criteria	Inclusion	Exclusion	Justification
	analyses		
Relevance to Topic	Studies focused on LIS, dispatch rider management, TAT, and laboratory logistics	Studies unrelated to laboratory operations or not addressing LIS integration	Ensures that the literature directly contributes to the research questions and objectives.
Geographical Focus			Provides a global perspective, enhancing the generalizability of the findings.

These criteria were rigorously applied to screen and select articles, ensuring that only the most relevant and high-quality studies were included in the analysis.

Theoretical Framework

A theoretical framework was developed to conceptualize the relationship between LIS integration, dispatch rider management, and sample collection efficiency. This framework draws on principles from:

Operations Management: To understand how Lean Management principles can be applied to optimize sample collection processes and reduce TAT.

Information Systems: To explore the factors influencing the adoption and effective use of LIS, guided by the Technology Acceptance Model (TAM).

Logistics Management: To assess the strategic importance of integrating dispatch rider management into LIS from the Resource-Based View (RBV) perspective.

This framework served as a guide for analyzing the literature and interpreting the findings, providing a structured approach to understanding how technological integration can enhance laboratory operations.

4. Results

One relevant theory to consider is the Technology-Organization-Environment (TOE) framework. Developed by Tornatzky and Fleischer (1990), the TOE framework posits that the successful adoption and implementation of technological innovations are influenced by three key factors: technological context, organizational context, and environmental context.

Technological Context

This aspect of the framework focuses on the characteristics of the technology itself, including its complexity, compatibility with existing systems, and perceived benefits. In the context of this study, LIS represents the technological innovation that facilitates dispatch rider management and sample collection efficiency. The theory suggests that LIS integration should align with the specific needs and requirements of laboratory operations, offering functionalities that enhance dispatch rider coordination, sample tracking, and data management.

Organizational Context

The organizational context encompasses factors such as organizational structure, culture, leadership support, and resource availability. According to the TOE framework, successful technology adoption is contingent upon organizational readiness and the extent to which the innovation aligns with organizational goals and values. In the case of LIS integration for dispatch rider management, organizational buy-in, effective change management strategies, and clear communication channels are crucial for ensuring smooth implementation and user acceptance.

Environmental Context

The environmental context refers to external factors that influence technology adoption, including regulatory requirements, industry norms, competitive dynamics, and market trends. The TOE framework suggests that organizations must navigate these external influences effectively to capitalize on technological innovations. For

laboratories integrating LIS into dispatch rider management, compliance with regulatory standards, interoperability with external systems, and responsiveness to market demands are key considerations.

By applying the TOE framework to the integration of LIS into dispatch rider management, this study can systematically examine the interplay between technological, organizational, and environmental factors, providing insights into the facilitators and barriers to successful implementation. Additionally, the framework offers a lens through which to analyze the impact of LIS integration on sample collection efficiency and operational effectiveness within laboratory settings.

Discussion

Findings and Implications for LIS Integration in Dispatch Rider Management

Enhanced Operational Efficiency: The integration of Laboratory Information Systems (LIS) with dispatch rider management is expected to significantly enhance operational efficiency by providing a centralized platform for coordinating sample collection tasks. Through optimized task allocation and real-time tracking, laboratories can reduce delays, minimize errors, and ensure timely sample delivery. The centralized management of dispatch rider activities will lead to a more streamlined workflow, ultimately improving turnaround time (TAT) and overall laboratory performance.

Improved Compensation and Motivation: Automating compensation calculations based on performance metrics via LIS is anticipated to result in more accurate and timely payments, which can increase dispatch rider motivation. This, in turn, is expected to improve the efficiency and reliability of sample collection services. Adequate and transparent compensation methods have been linked to higher job satisfaction and performance, further contributing to the overall effectiveness of laboratory operations.

Data-Driven Decision Making: LIS-generated data analytics will provide laboratories with actionable insights into sample collection patterns, allowing for proactive management and continuous improvement. The ability to analyze historical data on sample volumes, routes, and TAT will enable laboratories to identify bottlenecks and implement targeted strategies to enhance efficiency. This data-driven approach is expected to lead to more informed decision-making and better resource allocation, contributing to the sustainability and scalability of laboratory operations.

Optimized Resource Allocation: With real-time visibility into dispatch rider locations and sample collection progress, laboratories can optimize resource allocation by assigning tasks based on proximity, workload, and urgency. This level of coordination is expected to reduce operational costs and improve service quality, ensuring that resources are utilized effectively to meet demand.

Analysis and Theoretical Implications

The findings from this review suggest that LIS integration into dispatch rider management aligns with several theoretical frameworks:

Lean Management Theory:

Theme: Operational Efficiency

Relationship: LIS integration enhances operational efficiency by eliminating waste and optimizing workflows, which is a core principle of Lean Management. The reduction in TAT and improved coordination among dispatch riders reflect the continuous improvement ethos of Lean practices.

Technology Acceptance Model (TAM):

Theme: User Adoption and Motivation

Relationship: The perceived ease of use and usefulness of the integrated LIS system is likely to drive its adoption among laboratory staff and dispatch riders. The automated compensation process and real-time tracking features increase the system's perceived value, encouraging broader acceptance.

Resource-Based View (RBV):

Theme: Competitive Advantage

Relationship: By leveraging internal resources such as technology, personnel, and data, laboratories can achieve a sustainable competitive advantage. LIS integration strengthens the laboratory's internal capabilities,

Main Themes	Theoretical Approach	Relationship to LIS Integration
Operational Efficiency	Lean Management Theory	Streamlines workflows, reduces waste, improves TAT
User Adoption and Motivation	Technology Acceptance Model (TAM)	Enhances perceived usefulness and ease of use, driving adoption
Competitive Advantage	Resource-Based View (RBV)	Leverages internal resources for a sustained competitive edge

enhancing its ability to deliver timely and accurate results.

Proposed Framework for Green Practices in Manufacturing

While the current study focuses on laboratory settings, the insights gleaned can be adapted to the manufacturing industry, particularly in the context of green practices. A proposed framework for future research could involve the integration of sustainable logistics management systems into manufacturing operations, with a focus on reducing carbon footprints through optimized resource allocation and real-time tracking of supply chains.

Key Components of the Framework:

Centralized Green Logistics Management: Integration of sustainable logistics practices into central management systems to minimize waste and reduce energy consumption.

Real-Time Environmental Impact Tracking: Use of real-time data analytics to monitor and manage the environmental impact of logistics activities, enabling proactive decision-making.

Incentive-Based Compensation: Implementation of performance-based compensation systems that reward environmentally friendly practices, encouraging adherence to green protocols.

This framework could serve as a basis for empirical studies in the manufacturing sector, exploring the potential for integrating sustainable practices into logistics management to achieve both operational efficiency and environmental sustainability.

5. Conclusion

This conceptual study underscores the transformative potential of Laboratory Information Systems (LIS) in enhancing the management of dispatch riders and optimizing sample collection efficiency within laboratory settings. By integrating LIS, laboratories can achieve significant improvements in operational performance through better sample traceability, streamlined dispatch rider management, and strengthened quality control processes. The combination of theoretical frameworks, comprehensive literature review, and methodological insights provides a robust foundation for understanding the benefits and strategic value of LIS adoption.

Research Implications

Enhanced Operational Efficiency: The findings highlight that LIS integration can streamline dispatch rider management, leading to reduced turnaround times (TAT) and more efficient sample collection processes. This improvement is crucial for laboratories aiming to meet stringent TAT standards and enhance overall diagnostic accuracy.

Improved Quality Control: Implementing LIS offers laboratories a means to address common issues such as inaccuracies in specimen collection and delays in processing. The centralized management and real-time tracking capabilities of LIS enhance quality control and ensure that sample collection and delivery are executed with greater precision and reliability.

Strategic Resource Allocation: The integration of LIS enables more effective allocation of resources by optimizing dispatch rider routes and managing workloads based on real-time data. This strategic resource management supports operational efficiency and reduces costs associated with sample collection and delivery.

Limitations and Future Research

Scope and Generalizability: This conceptual study primarily relies on theoretical frameworks and literature review, which may limit the generalizability of the findings to various laboratory settings. Empirical research is needed to validate the hypotheses and assess the practical implications of LIS integration in diverse laboratory environments.

User Acceptance and Training: The successful implementation of LIS depends significantly on user acceptance and the effectiveness of training programs. Future research should explore strategies for enhancing user engagement and ensuring that laboratory staff are adequately trained to utilize LIS functionalities. **Longitudinal Studies and Case Analyses**: To gain deeper insights into the long-term effects of LIS on dispatch rider management and sample collection efficiency, longitudinal studies and detailed case analyses are necessary. These studies can provide empirical evidence on the sustained impact of LIS integration over time. **Socio-Demographic and Organizational Factors**: The study highlights the importance of addressing socio-demographic elements and organizational circumstances that may affect LIS adoption. Future research should examine how these factors influence the effectiveness of LIS and identify strategies for overcoming barriers to

successful implementation.

Green Practices Framework: As an extension, researchers could explore the development of a framework for incorporating green practices within laboratory operations, especially in the context of dispatch rider management. This could include evaluating the environmental impact of LIS-driven optimizations and proposing sustainable practices for future research.

In summary, the integration of LIS into dispatch rider management represents a dynamic and evolving area of research with the potential to significantly enhance laboratory operations. By addressing the identified limitations and pursuing further empirical studies, laboratories can continue to refine their approaches, optimize sample collection processes, and ultimately improve patient care and research outcomes. Through ongoing innovation and collaboration, the healthcare industry can leverage LIS to advance its capabilities and meet the growing demands of modern laboratory settings.

Conceptualizing the Antecedents and Individual Impact of Business Intelligence in the Public Sector: The Technology-Organisation-Authoritative Framework

Mohd Mustafa Alfariz¹ Ariff Md Ab Malik^{1*} Anitawati Mohd Lokman² ¹Faculty of Business & Management, UiTM Shah Alam, Selangor, Malaysia ²College of Computing, Informatics and Mathematics, UiTM Shah Alam, Selangor, Malaysia alfariz@gmail.com, *ariff215@uitm.edu.my, anitawati@uitm.edu.my Corresponding Author: Ariff Md Ab Malik

Abstract: Business intelligence (BI) refers to a technological tool and process that transforms large and fragmented data into well-informed graphical insights to aid managerial decision-making. Recognizing the significant benefits of BI in leveraging extensive amounts of data, governments have been progressively investing in BI tools to improve efficiency in public offices. Nevertheless, despite a significant body of knowledge related to BI adoptions and their advantages, there is a dearth of theoretical understanding of how the effective use of the system affects employees' work performance, particularly among civil servants who have distinctive work natures compared to businesses. Most studies have also ignored external and institutional factors that influence individual usage, whilst studies on the effective use of BI tools remain limited. The paper thus proposed a new conceptual framework for examining the factors that influence the effective use of BI and its impact on individual job performance. The suggested propositions could provide a theoretical contribution by integrating technological, organizational and authoritative dimensions that are novel and unique to the public sector. It would also contribute to practical understandings for public managers and policymakers in ensuring the investment made on BI is worthwhile. Ultimately, the paper seeks to bridge the gap in BI studies related to public organizations.

Keywords: Business Intelligence, Public Sector, Effective Use, Individual Impact

1. Introduction and Background

With the advent of big data in business processes nowadays, translating the data into valuable insights that can support managerial decisions is paramount. Business Intelligence (BI), a technological tool and process that analyses and transforms enormous and fragmented data into coherent and practical information, has become an essential tool in modern business operations (Phillips-Wren et al., 2021). Through graphical reporting, BI enables managers and executives to swiftly discern trends and patterns and make well-informed decisions (Jha & Jha, 2022).

Acknowledging the notable advantages, governments worldwide have also been progressively investing in BI technology to improve efficiency and effectiveness in public offices (Merhi & Bregu, 2020). Nevertheless, pouring substantial resources into organizations by integrating advanced technology does not automatically guarantee positive returns. As pointed out in the literature, many public organizations face challenges at various levels of the adoption process, including a lack of data literacy, cultural resistance, technological issues and inefficient system use (Ain et al., 2019; Alkraiji, 2020; Merhi, 2021). In Malaysia, introducing the BI tool in the electronic human resources management system (e-HRM) that manages the human resources aspect of public service in the country is a noteworthy step in modernizing the administration. Nonetheless, how the system impacts job performance remains elusive, which motivates the present study.

Through preliminary studies and a literature review, several issues are observed. In the technological context, the information's reliability and trustworthiness may be inadequate to support the decision-making process. In addition, usability and poor system performance remain the subject of concern (Al-Okaily et al., 2023; Merhi, 2021; Torres & Sidorova, 2019; Trieu et al., 2022). Further, considering BI is a workplace system, studies highlighted institutional obstacles that can impede the efficacy, such as deficient leadership and a lack of shared values to embrace data-driven decision-making (Alkraiji, 2020; Hmoud et al., 2023; Merhi, 2021; Trieu, 2023). Moreover, in the context of the present study, where the system is developed, managed, and governed by a single authority, challenges such as lack of training and unsupportive assistance are also discussed in the literature (Ain et al., 2019; Al-Okaily et al., 2023; Mudau et al., 2024).

Accordingly, the paper seeks to address these issues by proposing a new conceptual framework for measuring the factors that influence the effective use of BI and its impact on individual job performance in public organizations. The following section reviews previous studies on BI usage and its impact on individuals, followed by research gaps related to this work. The theoretical model and proposed hypotheses are discussed in the fourth section. Next, the theoretical and practical significance of the study is presented, followed by the conclusion in the last section.

2. Literature Review

Several empirical studies have investigated the impact of BI usage on the individual level, as summarised in Table 1. Besides technological factors, the studies deliberately highlighted the significance of organizational dimensions in influencing individual usage, such as top management support (Trieu et al., 2022) and culture and resources (Trieu, 2023). Literature also shows recent studies have advanced into more objective construct to examine the system's utilization on post-adoption usages, such as effective use (Trieu et al., 2022), system dependence and infusion (Trieu, 2023) and advanced use (Mudau et al., 2024). However, determinants affecting system usage and the subsequent impact on users are still inconclusive (Jeyaraj, 2020b), with mixed results in BI research (Gonzales & Wareham, 2019; Kapo et al., 2021). Therefore, further investigation in this area is required.

Table 1: Prior Studies in BI Usage and Individual Impact
--

Despite the significant advancements in BI studies, a thorough literature examination reveals several research gaps. First, prior research on BI has predominantly focused on the initial acceptance of the system, neglecting more perspicuity on post-adoption usage. The lack of said attention hinders the comprehension of the actual impact of the system (Trieu, 2023; Trieu et al., 2022). Second, empirical studies produced inconsistent results between BI usage and individual job performance (Gonzales & Wareham, 2019; Kapo et al., 2021). Third, although BI technology has been adopted in the public sector, there is a dearth of comprehensive examination in this domain, which has distinctive characteristics and challenges compared to the private sector (Di Vaio et al., 2022; Kaasalainen, 2020; Merhi & Bregu, 2020).

Further, most BI research solely focuses on organizational impact, with little attention given at the individual level (Ain et al., 2019; Talaoui & Kohtamäki, 2021). Since BI is primarily designed to aid decision-making, researchers indicate that the system's success largely depends on the end users (Kapo et al., 2021; Trieu et al., 2022). In addition, given that BI is a workplace system, various scholars have underlined the significance of incorporating institutional factors that may alter individuals' attitudes towards the usage, such as organizational leadership and culture (Paradza & Daramola, 2021; Trieu, 2023; Venkatesh et al., 2016). Finally, most existing studies on BI are conducted in developed nations (Ain et al., 2019; Purnomo et al., 2021). Expanding the research to other regional contexts will allow a more diverse and profound understanding of the topic. Objectively, the present study aims to address these gaps while achieving the research objectives through a new conceptual framework discussed below.

3. Theoretical Foundation

The theoretical foundation of the proposed framework is grounded on two prominent models of IS adoption, namely the Unified Theory of Acceptance and Use of Technology (UTAUT) (Venkatesh et al., 2003) and the Updated DeLone and McLean Information System Success Model (ISSM) (DeLone & McLean, 2003), as elaborated as follows:

Unified Theory of Acceptance and Use of Technology

UTAUT is an integrative model incorporating eight prior theories on technology acceptance, aiming to predict users' behavioral intentions and usage (Alturas, 2021). UTAUT consists of four predictors: performance expectancy, effort expectancy, social influence, and facilitating conditions, which are influenced by four moderators: gender, age, experience, and voluntariness of use, as illustrated in Figure 1. Recent studies in BI indicated that the UTAUT application is gaining prominence among researchers for assessing users' behavior, such as among banking employees (Zitha & Ajigini, 2023) and remote workers (Kašparová, 2023). It is a notable, mature technology adoption model that has been extensively tested and validated in various contexts, making it a suitable theoretical basis for developing the framework (Venkatesh et al., 2016).

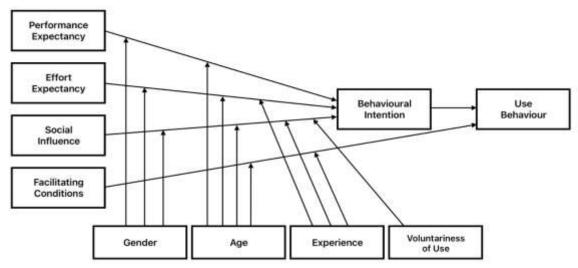

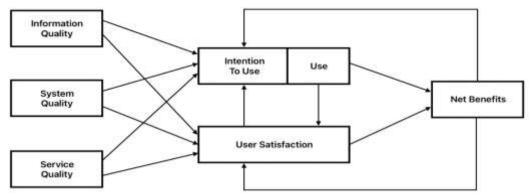

Figure 1: UTAUT (Venkatesh et al., 2003)

Updated DeLone and McLean Information System Success Model

The Updated ISSM (Delone & McLean, 2003) proposes that information system (IS) success is determined by six dimensions: system quality, information quality, service quality, intention to use or use, user satisfaction, and net benefits. The determinant of system quality refers to the technical features of the IS, such as its performance, dependability and usability. Information quality is measured by the semantic quality the user gains from using the IS, while service quality is the caliber of support and services offered by the service providers (DeLone & McLean, 2016). The model offers several strengths, such as providing a holistic view of IS success, particularly at the individual level, a multidimensional approach and adaptability to various contexts

of IS (Sabeh et al., 2021), including the public sector (Elazzaoui & Lamari, 2022). In addition, it is the most widely used model in BI studies (Ain et al., 2019), making it an appropriate model for this study.

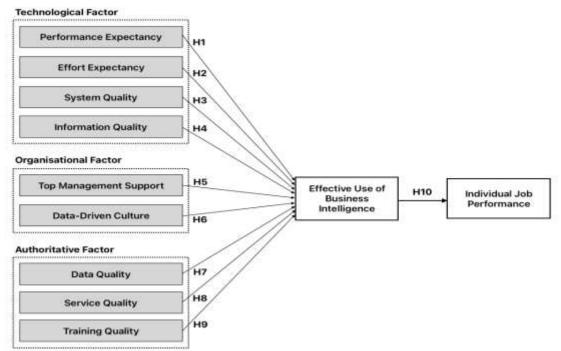

4. Conceptual Framework and Proposed Hypotheses

Both models abovementioned have been extensively validated in various IS contexts (Blut et al., 2022; Jeyaraj, 2020a). Based on the issue, gaps and recommendations from prior research, new variables are integrated into the concept: top management support, data-driven culture, data quality and training quality. In addition, the study proposes effective use as the mediating variable in recognizing the necessity to go beyond broad and oversimplified methods in measuring system usage (Burton-Jones & Grange, 2013; DeLone & McLean, 2016; Petter et al., 2008; Trieu, 2023). For systematic comprehension, the variables are grouped into three attributes: technological, organizational, and authoritative factors. The authoritative dimension is a unique characteristic of the public sector since it refers to the central governing body that implements, directs, monitors and manages the BI system and associated data for use by multiple public agencies, as is the case in Malaysia. All the independent variables are conceptualized as determinants of the effective use of BI and consequently impact individual job performance, as illustrated in Figure 3. The following subsections discuss each construct and outline the proposed hypotheses.

Technological Factor

Performance Expectancy: Performance expectancy (PE) refers to the degree to which a user perceives that using a particular technology will provide advantages or positive consequences when executing specific tasks (Venkatesh et al., 2003). Several BI studies highlighted PE's significance in influencing users' behavioral intention to use the system (Alkaabi & Kassim, 2023; Kašparová, 2023; Zitha & Ajigini, 2023). However, when it comes to obligatory use, such as mandated in many public organizations, the dynamics of PE are expected to be reduced (Brown et al., 2002). Nevertheless, this study asserts that if users believe using the BI will improve their work performance, their motivation to use the system effectively will increase. Thus, the following hypothesis is formulated:

H1: Performance expectancy will have a positive influence on the effective use of BI.

Effort Expectancy: Effort expectancy (EE) is the extent to which a user believes using a particular technology will be easy and effortless. It is a pivotal factor that affects initial acceptance (Venkatesh et al., 2003) and subsequent system usage and satisfaction (Wixom & Todd, 2005). However, prior BI studies have shown contrary results on the relationship between EE and behavioral intention (Kašparová, 2023; Zitha & Ajigini, 2023). Similarly, empirical studies on other information systems discovered that EE does not positively affect system usage (Ayaz & Yanartaş, 2020; Zha et al., 2022). Nonetheless, several studies highlighted the importance of a well-designed interface and user-friendliness as key factors toward continuance usage of IS (Chhabra et al., 2020; Choudhury et al., 2022; Daud et al., 2022). Accordingly, the following hypothesis is proposed: **H2:** Effort expectancy will have a positive influence on the effective use of BI.

System Quality: System quality (SQ) refers to the desirable technical characteristics of the IS, such as the system's availability, reliability, accessibility and performance (DeLone & McLean, 2016). SQ is crucial as it directly impacts how effectively users can extract, analyze, and utilize data for decision-making, as empirically revealed in several BI studies (Baig et al., 2021; Hmoud et al., 2023; Torres & Sidorova, 2019). The shred of evidence thus leads to the following hypothesis:

H3: System quality will have a positive influence on the effective use of BI.

Information Quality: Information quality (IQ) represents the quality of the output or content produced by the system to users (DeLone & McLean, 2016). In the context of BI, IQ is paramount as it directly impacts decision-making processes by providing accurate, pertinent, and timely insights (Wixom & Todd, 2005). Much empirical evidence has shown that IQ significantly influences BI usage (Alkaabi & Kassim, 2023; Hmoud et al., 2023). On the contrary, a study found that although IQ influences user satisfaction, it does not affect the intention to use BI (Candra & Nainggolan, 2022). While the evidence is mixed, the study implies that IQ is the primary goal for utilizing BI. Thus, the following hypothesis is formulated:

H4: Information quality will have a positive influence on the effective use of BI.

Organisational Factor

Top Management Support: Top management support (TM) toward IS usage refers to the level of leadership commitment in fostering technological enthusiasm among the employees, which includes strategic vision, involvement and provision of necessary resources (Ragu-Nathan et al., 2004). Prior research has empirically supported the significant influence of TM on BI adoption (Baig et al., 2021; Bordeleau et al., 2020; Hmoud et al., 2023). It has also been revealed that TM plays a crucial role in determining the effectiveness of data utilization in public organizations (Merhi, 2021). These evidence thus allow the following hypothesis: **H5:** Top management support will have a positive influence on the effective use of BI.

Data-Driven Culture: Data-driven culture (DC) refers to the collective beliefs, standards or practices among individuals in an organization that prioritizes using factual data in their decision-making processes (Ali & Miah, 2018; Alkraiji, 2020). Various studies have demonstrated that organizations cultivating DC have increased employees' confidence to make informed decisions using data (Kiu & Chan, 2023; Medeiros et al., 2020; Triono et al., 2023). However, studies on the relationship between DC and the effective use of BI remain limited (Trieu, 2023). Consequently, the proposed hypothesis is:

H6: Data-driven culture will have a positive influence on the effective use of BI.

Authoritative Factor

Data Quality: Data quality (DQ) refers to the fitness of available data stored in a data warehouse and leveraged for analysis and reporting (Wixom & Watson, 2001). BI studies indicate that DQ is critically important as it directly affects information accuracy, credibility and trustworthiness, eventually impacting decisions (Al-Okaily et al., 2023; Torres & Sidorova, 2019; Trieu, 2023). A recent empirical study shows that DQ positively affects BI usage and subsequently influences user performance (Mudau et al., 2024). These conclusions thus allow the following hypothesis:

H7: Data quality will have a positive influence on the effective use of BI.

Service Quality: Service quality (SVQ) pertains to the quality of support and assistance given by the authority that oversees and manages the BI system, either in technical or administrative aspects. It includes responsiveness, professionalism and corresponding skills (Delone & McLean, 2003; DeLone & McLean, 2016). Research shows that SVQ positively affects users' intention to use BI (Alkaabi & Kassim, 2023) and system usage (Mudau et al., 2024). Therefore, the hypothesis proposed is:

H8: Service quality will have a positive influence on the effective use of BI.

Training Quality: Training quality (TQ) is defined as a process of educating users to enhance their knowledge, skills and proficiencies in using the system (Merhi, 2021). Literature reveals that insufficient, unsuitable, and poor trainers are reasons for user resistance to BI usage (Ain et al., 2019). Since BI is a dynamic system involving various user characteristics, TQ is essential in motivating and influencing system usage. Thus, the study proposed:

H9: Training quality will have a positive influence on the effective use of BI.

Effective Use and Individual Job Performance

System usage has become an essential dimension in numerous IS studies and is a significant predictor of IS success (DeLone & McLean, 2016). Recent studies have emphasized the need to transcend beyond simplistic measures and proposed a more comprehensive method for measuring system usage (Trieu, 2023; Trieu et al., 2022). Consequently, the overall success of an organization relies on each individual's job performance in achieving the goals and objectives. In the context of BI, individual job performance is described as the extent to which the system impacts decision-making quality and enhances overall work performance (Mudau et al., 2024; Trieu, 2023). Nevertheless, prior studies examining the relationship between system usage and individual impact yield inconclusive findings (Jeyaraj, 2020b). In addition, measuring the effective use of BI remains understudied (Torres & Sidorova, 2019; Trieu, 2023). Asserting that the actual rewards and benefits of IS can only be achieved through the effective use of the system, thus the proposed hypothesis is: **H10:** Effective use of BI will have a positive impact on individual job performance.

5. Implications

The proposed conceptual framework, developed through extensive literature analysis, would pave the way for validation through future empirical examination. The discussion and propositions of the framework offer a fresh theoretical perspective on BI studies. It also fills the research gaps and addresses prior research suggestions, particularly on post-adoption usage and individual impact. Practically, by focusing on the public sector, this research could provide valuable insights for policymakers, administrators, and system developers to reflect and formulate more effective strategies to ensure that the investment of IS made in public organizations is fully optimized and yields beneficial impacts.

Conclusion and Recommendations

The emergence of big data has prompted many governments, including Malaysia, to invest in BI technologies in public offices to obtain the advantages. Unfortunately, the adoption often faced obstacles in reaping the actual benefits. The topic has also gained considerable concern among scholars, highlighting the issues and gaps in the research. Hence, grounded on robust theoretical models, the paper thus presents a new conceptual framework for examining the determinants and impact of effective use of BI at the individual level in the public sector. The novelty of the model would provide a fresh foundation for ongoing empirical validation to expand the knowledge in the field while also offering practical insights to stakeholders. The limitations of this article include its inability to draw definitive conclusions on the effectiveness of the proposed model, which will

require further validation through empirical research. As highlighted in the gaps, future research on BI should prioritize understudied areas, such as examining the end-user level, post-adoption usage and unexplored domains like the public sector.

A Conceptual Framework of the Retirement Savings Behavior among Civil Servants in Malaysia

*Attia Azarina Amirludin¹, Mohamad Nizam Jaafar², Sylvia Nabila Azwa Ambad³ ¹Faculty of Business Management, Universiti Teknologi MARA Shah Alam, Malaysia ²Arshad Ayub Graduate Business School, Universiti Teknologi MARA Shah Alam, Malaysia ³Faculty of Business Management, Universiti Teknologi MARA Sabah, Malaysia *2023600674@student.uitm.edu.my, mnizam7520@uitm.edu.my, abila1793@uitm.edu.my Corresponding Author: Attia Azarina Amirludin

Abstract: The feasibility of maintaining a comfortable standard of living for civil servants in Malaysia is frequently questioned due to their reliance on pensions as the primary source of retirement funds, which may not suffice to cover the rising retirement costs. To address this issue, civil servants could consider accumulating savings during their working years instead of solely depending on pension disbursements. This academic discourse examines the effect of the independent variables of attitudes towards retirement savings (financial risk tolerance, past behaviours, and subjective norms as psychological elements) and financial considerations (tax incentives) on retirement savings behaviour. Additionally, the research also explores the moderating role of perceived government policy and perceived behavioural control with its antecedents, namely financial literacy, self-control between the independent variables, and retirement savings behaviour, amalgamated theories comprising the interactive theory of planned behaviour, rationale choice theory, and the behavioural economic model and existing literature, this article introduces a conceptual framework detailing the determinants influencing the RSB of civil servants in Malaysia. The proposed framework has the potential to benefit various stakeholders, particularly civil servants seeking to prepare adequately for their retirement years.

Keywords: Extended Interactive Theory of Planned Behaviour, Retirement Savings Behaviour, Civil Servants, Conceptual Framework, Malaysia

1. Introduction

Research Background: Almost half of Malaysians cannot save more than RM1,000 for emergencies due to a lack of financial planning knowledge (News Straits Time [NST], 2024). Additionally, 48% of Malaysians do not have any emergency savings (Murugiah, 2021). A survey by Perbadanan Insurans Deposits Malaysia (PIDM) in 2023 reported that many Malaysians cannot withstand financial shocks, as indicated by 55% of the survey respondents who admitted they have less than RM10,000 in available savings to withdraw in the event of an emergency. The financial distress worsened when it was reported that civil servants accounted for approximately 10% to 13% of new bankruptcy cases (The Star, 2024). Although the statistics from the Malaysian Department of Insolvency (MDI) (2023) reported a decreasing number of bankruptcies among civil servants, including pensioners, this group continues to be exposed to bankruptcy because of failure to manage their finances (Tan & Singaravelloo, 2020).

The pensioners' savings for their retirement planning continued to decrease further when the government announced that public service officers could redeem Cash Awards in place of Leave (GCR) while they are still in service compared to the previous policy in which GCR could only be paid after retirement. This measure may affect public service retirement savings because civil servants are inclined to make the withdrawal similar to the early withdrawal of their Employee Provident Fund (EPF). Malaysia's government is expanding the measures to civil servants on GCR's early withdrawal, while scholars are still debating on the pre-retirement withdrawal of EPF and the issue of the inadequacy of retirement savings (Md Yusuf et al., 2014).

The public service retirement savings were further affected by the government's announcement on 13th July 2023 that the July pension and derivative pension for civil servants who retired before and from 2013 will be paid using the original pension amount. The retirees will no longer receive an annual increment of 2%. This is following a Federal Court decision, which involved pension payments for civil servants who retired before 2013 being reverted to the December 2012 amount, while those who retired from 2013 onwards will have their pension payments reverted to the original amount at the time of their retirement.

The difference between the current pension amount and the original figure will continue to be paid in the form of a special aid known as Special Recognition for Retirees, which allows pensioners to receive the same amount as the one received in June 2023. However, the special aid cannot be sustained as it has legitimate expectations. Another recent policy was announced on the introduction of the Employee Provident Fund's (EPF) Account 3, or Flexible Account, as one of the institution's alternatives to meeting the emergency needs and funds of its contributors in tackling life's challenges before retiring (Bernama, 2024). The initiative to have a flexible account contradicts the aim to increase savings for retirement; the function of Account 3 is similar to any existing personal bank account.

Issues such as increasing poverty among the elderly (DOSM, 2023), low replacement rates (Jaafar et al., 2019; Park, 2009), and insufficient savings for retirement planning (Bank Negara Malaysia, 2022) continue to be major concerns in Malaysia's social security system. The government needs to take immediate action to reduce the burden on public servants during their retirement, especially for pensioners who may receive the lowest pension amount of RM1000 effective from 1 January 2018 (Public Service Department [PSD], 2023). Public retirees receive pension payments based on a formula that calculates 60% of their final salary. However, the replacement rate is not sufficient to maintain their standard of living from the pre-retirement period. Thus, to address the shortfall in retirement savings, it is recommended that a certain percentage of their income should be placed into long-term savings.

This research analyses the impact of various factors on retirement saving behaviour among civil servants in Malaysia. Previous studies have highlighted demographic and psychological factors influence retirement savings behaviour (Hershey & Mowen, 2000; Yusof & Sabri, 2017; Tomar et al., 2021). Additionally, this study explores the potential moderating role of perceived government policies in retirement savings behaviour, building on previous research, which found that perceived government policies moderated the relationship between retirement goal clarity and financial planning for retirement (Ghadwan et al., 2023). However, there has been limited investigation into whether PGP moderates the associations between attitude towards retirement savings, subjective norms, perceived behavioural control, and financial factors such as tax incentives and retirement savings behaviour. In this regard, using the extended interactive theory of the planned behaviour model helps to provide insight and a better explanation of factors influencing civil servants' behaviour to increase their retirement savings.

2. Literature Review

Interactive Theory of Planned Behavior: To address the issue of inadequate retirement savings behaviour among civil servants in Malaysia, it is imperative to comprehend the chronology of the extended interactive theory of planned behaviour (ITPB). It expands upon the interactive theory of planned behaviour (TPB) by integrating supplementary variables (Ajzen, 2020). Within the realm of ITPB, it is theoretically anticipated that perceived behavioural control will moderate the impact of attitude and subjective norms on intentions. Nevertheless, due to the complexity of the interaction effects (i.e., moderation), most empirical examinations of the TPB have solely reported additive effects. Recent investigations have begun to unveil noteworthy ATT x PBC and SN x PBC interactions. The current iteration of the ITPB illustrates the model with the proposition (Ajzen, 2019). Limited research has been conducted on ITPB concerning retirement saving behaviour (RSB).

In the context of this study, the extended interactive theory of planned behavior was developed based on integrated theories and models, comprising the interactive theory of planned behaviour, rational choice theory, and behavioural economics model. The purpose of the ITPB is to obtain a comprehensive understanding by incorporating additional variables and dimensions from the integrated theories and models. The conceptual framework aims to provide a better understanding of human behaviour, allowing for more accurate predictions and targeted interventions to address the issue of inadequate retirement savings among civil servants in Malaysia.

Rational Choice Theory: The evolution of rational choice theory (RCT) can be delineated by pivotal references that have substantially contributed to its advancement and utilisation across a variety of fields. The inception of the notion of maximising benefits within rational choice theory can be attributed to the work of American sociologist George Homans in 1961, establishing the basis for comprehending decision-making processes

grounded in rational assessments of costs and benefits (Hiep & Tram, 2020).

Rational choice theory offers a method for comprehending social phenomena based on the assumption that individuals or entities act purposefully to accomplish their objectives. This involves making decisions according to their preferences, constraints, and rational thinking to maximise benefits or utility within specific limitations (Lovett, 2006; Sato, 2013). The fundamental assumptions of RCT encompass the presence of distinct purposeful actors, the application of utility theory to elucidate choices, and the rationality exhibited by these actors in optimising their decision-making processes. Conversely, another scholar proposed that the theory has two primary processes: individual choices and the shift from individual actions to broader social consequences. It is posited that individuals prioritise their preferences according to the utility or payoff they anticipate, ultimately selecting the alternative perceived to offer the greatest utility (Sato, 2013).

Within the domain of perceived governmental policies concerning retirement savings behaviour, RCT serves as a framework for elucidating how individuals reach decisions regarding retirement savings based on rational assessments of costs and benefits (Askari et al., 2019). This theoretical perspective implies that individuals logically pursue objectives geared toward advancing their interests, which, in turn, impact their attitudes toward retirement savings (Askari et al., 2019). During retirement preparation, effective decision-making necessitates individuals to comprehend the pension mechanisms, portfolio distribution, anticipated benefits, contribution records, and associated risks (Fleishman-Mayer et al., 2013).

The governmental rules might influence retirement savings behaviour through diverse channels, such as grants and automated deposits into retirement accounts (Chetty et al., 2012). These policies shape individuals' decisions by offering incentives or prompts that steer their decision-making process (Chetty et al., 2012; Halpern & Sanders, 2016). Encouraging individuals to save money through saving policies could also be more cost-effective for the government, leading to higher increases in household savings at a lower fiscal cost compared to tax subsidies (Chetty et al., 2013). Moreover, the configuration of retirement saving mechanisms, such as providing concise information with beneficial recommendations, could modify retirement planning decisions (Cardella et al., 2021). Applying principles of choice to retirement savings causes the structure of retirement plans to significantly impact saving rates and investment choices (Benartzi et al., 2007).

RCT is crucial in comprehending individuals' choices concerning retirement savings behaviour and their views on government policies in this context. Contrary to the expectations of RCT, which imply that annuities would be appealing because they mitigate the risk of outliving income, studies show that not many individuals opted to annuitize a portion of their assets (Benartzi et al., 2011). The inconsistency between theory and behaviour underscores the intricacy of retirement savings choices. Government policies could shape retirement savings behaviour through diverse means. For example, measures such as price subsidies and automatic deductions from salaries into retirement accounts influence individuals' saving choices (Chetty et al., 2012). Behavioural economics also brings insight into retirement savings behaviour, underscoring bounded rationality and self-control as factors affecting low-saving households. This circumstance suggests that certain individuals might benefit from support in making saving decisions (Thaler & Benartzi, 2004).

In essence, rational choice theory serves as a significant instrument for comprehending decision-making processes within the realm of public policy. Policy formulators could leverage this framework to pinpoint challenges and formulate remedies that motivate individuals to engage in behaviours that promote collective welfare. Nevertheless, it is vital to acknowledge the restrictions of this framework and consider various other aspects that could impact decision-making processes. The integration of insights derived from behavioural economics and governmental directives is pivotal in shaping the retirement savings behaviours of individuals and their perspectives on government interventions. Through comprehensive scrutiny of these theoretical constructs and their policy implications, stakeholders could devise more productive approaches to foster sufficient retirement savings among public sector employees in Malaysia.

Behavioural Economics Model: The behavioural economics model integrates insights from psychology and economics to understand how individuals make financial decisions. It recognises that individuals do not always act rationally and are influenced by cognitive biases and emotional factors. The theory emphasises the importance of understanding human behaviour in economic decision-making, including retirement savings

behaviour (RSB). In contrast, traditional economics theories often assume rational decision-making and overlook the psychological and behavioural aspects of financial choices (Knoll, 2010). However, behavioural economics recognises the importance of psychological aspects, such as financial literacy and self-control, in influencing individuals' retirement savings behaviour (Sekita et al., 2022).

Thaler and Benartzi (2004) introduced the "Save More Tomorrow" (SMarT) programme, which utilised behavioural economics principles to increase employees' savings. The programme's key findings revealed a high enrolment rate and a significant increase in the average saving rates of participants over time (Thaler & Benartzi, 2004). This outcome demonstrates the effectiveness of behavioural economics strategies in influencing retirement savings behaviour (RSB). Nevertheless, the study suggested future research to focus on the effectiveness of automatic escalation plans and explore the impact of behavioural economics on retirement savings. Another study on behavioural economics principles, as well as the use of matching contributions and commitment mechanisms to promote savings behaviour, found that deposit frequency and amounts were higher in the first intervention year than in the second year. Higher match incentives led to increased deposit frequency but not to a higher amount of savings (Wang et al., 2018).

In essence, behavioural economics is employed in the Malaysian government's initiative to increase retirement savings behaviour (RSB) among Malaysian civil servants and to tackle and revisit existing policies, such as tax incentives and matching contributions, the independent variables of this study. Therefore, further investigation on the long-term impact of economic empowerment interventions on savings and consumption behaviours is justified.

Furthermore, Duckworth et al. (2018) highlighted the impact of self-control failures on retirement savings, emphasising the role of behavioural control in financial decision-making. Behavioural economics provides insights into how external interventions, such as incentives or penalties, can be designed to facilitate people making choices that align with their long-term interests without needing to rely solely on willpower (Duckworth et al., 2018). Hence, behavioural economics is pertinent in understanding self-control issues and challenges hindering civil servants from committing to retirement savings.

In summary, behavioural economics theory provides an invaluable understanding of retirement savings behaviour by acknowledging the influence of psychological and behavioural factors. The theory recognises most individuals' psychological matters, such as financial literacy and self-control (Sekita et al., 2022), incentives (Duckworth et al., 2018), matching contributions (Wang et al., 2018), and tax incentives (Sabri et al., 2019) as factors influencing RSB.

Retirement Savings Behaviour: Previous research offered limited insights into retirement savings behaviour (RSB), defining it based on individual interpretations and viewpoints. Various studies have outlined their understanding of RSB, emphasising psychological, behavioural, financial, and economic aspects. For example, a study by Benartzi and Thaler (2007) delved into how individuals make decisions regarding saving for retirement, encompassing participation in savings plans, contribution amounts, investment strategies, and the utilisation of incentive schemes like tax benefits, matching contributions, and programmes such as Save More for Tomorrow. Meanwhile, Sass (2016) discussed the choices people make regarding saving for retirement, including the decision to save, the amount saved, and the chosen saving mechanisms.

According to Weaver (2019), retirement savings behaviour (RSB) entails a series of actions throughout one's career, involving entry into the retirement system, asset accumulation, and eventual asset utilisation during retirement. Studies concurred that these factors, such as governmental incentives, individual attitudes toward retirement savings, and the impact of social influences and cultural norms, significantly shaped retirement savings behaviour. RSB entails the financial decisions individuals undertake to secure their future, influenced by their attitudes towards retirement saving, prevailing social standards, and their confidence in post-retirement saving capabilities, including the amount saved and the chosen saving mechanisms (Magwegwe & Lim, 2021). RSB is also known as resource allocation for future needs, particularly in the post-employment phase (Alkhawaja & Albaity, 2022).

Researchers in Malaysia view retirement savings behaviour as how individuals strategize and allocate funds

for their financial requirements post-retirement. This involves depositing funds into designated retirement accounts, such as the Employee Provident Fund (EPF) and making informed investment decisions to ensure adequate coverage for living expenses, medical bills, and unforeseen circumstances during their retirement years (Ibrahim et al., 2012). The concept of retirement savings behaviour revolves around the systematic allocation of financial resources in preparation for the cessation of full-time employment, taking into account the management of escalating living expenses and healthcare costs (Nga & Yeoh, 2018). However, one study delved into the realm of retirement savings funds rather than focusing specifically on retirement savings behaviour. This study defined such funds as financial schemes enabling individuals to set aside savings for retirement, while incentives like tax benefits or subsidies promote active participation and boost contributions. Importantly, these funds are established voluntarily, with individuals opting to save in them to secure a financially stable retirement, in addition to any government pension schemes or obligatory retirement savings plans they may be enrolled in (Sabri et al., 2019). In conclusion, retirement savings behaviour is putting aside certain income after considering all necessary expenditures during working or productive life for retirement or non-productive years. Understanding retirement savings behaviour may help researchers in the development of a comprehensive framework for RSB among civil servants in Malaysia.

Attitude Toward Retirement Savings: Ajzen (2019) postulated that individuals' attitude emanates from behavioural beliefs, specifically determined by whether the anticipated outcomes or experiences are perceived as positive or negative, ultimately impacting the behavioural outcome. Chee et al. (2011) generally characterised attitude towards saving as individuals' positive or negative perceptions regarding the practice of saving money, influenced by their beliefs about the consequences of saving and the personal assessment of such outcomes. This attitude significantly shapes the inclination to save by fostering a mindset that prioritises the advantages of saving over immediate expenditures. Initially, the decision-making process regarding retirement savings was influenced by individuals' beliefs about such behaviour, social influences exerted on them, and their perceived level of control over these savings determinations (Croy et al., 2012). Subsequently, scholars defined the attitude towards retirement savings as the emotional, cognitive, or perceptual stance individuals adopt towards the notion of setting aside money for the post-employment phase. A positive attitude signifies a recognition of the importance of saving and a propensity to save more, whereas a negative attitude may indicate a reluctance to save adequately for retirement (Tomar et al., 2021).

Attitude toward retirement savings behaviour refers to how individuals feel about saving for their retirement, including their willingness to plan and save and how they perceive the importance and benefits of having financial security in their later years. This attitude significantly influenced their actual savings and planning actions for retirement (Yusof & Sabri, 2017). Attitude toward retirement savings behaviour refers to how individuals feel about saving money for their future after they stop working, which includes their willingness to invest in retirement plans and their belief in the importance of financially preparing for retirement (Afthanorhan et al., 2020). It also refers to individuals' positive or negative evaluation of the act of saving money, which is influenced by their beliefs, feelings, and intentions regarding saving for future needs (Wahab et al., 2022)

Previous research also investigated the effect of financial risk tolerance (FRT) on attitude towards retirement savings behaviour. When a person feels comfortable with the possibility that an investment may not perform as expected, it means that they accept potential loss when deciding on an investment, including retirement savings (Mutlu & Özer, 2022). Ghadwan et al. (2023) referred to FRT as individuals' willingness or ability to handle uncertainty and potential loss in investment value while aiming for higher returns. Past behaviour (PB) also affects attitudes, whether to react positively or negatively. Past behaviour refers to actions or decisions individuals have made in the past, which influence their future decisions, often without being fully aware of this influence (Albarracín & Wyer, 2000). Meanwhile, Habibah et al. (2018) described PB as the frequency with which individuals or households have previously engaged in a specific action, such as making mental budgets, which influences their current intentions and behaviours towards that action.

Financial risk tolerance or past behaviour helps in tailoring retirement savings behaviour that matches individuals' comfort level with risk, aiming to maximise satisfaction from their savings choices. Attitude towards retirement savings is the most important independent variable in shaping retirement savings behaviour among civil servants in Malaysia. Ahmad et al. (2020) revealed that financial risk tolerance (FRT)

was correlated with attitude, with risk attitude being a significant factor influencing risk tolerance. The study suggested that risk attitude directly influenced investors' financial risk tolerance, indicating a strong correlation between the two factors. Psychological characteristics, like attitude towards money, financial self-efficacy, and financial risk tolerance, positively influence personal financial management behaviour (Goyal et al., 2023).

Prior research also confirmed that past behavioural biases positively impact attitudes toward investment, supporting the hypothesis that it plays a crucial role in investment decision-making (Raut et al., 2018). PB is a critical factor that may influence both intention and future behaviour. Different forms of PB, such as experience with behaviour, frequency of behaviour, and habits, have been studied and shown significant effects (Sommer, 2011). Another study indicated that past financial experiences influenced how students currently manage their finances (Ameliawati & Setiyani, 2018). Recent studies' findings were consistent in that past experiences, or PB, correlate with attitude. Past experiences have a direct correlation with individuals' attitudes toward risk, uncertainty, and preventive measures. Experience plays a vital role in influencing people's intentions to adopt self-protective behaviours, such as purchasing insurance and safety devices (Innocenti et al., 2023). Past disastrous experience directly influences the attitudes of strategic decision-makers (SDMs) towards disaster planning (Sahadev et al., 2024). Meanwhile, open-experience individuals are more likely to accept products of new technologies, suggesting a positive relationship between openness and attitude (Grassini & Koivisto, 2024).

Attitude towards retirement savings reflects how important individuals perceive saving for retirement to be. A positive attitude indicates a strong belief in the necessity and benefits of saving for the future. Previous researchers widely use attitudes toward retirement savings to investigate the relationship between attitudes towards retirement savings (ATRS) and retirement savings behaviour (RSB). For example, in Malaysia, ATRS is positively correlated with retirement preparation among Gen Y in Selangor, Malaysia (Kumaraguru & Geetha, 2021). Furthermore, attitudes towards retirement and retirement behaviour significantly influenced retirement security for Malaysian civil servants (Ishak et al., 2022). Another study in Vietnam found that financial attitudes positively affected individuals' likelihood to save money (Nguyen & Doan, 2020). In the USA, attitudes towards retirement savings, such as the importance of a long planning horizon, setting specific financial goals, and risk tolerance, were found to significantly impact individuals' intention to save for retirement. The model developed in the study shows that psychological factors, including attitudes, not only influenced the calculation of retirement savings needs but also contributed to the ownership of individual retirement accounts (IRAs). The research highlighted a clear relationship between individuals' attitude towards retirement planning and their retirement savings behavior, emphasising the importance of fostering positive attitudes to encourage proactive retirement savings behaviour (Magwegwe & Lim, 2021).

The above discussions on the relationships between financial risk tolerance, past behaviour, and attitude suggest that they have been widely investigated, and the findings consistently agree that the relationships are still relevant. The relationship between attitude towards retirement savings and retirement savings behaviour has also been highlighted in a few prior research. Thus, in the context of retirement savings behaviour among civil servants in Malaysia, the current study proposed the following hypotheses:

H1: There is a significant positive relationship between financial risk tolerance and attitude towards retirement savings behaviour.

H2: There is a significant positive relationship between past behaviour and attitude towards retirement savings behaviour.

H3: There is a significant relationship between attitude towards savings and retirement savings behaviour.

Subjective Norms: There are two types of normative beliefs; firstly, the injunctive norms refer to what others consider desirable and acceptable in a particular situation; these norms suggest what should or should not be done. Secondly, descriptive norms refer to how people typically act or think in specific contexts based on empirical evidence (Ajzen, 2020). Individuals are prone to acknowledging and reacting solely to the concept of saving for retirement when individuals of significant importance and proximity exert influence on them to allocate funds towards their retirement savings. Scholars in the realm of social sciences widely concur that subjective norms encompass perceived societal pressure to either engage or refrain from specific behaviours, indicating that individuals are more likely to save money if those significant to them endorse the notion of

saving (Satsios & Hadjidakis, 2018). Various studies consistently underline the pivotal role of close and influential persons in motivating individuals to save for the future (Thomas & Subhashree, 2020; Magwegwe & Lim, 2021; Kumaraguru et al., 2022; Wahab et al., 2022; She et al., 2023), SN pertains to the influence of individuals who hold importance to a person, such as family or friends, and how their endorsement or disapproval influences the person's decisions regarding retirement savings. It concerns facing social pressure to conduct oneself in a specific manner owing to the expectations of others.

The primary individuals with the most significant impact on shaping the SN and promoting saving for retirement are the family members (Jamal et al., 2016; Puspasari et al., 2018), as well as close friends or peers (Kumaraguru & Geetha, 2021). Families play a crucial role in influencing students' behaviour, demonstrating that favourable and encouraging families results in more robust subjective norms among students, consequently enhancing their saving habits (Puspasari et al., 2018). Mutlu and Özer (2022) posited that financial attitudes are not inherently innate but are influenced by family and close acquaintances. This view was corroborated by Hartono and Isbanah (2022), who discovered that parental upbringing and peer pressure have a positive effect on the financial literacy of individuals. This illustrates the interconnected nature of individual variables, where SN intertwine with attitudes toward saving for retirement.

A positive and significant relationship exists between subjective norms and the intention to act, which in turn affects saving behaviour (Puspasari et al., 2018). SN, which entails the opinions of friends and family, have a strong influence on one's financial decisions (Bongini & Cucinelli, 2019); for instance, they significantly impact risky investment intention (Sobaih & Elshaer, 2023). Studies have highlighted that financial planning behaviour, including retirement savings behaviour, can be influenced by subjective norms such as financial socialisation, where societal expectations around financial planning are internalised through interactions with family, friends, and colleagues (Yeo et al., 2023).

Relationships between social influence and retirement planning were significantly and positively associated (Afthanorhan et al., 2020). If the SN in their environment leans towards the importance of retirement planning, individuals are more likely to adopt similar behaviours (Tomar et al., 2021). The influence of SN is evident in how individuals engage in proactive behaviours, such as saving more or investing wisely, based on the financial behaviours and opinions of their peers or society at large. This suggests that a supportive social environment that values financial preparedness could encourage better retirement-saving behaviours (Ugwu & Idemudia, 2023).

Subjective norms play a crucial role in shaping individuals' intentions and behaviours regarding retirement savings. Understanding this relationship could help financial advisors and educators design more effective strategies to encourage retirement planning and saving. Therefore, this study suggests the following hypothesis:

H4: There is a significant relationship between subjective norms and retirement savings behaviour.

Tax Incentives: Although psychological factors were recognised as determinants of retirement savings behaviour, several studies applied tax incentives in their framework of retirement savings and reported tax incentives according to the context of their studies. For instance, tax incentives for retirement savings were most utilised by older/high-income individuals. Tax incentives in this study refer to government policies designed to encourage individuals to save more for their retirement by offering benefits like reducing the taxes on the money they save in pension plans. These incentives work by increasing the after-tax return on savings, meaning people get to keep more of the money they earn from their investments in retirement accounts after taxes are taken out (Ayuso et al., 2019). Sabri et al. (2019) described tax incentives as government concessions, rebates, credits, subsidies, or contributions, either directly or through employers, which support individuals' retirement income savings. The aim is to encourage savings for retirement by offering tax advantages like tax deferral or performance-based incentives.

In the context of retirement savings behaviour, tax incentives are defined as a government subsidy, which can be front-loaded where the tax benefit is received when the contribution is made, or back-loaded where the tax benefit is received upon withdrawal during retirement (Cuccia et al., 2019; Fadejeva & Tkacevs, 2022). Cuccia et al. (2019) examined how these tax incentives, whether they are given at the start (front-loaded) or the end

(back-loaded), impact taxpayers' decisions on which retirement savings plans to choose, highlighting that people's choices were influenced not just by economic factors but also by their attitudes and preferences. Tax incentives also refer to the government's policy allowing individuals to deduct contributions to private pension funds and life insurance plans, up to 10% of their annual income, from their income tax base. These incentives are designed to encourage people to save more for their retirement by offering them a tax break, which means they pay less tax if they save money in specific ways.

However, earlier research found that these incentives are designed to have a delayed effect, contrasting savings by making saving in a voluntary retirement fund more appealing through tax benefits. The study suggested that tax incentives do not directly trigger additional savings but reduce the individual burden for a supplementary pension, acting as a facilitating condition that affects perceived behavioural control rather than directly influencing saving intentions (Sabri et al., 2019).

Economic policies, like tax rebates, could significantly influence corporate behaviour towards achieving dual economic and environmental benefits. Similarly, tax incentives could influence individual behaviour by making retirement savings more appealing, thereby improving personal financial security (Zhang & Song, 2022). The application of tax incentives as a medium to induce or stimulate specific behaviour is widely applied in multidisciplinary studies. For instance, taxes are more effective for smoking and alcohol consumption, while positive rewards have shown promise in preventing behaviours like unsafe sex, which are harder to monitor. Financial incentives, including taxes, correlate with behaviour by leveraging economic principles to encourage healthier choices and deter harmful behaviours (de Walque, 2020). In France, tax incentives modestly impacted the decision to energy-saving renovate, increasing renovations by only 1.09 percentage points. Meanwhile, a study in Spain highlighted that there are indeed tax incentives in place for the ownership of eco-friendly cars, specifically within the framework of the IVTM (Tax on Motor Vehicles). These incentives are designed to reduce the annual tax burden for owners of electric, hybrid, and liquefied petroleum gas vehicles (Alonso, 2020). In European countries, tax incentives significantly affect the decision to purchase electric vehicles (EVs), making them more financially attractive to potential buyers (Jurlin, 2023). Hence, based on the arguments above, this study postulates the following hypothesis:

H5: There is a significant relationship between tax incentives and retirement savings behavior.

Perceived Behavioural Control: The augmentation of retirement savings behaviour for the future necessitates the accessibility of behavioural beliefs that lead to a positive attitude and strong support from family and peer influences alongside normative beliefs. Additionally, a crucial factor that could strengthen the effectiveness of retirement savings behaviour is perceived behavioural control. Within the framework of the interactive theory of planned behaviour, perceived behavioural control operates as a moderating element between attitude and subjective norms regarding intention, while the actual behavioural control is expected to moderate the impact of intention on behaviour (Ajzen, 2020). In the present study's context, perceived behavioural control is projected to moderate the influence of attitudes towards retirement savings and subjective norms with regard to retirement savings behaviour. Various research elucidated perceived behavioural control as individuals' beliefs regarding control that could influence or enable the execution of specific behaviours (Jamal et al., 2016; Nosi et al., 2017; Kumaraguru & Geetha, 2021). Control belief is instrumental in shaping and contributing to PBC in the context of retirement savings behaviour (Ajzen, 2020).

Perceived behavioural control is a vital factor in the interactive theory of planned behavior. It suggests that the more control people feel they have overperformed a behaviour, the more likely they intend to do it. This highlights the importance of confidence in one's abilities and resources. Kumaraguru and Geetha (2021) described PBC as how much a person feels they can perform a certain behaviour, considering both their skills and the potential challenges. It reflects on past experiences and the expected difficulties in doing the behaviour. From another perspective, PBC is about how easy or hard people think it will be to perform a certain action based on their feelings and not on the real difficulty of doing the action.

In the context of this study, it is expected that financial literacy and self-control contribute to PBC in influencing and shaping retirement savings behaviour among civil servants in Malaysia. Several studies examined how these factors influenced retirement savings behavior. Lajuni et al. (2018) defined financial literacy as the knowledge about financial matters and the skills of how to manage finances effectively, which influence a

person's ability to change their financial behavior. Financial literacy suggested that higher financial literacy encourages individuals to save more, indicating that higher financial knowledge significantly enhances the propensity to save among low-income groups (Rabun et al., 2023). Research findings also show that the better the financial literacy applied, the lower the level of consumptive behaviour, implying the role of behavioural control. Research findings further highlighted the influence of financial literacy on students' spending habits, indicating a correlation with behavioural control (Putri et al., 2022).

Understanding financial products through financial literacy augments perceived behavioral control, helping individuals make informed and confident investment decisions. Thus, a positive relationship exists between financial literacy and perceived behavioural control in the context of investment decision-making (Pambudi et al, 2024). Prior studies have indicated that enhancing financial literacy can be a valuable strategy to encourage savings behaviour and the intention to save more, underscoring the significance of perceived behavioural control in the financial decision-making process (Peiris, 2021).

Self-control is the ability of individuals to regulate their desires, practice self-discipline, and delay gratification to save money, making saving an effortless endeavour for those with high levels of self-control. It involves managing wants and expenditures effectively to enhance savings, where individuals with higher self-control are better at financial management and less likely to spend impulsively on shopping (Mohd et al., 2020). Generally, self-control encompasses the ability to change or override dominant response tendencies and regulate individuals' behaviour, thoughts, and emotions, which are crucial for managing financial behaviour and savings. The concept also includes the exertion of self-discipline, characterised by the will and capacity to delay fulfilment, which is essential in financial decision-making and saving behaviour (Hartono & Isbanah, 2022).

Furthermore, self-control positively impacts saving behaviour, indicating that individuals with higher selfcontrol tend to save more efficiently, which is crucial for financial management and planning (Faisal et al., 2023). Self-control is positively correlated with perceived behavioural control, as individuals with high Selfcontrol tend to believe more in their ability to conduct certain behaviours. Another study found that self-control has a significant effect on students' saving behaviour; good self-control was correlated with the ability to control money usage and manage finances better (Setya Ningsih & Sudarma, 2018). Self-control contributes significantly to saving behaviour, signifying that individuals with good self-control are more likely to engage in positive savings habits. In short, there is a direct correlation between self-control and perceived behavioural control in the context of saving behaviour (Angela & Pamungkas, 2022).

Perceived behavioural control enhances the relationship between a positive attitude towards retirement savings and retirement savings behaviour by providing the means and confidence to act on the attitude (Yeo et al., 2023). Individuals who feel more in control of their finances are more likely to translate positive attitudes towards retirement savings into actual saving behaviours. This control enhances the impact of a positive attitude toward retirement savings on the behaviour of saving itself (She et al., 2024). Another study also indicates that PBC moderates the effect of attitudes on behaviour by influencing individuals' perceptions of their ability to perform the behaviour. Thus, when someone has a positive attitude towards road violations, for instance, if they perceive that they have no control over performing such actions (due to external factors or personal limitations), they may be less likely to commit them (Castanier et al., 2013).

Perceived behavioural control may also strengthen the impact of subjective norms on retirement-saving actions by equipping individuals with the knowledge and confidence needed to save for retirement (Yeo et al., 2023). For individuals with low perceived behavioural control, the influence of subjective norms on recycling behaviour might be more pronounced. If these individuals perceive strong social support or pressure to recycle, they might be more likely to recycle despite feeling less capable of doing so. In addition, subjective norms have the highest variance in behavioural tests, and researchers suggested that this may happen because moral norms were employed to operate as subjective norms (Liu et al., 2022). Hence, based on these arguments, this study postulates the following hypotheses:

H6: There is a significant relationship between financial literacy and perceived behavioural control.

H7: There is a significant relationship between self-control and perceived behavioural control.

H8: Perceived behavioral control does significantly moderate the relationship between attitude towards

retirement savings and retirement savings behaviour.

H9: Perceived behavioral control does significantly moderate the relationship between subjective norms and retirement savings behaviour.

Perceived Government Policy: Government policy is described as actions taken by the government to address specific public issues, which may involve the use of funds, laws, and regulatory measures to shape and change individuals' behaviour, for example, saving money. This policy includes a set of systems aiming to significantly change savings behaviour through strict legislation and possibly coercion, ensuring individuals save money for future use (Muhammad Husin & Mohamed, 2021).

There are minimal studies investigating perceived government policy's moderating role in the context of attitude and retirement savings behaviour. However, in a different discipline, it was found that the relationship between attitude towards entrepreneurship and the actual development of entrepreneurial ventures can be significantly influenced by perceived government policy. Perceived government policy could augment individuals' attitudes towards entrepreneurship by creating an environment that is encouraging and safe for starting new ventures. The effect of individuals' attitudes on their likelihood to engage in entrepreneurship can be strengthened or weakened depending on the perceived government policies (Obaji, 2014). Another study highlighted the importance of a supportive environment policy in bridging the gap between farmers' positive attitudes towards environmental protection and their actual participation in these activities. It underscores the need for policies that not only encourage positive attitudes but also facilitate the translation of these attitudes into meaningful actions (Dong et al., 2023).

A study on vaccination behaviour found that PGP positively moderated the relationship between attitude and vaccination behaviour among teachers (Abd Rahman et al., 2024). Several other studies defined perceived government policy as how individuals understand and interpret the actions and regulations set by the government, especially those aimed at influencing specific behaviours, such as retirement savings behaviour, through various policy activators, such as information dissemination, incentives, and current policy. Ghadwan et al. (2023) explored how perceived government policy influences employees' financial planning for retirement. The study shows that policies play a crucial role in shaping retirement planning behaviours among public university employees. The research also revealed that government policy significantly moderated the relationship between retirement goal clarity and financial planning for retirement. The finding indicates that clearer retirement goals aligned with supportive government policies lead to better financial planning outcomes.

There have been minimal studies investigating the role of perceived government policy in moderating the relationship between subjective norms and retirement savings behaviour. A study found that when people perceive strong government support for energy-saving initiatives, the social pressure to save energy is more likely to translate into actual energy-saving actions (Hong et al., 2019). In another study, a supportive policy environment enhanced the positive impact of participation intention on actual participation behaviour, indicating that when farmers perceive government policies as favourable, the influence of subjective norms on participation is likely to be stronger (Dong et al., 2023).

Similarly, studies exploring the moderating role of perceived government policy in the relationship between tax incentives and retirement savings behaviour are scarce, specifically in the context of Malaysian civil servants. A study by Ningrum and Setiyawati (2022) investigated the influence of taxpayer awareness on tax compliance and examined whether trust in the government, which is seen as a proxy for perceived government policy, moderates this relationship. The study concluded that trust in the government did moderate the relationship between taxpayer awareness and tax compliance. Another study on the effectiveness of R&D tax incentives in Turkiye did not directly discuss perceived government policy but found that R&D tax incentives were designed to encourage firms to increase their R&D expenditures to boost innovation and economic growth. Meanwhile, Taş and Erdil (2023) suggested that firms' behaviour in response to R&D tax incentives was influenced by the incentives, which can be seen as a reflection of their perceived government policy. Another study described the moderating role of perceived government policy as an investigation of how perceived government policy moderates the relationship between tax incentives and foreign investment, indicating that the perceived government policy regarding transparency and fairness in the application of tax

incentives impacted investment behaviour (Hyun Hong & Nam, 2021). Venti (1992) noted that incentives to save for retirement have been an important component of government tax policy, and pension funds have grown enormously. For instance, private firm pension assets increased from \$13 billion in 1950 to \$1,836 billion in 1989.

While most of the literature works did not directly explore the moderating role of perceived government policy in the relationship between attitudes towards retirement saving, subjective norms, tax incentives, and retirement savings behaviour, the studies offer several points from their similar concepts related and applicable to the current study. Hence, this study suggests the following hypotheses:

H10: Perceived government policy does significantly moderate the relationship between civil servants' attitudes and retirement savings behaviour.

H11: Perceived government policy does significantly moderate the relationship between civil servants' subjective norms and retirement savings behaviour.

H12: Perceived government policy does significantly moderate the relationship between tax incentives and retirement savings behaviour.

3. Research Methodology

The current study is a causal study, which focuses on the cause-and-effect association between variables. The target population is Malaysian civil servants working in grades 41 to 54. The sample size required was 135 based on the G*Power 3.1 application. The sampling techniques used are nonprobability sampling and purposive sampling. The data were collected through online and offline questionnaire surveys. The questionnaire used was adapted from previous studies, which consisted of 50 items and 10 variables. The SPSS and SEM PLS using Smart PLS Version 4 were applied for the statistical analysis of the data.

Conceptual Framework

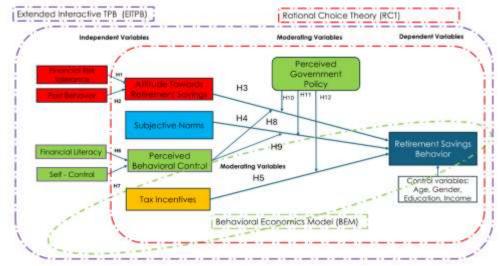

Figure 1: Conceptual Framework of Retirement Savings Behaviour Among Civil Servants in Malaysia

4. Conclusion

There are very few theories explicitly related to retirement savings behaviour among civil servants in Malaysia, and they focus on motivations to save for retirement. After a careful and details review of previous research on retirement savings behaviour, this study integrates the interactive theory of planned behaviour, the behavioural economics model, and the rational choice theory to construct a research framework to justify this study. In addition, several variables of new determinants were included to explain further the variance of retirement savings behaviour among civil servants in Malaysia. The current study focuses on the psychological factors of the theory of planned behaviour, namely attitude towards retirement savings and subjective norms,

while perceived behavioural control was employed as a moderating variable to strengthen the relationship between attitude towards retirement savings and subjective norms towards retirement savings behaviour. Tax incentives, which aim to increase income for savings are plotted from the behavioural economics model. The rational choice theory supports perceived government policy in making decisions to encourage those factors to motivate civil servants to increase retirement savings behaviour among civil servants in Malaysia.

A more comprehensive and established theory is needed to better explain factors influencing retirement savings behaviour among civil servants in Malaysia. The conceptual framework proposed in the current study attempts to take a wider view of retirement savings behaviour and examines attitudes toward retirement savings, subjective norms, tax incentives, perceived behavioural control, and perceived government policies in the context of RSB. This new conceptual framework could guide researchers in developing the knowledge base for retirement savings behaviour. As discussed earlier, past studies yielded inconsistent findings and only focused on certain factors, such as psychological factors, which do not guarantee better retirement savings behaviour. Stronger predictors or variables are required to inspire and motivate retirement savings, especially among civil servants in Malaysia. Additionally, there are very minimal studies in the literature that employed perceived government policy and perceived behavioural control as moderating variables. In short, this discourse proposes to develop and validate a conceptual framework to explain the relationships between factors influencing retirement savings behaviour among civil servants in Malaysia, as well as to better understand their retirement savings behaviour.

Impact of Remuneration and Motivation on Employee Performance Amidst The COVID-19 Pandemic

Adilah Mazlan¹, *Nur Atiqah Rochin Demong² ¹Kolej Teknikal Sri Ayu Sdn Bhd, Taman Kampar Perdana Kampar Perak, Malaysia ²Department of Technology and Supply Chain Management Studies, Universiti Teknologi MARA, Puncak Alam, Selangor, Malaysia adilah.mazlan95@gmail.com, *rochin@uitm.edu.my Corresponding Author: Nur Atiqah Rochin Demong

Abstract: Globalization and other environmental issues are causing problems for organizations. Improving employee performance is the responsibility of any organization, as it is crucial for the attainment of optimal objectives. An employee's reputation is improved by performing well on the job, which helps them advance in their professions. Without effective remuneration and motivation, it can affect employee performance in the organization. Other than that, the past researchers regarding this study also discussed. The relationship between independent variables and dependent variables was assessed using descriptive analysis, normality analysis, reliability analysis, Pearson's correlation analysis, and multiple regression analysis in this study. The population and sample of employees in the selected organization in Perak. The total population of 250 respondents in the company, and the sampling size was 148 respondents based on the Krejcie & Morgan table. Data collection in this study was conducted through questionnaires, and the data were analyzed using SPSS 20. The findings indicated that employee performance is significantly and positively influenced by remuneration and work motivation, with motivation being the most significant factor in the performance of education employees during the COVID-19 pandemic.

Keywords: Employee performance, Remuneration, Work Motivation, COVID-19 Pandemic

1. Introduction and Background

In an organization, employee performance and employee well-being are the most important things that employers need to be concerned to improve the productivity of employees (Abdullah et al., 2021). Productivity can be increased by improving levels of employee performance (Prasetyo et al., 2021). An organization's success is dependent upon the employee's performance, innovation, creativity and commitment (Belete, 2021). Employees are a fundamental aspect of a company, the growth or failure of a firm relies on staff productivity. (Nguyen et al., 2020). Theoretically, excellent performance can lead to more rapid employee career advancement (Firman, 2021). COVID-19 is a global health tragedy and a worldwide economic threat (Al-Sharify et al., 2021). The social and economic effects of COVID-19 widespread will be far-reaching and damaging for all. The COVID pandemic19 also affects global mental health (Sheridan Rains et al., 2021), lots of individuals feel out of control because of this pandemic, worry and concern (Dubey et al., 2020), economic, social and psychological parts (Passos et al., 2020).

This unexpected worldwide health crisis has disrupted the economy in a number of ways, affecting more than just service providers (Akram et al., 2021) but also alter how enterprise services are being provided and the performance of employees (Bartsch et al., 2021). Since the widespread of COVID-19, most companies or industries needed to ask each staff to work from home, and that remained not the actual working life and it lacked the quality of work, family-work engagement, job stress, and sleeping difficulties. Now the whole thing is ongoing by 'new normal' procedures but still alive with the anxiety of the COVID-19 pandemic (Bhattacharjee & Ghosh, 2022). According to Mohamad and Akbari (2022) many industries in Malaysia have suffered greatly as a result of the COVID-19 outbreak, not excluding tertiary education. Gorlick also mentioned employees in technical and vocational education and training (TVET) faced problems caused by COVID-19 such as employees who work from home missing out on social interactions with co-workers, moving less (e.g., stopping walking), fatigue, headaches, and eye-related ailments, and may also suffer from mental health problems including depression and social isolation. In 2020, the global coronavirus pandemic (COVID-19) outbreak caused unanticipated problems that significantly affected the university system (Ngwacho, 2020).

Remuneration is always the most significant aspect affecting employee performance. Sitopu et. al., (2021) mentioned remuneration as salary or incentive given to employees for work done and also further defined the

measurements of remuneration including employee basic salary, wages, bonuses, incentives, allowances and benefits that companies provide and reward for employment. Performance among employees can be raised by paying workers more and implementing human resources improvements more effectively (Elisa et al., 2022).

Work motivation can have a positive impact on enhancing performance (Riyanto et al., 2021). Werdhiastutie et. al., (2020) stated that the Motivation among workers will always enhance the caliber of work produced and the effectiveness of the company. Karim et. al., (2020) stated that the staff pay and benefits fell in 2020 as a result of the COVID-19 pandemic's consequences and the MCO's nationwide implementation. According to Ntanjana (2022), an employee's productivity depends on how frequently they are physically present at their place of employment, how much they are "mentally present," and how well they perform when on the job. Since the COVID-19 epidemic, employees from many businesses, particularly those in education, have been expected to work from home using whatever resources are available in their homes. As a result, motivation has an impact on employee performance since motivated individuals work harder and produce better work (Chien et al., 2020).

Remuneration and motivation are variables that influence the success of employee performance in the organization. From several earlier research, Sitopu et. al., (2021), Iptian et. al., (2020) and Didit and Nikmah (2020) agrees that remuneration and motivation affect concurrently with employee performance. These studies emphasized the skills education sector to identify employee performance and factors affecting them during the pandemic COVID-19 and this research intends to look at the factors of the relationship between remuneration and motivation and the dependent variable which is employee performance.

Problem Statement

The employee is the main indicator for any business to ensure business performance. Organizations must ensure employee performance to achieve business sustainability, including education on business (Amjad et al., 2021). Employee performance is a critical component of an organization that determines whether it succeeds or fails (Ali & Anwar, 2021). Employee performance can be defined as the result or degree of achievement of a person over a specific period in performing tasks in relation to several options, including job requirements, desired outcomes, or shared defined standards (Faozen & Sandy, 2024; Xiang et al., 2021).

The coronavirus pandemic (COVID-19) outbreak in 2020 has brought about unforeseen difficulties worldwide that have severely impacted the service industry. Educational sectors happened to shut down as a pre-emptive determination against the COVID-19 disease. In the meantime, learning sectors have since been transformed into virtual enterprises. For a longer period, the disruptive impacts of the pandemic may have a substantial impact on the motivation and performance of instructors and employees in educational institutions (Kutieshat & Farmanesh, 2022).

Other factors that affect employee performance, especially during an outbreak such as job disagreement, lack of autonomy, higher workloads, and a lack of support from others can cause occupational strain and impair performance. (Saleem et al., 2021; Shoaib et al., 2022). They also experienced disruptions in their emotions and thinking (Sadovyy et al., 2021). To prevent performance from declining, management must comprehend the elements that can increase employee motivation throughout the endemic stage.

Various studies have been reported about the remuneration and motivation that influence employee performance during COVID-19. Employees who are highly motivated and covered by welfare are considered to have better job performance and overall will improve their performance, be more productive and effective (Shtembari et al., 2022). Therefore, the purpose of this study is to look at the variables that affect worker performance generally during COVID-19, and in the educational sector in particular.

2. Literature Review

This section discussed related studies of employee performance during the COVID-19 pandemic by numerous researchers. The association between an actual independent variable and with dependent variable based on the previous study was elaborated further in this section.

Employee Performance: After putting in the required effort at work, a worker's professional accomplishment is represented by their "employee performance," which is correlated with worthwhile employment, a motivated background, and understanding colleagues and bosses (Hendrik et al., 2021). Flexibility in the workplace enables people to combine their personal and professional life, which improves performance and an overall improvement in the organization (Roopavathi & Kishore, 2021). According to Sugiarti et. al., (2021), employees can gain information and skills that will help them fulfill their obligations effectively, resulting in enhanced performance, by focusing on their work.

According to Waal (2021), employee performance is one of the important components for achievement, which they use to outperform the competitors, accomplish their objectives, and generate profits. In addition, he added, corporate culture, training and development, stress, rewards and incentives, and leadership can all shed light on how well employees perform. Akdere and Egan (2020) defined employee performance as a deliberate, integrated method for raising the efficiency of an enterprise through worker performance enhancements as well as team and provider capacity building. It is the growth of capable and dedicated individuals working in a company that encourages and promotes their accomplishments to accomplish common, meaningful objectives (Astuty & Udin, 2020). Every firm will go above and above to correct the form and enhance the caliber of worker performance through efficient administration of human resources (Alipour et al., 2022). Employee performance is what workers accomplish to complete the tasks assigned by the organization (Nurpribadi et al., 2024).

According to Hombalimath and Kinange (2020), the triumph of any organization mostly varies upon the performance of its employees. She also mentioned the factors that significantly affect an employee's performance at work must be identified by an employer, and appropriate changes or corrections must be made as a result. Even in trying times, people's performance can be affected by their ability, effort, and surroundings (Widayanto & Nugroho, 2022). Performance becomes the substance of the company because if there is no performance, the goals cannot be reached. Accurate and unbiased employee performance measurement is the most challenging aspect of the performance appraisal policy (Camilleri & Camilleri, 2021). When assessing an employee's performance, the main responsibilities they have fulfilled and the progress they have achieved over a specified period are contrasted with the initial period objectives (Urdan & Kaplan, 2020).

Employee job quality, knowledge, inventiveness, teamwork, and other factors can all be used to gauge an employee's performance. Since it shows how dedicated and passionate individuals are about their work, the caliber of the work and how it is completed can be viewed as an artistic representation of the sensitive nature of employee performance (Hultman, 2020). Sembiring et. al., (2023), argues that some metrics derived from the work in question can be used to assess an employee's performance. These metrics include work both quantity and quality, proficiency in the field, innovation, collaboration, awareness of oneself, creativity, and individual excellence. Arifin et. al.,(2022) determined that a company can lead the market by using its skilled and dedicated workforce to provide it an advantage over rivals.

COVID-19 Pandemic and its Impacts on Employee Performance: During this pandemic, COVID-19 is not one of the problems for employees become weak, employees with efforts also can influence their performance. According to Narayanamurthy and Tortorella (2021), employee's performance during COVID-19 has been reduced compared to the situation before COVID-19. This is because, during COVID-19, most employees need to force themselves to work from their home and it can decrease and influence their performance and efficiency towards their job. Some employees do not feel comfortable working from home because they need to find a suitable place to do work and it can create conflict issues. The company needs to guarantee the protection of employees' well-being, social distancing, financial security, and job security to decrease pressure and improve the performance of the employees (Pacheco et al., 2020).

Aside from that, individuals must adjust to the COVID-19 pandemic and embrace a "new normal" in their lives since infection will occur if all standard operating procedures (SOP) are not followed. Now the whole thing is ongoing with 'new normal' procedures or standard operating procedures (SOP) but still stays with and with the fear of COVID-19 (Muhamad Khair et al., 2021). For the duration of this COVID-19 pandemic, employees were afraid, and worried about this virus, and work-family problems with working from the home-based system (Manroop & Petrovski, 2023). Frustration, work-family problems and conflict, digital inequalities, and

stress, at the same time, not entirely work can be completed from home, and several more problems disturb employee performance (Kundu et al., 2022).

Besides that, organizations have to play important roles during this pandemic to manage employees' performance based on their work stress. Sun et. al. (2022) also mentioned, that to maintain the performance of employees, organizations need to sustain mental health by decreasing anxiety and concern about COVID-19. Employees with good mental and physical health will perform well in the organization. If any company is concerned about sustaining good performance from their employee, the organization needs to make sure the performance of their employees is worthy as well (Kodarlikar & Umale, 2020).

Remuneration: The term "remuneration" means compensation, reward or pay and also can be benefits that each employee gets to boost their performance and job satisfaction. Remuneration is a reward for an employee's performance or contribution to the corporation. According to Ali and Anwar (2021), the payment schemes that are frequently employed to boost staff morale and motivation. Additionally, most firms believe that incentives, prizes, and recognition are essential components of employee motivation programs because they address the performance-related success element. Furthermore, pay and salaries are typically referred to as remuneration that raises workers' job happiness (Rinny et al., 2020). Paying employees helps guarantee that each business has the skilled and motivated workforce that is necessary to achieve both short- and long-term goals.

Martinr and Uribe (2021) mentioned rewarding an employee for services performed or work completed is known as remuneration. She also states that remuneration enhances employees' performance. Remuneration includes basic salary and extra bonuses or additional economic remunerations for employees accepted for the duration of their employment. In other words, the term "remuneration" describes the sum of a person's salary, stock options, bonuses, and other forms of financial support (Lovett et al., 2022). It has been determined that employee compensation, such as bonuses, allowances, and prizes, is a more effective motivational tool that can significantly improve both the job satisfaction and performance of employees as well as the performance of the entire firm (Reddy, 2020).

Didit and Nikmah (2020) suggest which remuneration is one of the payments or rewards that employees receive used because of their services or employment. Other than that, benefits and remuneration are crucial for any firm hoping to reach its targets and goals. Inadequate pay and benefits will result in subpar work, which will lower employee satisfaction and raise absenteeism, which will lower the final result (Pandey, 2020). There are two types of remuneration: non-financial and financial (Mahathir et al., 2020). Financial remuneration refers to salary, wages, bonuses and incentives while non-financial remuneration refers to employee's satisfaction with interesting tasks, job challenges, responsibilities, recognition and so on. Reddy (2020) also defined wages are hourly payments depending on the amount of work laborers complete in a given day, while salaries are a fixed amount provided to employees regularly for their performance and productivity.

Besides that, rewarding employees is the key to making employees more productive. Thus, to reach and sustain a competitive advantage that is to enhance organization performance and must control human capital in the sought-after direction (Alfawaire & Atan, 2021). The key means of accomplishing this is through the incentive power of rewards (Ali & Anwar, 2021) in that particular organization. The willingness of employees to use their skills, talents, and knowledge for the benefit of the company is what drives genuine business success, and it is the responsibility of the organization to foster and support these positive employee contributions by implementing efficient compensation systems (Walelign, 2021).

Motivation: When this COVID-19 pandemic happened, the organization needed to know that remuneration and motivation are very important to the performance of employees in the organization. Motivation plays an important role in increasing employee performance. Paais and Pattiruhu (2020) also pointed out that with motivation, each of the employees not only can achieve organizational goals, but they also can improve their performance and achieve their own goals. Motivation is the internal driving force that propels a person to perform at a high level to satisfy a need or meet an expectation (Maryani et al., 2021).

Motivation is the main thing that we need to be concerned about in the organization, especially related to

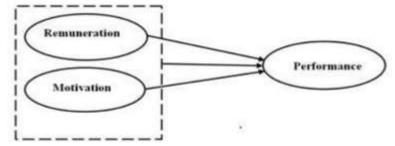

increasing the self-esteem among employees to accomplish their objectives. Motivated employees support the organization to develop more success because motivated employees are regularly looking forward to improving work performance (Hajiali et al., 2022). Motivation affects the performance of workers. Employees who are motivated take greater ownership of their work and are able to directly enhance performance. In contrast, "motivation refers to factors that activate, direct, and sustain behavior that is goal-directed." The "whys" behind our actions, or the needs or desires that propel us, are known as our motives. We assume that a purpose exists based on the conduct we witness, rather than observing one (Gardner et al., 2020).

Workers are motivated by specific variables that support their aspirations to improve their performance and guarantee that they will be more productive within the company. Motivation keeps workers more productive and enhances their subsequent job performance, which both raise job participation by making the work more fascinating and meaningful (Riyanto et al., 2021). Motivation by Nurlina et. al. (2023) is the ability to provide power that makes one's work exciting and motivates them to collaborate, perform well, and integrate with all of their strength and effort to be satisfied. Motivation will cause workers or employees of the company to take their tasks and duties seriously (Salas-Vallina et al., 2022).

Without motivation, we as humans or employees could not achieve better quality, work productively, have good knowledge and so on. While Hattie et. al. (2020) says that motivation is a psychological process that is brought about by or arises from variables as well as other elements. It also reflects the interaction of attitudes, needs, perceptions, and decisions that occur in an individual. Employees who maintain their effort to be motivated in the organization will achieve the goal at the right time. Diefendorff et. al. (2022) suggested that the mechanism that explains a person's level of effort, trajectory, and perseverance in achieving a goal is known as motivation.

Theoretical Framework: Ravitch and Carl (2019) concur that when researchers situate and incorporate formal ideas into their investigation, the theoretical framework acts as a guide. The same study can be approached very differently within different theoretical frameworks. The title of this theory is "Banking Employee Performance During Pandemic COVID-19: Remuneration and Motivation". Based on the model adopted, the researcher would like to find out the level of performance at the time of the COVID-19 pandemic. The variables were contained with the same variable as the model adopted. It is of the interest of the researcher to determine the association between variables and how variables influence each other.

Hypotheses

Hypothesis 1: This study investigated the connection between remuneration and employee performance. This hypothesis was supported by Sitopu et. al. (2021) rewarding an employee for services performed or work completed is known as remuneration. She also states that remuneration enhances employees' performance. **H1**: There is a relationship between remuneration and employee performance.

Hypothesis 2: This study investigated the relationship between motivation and employee performance. This hypothesis was supported by Riyanto et. al. (2021) asserts that motivating elements that result from an employee's behavior while executing and managing a job have an impact on that employee's performance. **H2:** There is a relationship between motivation and employee performance

3. Research Methodology

Correlational research was used in this investigation. The organization that now operates at a certain college in Perak is the focus of the sample frame, or in other words, the respondent of this study. The population of 250 respondents in this research study was defined as the entire number of employees in the company at the chosen college in Perak. Because it is accessible and readily available, the "convenience sampling technique" was employed as the appropriate sampling in this investigation. A non-probability design called convenience sampling makes use of time to gather some "quick" information to develop a "feel" for the phenomenon or variable of interest (Sekaran & Bougie, 2013). The study chose respondents from among the staff members of the workplaces. In defining the sample size, researchers refer to Krejcie & Morgan (1970) Table that specified when the total population was 250, the sampling size was 148 respondents. Data was gathered using a series of surveys that were disseminated by the researcher both manually and through a Google form. Items on both independent and dependent variables made up the questionnaire. The study questions from prior studies by Murpin et al. (2020) served as the basis for the questionnaire's design. Numerous questions on the questionnaire fell into the categories of independent and dependent factors. The questionnaire was constructed using the items Demographic Profile, Remuneration, Motivation, and Employee Performance, as shown in Table 1.

Variable	Number of Item	Measurement	Sources
Remuneration	5	 The retribution policy is in line with employee expectations. With the achievement of targets get incentives. The company provides promotions for outstanding employee positions. Bonuses given by the company are appropriate. 	Murpin et al. (2020)
Motivation	5	 5. Provision of benefits according to workload. 1. The amount of salary received by the employee. 2. The company cares about the work performance achieved by employees. 3. Support from colleagues. 4. Monthly targets are always achieved. 5. Opportunity to reach a career path. 	Murpin et al. (2020)
Employee Performance	7	 Carry out tasks according to applicable SOPs. Correct mistakes in work mistakes. Able to complete tasks assigned by the company on time. Able to fulfill what the company is targeting. Meet the monthly target. Understand what is done. Find ideas and new ideas in completing work. 	

Table 1: Item Measurement

4. Results

This section discusses the findings of the study on the independent and dependent variables of remuneration and motivation towards employee motivation at several selected colleges in Perak.

Demographic Profiles

The findings show that out of 148 respondents, 77 (52.0%) were male, meanwhile 71 (48.0%) were female. In this study, most of the respondents were aged 21 - 30 years old which was 92 (62.2%) of them. Meanwhile, 42 (28.4%) were aged from 31 - 40 years old, followed by respondents aged 41 - 50 years old with 10 (6.8%). The least number of respondents are from 51 - 60 years old which was 4 (2.7%). It can be seen that most of the respondents came from the age of 21 - 30 years old involved in this study. Most of the respondents are married which is 74 (50.0%), followed by respondents with status single which is 70 (47.3%). The least amount of

respondents is from widowed status which was 4 (2.7%). Most of respondents have the work experience from 3-5 years which was 63 (42.6%), followed by less than 3 years with 49 (33.1%). Meanwhile, 21 (14.2%) were respondents that have work experience of 6-10 years and 11 (7.4%) respondents that have work experience of 11-15 years. The lowest number of respondents is from respondents that have work experience of more than 15 years which is 4 (2.7%). Most of the respondent's job levels have the same frequency as general employee and supervisory/junior management which were 35 (23.6%), followed by middle management at 34 (23.0%). Meanwhile, respondent's job levels from the category specialist/technical were 29 (19.6%) and the least number of respondents were from upper management which was 15 (10.1%). Summary of demographic profile statistics depicted in Table 2.

Attributes	Label	Frequency	Percentage
Gender	Male	77	52.0
	Female	71	48.0
Age	21 - 30	92	62.2
	31 - 40	42	28.4
	41 – 50	10	6.8
	51 – 60	4	2.7
Marital Status	Single	70	47.3
	Married	74	50.0
	Widowed	4	2.7
Years of Working Experience	Less than 3 years	49	33.1
-	3 -5 years	63	42.6
	6 – 10 years	21	14.2
	11 – 15 years	11	7.4
	More than 15 years	4	2.7
Job Level	General employee	35	23.6
	Supervisory/Junior management	35	23.6
	Middle management	34	23.0
	Upper management	15	10.1
	Specialist/Technical	29	19.6

Table 2: Demographic Profiles Statistics

Correlation Coefficient

Table 3 was measured by using Pearson Product-Moment Correlation Coefficient data analysis and it was found there is a relationship between remuneration and motivation towards employee performance. The result of the correlation shows there is a significant, positive, and moderate relationship between remuneration and employee performance. This is because the p-value was less than 0.01 (r=.499, p<0.01).

Meanwhile, the result of the correlation shows there is a significant, positive, and moderate relationship between motivation and employee performance. This is because the p-value was less than 0.01 (r= .468, p<0.01). Based on the results of this study, it was obvious that employees adopt a lack of motivation and low remuneration management system especially during the pandemic COVID-19 and employees work remotely from home. This relationship was supported by Hafshah et. al. (2022). Wang et al. (2020) agrees that the lack of social interactions and the result of isolation is what can cause the lack of motivation and commitment due to difficulties in achieving the psychological needs for belongingness and relatedness. According to Pratap et. al. (2021), low-paid workers have been exposed to the full force of the health, performance and jobs crisis.

		Employee Performance	Remuneration	Motivation
Employee Performance	Pearson Correlation Sig. (2-tailed) N	1 148 .499**	.499** <.001 148	.468** <.001
Remuneration	Pearson Correlation Sig. (2-tailed) N	<.001 148 .468**	1 1 148 .258**	148 .258** .002
Motivation	Pearson Correlation Sig. (2-tailed) N	<.001 148	.258** .002 148	148 1

Table 3: Correlation Coefficient

** Correlation is significant at the 0.01 level (2-tailed)

The result indicates there was a significant relationship between remuneration and employee performance (β =.405, p<0.05). Thus, it can be determined that H1 was supported in this study. The finding shows there was a significant relationship between remuneration and employee performance (β =.364, p<0.05). Thus, it can be concluded that H2 was supported in this study.

Findings show the relationship between the independent variable remuneration on the dependent variable which is employee performance during the pandemic COVID-19. Based on linear regression was used to analyze that relationship and overall the findings of the study supported all the hypotheses. According to Reddy (2020), Pay is largely used as a tool to inspire employees to do their tasks successfully and to draw in and keep qualified workers with the necessary experience to help the organization reach its goals. Its presence in an organization cannot be ignored for the straightforward reason that it will have an impact on the accomplishment of objectives.

This study is supported by Rumanda et. al. (2023) entitled "The Effect of Leadership, Work Motivation and Remuneration Based on Worker Performance in the East Java Regional General Tax Office Directorate." The study's conclusions suggest that compensation significantly and favorably affects worker performance.

Based on the results and hypotheses which relationship between remuneration and employee performance is supported. Findings show the relationship between the independent variable which is motivation on the dependent variable which is employee performance during the pandemic COVID-19. Based on linear regression was used to analyze that relationship and overall the findings of the study supported all the hypotheses. Individual, group, and organizational performance would all improve with higher employee motivation (Nguyen et al., 2020).

According to Khan et. al. (2021), When better performance may fairly and equally increase employee rewards, job satisfaction will increase; otherwise, employee happiness is the feedback that shapes self-image and motivates performance improvement. The results of this investigation agree with those of Insan et al. (2021), who found that raising employee motivation will improve the performance of people as a whole as well as in groups and organizations. Based on the results hypotheses which relationship between motivation and employee performance was supported.

Regression Analysis

To investigate the relationship between compensation and employee incentives toward performance during the COVID-19 epidemic, this section addresses hypothesis testing. By examining the sign of a regression coefficient, it may also ascertain if there is a positive or negative relationship between each independent variable and the dependent variable. The regression analysis's result is displayed in Table 4. The coefficient of determination (\mathbb{R}^2) of.372 indicates that the independent variables of motivation and compensation accounted for 37.2% of the variance in the dependent variable of employee performance. Motivation and compensation together accounted for 62.8 percent of the variance in employee performance that could not be explained by independent variables.

Independent Variables	Standard Coefficients	Т	Sig.	Collinearity	Statistics
	Beta			Tolerance	VIF
Remuneration	.405	5.949	<.001	.934	1.071
Motivation	.364	5.346	<.001	.934	1.071
R square	.372				
Adjusted R square	.364				
F	43.028				
Sig. of F value	<.001				

Table 4: Results of Regression Analysis

Dependent Variables: Employee Performance *p-value<0.05

Based on the analysis above, the factors that affect employee performance, which is remuneration, were the most contributing to employee performance during the pandemic COVID-19 in five selected colleges in Perak. The findings show that 40.5% remuneration with (β =.405, p<.005) is the most influenced variable in employee performance during the pandemic COVID-19. Therefore, the results of this study showed that the dedication of remuneration substantially contributes to employee performance. The strong correlation between remuneration and employee performance indicates that institutions should reassess their compensation structures. Competitive remuneration can serve as a motivator that enhances dedication and commitment during tough times, thus directly impacting performance levels. This study highlights the importance of effective remuneration schemes in attracting and retaining top talent. In a competitive job market, institutions offering attractive remuneration are likely to maintain higher retention rates, which is crucial for organizational stability and growth during crises.

According to Narayanamurthy and Tortorella (2021), they showed that the COVID-19 pandemic had a substantial negative impact on workers' well-being and productivity, especially on employee's finances. Employees are paid a high rate of salary will boost their performance but while employees are paid a low rate of salary will affect employees and the organization's performance (Prasetyo et al., 2021). The remuneration system is a successful motivating tool that can significantly improve worker performance and job satisfaction as well as overall organizational performance (Didit & Nikmah, 2020). However, the value of remuneration is not too very reliable to the study. Other studies also showed that sig. variable remuneration is $(r^2 = 0.432)$ or 43.2% and can be concluded that the remuneration is affected by the performance of employees (Didit & Nikmah, 2020; Nguyen et al., 2020; Prasetyo et al., 2021).

The regression coefficients are essential for interpreting the direction of the relationship. A positive coefficient for remuneration implies that higher pay correlates with improved employee performance, while a positive coefficient for motivation suggests that increased motivation leads to enhanced performance. Conversely, if any coefficients are negative, it indicates that higher remuneration or motivation could correlate with lower performance, which could suggest deeper issues within the organizational culture, especially under the constraints of a pandemic.

5. Managerial Implications and Recommendations

The finding shows that only 37.2% of the variance in employee performance is explainable by remuneration and motivation indicating that many other factors are at play. This could include organizational culture, leadership styles, employee engagement, operational processes, and external factors such as market conditions during the pandemic. Organizations need to recognize that merely focusing on financial compensation and motivation strategies may not suffice. The significant unexplained variance suggests that organizations should explore other potential contributors to employee performance (Kurdi et al., 2022). These could range from mental health support to flexible working conditions and professional development opportunities. During the pandemic, employees often faced increased stress and anxiety, making it crucial for organizations to adopt a more holistic approach to employee wellbeing (Mun et al., 2022). Economic instability and changing job markets due to the pandemic could impact employee performance decisions that are beyond the organization's acknowledged in future performance evaluations and strategies (Alsharif et al., 2021).

Organizations should consider how remuneration packages are structured. Offering competitive salaries is essential, but also incorporating non-monetary benefits such as health and wellness programs can enhance overall employee satisfaction and motivation (Dalal et al., 2022). Moreover, organizations also can focus on strategies to foster intrinsic motivation among employees by providing opportunities for growth, promoting a balanced work-life environment, and recognizing employee contributions. Regular feedback and communication can also significantly enhance motivation levels. Given the pressure from the pandemic, organizations should prioritize mental health initiatives and support systems. Employee assistance programs, stress management workshops, and flexible working hours can play a vital role in maintaining performance levels (Davidescu et al., 2020).

Besides, further research to identify additional factors that influence employee performance should be conducted. Surveys and interviews can provide insights into employee needs and preferences, leading to more targeted interventions. Organizations also need to adapt to change while remaining adaptable and responsive to the evolving needs and challenges faced by employees. What worked pre-pandemic may no longer be effective, and continuous evaluation of strategies will ensure that organizations remain relevant and supportive.

The relationship between remuneration, motivation and employee performance during the COVID-19 pandemic highlights the complexity of workplace dynamics in times of crisis. While remuneration and motivation significantly contribute to employee performance, the substantial unexplained variance indicates a broader set of factors at play. By adopting a more integrated and holistic approach, organizations can foster a resilient and high-performing workforce capable of navigating the ongoing challenges presented by the pandemic and beyond. The journey towards effective employee performance is ongoing and insights from this analysis can guide organizations in refining their strategies to foster a productive and motivated workforce.

Organizations need to remember that it is not only a remuneration factor influencing employee performance since remuneration was the most significant variable in this study. Different employees may have varying motivational drivers, such as job security, recognition, job satisfaction, and workplace culture. Thus, a holistic approach to employee motivation should be adopted. In the context of economic hardship caused by the pandemic organizations may face financial constraints that hinder their ability to enhance remuneration. This finding encourages institutions to explore alternative ways to boost employee motivation, such as non-monetary benefits, particularly giving employees flexible working hours, and professional development opportunities that can complement limited financial resources.

The dynamic nature of the pandemic requires organizations to continuously evaluate and adapt their remuneration strategies. Institutions should conduct regular assessments of employee needs and preferences to ensure that compensation packages remain competitive and effective in motivating their workforce. As for recommendations, the organization should review and revamp compensation structures and should conduct a comprehensive analysis of their current remuneration packages to identify areas for improvement. This process may involve benchmarking against other institutions and industry standards to ensure competitiveness. Managers should consider establishing performance-based incentives linked to employee contributions during the pandemic. This can reinforce the connection between remuneration and performance while assuring employees their efforts are recognized.

Organizations also need to provide clear and transparent communication regarding remuneration policies and how they relate to performance can encourage ambition and a sense of trust among employees. Managers should often engage with staff to ensure clarity and gather feedback on compensation-related matters. A supportive workplace culture that emphasizes employee well-being, inclusion, and recognition, going beyond financial incentives should be created. Initiatives might include team-building activities, mental health resources, and professional development workshops. Post-implementation of any remuneration or motivational changes is crucial to continuously monitor to explore its impacts on employee performance and satisfaction. Regular surveys and performance assessments can help gauge effectiveness and inform future strategies.

Conclusion

These days, some companies are content with their staff working remotely since it gives them more time to focus on their performance, which is ultimately what counts. When technology is used to share information and maintain strong contact among employees who work from home, the desire of employees to accomplish their work will grow. Remote, flexible workers tend to be happier and more motivated in life because working from home has been shown to lower stress, allow more time for hobbies and interests, and strengthen personal connections, among other things.

Several recommendations can be described based on the literature review and findings of this study. The independent variables which remuneration were significant but at a lower value for correlation analysis and the recommendation towards it is that some organizations need to develop a modern work environment. An efficient, contemporary workplace encourages more achievement and drives workers to deliver quality work. Employers might supply a set of office supplies for employees to set up at home if they work remotely and employers can listen to each other's opinions even though virtually.

Other than that, employers must encourage cooperative work environments since they will boost output, job happiness, creativity, innovation, and quality of work. and from that it can build trust between team members. Employees will be motivated to work and perform well in the company where they work if their safety and recognition are thought of by the company.

To enhance worker performance, the company needs to design and execute strategies for providing workers with fair compensation and benefits. Since salaries are employees' primary source of income, they place a high value on benefits offered by their employers. Offering benefits to staff members can help them feel valued and rewarded for their efforts. Online and off, managing the company's reputation should be of utmost importance. A business that mistreats its staff is more likely to lose clients and have a disastrous PR campaign. One disgruntled worker is all it takes to lower revenue and decrease consumer loyalty. It is evident that giving employees the proper benefits is more crucial for the business.

Last but not least, the company must be concerned about employee motivation. The performance of the organization will suffer if employees are not more motivated. Organizations must give workers equitable promotion opportunities based on their productivity. Additionally, allowing employees to make decisions about their particular jobs might boost their motivation. Not only do rational, quantitative approaches hold the key to sustained survival and organizational success, but also employee commitment, engagement, and drive at work. As the world continues to overcome the obstacles the pandemic has brought about, educational institutions and other organizations must leverage these insights to motivate their workforce effectively and enhance overall performance. By prioritizing competitive remuneration, fostering a supportive culture, and continuously evaluating strategies, organizations can emerge stronger in the face of adversity.

Acknowledgments: The authors would like to thank the Faculty of Business and Management for their assistance with the research. The editors and reviewers deserve special recognition from the writers for their essential work.

Abstract: Malaysia's captivating attractions are increasingly promoted through community-based ecotourism (CBE) initiatives. These efforts aim to empower local communities, conserve nature, and generate income by involving locals in managing ecotourism resources and activities, ensuring both economic benefits and sustainability of protected environments. CBE highlights diverse customs and cultures, enhancing ecotourism experiences through local resources. Understanding tourists' attitudes and preferences is crucial for developing sustainable cultural tourism packages. Key inquiries involve measuring local community participation, artistic elements, and tourism offerings in CBE management around protected parks. Evaluating tourism preferences and willingness to pay (WTP) for attributes provided by local businesses is essential for effective CBE management strategies in rural areas. This study employs the Choice Experiment model to analyze tourists' preferences for CBE activities and their marginal willingness to pay (MWTP) for management attributes at Min House Camp (MHC) in Kubang Kerian, Kelantan. The attributes examined include local community involvement, activity packages, accommodation facilities, and information provided. The study found 'super' package activity, increased local participation and employment, excellent accommodation, and adequate information to be the most important attributes. The study suggests that business owners and local managers adopt the CBE concept and focus on the key qualities that have been identified. Local communities and stakeholders should implement new tour packages at MHC, combining desirable features to meet market demand. Future studies could use a mixed logit model to account for multiple attributes of community ecotourism tours in protected parks.

Keywords: Choice Experiment, Community-based Ecotourism, Local Communities, Min House Camp, Kelantan, Willingness to Pay

1. Introduction and Background

Like many other countries, Malaysia is renowned for its captivating and authentic attractions. Sabah and Sarawak have increasingly expanded their initiatives to promote community-based ecotourism (CBE), with a strong emphasis on empowering local communities, conserving nature, and generating income. These efforts aim to engage local communities in decision-making regarding the management of ecotourism resources and activities. The objective is for ecotourism to not only generate income for local populations but also enhance the sustainability of protected natural environments.

Moreover, CBE highlights diverse customs and cultures, enriching individual ecotourism experiences through local and community resources. The economic value of CBE is derived from traditional cultural practices. Understanding tourists' attitudes and preferences is crucial for developing sustainable cultural tourism packages. A key inquiry concerns how to gauge local community participation, cultural elements, and tourism offerings in CBE management around protected parks. Therefore, assessing tourism preferences within the context of ecotourism activities and the willingness to pay (WTP) for attributes provided by local community businesses is imperative. This evaluation can inform management strategies for CBE in rural areas.

Community Engagement (CE) offers several advantages over the Contingent Valuation Method (CVM), particularly in addressing two key issues. CE delineates an asset in terms of its attributes and levels, enabling the measurement of multiple attributes of a good. In contrast, CVM primarily treats a single good as a whole. The CE model is well-suited for estimating tourists' preferences toward multiple facets of CBE in protected

areas. This study seeks to establish a preference framework for CBE using the CE model. The research aims to discover tourists' preferences for various attributes of ecotourism tours. Observable differences in preferences can be assessed through interactions between demographic characteristics and welfare estimates for potential ecotourism packages in protected areas. In essence, this study focuses on the critical aspect of effectively managing community-based ecotourism.

Background

The focal point of this study revolves around Min House Camp (MHC), situated in Kampung Pulau, Kota Bharu, Kelantan, adjacent to the Pengkalan Datu River (refer to Figure 1). Kota Bharu, characterized as a concentrated urban center, is positioned in the northeastern and most ruralized region of Peninsular Malaysia. Given the Malaysian government's keen interest in advancing the ecotourism industry, this research concentrates on rural ecotourism sites in West Malaysia. Notably, various governmental initiatives currently advocate for ecotourism destinations in this area, particularly in Kelantan. Consequently, the selection of this rural ecotourism destination in Kelantan is motivated by its categorization as a Community-Based Ecotourism (CBE) site and its strategic location. It involves and benefits local communities, promotes the conservation of natural resources, and offers unique cultural experiences to visitors who enjoy exploring the outdoors.

Crucially, MHC serves as a recognized research center, focusing on the study of stingless bee species by several local and international universities. In 2018, out of fourteen Malaysian organizations, MHC received the ASEAN Tourism Award from the Kelantan state, achieving the Green Hotel Standard. The ASEAN Tourism Award acknowledges exemplary sustainable rural or urban tourism products within ASEAN, proposed and implemented through collaborative efforts between public and private sector stakeholders, contributing to the advancement of their respective areas and destinations.

The research in this study was centered around Min House Camp (MHC) in Kubang Kerian a community-based ecotourism project located on the outskirts of Kota Bharu town. It involves and benefits local communities, promotes the conservation of natural resources, and offers unique cultural experiences to visitors who enjoy exploring the outdoors. The camp's expansive compound includes various facilities such as chalets, multipurpose halls, a bee farm, a firefly garden, an organic farm, and a mini petting zoo. Additionally, the camp caters to water sports enthusiasts, providing activities like kayaking, river bathing, fishing, and clam digging.

In addition to the firefly-watching, Min House Camp facilitates various cultural engagements, encompassing craft-making, culinary sessions, traditional games, and performances like "wayang kulit and dikir barat. Wayang Kulit is a traditional form of puppet-shadow play, where intricately designed leather puppets cast shadows on a backlit screen. A skilled puppeteer narrates stories from ancient epics, accompanied by traditional music and voices. Dikir Barat is a form of traditional Malay vocal music that involves group chanting, typically performed in a rhythmic and melodic style. It often includes elements of poetry, praising religious or cultural themes, and is commonly performed during festive and cultural events.

Min House Camp not only functions as a recreational venue but also serves as a comfortable accommodation option, especially beneficial for individuals who need to be close to Hospital Universiti Sains Malaysia. Its strategic location, within a 2 km radius, makes it an optimal choice for long-term patients in search of a peaceful setting. The camp's association with Kelantan's Down Syndrome Association, led by the owner serving as its President, emphasizes its sincere dedication to community involvement.

2. Literature Review

Much literature has been published on economic valuation studies using the Choice Experiment (CE) technique (Louviere et al., 2000). Various studies have highlighted the application of different valuation methods to assess the economic value of marine biodiversity, coral islands and national parks, in both developed and developing countries (Hearne & Salinas, 2002; Lindhjem & Navrud, 2008; Suwardi et al, 2020; Rani et al, Silva et al., 2022). However, in developing countries, this technique is still not well-known (Adamowicz et al., 1998). In the case of Malaysia, CE has been widely applied to value national parks, marine parks, and cultural-heritage sites by Jamal et al. (2004), Yacob et al. (2008), Chea (2016), and Bakar et al. (2018).

Jamal et al., (2004) conducted a study to help decision-makers determine the optimum management strategy using the CE technique in the Matang Mangrove Wetland in Perak. Here, CE was used to estimate the nonmarket value provided under different management options where they stratified a random sample of ethnic groups in three selected districts in Perak with a sample size of 571 respondents. Five attributes were used, namely; the environmental forest protected, the number of local people employed, the number of bird species protected, the price of visitation and trust fund contribution. The results showed that on average, nonconsumer households were willing to pay a sum of RM 12.70 a year to achieve a better alternative scenario. The results have proven that this CE approach can be successfully used in a developing country as long as the choice sets are carefully developed, and the effective collection of field data is undertaken.

In a separate study by Yacob et al. (2008), they estimated the value of ecotourism resources at Redang Island Marine Park using the CE approach. There are two parts of the management properties which include the marine park area and the ecotourism facilities and services. The author used the conditional logit (CL) model and mixed logit (ML) model to analyze the data. The findings show that socio-economic variables such as age, gender, education and income contributed to visitors' preferences. For the marine park area, the ML model showed a slight improvement in explanatory powers as compared to the CL model while for the ecotourism facilities and services, the CL model was better than the ML model regarding explanatory power. Hence, this application of CE to value ecotourism in the case of the Marine Park in Malaysia can be used as the benchmark for ecotourism operators and management authorities to improve operations and policy development.

A study by Chea (2016) estimated the economic benefit of 'living heritage' in Melaka city using the CE method. Here, there were four attributes identified namely living heritage, natural environment, crowded recreational activities and the heritage charge value. A sample size consisting of 502 responses was used for this study. The findings showed that the respondents had a positive WTP for all the attributes which would help to provide valuable insights into the value of this unique heritage site for both the community and society.

In another study, Bakar et al. (2018) estimated visitor's preferences towards the improvement in ecotourism and management in Kubah National Park (KNP) by utilizing the CE technique. There were five attributes of ecotourism and management used in their study namely amenities, information provided, availability of an interpretive trail, availability of a park guide and entrance fee charges. The CL model was used to analyze the data using a sample size of 303 respondents. The findings indicated that respondents were WTP to support the changes or improvements in the current management condition which were currently being provided at a reasonably basic or low level.

3. Research Methodology

Study Area

The research in this study was centered around Min House Camp (MHC) which is located at Kampung Pulau, Kota Bharu, Kelantan next to the Pengkalan Datu River (see Figure 1). Kota Bharu can be described as a concentrated city located in the most ruralized part of the northeast of Peninsular Malaysia. As the Malaysian government is concerned with the development and operation of the ecotourism industry, this study has focused on West Malaysian rural ecotourism sites as several government initiatives presently promote ecotourism destinations in this region, particularly in Kelantan (Habibu, 2018). Furthermore, this is one of the main reasons why this rural ecotourism destination in Kelantan was selected, given its location and being categorized as Community-Based Ecotourism (CBE). More importantly, MHC is also recognized as a research center, for studying the stingless bee species by several local and international universities. In 2018, among fourteen Malaysian organizations, MHC won the ASEAN Tourism Award from the Kelantan state, as it fulfilled the Green Hotel Standard. The ASEAN Tourism Award recognizes ASEAN's best sustainable rural or urban tourism products that are proposed and implemented by public and private sector stakeholders who have collaborated and worked together for the benefit of their respective areas/destinations.

The compound area of the MHC houses a variety of facilities ranging from chalets, a multipurpose hall, a bee farm, a firefly garden, an organic farm, and a mini petting zoo and even hosts water sports activities such as kayaking, river bathing, fishing and clam digging. Free Wi-Fi is also available in the area. The accommodation arrangements comprise 2 units (attached houses) with 3 rooms (for 13 max), 2 units attached with 2 rooms (9

pax), and 2 units attached with 1 room (4 pax max). Floating river rooms are also available (max 2 pax) and 1 traditional small hut (max 3 pax) with a shared bathroom. Besides that, there are two types of dorms which are basic and standard that are offered particularly for backpacker visitors who require budget accommodation. Peak season is during public and school holidays where many student groups visit and camp overnight as the compound also provides a camping area. One of the exciting highlights after dark is to watch fireflies where visitors are taken on a boat ride to witness the beautiful fireflies that naturally light up the local surroundings. The boat ride for firefly-watching operates from 8 pm until 11 pm. Besides that, visitors can also engage in the many cultural activities that are offered including handicraft-making, cooking lessons, traditional games and watching cultural heritage performances such as the wayang kulit (shadow play) and dikir barat (a Kelantanese traditional dance).

Figure 1: Map of Research Sites (MHC)

Material And Methods

The choice experiment (CE) technique was first introduced by Louviere and Woodworth (1983). This technique uses a common theoretical framework with a dichotomous choice contingent valuation in the Random Utility Model (RUM) (McFadden, 1973). In CE these characteristics are known as attributes. For example, visitor n obtains utility from an alternative j over other choices in the choice set C, therefore:

$$U_{nj} = \max(U_{n1}, U_{n2}, U_{n3} \dots U_{nJ}) (i \neq j, \forall i, j \in C_n)$$
(1)

Their choices can be observed but cannot be measured directly. However, the true individual's utility U_{nj} can be stated as:

$$U_{nj} = V_{nj} + \varepsilon_{nj} \tag{2}$$

Where V_{nj} represents the measurable component of utility, which is independent of the observable attributes of alternatives including demographic information of the individual. ε_{nj} is a random component that captures the effect of unobserved and omitted influences on choices. Consequently, Equation 2 then becomes:

$$V_{nj} + \varepsilon_{nj} > V_{ni} + \varepsilon_{ni} (i \neq j) (i \neq j, \forall i, j \in C_n)$$
(3)

This shows that the ϵ_{nj} affects the utility of alternative j but cannot be observed. When this error term is treated as a random variable, and the visitor selects alternative j over another alternative I among a set of possible alternatives C, the probability can be presented as:

$$P_{nj} = p(U_{nj} > U_{ni})$$

$$= p(V_{nj} + \varepsilon_{nj} > V_{ni} + \varepsilon_{nj})$$

$$= p(V_{nj} - V_{ni} > \varepsilon_{nj} - \varepsilon_{ni})$$

$$= (i \neq j, \forall i, j \in C_n)$$

$$(4)$$

In this form, the utility function can be expressed as a linear function of the site attributes and can be presented as:

$$V_{nj} = \beta_1 + \beta_2 X_{nj2} + \beta_3 X_{nj3} \dots + \beta_k X_{njk}$$
(5)

where X_{njk} measures the site qualities and β is the parameter.

The discrete choice model in the previous section becomes a CL model when the ε_{nj} Is assumed to be independently and identically distributed (IID) with an extreme value of type 1 Gumbel distribution. The probability of choosing *j* using this IID assumption becomes:

$$P_{nj} = \frac{\exp(V_{nj})}{\sum_{i} \exp(V_{ni})}$$
(6)

The maximizing likelihood function is then used to estimate the coefficients as stated in Equation 7, as: $logL(\beta) = \sum_{n=1}^{N} \sum_{i=1}^{J} y_{nj} \log \left[exp(\text{Vnj}) / \sum_{i=1}^{J} \exp \left(V_{nj} \right) \right]$ (7)

Where Y_{nj} Ll take the value of 1 if the visitor chooses j and 0 if otherwise. This is the most applied model for parameter estimation in CE studies (Adamowicz et al., 1998; Hanley et al., 2001; Haider et al., 2004). Indeed, it is mostly used due to the ease of estimation as compared to other models such as multinomial probit (Train, 2009).

To estimate the marginal effects of the changes for certain attributes, for example, attribute k, the computation of implicit price is appropriate. According to Bennett and Adamowicz (2001), implicit price explains the amount of money that visitors are willing to pay to obtain an additional improvement in the k attribute. The function of this implicit price is:

Implicit price or WTP =
$$\beta k/\phi$$
 (8)

Where βk is the parameter of the attribute and ϕ is the MU of income; the resulting value is shown in ratio terms. If the value is greater than zero, this means a positive monetary return to a visitor, while a negative value results in a monetary loss.

Identifying the Attributes and their Levels

Based on the previous literature review, this study uses CE design to understand the CBE in the MHC area. Choices of attributes and levels should be relevant to the policy-making process and must have meaning to the person who answers the choice set of questionnaires (Bennett and Blamey, 2001). This list was then presented to a focus group who were asked to indicate which attributes played an important role in determining consumer choice, and the group was also allowed to add additional attributes. In addition, several discussions were undertaken with the Department of Tourism Kelantan, local communities and volunteer visitors to

discuss the attributes. Finally, five management attributes were agreed upon and a series of multiple choices to respondents such as involvement of the local community, package activity, accommodation facilities, information provided, and entrance fees. The preference attribute and level for CBE in MHC are shown in Table 1.

Variable		Level		<u> </u>	Expected	Explanation
	1	2	3	4	Sign	
CBE	No change	Increase 10%	Increase 20%	Decrease 5%	+	Utility increases as the level increases.
PAC	Normal	Premium	Super		+	Utility increases as the level increases.
FAC	Non- satisfactory	Satisfactory	Very Good		+	Utility increases as the level increases.
INFO	Low	Medium	High		+	Utility increases as the level increases.
PRICE	No Charge	RM 4.40	RM 4.80	RM 5.20	-	Utility reduces as the price increases.

Table 1: Attributes and level of management in Min House Camp, Kubang Kerian

Employment and Involvement of Local People

Based on the focus group discussion, the current level of jobs and involvement was set at 10% of the total population (Yacob, 2008) and was used as a base to determine the level of involvement in MHC. The attributes were selected based on the concept that CBE benefits the local community. The employment growth significantly creates an opportunity for the local economy, and therefore job opportunities are created for locals who live within the boundary of the ecotourism sites. Four levels were assigned to this attribute: No change.

Increase 10%. Increase 20%. Decrease 5%.

Package Activity

The other attribute regards the package of activities. Three levels were chosen: normal, premium and super. The normal package offered by MHC was inclusive of accommodation, food and usage of multipurpose halls, while other activities such as firefly watching, kayaking, folk games, team building, traditional archery, organic farm, stingless bee farm and honey tasting were excluded. The premium package activity included a normal package with better accommodation, traditional food, and two additional activities, while the super package activity included comfort accommodation, and organic food with three additional activities. Three levels were assigned to this attribute:

Normal activity packages. Premium activity packages. Super activity packages.

Accommodation Facilities

MHC currently offers various types of accommodation such as chalets and campsites. The improved provision of facilities is planned to increase the tourists' use of utilities such as the quality and the number of lockers, cleanliness of public washrooms, showers, café restaurants, and the parking area. Therefore, for this study set, three levels comprising the status quo were used. First, 'unsatisfactory: a low number of facilities provided such as no locker for dorm visitors with less cleanliness of public washrooms, showers, café restaurant and park area'. Second, 'satisfactory: this envisioned relatively better facilities including the provision of locker facilities for visitors who stayed in the dorm, with clean washrooms, showers, café restaurants and the surrounding park area. Third, 'very satisfactory: the best provision of the facilities, including lockers, water supply, washrooms, showers, café restaurant and the surrounding park area kept clean at all times. Three levels were assigned to this attribute:

Unsatisfactory. Satisfactory. Very satisfactory.

Information Provided

The type of information presented was another important factor in the decision of where to recreate. Various levels of information are currently offered at the site as some tourists may need to be better informed while performing recreational activities. However, some tourists may be looking for more information about flora, fauna and park attractiveness. The additional information could be achieved through the availability of interpretive programs, proper positioning information boards, signboards and posters in the right place, where relevant brochures and pamphlets could also be made available. However, the effectiveness of this program depends on how well the visitors can obtain useful information inside the park itself.

Accordingly, this shows that the design of materials and their distribution and accessibility at appropriate places will determine how effective the information is and how it is used. Notwithstanding, the environment created could also help to create and encourage nearby residents to support nature protection in the nearby park and to reduce degradation of the nature park resources. Three levels were assigned to this attribute:

Low: Limited information, direction and sign only for management and safety purposes; informative paper, brochures and pamphlets are not well-organized in a specific place.

Medium: Better conditions, where directions and signs for management and user safety are provided in key intersections. Signs are easy to read and identifiable, park guards and educated guides provide information on nature and cultural activities.

High: The best level of providing information services, where directions and signs for management and safety are provided at intersections and near the camping area and restrooms. Park guards and guides act as one-on-one guides to visitors in the park, enlightening them on how to contribute to the sustainability of the park and the environmentally friendly use of the park using video presentations.

Marginal Entrance Fee

Although the entrance to the MHC was set as 'no charge' for local and international visitors, MHC managers were asked to reflect on the acceptability of introducing an entrance fee. The entrance fee would be used towards the management and maintenance of the park and building facilities. The paying of an admission fee would also give visitors the right to enter and utilize the facilities provided in the park. However, in this case, the payment vehicle attribute needed to be defined carefully so that all respondents could make real choices and, therefore, any hypothetical bias in the study could be reduced (Juutinen et al., 2011). Suggestions for the entrance fee included several possible payments of no charge, RM 4.40, RM 4.80, and RM 5.20, as: No charge.

An increase of RM 4.40. An increase of RM4.80. An increase of RM5.20.

Experimental Design

A statistical software package (SPSS) was used to produce the orthogonal design. With this design, the levels of different attributes were consequently reduced and allocated properly into each choice set. The last step was to pair the generated alternatives from the orthogonal design with the status quo or current scenario. Each set consisted of two alternatives and one current scenario in the CE questionnaire. For example, in Figure 2, the visitors were given a choice between two alternatives with costs of RM4.40 and RM5.20. The trade-off concerns whether increase jobs and involvement of local people to 10%, super package (Inclusive comfort accommodation, traditional food and hall usage (only necessary) + 2 additional activities), satisfactory accommodation facilities and high information provided rather than decrease jobs and involvement of local people to 5%, normal package (inclusive accommodation, food and hall usage for student and university only), satisfactory accommodation facilities and medium information provided. Moreover, before each choice card, the following statement was made, "suppose Figure 2 represents the scenarios of management to be available in Min House Camp. Please tick ($\sqrt{}$ your preference in the box".

Management	Option A	Option B	Option C (Current Situation)
Employment to Local People	## Increase 10%	Decrease 5%	No Change
Package Activity	Super	শ্রু গ্র্ Normal	No change 《公 《父 》 》 》 》 Normal
Accommodation Facilities	Satisfactory	ن Satisfactory	ب Unsatisfactory
Information Provided) High) Medium	図 Low
Marginal Entrance Fee	RM4.40	RM5.20	No Charge
Your most preferred Option (Tick one box)	\checkmark		

Figure 2: Example of a choice card in the CE model questions

Sample Design and Implementation

The experimental survey was conducted at Min House Camp from July to November 2019 with a sample size of 360 respondents. Convenience sampling was applied where local and foreign visitors who visited the MHC could be selected given their accessibility, convenience and proximity to partake in the questionnaire survey.

4. Results

A summary of the socio-economic profile of respondents is next presented in Table 2. The distribution of the sample respondents' gender was 42% for males and 58% for females. The total number of respondents was 360 with ages ranging between 18 and 72 years of age, with a mean age of 42 years. Regarding the respondents' education level, 17% of the respondents had completed primary school, 16% had completed secondary school, and with a degree certificate, 44% had a pre-university and diploma certificate, and 24% held a Master's and PhD certificate. As for marital status, 44% of respondents were currently single, 55% were married, and 1% of them were others. Most of the respondents were currently employed or seeking employment status; 53% and 36% respectively.

Table 2: Demographic and Geographic Information About Visitors in Min House Camp, Kubang Kerian, Kelantan

Variables	Frequency	Percentage (%)	Mean
Age (Years)			41.806

Conditional Logit Result

Table 3 shows the results of simple CL model conservation. Most of the variables in the model such as CBE2, CBE3, PAC2, PAC3, FAC2, FAC3, INFO2, INFO3 and PRICE are significant at a 1% and 5% significant level. Whereas CBE4 is not significant due to the visitors who are not in favor of reducing local people's employment by 5%, which is consistent with the finding of Yacob et al., (2008). As seen from the results, these variables are by a priori expectations. The positive coefficient in all the parameters except for PRICE implies that visitors have a higher preference for these levels as compared to the status quo (CBE1, PAC1, FAC1 and INFO1). Also, the coefficient for PRICE is negative which confirms that imposing a higher marginal entrance fee would lead to negative contributions towards satisfaction (UTILITY).

Table 3 also reports the marginal rate of substitution (MRS) of the management attributes for each level. Here, all the variables have positive values which means that most of the visitors are willing to pay slightly more with the improvement of the attribute levels. Accordingly, CBE2 and CBE3 have a value of RM 1.05 and RM 1.06 respectively. Next, PAC3 has a higher value of RM 1.03 than PAC2 valued at RM 0.49. FAC2 and FAC3 both have a higher value than the other variables of RM 1.41 and RM 2.52 and the values for INFO2 and INFO3 are RM1.52 and RM1.40 respectively.

Variables	Coefficients (β)	Std.Error	P-value	Marginal Value (RM)
CBE2	0.79858626	0.12406717	0.0000***	1.05

```

Log-likelihood function	-1196.845
Log-likelihood function no coefficients	-1289.8753
Chi-Squared	186.0606
Pseudo- R ²	0.07212
Adjusted Pseudo- R ²	0.06889

NOTE: *** Significant at 1% and ** 5% level

In the interaction model, the best-fit model for the CL interaction model for management is shown in Table 4. The likelihood ratio value increased to 365.6886 as compared to the simple model which was 186.0606. This value is also compared to the critical chi-squares value of 40.289 (X^{2} (0.01, 22)). The model chi-squared statistic displays satisfactory results, thus, rejecting a null hypothesis that indicates the coefficients are statistically, significantly different from zero. The increase in pseudo-R2 values also confirms the improvement of this model. This value has slightly increased from 0.07212 to 0.14175 which shows the interaction model is more precise. There are some notable features of the variables in this interaction model for the management attributes. In Table 4, eight main attributes are found to be significant at a 1% level and with the expected sign. In a comparison of this model with the previous simple model in Table 4.20, it shows that CBE4 is still not significant although having a positive coefficient which is consistent with the findings by Yacob et al., (2008). Therefore, this indicates that strong relationships are affecting the interaction variables to the main attributes.

Regarding the interaction variables, most of them are significant at the 1% level. The negative sign of all age coefficients (CB2_AGE) shows that young people were more inclined compared to older people to support the employment of local people at a 10% increase in employment. Next, the negative sign of the age coefficients (PC2_AGE and PC3_AGE) shows that young people were more inclined compared to older people to support either "premium package activity" or "super package activity". Furthermore, the negative sign of FC2_AGE also shows that young people were more inclined to support satisfactory accommodation facilities. The positive sign of PC3_INC and FC2_INC indicates that a higher level of income contributes positively to support "super package activity" and "satisfactory accommodation facilities". Also, the medium information provided and associated with employment has a negative relationship (IN2_WORK) indicating that full-time employment does not support the provision of information at the medium level. Likewise, FC2_EDU indicates that people who have a higher level of education tend to support satisfactory accommodation facilities and the negative sign of gender with the upgrade package activity (PC3_GEN) indicates that females have a higher preference than males in supporting the super package activity.

Welfare measure (Marginal Value)

The marginal values for both CL simple and interaction models are shown in Table 3 and Table 4 respectively. According to Siebert (2008), the marginal rate of substitution shows the WTP of respondents based on their (truly revealed) preferences. To measure the average WTP of the respondents, the β value of this attribute is divided by the β value of price. The marginal value can be called 'implicit price' which explains the amount of money that visitors are willing to pay to obtain an additional improvement in k attribute (Bennett and Adamowicz (2001). For example, The MWTP of 'No Change' (10% of the total population) to 'increase 20%' regarding the issue of involvement and job employment of the local community is RM 3.54. Here, the respondents are willing to contribute as much as RM 3.54 on average to support employment and involvement of the local community by up to 20%. Next, the MWTP of 'increase 20%' to 'increase 30%' is RM 0.94. This indicates that the respondents value the improvement of 'increase 30%' shows that the respondents most preferred an increase to 20% for involvement and employment of the local community in MHC.

For, package activity, the MWTP of the 'normal' package to 'premium' is RM 2.27. Here, the respondents are willing to pay an average of RM 2.27 for the premium package to ensure better accommodation, traditional food, free hall usage, and two additional activities. The MWTP of the 'premium' to the 'super' package is RM 4.62. Here, the respondents are willing to pay more; RM 4.62 for the 'super' package to ensure better accommodation, organic food, free hall usage and three additional activities. Next, the MWTP of 'non-satisfactory' to 'satisfactory' accommodation facilities is RM 1.42. Here, the respondents are willing to pay on average RM 1.42 for satisfactory accommodation facilities. In this case, 'satisfactory' includes the better provision of locker facilities for visitors who stay in a dorm, upgraded washrooms, showers, café restaurants and the surrounding park area. Next, the MWTP regarding the 'satisfactory' to 'very satisfactory' accommodation facilities in MHC. 'Very Satisfactory' means the best provision of facilities including lockers, water supply, washrooms, showers, café restaurants and the surrounding park area always kept clean.

Lastly, the MWTP for the information provided from 'basic' to 'medium' is RM 2.88. The respondents here are willing to pay on average RM 2.88 for 'medium information' which includes directions and signs for management and user safety provided at key intersections. Also, the signs are easy to read and are identifiable, plus park guards and educated guides provide information on nature and cultural activities. However, the

respondents are willing to pay a lesser amount for 'high information' which is RM 0.80. This means that the respondents are more supportive of the effort of providing 'medium' rather than 'high' information. The reason for the low relative value of 'high' information is that the improvement of 'medium' information provided is relatively sufficient for the MHC visitors.

Discussion

Based on the CE model, this study analyses tourists' preferences for CBE and related activities as well as their MWTP four management attributes of the ecotourism destination at MHC namely, involvement of the local community, packages activity, accommodation facilities, and information provided. This study uncovered tourists' preferences for potential CBE tour packages in communities adjacent to the protected area. Based on the empirical results model, the most important attributes were found to be 'super' package activity, followed by an increased 20% involvement and employment of local people, very good accommodation facilities and medium information provided. Indeed, the findings of the CE results are consistent with the previous literature by Yacob et al., (2008), Mohamad (2014), Juutinen et al., (2011) and Bush et al., (2008).

5. Managerial Implications and Recommendations

For policy implications, business owners or local managers may consider adopting the concept of CBE in the future and focusing on the key attributes identified in this study. Moreover, local communities and other stakeholders should be encouraged to implement new tour package programs identified in the MHC area. For example, park management could develop better combinations of tour features. The ideal combination would involve visitors enjoying superior activities with the involvement and employment of the local community.

Conclusion

The objectives of this study are to discover tourists' preferences for various attributes of ecotourism tours. These aspects should be highlighted to meet future market demand. Furthermore, it may be beneficial to segment the market based on tourist preferences and needs and to set budgets for ecotourism management in protected areas accordingly. For future studies, the application of a mixed logit model could be considered to account for the multiple possible attributes of community ecotourism tours in protected parks.

Public Private Partnership and Financial Implication to Government: A Case Study from Malaysia

Amir Faisal Che Abdul*, Suhaimi Mhd Sarif, Nik Hziman Nik Mat International Islamic University Malaysia, Malaysia *mramirfaisal@yahoo.com Corresponding Author: Amir Faisal Che Abdul

Abstract: The implementation of infrastructure projects through the Public Private Partnership (PPP) that involve investments from the private sector has greatly benefited the country. Apart from being an alternative to conventional public infrastructure projects, PPP is also said to be a more efficient method as the risk of project implementation is transferred to the private partner. Even with these advantages, it cannot escape criticism, especially the implementation of PPP projects which involve financial implications to the government. The main purpose of this study is to investigate the Malaysian government's experience in the implementation of PPP projects especially regarding its financial implication issue and how the Malaysian government addresses the issue. A total of 29 officers from several government agencies were interviewed. The interview transcripts were analyzed using ATLAS. Ti application. Apart from contributing a theory regarding PPP, the results of this study have provided new knowledge on PPP, especially Malaysia's experience in dealing with financial commitment issues arising from the implementation of PPP projects. Although the context of development in other countries may differ, this Malaysian experience can be used as an example for PPP projects elsewhere.

Keywords: *Public-private partnership; development program; government procurement; fiscal management*

1. Introduction and Background

Public Private Partnership (PPP) is a strategy used by the government to provide public services, especially public infrastructure by inviting private partners to invest in public infrastructure projects. It refers to the collaboration between government and private companies in designing, building, financing and operating public infrastructure for the benefit of the general public (Ismail & Abdul Razak, 2023; Musawa et al., 2017). The implementation of the PPP program in Malaysia rooted since the 1980s under the privatization policy (Mohamad et al., 2018). The policy aims, among others, to reduce government participation in the economy and to enhance greater private-sector involvement (Economic Planning Unit, 1991). The privatization program undertaken in Malaysia does not only involve the corporatization of government entities and transferring/selling of government assets but also includes the implementation of new government projects using the private sector's investment under the build-operate-transfer (BOT) and build-operate-own (BOO) scheme (Hensley & White, 1993).

Over the years, new ideas have emerged in development practice worldwide. Private Finance Initiative (PFI) policy was introduced in 1992 by the British Conservative government. This PFI policy was initiated because it offered an opportunity for the British government to invest in infrastructure "off-balance-sheet", that is, implementation of infrastructure through public spending or borrowing was replaced by paying a tariff for infrastructure use to the private sector (Spackman, 2002). The introduction of PFI was controversial and attracted criticism as some argue that the PFI contract is a 'marriage made in heaven' and used by the government to enrich certain businesses with lucrative terms (Hodge & Greve, 2005). Being critical to Conservative Party policy, The Labor Party government in 1997 introduced PPP policy, a friendlier term to denote partnership in the contract, as an alternative to the Conservative Party's controversial PFI policy (Wettenhall, 2008).

Many criticisms of privatization policy related to mismanagement and corruption (Reinsberg et al., 2020). Privatization was expected to promote competition and eliminate corruption. In practice, the opposite has often been true as beneficiaries have engaged in new types of corruption to maximize their gains instead. As the failures and abuses of privatization became apparent, PPPs have been promoted, ostensibly to mobilize private finance for the public purpose (Sundaram, 2023).

Corresponding to the development of PFI and PPP in the United Kingdom, Malaysia shares a similar story where PFI has been announced in the Ninth Malaysia Plan. PFI is an initiative to use private sector funding in public infrastructure. Although the usage of private sector financing has been practiced in toll road projects since the 1980s, the PFI initiative has enhanced the private financing alternative. As opposed to the user pay concept in the toll road project, the private partner in PFI is paid by the government on the usage of the facility constructed. This is in line with PFI practices in the United Kingdom where under PFI, private sectors are remunerated through payment based on service availability (Spackman, 2002).

There were various initiatives by various government departments regarding PFI. The Economic Planning Unit (EPU) considers the PFI program the same as the privatization program because it is similar to the build-lease-transfer (BLT) that has been implemented in Malaysia. For example, the government building in Putrajaya Administrative Center was built by a private partner and it was leased to the government (Suhaiza Ismail & Abdul Razak, 2023). The lease payment made by the government to a private partner in BLT is similar to the availability payment concept under PFI.

On the other hand, by the PFI initiative announced in the Ninth Malaysia Plan, Pembinaan PFI Sdn. Bhd. (PFI Sdn. Bhd.) was established by the Ministry of Finance (MOF) to implement PFI projects. Several projects were identified to be constructed through PFI and PFI Sdn. Bhd is assigned to raise project financing for those projects. It was reported that the financing was provided by Employee Provident Fund (EPF) and Retirement Fund Incorporated (Public Account Committee, 2015). Under this arrangement, all PFI-identified projects will be funded by PFI Sdn. Bhd. will then repay the financing. This arrangement makes PFI projects implemented under the Ninth Malaysia Plan significantly different from the term PFI that has been normally understood and practiced in other jurisdictions worldwide (Ismail & Yusof, 2010).

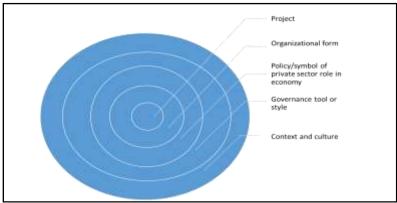

PFI Sdn. Bhd. was established by the MOF as a controlling tool for future payment commitments related to PFI projects. This corresponds to a general argument that claims PFI is used to circumvent the government budget. (Acerete et al., 2019; Benito et al., 2008; Reeves, 2015). There are beliefs that PFI will cause greater financial implications to the government if it is not properly managed because the government is committing to pay the private sector throughout the concession period (Engel et al., 2013).

The establishment of a PPP unit, namely, Unit Kerjasama Awam Swasta (UKAS) in 2009 marked a new direction in the privatization and PFI initiative in Malaysia. PFI projects that have been implemented through PFI Sdn. Bhd. was discontinued. UKAS is entrusted with the administration of the privatization program and PFI program that was originally administered by EPU and MOF separately. The term public-private partnership (PPP) was promoted to be the new term as an umbrella policy that combines both privatization and PFI under one program (Unit Kerjasama Awam Swasta, n.d.).

2. Literature Review

Hodge and Greve (2013) Have discussed a broader conceptual phenomenon of the term PPP which may be referred to as (1) a specific activity or project, (2) an organizational form or management tool, (3) a statement, or policy regarding the role of the government in economic activity, (4) a symbol or governance tool or (5) a historical context and culture sets of assignment (Figure 1).

Figure 1: Dimensions of PPP Phenomenon

Source: Hodge and Greve (2013)

Hodge and Greve (2013) conclude that the most usage of the term is always regarding what they call a longterm infrastructure contract' (LTIC) partnership between public and private partners. Another contributor to PPP research, Grimsey and Lewis (2004) also discussed the term PPP which has been used in various countries. They have defined PPP as a risk-sharing relationship based on a shared aspiration between the public sector and one or more partners from the private and/or voluntary sectors to deliver a publicly agreed outcome and/or public service'. Looking at this definition, it has been construed from three dimensions identified by Hodge and Greve (2013), that is, PPP as a specific project, a management tool, and a policy statement of the government as to their involvement in the economy.

Yescombe (2007) Took the position to discuss PPP from a similar dimension where PPP is regarded as 'project based' and 'contract based' with its definition comprised of 4 key elements, (1) a long-term contract; (2) involves activity of design, construction, financing, and operation of public infrastructure (facility) by private-sector party; (3) with payments over the long-term contract made either by the government or by the public as users of the public facility; and (4) with the facility remaining in public-sector ownership, or reverting to public-sector ownership at the end of the contract. This LTIC-type definition of PPP concurs with the observation made by Hodge and Greve (2013) that most discussion about PPP is related to infrastructure project dimensions.

Martin (2016) Argues that there is much confusion about what PPP is and what is not PPP when he discusses that on many occasions, being in public seminars and/or academic conferences, collaboration between public and private partners and any contracting-out procurement by public organizations has been attributed to PPP. He contended that PPP should be part of a procurement contract that involves construction/reconstruction of infrastructure/ public facility and not any other else. PPP should not cover other arrangements such as collaboration/joint venture and/or long-term services.

In a different perspective to the conclusion made by Martin (2016), Saussier and de Brux (2018) Explained PPP where they categorized the implementation of infrastructure projects into three types, (1) public procurement where the government assigns construction or service needs to a private entity as a contractor in return for a payment in the immediate term; (2) concessions contract which is based on the assignment of a mission comprising financial investment, construction of the project together with its operation and maintenance; and (3) Availability-based PPP that allow a government to assign a contractor with a comprehensive project as part of a long-term contract, against payment or remuneration paid by the government and spread over time. She also explained that apart from public procurement, the other two categories are always regarded as PPP where a concession contract is a "user pay PPP" meanwhile an availability-based contract is a "government-pay PPP". Either "user-pay PPP" or "government-pay PPP", many kinds of literature have also discussed the use of PPP as a way to avoid budget constraints. (Cepparulo et al., 2024)

Theories Underpinning PPP

It has been discussed in literature that not all collaboration between the public sector and private sector can be regarded as PPP in its true technical meaning although any form of collaboration between government and private sector may be called public-private partnership. PPP has been established as a technical term and can only be attributed to certain features as follows:

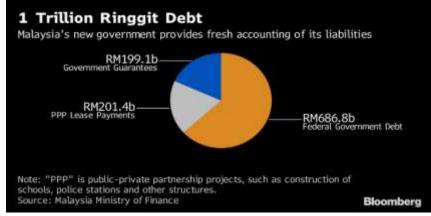

PPP is part of a public infrastructure procurement program that uses private sector investment; PPP involves long-term infrastructure contracts between public and private partners, and it ranges from the designing, funding, and building of the facility to the operation and maintenance of the facility; and two major types of PPP, that are, user-pay PPP and government-pay PPP.

Issue And Challenges

Government strategy to use PPP in providing public service and public infrastructure seems to be a good strategy. However, although PPP used private sector investment, the implementation of the PPP strategy still has financial implications for the government. It is because in the availability type PPP, although it does not need government funds for the construction of the project, it requires government payment commitment in the form of lease rental payment throughout the contract period. For example, the government has explained in the parliament that they chose to construct six Universiti Teknologi Mara (UiTM) campuses through PPP to overcome a lack of development funds. By doing this, the government must pay RM375 million in rent annually for 23 years, based on concession agreements that have been signed (Zahiid, 2014).

It was in 2018 when the newly elected Malaysian government reported that the national commitment to its debt was bigger than what had been reported by the previous government. The total amount is to be more than RM1 trillion. In explaining the number, the government has included in the calculation of the national debt with government guarantee loan and PPP payment commitment illustrated in Figure 2 (Shukry & Jamrisko, 2018).

Figure 2: Illustration of Announcement by Newly Appointed Political Government

Although it has been clarified that the inclusion of government guarantee loan and PPP lease payments commitment is not an appropriate mechanism to assess the actual government's debt as compared to the regulatory limitation (55% of GDP), it is still an eye-opening discovery that PPP lease payments commitment has become a serious issue that the government needs to address. According to the data reported when Budget 2021 was tabled in Parliament, the amount of PPP payment commitment represents 12% of the GDP as shown in Table 1.

Table 1: Government Debt and Liabilities Exposures

Component	RM E	RM Billion		GDP (%)
	2019	2020	2019	2020
Federal Government Debt	793.0	874.3	52.5	60.7*
Committed Guarantees	194.0	209.3	12.8	14.6
Other liabilities (PPP, PFI, PBLT)	182.2	173.3	12.1	12.0
Total	1,169.2	1,256.9	77.4	87.3

* Debt ceiling amount of 55% of GDP has been raised under a new Act enacted in 2020, that is, Temporary Measures for Government Financing (Coronavirus Disease 2019 (COVID-19)) 2020 Act. Source: Ministry of Finance, 2020

This disclosure inspires the researcher to undertake this study with the general objective of investigating the government's experience in the implementation of PPP projects especially on the procedure that may have been overlooked regarding the financial commitment of PPP projects.

3. Research Methodology

The main objective of the study is to investigate the experience of public officials on PPP projects and their financial matters. The study utilizes a qualitative research design with face-to-face semi-structured interviews. The population of the study construed government officers in departments which directly involved in PPP mainly UKAS, several divisions in MOF and specific divisions in Ministries which directly involved in the implementation of PPP projects.

A total of 29 individuals were interviewed and became a sample of the study. They represent three clusters for analytical purposes that are UKAS cluster, the MOF/EPU cluster and the cluster from implementing agencies. The details of the individual interviewed in terms of demographics and the date the individual was interviewed are presented in Table 2.

	Table 2: Participants Demographic				
Coding	Cluster	Designation	Service Experience (Years)		
P1	UKAS	Principal Assistant Director	17		
P2	UKAS	Deputy Director General	28		
P3	UKAS	Principal Assistant Director	19		
P4	UKAS	Senior Assistant Director	8		
P5	UKAS	Director	20		
P6	UKAS	Principal Assistant Director	18		
P7	UKAS	Director	22		
P8	UKAS	Director	20		
P9	UKAS	Principal Assistant Director	17		
P10	UKAS	Senior Director	23		
P11	UKAS	Senior Assistant Director	12		
P12	UKAS	Senior Assistant Director	14		
P13	UKAS	Principal Assistant Director	18		
P14	Implementing Agency	Assistant Secretary	2		
P15	Implementing Agency	Mechanical Engineer	19		
P16	Implementing Agency	Senior Assistant Secretary	8		
P17	MOF	Principal Assistant	19		
		Secretary			
P18	MOF	Principal Assistant	18		
		Secretary			
P19	MOF	Principal Assistant	19		
		Secretary			
P20	MOF	Senior Assistant Secretary	14		
P21	MOF	Senior Assistant Secretary	13		

Table 2: Participants Demographic

Coding	Cluster	Designation		Service Experience (Years)
P22	MOF	Head of Section		22
P23	MOF	Principal Secretary	Assistant	16
P24	MOF	Head of Section		21
P25	MOF	Head of Section		21
P26	Implementing Agency	Principal Secretary	Assistant	19
P27	EPU	Principal Secretary	Assistant	15
P28	Implementing Agency	Deputy Undersecretary		22
P29	Implementing Agency	Principal Secretary	Assistant	18

Although it is visually seen that the distribution of samples by cluster is less balanced, the fact is that there are samples representing the UKAS and MOF clusters that have also served in the implementing agencies. 5 participants (P6, P8, P13, P17 and P23) representing UKAS and MOF have served in other ministries and have been directly involved in the implementation of infrastructure projects. It is also visually shown that only 1 participant represents EPU. However, 5 of the participants (P1, P7, P9, P23 and P25) representing UKAS and MOF have served in EPU. Therefore, the visual distribution should not be considered disproportionate because the samples' experience in other clusters is not uncommon.

4. Findings and Discussion

The findings of the study are based on two research questions. The research questions and the findings are elaborated in the following subsection.

First Research Question

The first research question of the study is "What are the experiences of public sector officials in managing PPP projects, especially future payment commitment about PPP projects?". Although this research question emphasizes the experience in managing future financial commitment regarding PPP, the responses from the participants do not necessarily answer this research question directly. Not all participants are involved with the future financial management of PPP. The financial management of PPP also depends on the perspectives of participants which are diverse from each other. For example, most of the responses from UKAS cluster participants consider that financial management is related to private company's investment and how to ensure that the private company is getting fair and not extravagance returns. Meanwhile, the response from the MOF Cluster assumes that financial management is related to payments to be made by the government to the concessionaires. In addition, the perspective of the technical officers is that the financial management is related to the price offered for each component of the project and its management is hovering on the means and method to obtain more value for money to the government.

Each participant's response and explanation were labeled and encoded to specific codes and code categories. Using the ATLAS. Ti application, codes and code categories are generated to address the participants' experience in managing PPP projects and financial matters related to PPP projects. The codes and code categories are shown in Figure 3.

Based on Figure 3, there are 28 codes related to the existing experience of participants that have been classified into 4 code categories, namely policy-related experience, technical assessment-related experience, financial assessment-related experience and government budget-related experience. The code categories can be regarded as emerging themes in addressing the first research question. The detailed explanations of these themes are elaborated in the subsequent subsection.

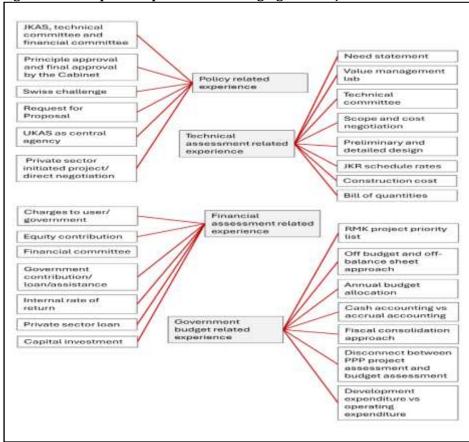

Figure 3: Participants Experience in Managing PPP Projects

Theme 1: Policy-Related Experience

The implementation procedure for PPP projects has been set by UKAS, the government department responsible for the implementation of PPP projects. This procedure includes (1) the role of UKAS as the single central agency that processes all PPP project proposals, (2) the evaluation of project proposals carried out by several levels of committees and (3) the need to obtain approval from the Cabinet. This procedure is a procedure set on a policy basis by the Government. In explaining their experience in processing PPP projects, P8 and P4 stated:

"...as a central agency, the role of UKAS is to coordinate and negotiate. We have the secretariat role. We are not even the signatories, right? to all this concession agreement. We are not the signatories... at the end, it is that implementing agency which will be entrusted to carry forward with that project."

"...in terms of my experience, I handle project proposals to be discussed at the JPP, JKAS, and JTAS level and prepare Cabinet paper to get cabinet approval. That is how we implement a project. We have a strong governance. I would like to say strong. Through these committees, we solve issues. Make recommendations."

The establishment of UKAS in 2009 is also linked to the government's intention and policy to boost private investment. P9 is among officers previously posted in EPU manages privatization projects and has been transferred to the newly established UKAS. P9 shared her experience:

"The time when I joined EPU is in two thousand and seven. At that time as I recall, we had not implemented PFI. We are still researching the model, the cash flow, and the viability as we are going to implement a project on a PFI model. So, this PFI model is one of the new models under PPP. So, at that time, the privatization section (in EPU) mostly managed projects that have already been implemented on a privatization basis, right? And PFI was a subset or new model at the time. We have no project that involves payment by government, long-term commitment... It is only after two thousand nine, we (the government) decided to implement projects through PFI. And UKAS was established..."

PPP project assessment and planning procedures set by UKAS are also influenced by the previous experience in evaluating privatization project proposals. The assessment of proposed privatization projects was previously made through the Privatization Committee, a committee chaired by the central agency responsible for the approval of development projects i.e., EPU. The privatization committee consists of other central agencies such as MOF, the Attorney General's Chambers, the Department of the Director General of Lands and Mines, and the Ministries and technical departments that regulate the relevant industries. The privatization committee acts as a main committee assisted by two sub-committees, namely the technical sub-committee and the financial sub-committee.

After UKAS was established, the privatization committee was renamed the Public-Private Partnership Committee (Jawatankuasa Kerjasama Awam Swasta - JKAS). Given the large number of project proposals at the beginning of its establishment, JKAS was assisted by another committee called the project steering committee (Jawatankjuasa Pemandu Projek – JPP) which coordinates technical inputs and financial inputs before a project proposal is discussed at JKAS. There was a time when all PPP projects were discussed at another level of committee chaired by the Chief Secretary to the Government named the PPP Highest Committee (Jawatankuasa Tertinggi Awam Swasta - JTAS). Although it has been very active before, JTAS only convenes as needed and on a case-by-case basis in current practice. P10 explained the role of JKAS and JTAS as follows:

"So now, now we have JTAS again. Okay. But the terms of reference. It's not like the JTAS that you remembered. Okay. The JTAS that you remember was elevated from the JKAS meeting, and then after that KSN (Ketua Setiausaha Negara – Chief Secretary to the government) chairs and the KSU (Ketua Setuausaha – permanent secretary at the Ministries) were attending, then they make the decision. Then it is elevated to the cabinet for approval. Okay, so now the JTAS, uh, it was re-established But I think is more of a problem solving, not, it is not as frequent as JKAS. Uh, so this is as and when necessary,"

Theme 2: Technical Assessment-Related Experience

Details of the technical assessment process were mostly obtained from participants who focused only on technical assessments. Generally, the technical aspect that is given attention in PPP projects is the detailed project requirements, especially the design desired by the Ministry as the project owner. This design will be discussed in a value management workshop, or they like to call it a value management lab, to detail each component of the project. Once the details of the scope and components of the project are determined, it is evaluated in terms of the construction cost of each component of the project. This scope and cost determination process is done many times, and it is finalized in value management lab sessions coordinated by technical experts from various disciplines including civil engineering, mechanical engineering, electrical engineering, architects, and quantity surveyors. All these experts are government employees serving in the Public Works Department. P1 commented:

"When we look at any proposal, the first person that we will turn to is our technical agency. They advise us in terms of technicalities. It is the technical reason that is going to determine the cost. Do you want a four-hundredbed hospital? How do you want to do it? Do you want an A grade? ... Everything is determined by the technical agency. From that we can determine the cost and from the cost, he will further evaluate, but the most important thing is to determine the scope and to determine the cost, we need to get a view from the technical agency."

In explaining the process of technical assessment, P12 explained:

"...when we have a value management lab, we're going to break it down by a few groups and that's where the customers will see, along with technical agencies, technical advisors ..., we will sit down together and we will review the requirements that they have... the customer's requirement, the previous statement of need to match with the company's proposal. So, to match the two, the government and the company will come up with the optimal scope and cost to make sure that there is no waste there. ...we must sit down and design back-to-back... arrange the value management lab to make sure that we get the optimal cost. Value for money."

"I would like to inform you that it is important to prepare documents before going to the value management lab. The documents, in terms of the adequacy of the documents, play a vital role. Normally, we are going to ask for the design drawing up to thirty percent."

Theme 3: Financial Assessment-Related Experience

Details of the financial assessment process were obtained from the interview participants who carried out the financial assessment. Generally, the financial aspect that is given attention starts with the cost of project implementation in terms of capital expenditure (capex). From this capex, a simulation of the projected cash flow will be made assuming the company's equity contribution of 20% and project financing of 80%, project borrowing cost of 8% and financing tenure of 20 years. Through these cash flow projections, the Government can determine the reasonable payment to the concessionaire so that the concessionaire gets a fair payment which is equivalent to equity internal rate of return (equity IRR) at around 10%. P21, a participant representing the MOF who has experience attending meetings in UKAS explained:

"Okay. If I can still recall back... one of the financial assessment guidelines that we (MOF) issued at the time was in terms of specifically assessing financial viability aspects of the PPP project which include capping the return to the private partner, we also determining another financial requirement, for example, the WACC (weighted average cost of capital) as well as the determination of the debt-equity ratio. Reasonable return to private partner is important to achieve the project viability with correct cash flow projection to ensure that the project is sustainable commercially."

This financial assessment process was influenced by the previous financial assessment process in the privatization project. For example, in a toll-highway privatization project that was implemented through buildoperate-transfer under a user-pay concept, the cost to construct the highway and other related costs during the construction is termed capital expenditure (CAPEX). From this capex, a simulation of the projected cash flow will be made assuming a certain number of traffic using the highway, the company's equity contribution, amount of project financing, financing cost, financing tenure, maintenance as well as operating cost throughout certain concession periods. Through these cash flow projections, the government can determine the reasonable toll rate for the highway and reasonable concession period so that the concessionaire gets a fair return.

Theme 4: Government Budget Related Experience

When PPP projects were actively implemented after the establishment of UKAS in 2009, there was a loophole in terms of procedures regarding the evaluation of PPP projects, especially regarding the provision of future financial allocations. As told by the participants, the evaluation of PPP projects covers two main aspects, namely the technical aspect and the financial aspect. The financial aspect involves matters relating to the amount of private investment, equity amount, project loan amount, borrowing cost, concession period and availability payment rate. In both aspects, this technical examination and financial assessment do not consider the need to apply for financial allocation. The financial allocation for the PPP project is as explained by P4:

"...in the Malaysian context, the implementation of Malaysia's development project is all about budgeting and allocation, right? The Ministry has to apply allocation from development expenditure. It is all about budget, budget, and budget. But for the development of PPP projects, it is the same. However, for the PPP model, right? It is easy because we can do the project first and we do not have to get the budget. It is private partner money. But we made a financial commitment throughout the concession period."

The loophole happens because of two factors, namely (1) the evaluation process of the PPP project is influenced by the evaluation process of the privatization project. The evaluation of privatization projects does not involve future government payments as they are mostly user-pay. (2) The allocation application mechanism adopted by the government does not involve an application to provide future allocation. Application for allocation by government agencies to the Ministry of Finance involves allocation for operating expenses and allocation for development expenses. The allocation for operating expenses is based on the needs of the department's operation in the current year while the allocation of development expenses is based on the implementation of development projects that have been approved in the five-year Malaysia Plan. In this regard, there is a gap at the beginning of the implementation of the PPP project about the allocation application. Among the general opinion at that time is that the financial application for PPP payment will only be made after the relevant

ministry has started making availability payment and this payment is of an operating in nature i.e., the application will be made for operating expenses. It was explained by P24:

"We allocate the expenditure for the PPP payment. We used to put under the OE (operating expenditure) for PPP, right? It was just that we were going to pay some sort of rent. However, the thing that we pay for is a package for a building, (such as) UITM. That was supposed to be the thing that we spent under DE (development expenditure) but we were doing it on PPP... Then, we start to look at the bottom of the OE. The amount is enormous."

The issue related to PPP payments began to arise after the government, in particular the MOF realized that the increase in government budget applications by Ministries and agencies was a consequence of the impact of financial commitments for completed PPP projects. At that time, the MOF initiated a fiscal consolidation process to reassess the government's payment commitments either in the form of operating expenses, development expenses or other payments including loan repayments, debt service payments, commitments related to PPP projects and commitments related to projects borrowed by other entities with government guarantees. It was explained by P20:

"...starting from the year two thousand and seventeen, the government has begun to make a more comprehensive report on government liability. Before this, PPP projects, government guarantees as well as government's company debt were not reported in any reporting but only used for internal reference. Starting in two thousand and seventeen, uh, two thousand and eighteen, we have done more comprehensive reporting to include all of these elements.... So, the issue that arises over the PPP is a huge commitment from the PPP project itself... resulting in the inability of the government to finance payments arising from PPP, using operating expenditure.... (payment for) PPP need to be reclassified as development expenditure."

After the fiscal consolidation process was implemented, a resolution was made that all payments related to PPP be made through the development expenditure even though it was previously seen as an operating in nature to be paid through the operating expenditure. Development expenditure comes from Development Funds. According to P18, this resolution is by the Development Funds Act, 1966 where Schedule 1 of the Act has listed the purpose to which the Federal Development Funds may be applied. The list includes the acquisition of capital assets as well as the repair and maintenance of public property. According to this list, maintenance payments for PPP projects may also be made through the allocation of the Development Funds.

The determination of PPP payments using the allocation from the Development Fund is a strategic and critical decision as the government needs to ensure a controlled fiscal position where the government's borrowings to cover the shortfall in government income each year can only be made for development expenses. The government shall not borrow for operating expenses. This was explained by P18:

"If you look at the Federal Constitution, Article Nine states that all government spending for operating expenses, Supply Bill, must be covered by the government revenue. So, if there is (enough) revenue, then you can finance the OE (operating expenditure). If there is no (enough) revenue, there is no OE. We cannot do it. That means the government has to make sure the revenue is always sufficient to fund the Supply Bill's expenses."

P20 further explained:

"... the operating expenditure is funded using revenue.... Federal Constitution and the Financial Procedure Act... does not allow the government to finance the operating expenses through borrowing. It means that OE can only be funded using the revenue. So as the amount of OE grows because it includes PPP... as well as other operating expenses such as emoluments, pensions, subsidies and so on, the government has decided to transfer this PPP commitment to development expenditure..."

Financial commitments related to PPP have also been included in the list of development allocation requirements for each Ministry involved. In this regard, each Ministry should consider the need for PPP payment in applying for development allocation. This affects the Ministry not only in applying for the annual

allocation from the MOF but also in applying for new projects in the Malaysia plan every five years. It was explained by P25:

"...an example, the implementation of the university through PPP, (including) the development of the Pagoh higher education hub... residential college... many residential colleges. It does not fit in with the development planning. The development planning by the Ministry of Higher Education itself. When it happens like this, in a very short time with so many PPP projects, until now the allocation for the development expenditure to the Ministry of Higher Education is just to pay for this PPP. (As a result) We cannot submit or create new development projects... The allocation requires a lot to be spent on PPP projects that were not planned and are not in line with the initial plan in the (five-year) Malaysia Plan."

Second Research Question

The second research question of the study is "What kind of new procedure needs to be established to control government financial commitment to PPP projects?" The second research question is intended for the researcher to conclude on the responses given by the participants and to propose a well-directed budgetary management framework for the implementation of PPP projects.

From the responses received from the interview participants, it can be noted that each participant had a different perspective on the control of financial implications regarding PPP projects. For participants involved in the financial evaluation, the control of financial implications is more focused on the method to ensure that the concessionaire does not profit extra-ordinarily from the implementation of the PPP project. The method they use is to evaluate the PPP projected cash flow and the appropriate charge rate to the user or the appropriate availability payment set out in the concession agreement. The government's ability to pay for the availability payments does not fall within the scope of the evaluation by the financial evaluation committee.

For participants involved in the technical evaluation, the control of financial implications is about how to obtain the construction design at the lowest and optimal cost. Each component of the project is refined through a value management lab and each cost of the components is checked to suit the market price. The scope of this assessment also does not consider the government's ability to meet the payment requirements involved.

The existing procedures inherited from the government's experience in implementing privatization projects before the UKAS era became one of the factors that led to the existing loophole in the need to obtain financial allocations in advance. The previous privatization project evaluation procedure was suitable for previous privatization projects as the privatization projects did not involve payment from the government, but they were mostly user-pay projects. When PFI projects, which involve payment from the government in the form of availability payments, are processed through the privatization project procedure, the ability of the government regarding the payment component is not considered in the evaluation process.

Another reason why there is a loophole is that there is confusion over the allocation to be applied for PFI projects when it was first implemented after 2009. The common opinion at that time is that the allocation will only be applied in the future after three or four years when the project is completed by the concessionaire. The allocation is believed to be under operating expenditure because all rental payments are made under operating expenditure. So, with that belief, the need for development allocation does not arise.

The issue related to the financial implications of PPP began to arise after the MOF realized the high number of operating expenditure applications from Ministries that have PPP projects completed by the concessionaires. Since this PPP payment commitment is a contractual obligation, the MOF has no option but to provide the allocation. This event led to a fiscal consolidation process implemented by the MOF.

The fiscal consolidated approach that was implemented by the MOF has led to a new approach and it affects the implementation procedures of PPP projects. These approaches include:

to ensure that all PPP project payments are made through development expenditure;

all PPP-related payment commitments are listed in the development commitment for each Ministry each year in the annual budget; and

the commitment to PPP projects is monitored every fiscal year through the annual fiscal outlook report.

5. Conclusion

In a nutshell, the response from PPP practitioners, especially government officials, regarding PPP financial commitment is hovering around single window proposal, that is, the need to have a single source of approval for all government development projects either directly funded by the government or development project that is implemented through PPP. This is because most participants are of the view that procedures processed by different central agencies have resulted in the widespread implementation of PPP projects without regard to the government's financial capabilities.

The common opinion at this time is for EPU (now officially known as the Ministry of Economy) to review all development projects in the five-year Malaysia plan and determine all the projects to be implemented either through the development allocation or the projects to be implemented through PPP. Nevertheless, it is noted that this matter is ultimately up to the Ministries to determine their projects and the method of implementation of their projects considering the Ministry's existing commitments. This is because the EPU usually sets the ceiling of development allocation to every ministry, and it is the Ministry that will formulate the project implementation strategy based on the ceiling. After all, the commitments for PPP projects have been listed in the list of the Ministry's development expenditure requirements in the annual budget.

This study suggests a theory that, at least from a Malaysian experience perspective, a PPP project is a development project and should be funded from the development expenditure of the country. This Malaysian experience has demonstrated one of the forms of a well-directed management framework to address the issue of Government payment commitments about PPP projects. It can be replicated by any other government in addressing the issue of future commitments related to PPP. It may not suit every country as the way they implement development projects and PPP projects may vary. However, the Malaysian experience is one of the case studies that other countries may learn if they have the same or similar problems.

Abstract: This research illuminates the determinants and outcomes of Islamic financial literacy as scrutinized in prior investigations. A systematic literature review unfolded across the Scopus database from 2016 to 2023. This investigation encompasses 22 articles from the 40 scholarly works extracted from the Scopus database. The Journal of Islamic Accounting and Business Research emerges as the most prolific disseminator of insights into the determinants and outcomes of Islamic financial literacy, credited to its robust publication frequency throughout the year. The autonomous and reliant facets of Islamic financial literacy were predominantly studied, with emphasis not only on individual dynamics but also on business perspectives. The determinants instigating Islamic financial literacy congregate within the affective, conative, family influence, self-controlled, and demographic predictors. Conversely, the ramifications stemming from Islamic financial literacy manifest in cognitive, affective, and conative dimensions, leaving an indelible imprint on the business realm. Geographic focus reveals a concentration of prior investigation within Muslim-majority nations, predominantly Indonesia. Furthermore, the investigation discovers that past studies were mainly conducted in the context of Islamic banking. The evidence from the present study provides input to researchers in conducting further research on Islamic financial literacy.

Keywords: Islamic Finance, Islamic Financial Literacy, Muslims, Scopus, Systematic Literature Review

1. Introduction

Increasing interest has been shown among researchers on Islamic financial literacy, especially in countries with a high population of Muslims. Islamic financial literacy refers to the awareness, knowledge, skills, attitudes, and behavior of Islamic financial activities (Mujiatun et al., 2023). Islamic financial literacy has also been quoted as *Sharia* financial literacy or literacy in Islamic finance in various research (Hoque et al., 2022; Satria et al., 2023; Srisusilawati et al., 2022). In contrast to financial literacy, Islamic financial literacy integrates an Islamic or *Sharia* perspective into its conceptualization.

In the Malaysian context, financial literacy has gained the attention of the banking system's regulator, Bank Negara Malaysia. The launching of the second Financial Inclusion Framework 2023-2026 shows the continuous commitment of Bank Negara Malaysia to improving financial inclusion and enhancing Malaysia's financial wellbeing and living standards (Bank Negara Malaysia, 2023). The Financial Education Network (FEN), an interagency consortium with eight members and 22 collaborating institutions, is playing a crucial role in supporting this framework. FEN aims to enhance financial literacy among Malaysians (Bank Negara Malaysia, 2016). The Financial Inclusion Framework also receives support from the National Strategy for Financial Literacy 2019-2023 with the mission to enhance financial education, which in turn will improve financial literacy among the Malaysian community (Bank Negara Malaysia, 2019). It is a known fact that justified decisions on financial matters and financial resilience can be achieved by financially literate individuals (Bank Negara Malaysia, 2019).

Motivation of Study

The main objective of conducting this study is to explore the determinants and outcomes of Islamic financial literacy in past studies. Such exploration would shed light on the existing level of exploration on Islamic financial literacy as the systematic literature review will provide the compilation of past studies (Okoli and Schabram, 2010). The systematic literature review would also highlight the loophole in the existing studies

(Xiao & Watson, 2019; Tamrin et al., 2017). This study reviewed articles published in Scopus-indexed journals from the year 2016 until 2023.

Research Questions

This research has been carried out based on the following research questions:

Research Question 1: Who are the respondents in previous research?

Knowing the respondents studied in previous research would allow us to understand the behavior of different types of respondents, as affected by specific determinants and causes of specific outcomes. Human behaviors differ due to the different characteristics and nature of human beings. It would be interesting to see the diverse behavior of the respondents as it sheds light on conducting future research.

Research Question 2: What are the study contexts in previous research?

The study contexts set the basis for understanding the evidence provided by previous research. It specifies the specific areas where past research has been carried out. It also shows the variation in the determinants and outcomes of Islamic financial literacy across different study contexts. This helps us to determine the areas that need to be studied in future research to be conducted.

Research Question 3: Which countries became the venues for conducting previous research?

Population differs from one country to another. The population influences the nature, customs and expectations of the people in the country. Knowing the countries that became the venues for conducting the previous research would facilitate us in understanding the evidence provided by the previous research, besides assisting researchers in planning their future research.

Research Question 4: What are the determinants of Islamic financial literacy in previous research?

Recognizing the factors that determine Islamic financial literacy would enable us to understand the factors that could influence Islamic financial literacy. This would assist future researchers in designing their studies, specifically in determining the factors that they would study in their research.

Research Question 5: What are the outcomes of Islamic financial literacy in previous research?

Identification of the outcomes of Islamic financial literacy would enable us to understand the impact that Islamic financial literacy could have. This would assist future researchers in determining what impact they would like to discover in their research.

2. Research Methodology

Kitchenham et al. (2009) method of conducting a systematic literature review guided this study. Six researchers were involved in performing the systematic literature review of journal articles on Islamic financial literacy. The systematic literature review conducted involves all the phases recommended by Kitchenham et al. (2009) from planning the systematic literature review, executing the systematic literature review, and reporting the systematic literature review conducted. This study also employed Okoli and Schabram's (2020) steps of conducting systematic literature. The steps encompass (1) defining the purpose of conducting literature, (2) delineating the protocol of conducting research, (3) searching the literature, (4) implementing practical screening, (5) assessing quality, (6) extracting data, (7) synthesizing the literature, and (8) writing the completed review.

As stated earlier, exploring the determinants and outcomes of Islamic financial literacy in past studies is the main objective of this study. The protocol of this research outlines the research objective and questions, as well as a systematic literature review as the research method for this study. Database containing Scopus-indexed journals was searched as it contains compelling and reliable research articles. Practical screening, an

indispensable phase, winnowed out extraneous articles, ensuring a focused investigation of Islamic financial literacy. Quality appraisal was safeguarded by exclusively considering journal articles, products of a stringent review process by adept evaluators. Extracting data from these chosen articles involved capturing details on respondents, study context, research venues, determinants, and outcomes of Islamic financial literacy. The denouement of this research endeavor materialized in the comprehensive documentation of the systematic literature review process.

The initial string searches yielded 40 journal articles, and after judicious quality appraisal and practical screening, 22 articles emerged as germane for further scrutiny, as delineated in Table 1.

3. Findings and Arguments

The meticulous review of the 22 carefully selected articles provided the research team with insights to address the five research questions.

Research Question 1: Who are the respondents in previous research?

Previous investigations into the determinants and outcomes of Islamic financial literacy predominantly scrutinized the individual perspective, besides the business perspective. Within the individual paradigm, respondents encompassed Muslim individuals, investors of Islamic instruments, customers of Islamic banks, customers of conventional banks, prospective Muslim investors, prospective Islamic bank customers, past investors in Islamic unit trusts, Muslim university students, and members of the public in general, as shown in Table 2. On the business front, insights were derived from entrepreneurs in the *Halal* tourism sector, small and medium enterprise (SME) entrepreneurs, street vendors in the SME sector, and business owners in general, as shown in Table 3.

P19	Business owners

Research Question 2: What are the study contexts in previous research?

The canvas of Islamic financial literacy in prior research primarily unfolded within the precincts of Islamic banking. Additionally, investigations extended to encompass Islamic financial products and services, the Islamic capital market, Islamic unit trust, Islamic financial management, zakat on income, crowdfunding FinTech platforms for Islamic securities, small and medium enterprises (SMEs), and micro, small, and medium enterprises (MSMEs) in the *Halal* tourism sector. Notably, some studies did not explicitly specify any particular context. The study contexts are shown in Table 4.

Research Question 3: Which countries became the venues for conducting previous research?

The geographical landscape of previous research on Islamic financial literacy predominantly centered around Muslim-majority nations, with Indonesia taking the lead. Other countries contributing to the body of knowledge include Malaysia, the United Arab Emirates, Turkey, Bangladesh, Yemen, and Jordan. This geographical concentration might be attributed to the heightened interest of Muslim researchers in Islamic financial literacy.

 Table 5: Countries where Previous Research was Conducted

Research Question 4: What are the determinants of Islamic financial literacy in previous research?

The determinants of Islamic financial literacy are clustered into affective and conative dimensions for studies emanating from the business perspective (as illustrated in Figure 1). In contrast, investigations from the individual perspective revealed determinants grouped into family influence, self-controlled, and demographic predictors (as depicted in Figure 2).

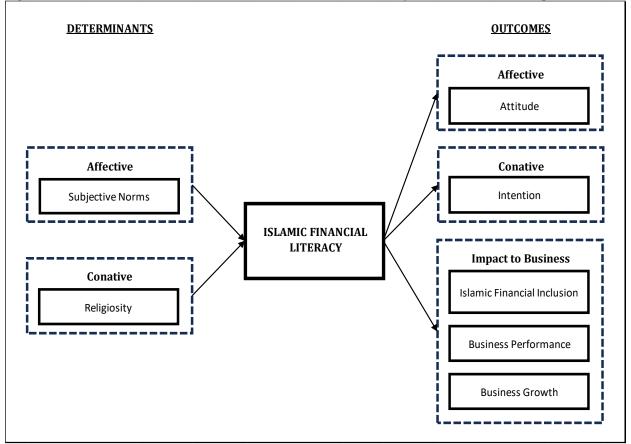

Figure 1: Determinants and Outcomes of Islamic Financial Literacy from a Business Perspective

Research Question 5: What are the outcomes of Islamic financial literacy in previous research?

Outcomes stemming from Islamic financial literacy are clustered into affective, conative, and impact on the business for studies approached from the business perspective (as illustrated in Figure 1). Conversely, outcomes from the individual perspective coalesced into cognitive, affective, and conative dimensions (as depicted in Figure 2). These delineations provide a nuanced understanding of the multifaceted impact of Islamic financial literacy on individuals and businesses alike.

Figure 2: Determinants and Outcomes of Islamic Financial Literacy from an Individual Perspective

4. Conclusion

This investigation illuminates the prevailing patterns in the determinants and outcomes of Islamic financial literacy. The determinants of Islamic financial literacy are classified into affective, conative, family influence predictors, self-controlled predictors, and demographic predictors. On the other hand, the outcomes of Islamic financial literacy are classified into cognitive, affective, conative and impact on business. It is also noted that prior research was concentrated on studying the perspective of the individual rather than from a business perspective. Islamic banking emerged as the main context for studying Islamic financial literacy in previous research. This is because Islamic banking is the most significant component among the few components of Islamic finance. Past studies on Islamic financial literacy were carried out mainly in countries dominated by Muslims. The research evidence outlines the basis for future research design on Islamic financial literacy. The industries can also benefit as this study provides the input for them to strategize their businesses in the increasingly competitive environment. Nevertheless, more studies on the determinants and outcomes of Islamic financial literacy are required to enable us to better appreciate the importance of Islamic financial literacy.

Abstract: Housing maintenance fees are essential to maintaining the standard and operation of residential communities. However, non-payment issues present serious problems to the Joint Management Body (JMB) and residents due to various issues related to maintenance are delaying to be solved. Thus, this study objectively assesses the role and relationship of JMB with the respondents toward residents' commitment and support in making payments for housing maintenance. A quantitative approach through a survey questionnaire was distributed among 31 respondents of high-rise buildings in Klang Valley for a pilot study. Four (4) independent variables were involved: the role of JMB, the relationship between residents and JMB, facilities provided, and safety and security towards the dependent variable of resident's commitment and support. The findings show that most respondents agree that any problems related to the housing unit should be consulted with JMB and residents should get permission from JMB before proceeding with any necessary action. This study is expected to benefit JMB and residents in ensuring a sustainable harmonious housing environment in the high-rise buildings and thus contribute to the achievement of SDG 11: Sustainable Cities and Communities.

Keywords: Financial Management, Maintenance Fee, Joint Management Body (JMB), High-rise Resident, Resident's Commitment

1. Introduction and Background

Building maintenance is defined as ongoing efforts and tasks to keep a building or facility in good condition (Eisner, 2022). High-rise buildings are required to have regular maintenance. In addition to contributing to the preservation of a property's value, maintenance fees are mandated by law under The Strata Management Act 2013, which requires developers who choose strata titles to establish a Management Corporation to oversee the property's facilities and common areas (since the development company is legally the owner of the common areas). In Malaysia, building maintenance procedures were first implemented in 1971. When the Prime Minister intended to create a new culture for the entire country through maintenance, it became more active in 2007 (Zakiyudin et al., 2015).

The next step is for the Management Corporation to suggest how much and when the fees will be collected for property maintenance. Eventually, a Joint Management Body comprised of the developers and property owners will be established to oversee how the money is used for property management and upkeep. In addition to interest charges by the Joint Management Body for late payments, failure to pay Maintenance Fees and contributions to Sinking Funds may result in significant fines or even jail time from the government. Therefore, it is in everyone's best interest to pay the fees they owe on time and to resolve any issues or disagreements about how the property is managed by following the correct procedures.

Most of the residential type in Malaysia is high rise building. Table 1 shows the data extracted from mudah. In 2023 which items are listed on the website? The majority of high-rise buildings are condominiums with 1714 units followed by apartments with 1494. The square feet range from 318 sqft to 3735 sqft. The selling price is between RM 788,000 and RM 3.1 million. The sample taken was collected from the Klang Valley area.

Type of High-Rise Building	Frequency	
Service Residence	506	
Apartment	1494	
Flat	247	
Studio	13	
Condominium	1714	
Others	17	
Duplex	5	
Townhouse Condo	4	
TOTAL	4000	

Table 1: Unit Listings on the Malaysian Housing Website (mudah. my)

The common areas and facilities of a strata of property, such as a condominium block, are owned collectively by all unit owners. Consequently, owners are required to pay a maintenance fee, sometimes known as a service charge, collectively to manage and maintain the property and its amenities. Homeowners in Malaysia are required by law to pay these monthly fees under SMA 2013. These payments are collected and managed by the Joint Management Body, or JMB, before strata titles are granted, and thereafter by the Management Corporation, or MC (LBS Bina, 2022).

There are over 20,000 strata development schemes throughout Peninsular Malaysia and the Federal Territory of Labuan. This includes condominiums, apartments, flats, shop houses, 'town houses', and 'landed strata'. All advancements of this strata are regulated under a piece of legislation which is the Strata Management Act 2013. This Act has the role of providing a uniform reference and guide regarding the maintenance and management of a stratified development. Table 2 shows the Program Perumahan Rakyat (PPR) ownership as of March 2022. In total, 20,715 units have been developed and are under construction. It shows that most of the housing projects consist of strata buildings.

which makes the addition of strata building in Malaysia. **Table 3: PR1MA Corporation Malaysia Housing Project**

However, the issue of late and non-payment of maintenance fees is a common issue for strata residents. It might be affected by several factors such as financial constraints of residents, low satisfaction of maintenance from JMB, and other related factors. The problem of faulty and inefficient lifts often shackles multi-story residential owners but unwittingly it stemmed from their attitude in failing to pay the maintenance fees to the housing management.

Mohammad Khalid Ab Karim, deputy chairman of the Housing and Strata Management Tribunal and the Housing and Local Government Ministry (KPKT), stated that the current state of affairs will inevitably make it impossible to do building maintenance, repairs and cleaning, including elevator maintenance.

Based on complaints received in 2019, of the 5,675 cases registered with the Strata Management Tribunal (TPS), a total of 5,291 cases 93 percent involved maintenance fees, which was the highest number of complaints in TPS (Malaysian Institute of Estate Agents, 2020). The maintenance fee arrears normally involved low and medium-cost houses which on average were imposed a payment of between RM30 and RM200 a month.

Due to that issue, the Housing Maintenance Division (BPP) under the Ministry of Housing and Local Government has introduced the Public Housing Maintenance Program and Private Housing Maintenance Fund to ensure that the government is providing a comfortable and quality living environment for residents of low and medium-low-cost strata public and private housing. This section provides allocations to help the management body (JMB/ MC) repair and maintain low and medium-low-cost stratified public and private housing. Table 4 shows the allocation of government for the Public Housing Maintenance Program and Private Housing Maintenance Fund.

Although there is an initiative from the government for the maintenance fund, it is not sufficient to maintain the building throughout the year. The commitment and support from the residents to pay the maintenance fee is essential to ensure that the building can be maintained well and thus provide the quality of life for the residents.

Ministry of Housing and Local Government has published a rating tool on the quality of life for the strata building residents. It was based on the star rating which indicates the number of stars represents the quality of life. The assessment was done in 2019 and implemented by COB to the 5739-development scheme. Five (5) main components involved in the star rating are the resident's well-being, risk safety management, finances, establishment and management of the body, and maintenance. The star rating was given based on these scores: Score Star Rating.

Score	Star Rating
90 - 100	***
60 - 89	$\star \star \star \star$
50-59	***
40-49	**
39 and below	\bigstar

Table 5: Score Star Rating

Based on the evaluation, it was found that a total of 65 development areas, which represent 1% achieved a 5star rating, 548 areas (10%) achieved a 4-star rating, 1006 areas (17%) achieved a 3-star rating, 1434 areas (25%) achieved a 2-star rating stars and as many as 2686 areas (47%) achieved a 1-star rating (Kementerian Perumahan dan Kerajaan Tempatan (KPKT), 2019).

Based on the information received, it was found that the measurement component of star rating under the component of strata residents' awareness and compliance with strata management laws is a component that requires more attention and improvement. Enforcement activity statistics show that the most enforcement action is about the owner's failure to pay maintenance charges. Thus, it can be concluded that the level of awareness of strata owners about the obligation to pay maintenance charges is still at a low level (Kementerian Perumahan dan Kerajaan Tempatan (KPKT), 2019)

2. Literature Review

Poor Collection Maintenance Fees

The expenses of housing upkeep are probably greatly influenced by maintenance considerations (Horner & El-Haram, 2002). In general, there are two primary categories of maintenance variables: technical factors and administrative issues. Technically speaking, low-quality spare parts and materials, as well as shoddy craftsmanship, might have an impact on maintenance costs. On the other hand, inadequate budgeting control, delayed maintenance execution, and inadequate maintenance management are among the administrative issues that affect maintenance costs. The maintenance elements that influence the cost of home maintenance are intimately tied to the choice of the maintenance management team and personnel.

The research concluded that five of the most dominant factors were the expectation of tenants, building materials, building services, building age and failure to execute maintenance at the right time. Meanwhile, it was found that two of the most influential impacts were outstanding maintenance charges and over-budget (Ali et al., 2010). Poor collection maintenance fees have become a common problem for high-rise buildings (Sholehah et al., 2020). This resulted in bad tenant satisfaction with the units they stayed in because of poor maintenance by the Joint Management Body (JMB).

A report by KPKT in 2019 shows the complaint received by the COB PBT. The quality-of-service delivery refers to the number of complaints received that were successfully resolved by the COB PBT. In 2019, a total of 25,914 complaints were received. Of the total number of complaints received, 25,545 representing 99% of the number of complaints were successfully resolved. Figure 1, shows that 20% of the issues are related to maintenance and damage which contribute to the second largest percentage. 9% of the issue comes from financial issues. Most of the complaints are about consultancy and advice.

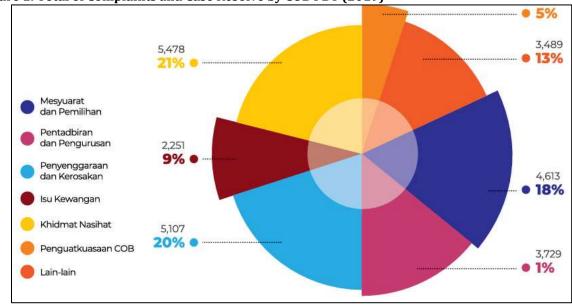

Figure 1: Total of Complaints and Case Resolve by COB PBT (2019)

Facilities Provided by JMB

Due to the growing trend of buyers choosing to own strata properties, it is crucial for both strata owners and tenants to comprehend the distinctions between shared facilities, auxiliary lots, and properties that are not part of strata schemes. Making a distinction between these components is essential to determining which amenities and facilities are the responsibility of the strata management bodies and which are the strata owners.

A stratum scheme consists of three components: the exterior of the stratum, the parcel, and the common property. The common property, which includes things like the roof, water tank, gutter, rainwater downpipe and external wall, is the primary subject of this study. Common use window, retaining wall, playground, fence,

manhole, garbage house, prayer hall, hall, lift, staircase, and corridor; sewer pipe, apron and drainage. (Shuhaimi et al., 2023).

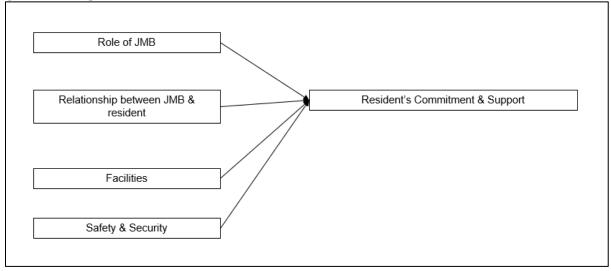

Financial Constraints by Residents

It was stated that following the enactment of the Building and Common Property (Maintenance and Management) Act 2007, the Ministry received roughly 15,000 complaints regarding various issues relating to strata buildings. The Malaysian Bar website also stated that one of the main grievances regarding strata properties is the inability to pay the maintenance fee, also known as and other contributions to the developer, while the parcel owners have no control over the monthly charges and the quality of service rendered. However, with the introduction of the Building and Common Property (Maintenance and Management) Act of 2007, which created a Joint Management Body (JMB), some of these issues were addressed (Mohamad, 2015).

Conceptual Framework

Figure 2 shows the conceptual framework of the study which contributed to the resident's commitment and support. Four (4) main factors are identified in this study which are the role of JMB, the relationship between JMB and residents, facilities provided, and safety and security.

Figure 2: Conceptual Framework

3. Research Methodology

The objective of this survey is to identify the challenges of the maintenance fee collection for the strata building. This survey comprises 31 respondents including owner and tenant on their perception towards JMB and challenges for late and non-payment of maintenance fee. The respondents were asked about their perception of the role of JMB, the relationship between the residents and JMB, the basic facilities provided, and the safety and security of the building. All these variables are measured towards the resident's commitment and support to the JMB, in this case including payment of maintenance fee to the JMB.

This study employed a quantitative method through a survey questionnaire to the residents of the strata building. This initial stage is distributed among 31 residents of the strata building and served as a pilot study, and in the future, more samples will be included. Determining the sample size such that there is adequate power to demonstrate meaningful effects and meet study objectives is a crucial part of research study design. The pilot study estimates are a valuable source of information when determining the sample sizes for the main investigations. Typically, the observed impact size or outcome variability from pilot studies is used to help with the main study's sample size estimate (Tseng & Sim, 2020). Roscoe (1975) suggested that a sample size greater than 30 and less than 500 is suitable for most behavioral studies. Thus, the sample of 31 for the pilot study is sufficient to test the reliability of the questionnaire.

4. Results and Discussion

This section discusses the results and discussion of the study. The analyses comprise reliability analysis, frequency distribution, and descriptive statistics. Reliability means the degrees to which the measures are free from error and therefore yield consistent results. The rule of thumb on the indication of internal consistency was explained by Kuder & Richardson (1937) as in Table 1.

Table 1: The rule of thumb	on the indication of internal	consistency
rubic 1. ruc ruie or thumb	on the malcation of meet has	consistency

Cronbach's Alpha	Internal Consistency
$\alpha \ge 0.90$	Excellent
$0.90 > \alpha \ge 0.80$	Good
$0.80 > \alpha \ge 0.70$	Acceptable
$0.70 > \alpha \ge 0.60$	Questionable
$0.60 > \alpha \ge 0.50$	Poor
0.50 > α	Unacceptable

Table 2 shows the Cronbach's alpha value for independent and dependent variable. The Independent variable consists of the role of JMB, the relationship between residents and JMB, basic facilities provided, and safety and security. Meanwhile, the dependent variable is the resident's commitment and support. All the variables show more than 0.80 Cronbach's alpha value which indicates that all variables have good and excellent internal consistency.

Table 2: Descriptive Statistics

Variable	Part	Cronbach Alpha Value
Independent Variable	Role of JMB	0.915
	Relationship between Residents and JMB	0.889
	Basic Facilities Provided	0.915
	Safety and Security	0.923
Dependent Variable	Resident's Commitment and Support	0.860

Table 3 shows the respondent profile of the respondents. Most of the respondents hold a position of others (administrative, executive, etc.) with 41.9% followed by director with 29.0%, 16.1% of managerial position and government officer is 12.9%. Regarding the types of residents, the majority of the respondents an owners of the unit with 58.1% and the balance of 41.9% is among the tenants.

Table 3: Respondent Profile

Classification		Frequency	Percentage (%)
Job Position	Managerial Position	5	16.1
	Director	9	29.0
	Government Officer	4	12.9
	Others	13	41.9
Types of Residents	Owner	18	58.1
	Tenant	13	41.9

The opinion of the respondents on the role of JMB is illustrated in Table 4. The ranking was measured based on the mean given by the respondent from the Likert scale of 1 to 5. Most of the respondents agree that they fully understand the role of JMB. It was followed by the agreement that the rules and regulations set by JMB are reasonable. The least agreement is on the system used by JMB which might not a systematic.

Table 4: Descriptive Statistics of Role of JMB

No	Role of JMB	Mean	Ranking
1.	I fully understand the role of the Joint Management Body (JMB).	3.94	1
2.	The rules and regulations set by JMB are reasonable.	3.68	2
3.	The JMB's staff have a good attitude towards residents	3.52	3

4.	The JMB's staff is knowledgeable and skilled in carrying out the task.	3.32	4
5.	JMB provides satisfactory service quality.	3.16	5
6.	The JMB uses a systematic system.	2.97	6

Table 5 shows the relationship between residents and JMB. Most of the residents agree that residents and JMB always respect each other. It was followed by the statement that they would greet each other when met up. The least agreement was residents did not know the staff name and JMB did not ask if the residents had any problems.

Table 5: Descriptive Statistics of Relationship between Residents and JMB

No.	Relationship between Residents and JMB	Mean	Ranking
1.	Residents and JMB's staff always respect each other.	3.57	1
2.	We will greet each other when we meet up.	3.13	2
3.	JMB's staff will always ask if we have any problems.	2.81	3
4.	I know the JMB's staff name	2.74	4

Table 6 shows the ranking of agreement to the statement of basic facilities provided by the JMB. Most of the residents agree that basic facilities were provided to the visitors such as public toilets, a prayer room, and a visitor parking area. It is followed by the facilities provided are in working order. The least mean was if there is any problem with basic facilities, it will be solved immediately. It means that if any problem arises with the basic facilities, JMB will take some time to resolve the issue, which does not make the residents happy.

Table 6: Descriptive Statistics of Basic Facilities Provided

No.	Basic Facilities Provided	Mean	Ranking
1.	Basic facilities are provided for visitors, such as public toilets, a prayer	3.71	1
	room, and a visitor parking area.		
2.	The basic facilities provided are in good working order.	3.58	2
3.	The basic facilities provided are sufficient for residents.	3.55	3
4.	The basic facilities provided are clean and ready to be used.	3.55	3
5.	The strata's surroundings are consistently tidy and well-kept.	3.52	4
6.	Basic facilities are provided for disabled visitors, such as toilets and	3.32	5
	wheelchair routes.		
7.	There is a platform for residents to express information, ideas, and	3.16	6
	suggestions.		
8.	If there is a problem with basic facilities, it will be solved immediately.	3.10	7

Table 7 is about the opinion of the respondents on the safety and security in their building. Two statements mostly agree with the residents which are the security guards have a good attitude and a complete fire extinguisher is provided in the housing unit. It was followed by another two statements which are relevant safety and security systems are provided and resident's safety is monitored regularly by security guards. The least agreement statement is the residents do not show how to use the fire extinguisher in case a fire starts.

Table 7: Descriptive Statistics of Safety and Security

No.	Safety and Security	Mean	Ranking
1.	The security guards have a good attitude.	3.45	1
2.	A complete fire extinguisher is provided in my housing unit.	3.45	1
3.	Relevant safety and security systems are provided in my housing unit.	3.39	2
4.	The residents' safety is monitored regularly by security guards.	3.39	2
6.	The safety and security equipment provided is well-functioning and ready to be used when necessary.	3.32	3
7.	The security guards are skilled and well-experienced.	3.06	4
8.	The central point and route information were being told to residents if a fire occurred.	2.87	5
9.	Residents were shown how to use the fire extinguisher in case a fire	2.45	6

started.

The resident's commitment and support are shown in Table 8 on the opinion of the statement. The residents agree that any dangerous incidents should be reported immediately to the JMB. It was followed by the statement that residents should consult JMB if facing any problems and the residents should get permission before proceeding with any action. Surprisingly, the issue of payment does not happen here and most of the residents do not feel that the rising maintenance fee makes it difficult for the residents to pay their bills.

Table 8: Descriptive Statistics of Resident's Commitment and Support

No.	Resident's Commitment and Support	Mean	Ranking
1.	Residents should report immediately to JMB if there are any dangerous incidents.	4.39	1
2.	Residents should consult JMB if facing any problems related to their housing unit.	4.06	2
3.	Residents should get permission from JMB before proceeding with any action they consider necessary.	4.06	2
4.	Residents should inform JMB if any wrongdoing occurs among residents	3.97	3
5.	Residents can help JMB with cleanliness and safety initiatives.	3.87	4
6.	The rising maintenance fee makes it difficult for residents to pay their bills.	3.45	5

	COMPUTE_SAFETY	207	.279	278	744	.464
a. Depe	ndent Variable: COMPUTE_CO	OMMITMENT				

The above table is the regression analysis of the study. The R square of the regression analysis is 0.484 indicating that 48.4% of the independent variables (role of JMB, Relationship between JMB and residents, Facilities provided by the JMB and Safety and Security) influenced the Resident's Commitment and Support.

Overall, this model is valid and significant since the significance value is 0.002, which is less than 005. For the

variable, only one independent variable is significant which is facilities provided by the JMB with a significant value of 0.010 less than 0.05 significance value. Meanwhile, other variables are not significant since the value is more than 0.05 (role of JMB, (0.446), Relationship between JMB and residents (0.254), and Safety and Security (0.464)).

Regarding the variable's influence on residents' commitment and support, the variable of basic facilities provided by the JMB has the highest influence (0.607) compared with other variables. The role of JMB and Safety and Security recorded a negative relationship between the variables and the residents' commitment and support.

5. Managerial Implications and Recommendations

In summary, most of the respondents agree that the section of residents' commitment and support is important in ensuring the issue of late and non-payment of maintenance fees can be resolved. Overall, three main factors that could contribute to the resident's commitment and support to the JMB are the role of JMB, the relationship between residents and JMB, and safety and security. The main focus which contributes to the residents' commitment and support is the basic facilities provided by the JMB. Thus, the issue of maintenance fees could be resolved through the action taken related to the basic facilities provided in the residency. Management sustainability is important to ensure that the building can be facilitated accordingly and the issue of facilities could be avoided.

Conclusion

A housing maintenance fee is important to ensure that the building is well maintained and thus could contribute to the resident's quality of life. The findings from the pilot study have shown that the financial issues of the respondents are not the main issue towards the commitment and support from the respondents to pay their maintenance fee. Most of the issues come from administrative issues such as a lack of awareness about using fire extinguishers. Apart from that, the residents are unhappy with the time the JMB took to resolve the issue of the basic facilities. It is recommended that the residents and JMB have a clear communication between them including the importance of paying maintenance fees and the facilities provided by the JMB. Besides that, the role of JMB is very important to ensure the resident's commitment and support. Therefore, necessary action should be taken to ensure that the country can achieve SDG11: Sustainable Cities and Communities. The policy that could enhance the collection of maintenance fees is suggested to have a late payment charge to the residents. Besides that, the role of the government in taking into consideration to include the maintenance fee in housing loans could be considered.

Acknowledgment: The authors would like to express their sincerest thanks to the Research Management Centre (RMC) of Universiti Teknologi MARA (UiTM) Selangor Branch, Puncak Alam Campus for the financial support under the grants DUCS 600-UiTMSEL (PI.5/4)(104/2022).

Abstract: Job satisfaction is among the most difficult issues for many business leaders to address. Researchers have widely discussed this problem, yet statistics still show an alarming increase, and various factors cause it to happen often. This study aims to examine the relationship between job satisfaction and turnover intention and investigate the moderating effect of employee gender and years of experience on the relationship. The four workplace satisfaction determinants—career advancement, employee empowerment, pay level, and nature of the work—that affect employee turnover intention are covered in this study. This study involved respondents among the travel agencies' employees within the state of Selangor, regardless of their working position. A set of questionnaires was distributed to 130 employees from 26 travel agency companies that participated in the study. The results show employee empowerment has a significant negative relationship with turnover intention. It has been also found that the relationship between job satisfaction and turnover intention is significantly moderated by gender and years of experience. This study recommends that further research should use a larger sample size and qualitative methods to gain comprehensive knowledge regarding the phenomenon.

Keywords: Job Satisfaction, Turnover Intention, Travel Agency, Employees, Selangor

1. Introduction and Background

Malaysia has a stable labor market with an increase in employment from 15.3 million to 15.6 million in guarter one of 2018, with the service sector recording the largest employment at 62.2 percent (DOSM, 2019a). Job vacancy increments in the market are also reported as highly competitive, with Malaysia expected to have 40, 4513 job vacancies by the end of 2022 (DOSM, 2019a). The government's strategic location, competitive environment, and stable business policies have attracted foreign investors to Malaysia, making the job market attractive for employees however, maintaining current good employees is extremely challenging. Many organizations face challenges in retaining employees and addressing turnover intention in today's globalized economy. Human resources play a crucial role in retaining experienced and skilled employees, but training new employees is time-consuming and challenging. In Malaysia, the average number of people changing jobs is 15 months and 73% of employees leave their existing company after switching roles (Page, 2015). To maintain a low turnover rate, organizations need to maintain a balance between inflowing talent and outflowing the best employees as many research shows that high turnover rates can negatively impact productivity and organizational profits. Malaysia has a sizable labor force, with the manufacturing and services industries employing the most people, according to the National Employment Returns report, which is produced yearly by the Institute of Labour Market Information and Analysis (ILMIA). In Malaysia, this industry has an average turnover rate of 20%, with lower-skill groups contributing to greater rates.

One of the reasons for job turnover is primarily caused by a lack of career progression, with 52 percent of employees stating that career advancement is the main reason to leave the company. Another push factor is seeking fresh challenges and salary increments, with 35 percent of employees seeking salary increases (Page, 2015). The Malaysia Employee Intentions Report (2015) found that 54 percent of respondents would be open to new jobs due to future career advancement and progression, while 49 percent would be motivated by salary increments. In many businesses, high turnover rates have long been a problem and a financial burden. Much research has been done on the reasons behind employee turnover, but the majority of them have focused on

the hotel sector, with very few also looking at travel agents (Phang, 2014). In addition to this increase in turnover, the Bureau of Labor Statistics' Job Openings and Labor Turnover Survey (JOLTS, 2020) reports that the tourist and hospitality sector experiences between 70 and 80 percent of annual turnover.

Hossain (2020) reported that those who work in the service industry, think that the workplace can occasionally be extremely hard and competitive. Consequently, it often leads to employee turnover, which is a serious issue for any company within the industry. According to Dwesini (2019), a significant staff turnover will have both positive and negative effects on the company where it has a detrimental effect on employees which may cause sales and profitability to decline. Thus, within the tourism sector, it is critical to understand both the possibility of resignation and job happiness in a study by Willie (2021), it has been demonstrated that greater job happiness is linked to improved employee productivity, which in turn results in better experience quality and more robust customer and organizational engagement.

In a prior study, Lei, Basit and Hassan (2018) investigated how job satisfaction can result in employees faithfully serving in an organization by reducing the turnover rate of intention among them. The study was conducted among 139 respondents out of a total population of 191 people in a travel agency in Malaysia. Prior studies (Nointin, 2018) have shown that among workers in travel companies in Sabah, Malaysia, job satisfaction positively affects the propensity to leave. It also recommends that the study population be expanded to include Malaysian travel agencies in future studies. Therefore, exploring and understanding job satisfaction is imperative for organizations to prevent losses and unnecessary cost increases as the biggest valuable asset in an organization is its experienced employees. Replacing them with experienced employees can be costly and negatively impact morale and business opportunities thus it is essential for organizations to thoroughly explore and understand job satisfaction to prevent losses and unnecessary costs.

There is also a need for employers to address the gender gap between male and female employees in terms of job satisfaction. According to a 2017 Jobstreet.com happiness poll of workers in the service sector, gender influences job satisfaction, with certain work conditions favoring male employees more than female employees. Furthermore, male and female employees have notable salary disparities, with male employees making more money than female employees (Ho, 2018). The labor force in Malaysia is divided into 15.77 million (48.4%) males and 15.25 million (46.8%) employed persons (DOSM, 2019c). The gap between males and females is statistically high, with males in the labor force and employed persons showing statistically higher numbers. The government has been working to attract more females to the labor force, but organizations must understand and justify their job satisfaction. One major issue is wage level and career enhancement. Female employees receive a mean of RM 890 monthly, while male employees receive RM 1,914 monthly (DOSM, 2019a). This gap is about 46 percent, with males receiving extra salaries even in the same sector and position. Some argue that males are more educated than females but this is not accurate (Abou-Shouk, 2021). Understanding the dynamic of job satisfaction and turnover intention impacted by gender is important. Despite the increasing number of female employees holding higher positions, male employees still dominate in certain areas. Organizations should focus on pressuring female employees to take higher positions to improve their wages and reduce turnover intention.

2. Literature Review

Job Satisfaction

Job satisfaction is a crucial aspect of organizational well-being, as satisfied workers perform better and contribute to higher performance levels. Research has been conducted to identify factors that contribute to employee satisfaction, such as individual attitudes toward work, motivation, and organizational policies. Herzberg's two-factor theory suggests that certain job motivation elements, such as recognition, achievement, work nature, advancement, growth, and responsibility, contribute to job satisfaction (Herzberg, 1959). However, other factors, such as company policy, working conditions, relationships with peers and subordinates, supervisors, salary and benefits, and job security, can also contribute to job dissatisfaction which is known as the hygiene factors (Herzberg, 1959). A study by Ghazi, Shahzada and Khan (2013) found that academic staff were satisfied with both hygiene and motivation factors, while the motivation of university teachers depended more on hygiene factors being fulfilled. Herzberg's theory suggests to preserve excellent

instruction and successful student outcomes, employers should concentrate on elements that affect job satisfaction.

Nature of Work

When the work is intriguing, the person could be thrilled and driven by the nature of the work. Maintaining enthusiasm for job content that does not pique an employee's attention is extremely difficult. Chin (2018) separated the measurement of intrinsic and extrinsic work satisfaction into two sections. The nature of work and opportunities for career advancement are measured by intrinsic job satisfaction, whereas salary and supervision are measured by extrinsic job satisfaction. The nature of the work indicates a positive relationship with the employee, however, the association between job satisfaction and supervision in Malaysia's manufacturing industries yields a negative relationship.

Another study by Ibrahim, et al. (2014) comparing the United States and Singaporean samples demonstrates significant differences statistically in t-tests measuring the nature of work. On the other hand, no statistical difference is shown on occur among Singaporean and Malaysia sample depending on observed running condition satisfaction. A study conducted in 2015 by Raziq and Maulabakhsh in Quetta, Pakistan, on employee job satisfaction found a favorable correlation between workplace culture and employee job happiness. This implies that to increase employee satisfaction, firms would need to quickly grasp the importance of a positive work environment.

Pay Level

Employee pay or wages are classified as compensation for their job (Spector, 1997). In a study by Richardson, Mikkelsen and Burkes (1997) there is a difference between men and women in terms of promotion and pay in doing the job. According to Clark (1997), this analysis reveals that women's employment is weaker than men's by certain statistical criteria, but women record higher rates of work satisfaction than men do. A study by Guha and Chakrabarti (2014) considered pay level as a pull factor and the result shows higher pay becomes a significant reason for IT workers to enter a new organization. Furthermore, a study by Ibrahim et al, (2014) revealed pay subscales were statistically important among workers in the United States and Singapore.

Employee Empowerment

According to Rana and Singh's (2016) study, work satisfaction scores and employee empowerment have a significant and favorable relationship. The study found that workplace ownership offers workers the power to execute the strategy and the manager's goal. A key strategy for managing the business to counter external stressors has been leveraging employee satisfaction and their support for the workplace. Employee empowerment is specifically described as giving employees decision-making authority while ensuring the highest level of customer satisfaction. Kim and Fernandez (2016) examined a quantitative model of the relationship between workplace satisfaction and the attrition plan of federal bureaucrats in the United States. The premise that employee empowerment favorably and considerably improves job satisfaction, which in turn has a considerable and negative impact on turnover, is strongly supported by the empirical investigation's findings.

Career Enhancement

Wexler (2001) defines advancement in career and employee growth as a promotion. A research of 26,359 managers in a financial services business found that promoted managers are less inclined to resign than non-promoted managers, and promoted women are less willing to withdraw than promoted men. A study has been done by Zhang (2016) to study the influence of job satisfaction and turnover intention among industrial workers. The findings revealed that a lack of professional progress in career enhancement and development is the most important factor contributing to employee turnover. This suggests that a corporation that provides a decent career path system for its employees while also offering promotions can retain good personnel.

Years of Experience

Terms of service or working experience are frequently taken into consideration when evaluating an individual's level of job satisfaction and risk of attrition. The number of particular studies on the impact of years of work experience on turnover and job satisfaction is still very small at this time. Sukriket (2014), however, discovered that the number of years of service in the current organization had a substantial impact on turnover

expectation, even if around half of the respondents envisaged leaving the firm within three years. The younger respondents, who had worked for the organization for one to two years, had the greatest intention of leaving their current position. Meanwhile, Zhang (2016) investigated the factors that influence employee turnover, focusing mostly on personal factors such as gender, age, years of employment, education, and experience. He found that younger workers with higher levels of education and inexperience seem to be less loyal to the company and to be more dissatisfied with their jobs overall.

Gender

One trait that has drawn a lot of attention is gender, particularly in the context of understanding work satisfaction and turnover. The theory of social roles contends that males and females tend to act differently in intent to exhibit turnover (Eagly, 2012). According to Lambert, et al. (2001), it has been demonstrated that men are less satisfied with their jobs than women. Men continued in their careers since they were frequently portrayed as the main breadwinners. Although the impact of gender on work satisfaction is also assessed, the literature has produced contradictory results. According to studies, women were more likely than their male coworkers to quit their occupations, supporting this argument. The study by Abubakar and Maitama (2015) is suggested to replicate and broaden the findings of earlier research by examining the moderating effect of gender on the connection between work satisfaction and employee turnover intention.

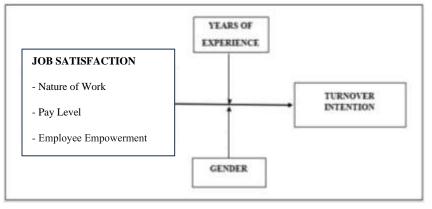

Turnover Intention

The percentage or quantity of workers who leave an organization and are replaced by new hires is referred to as employee turnover. These days, a lot of businesses are conscious of and concerned about the staff turnover rate. Turnover intention has been the subject of in-depth study by numerous academics, and it continues to be a productive area of research in the field of organizational psychology (Abubakar & Maitama Kura, 2015; Guha & Chakrabarti, 2014). A study by Tnay et al., (2013) aimed at ensuring that workers are kept within an organization, concentrated on a variety of variables that may affect employee engagement behavior, including work satisfaction (pay satisfaction, supervisory support, and organizational dedication. The finding revealed pay satisfaction is correlated with the intention of the turnover of employees. This is similar to another research by Phang, Kucukusta and Chan (2014) who studied Hong Kong travel agencies workers' turnover intention. Five factors are found to be substantially correlated with turnover intention that are, total work satisfaction, career jumping, employment stability, educational chances, and promotional incentives.

Research Objectives and Hypothesis

The purpose of the study is to investigate the relationship between job satisfaction and turnover intention among employees in the travel agencies within the Selangor area. The objectives of the study are (1) to examine the relationship between job satisfaction and employee turnover intention, (2) to investigate the moderating effect of employee gender on the relationship between job satisfaction and turnover intention, (3) to investigate the moderating impact of the employee years of experience towards the relationship between job satisfaction and turnover intention. Figure 1. shows the research framework in which job satisfaction is measured through four variables (nature of work, pay level, career enhancement, and employee empowerment) on turnover intention. The moderating factors are gender and years of experience. The study's hypotheses attempted to find whether; the nature of work negatively affects turnover intention (H1a), the pay level negatively affects turnover intention (H1b), the employee empowerment negatively affects turnover intention (H1c) and career enhancement affects turnover intention (H1d). The study also hypothesized; that year of experience moderates the turnover intention (H2) and, that gender moderates the turnover intention (H3).

Figure 1: Research Framework on the Relationship between Job Satisfaction and Turnover Intention: Gender and Years of Experience as Moderator

3. Research Methodology

This cross-sectional quantitative study includes the employees working in travel agencies in Selangor with a total population of 13,252 people. The unit of analysis is trainee, non-executive, junior executive, and senior executive. The sampling frame is retrieved from the MOTAC data system, with respondents from 110 travel agencies in Selangor. The study consists of 130 respondents from 26 travel agencies. The sample size is calculated using G Power analysis, with an effect size of 0.15 and several predictors according to the variable. The sample size indicated for this study is 129. A convenience sampling technique is used to collect data from 130 employees working in a tourism agency in Selangor. The questionnaire was distributed via email to the administrative officer, who circulated it among the staff. The items for nature of work, pay level, employee empowerment, and career enhancement were adopted from Chin (2018), Chan (2019), Rana (2016), and Ibrahim (2018). All the items used 5 Likert scales ranging from 1 to 5 with 1 being the lowest scale in each section. The reliability of indicators is shown in Table 1.

A preliminary test for testing the normality of the data was conducted and data were analyzed using SPSS 25.0 using multiple regression to assess the correlation of the relationship between job satisfaction and turnover intention and the moderating effect of years of experience and gender.

Table 1: Reliability Value

Job Satisfaction	
Previous Study	Cronbach Alpha
Factor A- Nature of Work (Chin, 2018)	0.714
Factor B- Pay Level (Chan, 2019)	0.850
Factor C-Employee Empowerment (Rana, 2016)	0.584
Factor D- Career Enhancement (Ibrahim, 2018)	0.840

4. Results

Statistical evaluation of the data was performed in IBM SPSS Statistics version 25.0 using descriptive statistics and regression analysis to assess the predictive value of independent variables. The values of Skewness and Kurtosis for all variables are within the range of ± 3 . The subsequent analysis proceeded as the first assumption of multivariate analysis was met. Table 2. highlights the demographic details of the respondents who participated in the study.

Demographic		Frequency	Percentage %
Age	18-30	51	44.6
C	21-40	58	39.2
	41-50	21	16.2
Gender	Male	57	43.8
	Female	73	56.2
Education Level	SPM	7	5.4
	STPM	9	6.9
	Diploma	48	36.9
	Bachelor Degree	58	44.6
	Master	8	6.2
Total years of working experience	0-2 years	11	8.5
-	3-5 years	33	25.4
	6-8 years	39	30.0
	>9 years	47	36.2
Current Position	Trainee	4	3.1
	Non-Executive	26	20.0
	Junior Executive	47	36.2
	Senior Executive	53	40.8
Total		130	100

Table 2: Demographic Details of Respondents (n=130)

The majority of respondents were in the age group of 21 to 40, contributing the most significant percentage, and females formed slightly more than half of the total respondents. An enormous number of participants have a bachelor's degree qualification (44.6%), and most had a cumulative number of working experiences of more than nine years (36.2%). Senior executives and junior executives' positions contribute the most profile of respondents in the organizations (77%).

	Beta	Partial Correlation	t-value	sig
Constant	34.809	2.135	16.307	< 0.000
Employee Empowerment	272	215	-2.493	<0.014
The excluded Variable Nature of Work	020	017	189	.850
Pay Level	148	111	-1.254	.212
Career074 Enhancement		054	613	.541

Table 3: Coefficients of Multiple Regression Analysis

R = 0.215, R² = 0.046, F = 6.213, P < 0.05

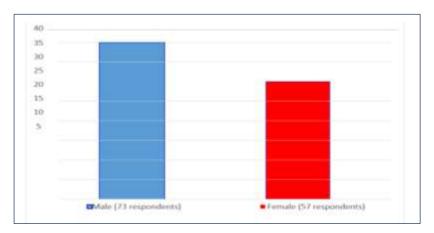

In the multiple regression analysis of independent variables thought to affect turnover intention (nature of work, pay level, career enhancement, employee empowerment), the resulting model was significant (R = 0.215, $R^2 = 0.046$, F = 6.213, P < 0.05). When the predictive value of job satisfaction was examined, a significant relationship was detected between employee empowerment and turnover intention ($\beta = -0.272$, p < 0.05). Nature of work, pay level, and career enhancement were not associated with turnover intention (p > 0.05). The coefficient value shows that the intention to leave the company decreases by 0.272 for every unit increase in employee empowerment. The finding further confirmed that hypothesis 1c is accepted while hypotheses 1a,1b, and 1d are rejected.

Model			Adjusted R	Std. Error of the Estimate	
	R R Square		Square		
EE	.226ª	.051	.036	.58805	
EE x Gender	.247 ^b	.061	.039	.58731	
EE	.350ª	.123	.101	5.121	
EE x YOE	.369 ^b	136	.103	5.114	

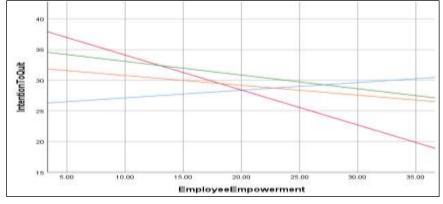

Table 4: Model Summary (Gender and years of working experience as moderators)

F = 2.725, Sig.=0.047, P < 0.05 (Gender moderator); F = 4.143, Sig. =0.09, P < 0.05 (Years of working experience moderator)

Figure 2: Grouped Scatter of Employee Empowerment on Turnover Intention by Gender

The hierarchical regression analysis on moderators towards employee empowerment and turnover intention has yielded significant results for gender (F = 2.725, p=0.047) and years of working experience (F = 4.143, p= 0.009). The model summary result in Table 4. shows the variance of the dependent variable turnover intention for both moderator gender and years of experience are 3.9% and 10.3% respectively (R = 0.247, $R^2 = 0.039$) and years of working experience (R = 0.369, $R^2 = 0.103$). The results are significant at p<0.05. Gender and years of working experience are found to have moderating effects on turnover intention through employee empowerment. Males have the highest job satisfaction through employee empowerment as compared to females. People with 3 to 5 years of working experience who have the lowest turnover intention. The findings further

prove that hypotheses 3 and 4 are confirmed and accepted. Hence, all hypotheses within this study are supported except for H1a (nature of work, H1b (pay level), and H1d (career enhancement). The study confirms that employee empowerment is the key factor that leads to turnover intention among employees while gender and years of working experience moderate the relationship.

Discussion

Four factors of job satisfaction were measured within this study that are pay level, nature of work, career enhancement, and employee empowerment. The result from the study indicates job satisfaction through employee empowerment affects turnover intention where employees who experience job empowerment will decrease the intention to leave the company. This study shows employee empowerment has the greatest impact on turnover intention and this further indicates that higher degrees of independence and non-routine job duties are linked to a reduced likelihood of turnover. The finding is supported by a previous study (Kim & Fernandez, 2016) where the outcome shows staff empowerment has a positive and materially meaningful impact on job satisfaction, which in turn has a negative and substantive impact on the purpose of turnover. Additionally, it is also supported by Sergio and Rylova (2018) who highlighted to ensure that individuals are engaged and satisfied with their jobs, employee empowerment may prove to be the most effective strategy, and being employee-empowered is primarily focused on granting them the authority to make decisions independently. Besides that, the factor of pay level in job satisfaction shows there is no relationship with turnover intention and this finding correlates with previous studies that indicate a non-relationship between pay level and turnover intention (Romeo, Yepes-Baldo, & Lins, 2020). Concurrently, the nature of the work exhibits negligible value in the multiple regression analysis, indicating the absence of a relationship between turnover intention and turnover, a finding corroborated by earlier research (Al Sabei, et al., 2020). Finally, there is a negligible correlation between job satisfaction and turnover intention when it comes to the career enhancement components as discovered in this study.

Employee empowerment and turnover intention also revealed a substantial association between job satisfaction and the moderating impacts of an employee's gender. There exists a robust association between the components of employee empowerment and the degree to which gender influences the intention to leave. This outcome aligns with the research findings by Rigther (2017) who also found gender strongly moderates the association between job satisfaction and intention to resign, according to a sample of employees from various organizations operating abroad. It is also evident from the results that men are more satisfied with their jobs' empowerment than women are. Research by Crookston et al. (2021) supports this, demonstrating how men differ noticeably from women in that they feel more in control.

Men who feel powerful at work and who are also highly satisfied with their jobs are less likely to want to change jobs. Previous research (Obi, 2021) that looked at the degree of empowerment of non-managerial bank employees in both Nigeria and the U.S. supports the findings of this study by showing that male respondents in both nations exhibit higher levels of empowerment than female respondents. The study also demonstrates a substantial association between job satisfaction and turnover intention, with years of experience having a moderating influence. Notably, the group with the highest turnover intention is one with three to five years of experience. Sukriket (2014) supports this conclusion with research on employees that reveals most respondents intend to quit the company, with younger respondents having worked there for two to three years making up the majority of respondents. Additionally, this study demonstrates that the group with the lowest intention of turnover has more than nine years of experience. Previous studies have also indicated that employees with more experience with the current organization are likely to have fewer plans to depart (Gupta & Shaheen, 2017; Zhang, 2016).

5. Conclusion and recommendations

The study's main objective is to assist the Selangor tourist organization in comprehending the relationship between job happiness and intention to leave, taking into account the moderating effects of gender and years of experience. This study has already looked at several factors that influence turnover intentions, and it turns out that gender and years of experience supported the noteworthy value association between employee empowerment and turnover intention. For future studies, it is crucial to consider other variables that may impact the intention of staff turnover. Furthermore, certain of the correlations discovered were not in the path

expected by the hypotheses thus extended studies are required to disentangle these interactions and offer more insight into the link between job satisfaction and intention to leave in travel agency companies in a larger geographical context that is the whole state of Selangor. Furthermore, it would be interesting to use the qualitative research method to examine the participants' observations, along with the focused group which can help to develop a more comprehensive knowledge of turnover intention behaviors.

Acknowledgment: The authors would like to thank the Research Management Centre of Universiti Teknologi MARA, and The Ministry of Higher Education of Malaysia for funding the research works through the Fundamental Research Grant Scheme (FRGS) FRGS/1/2022/SS09/UITM/02/38.

Abstract: The integration of progressive 4.0 technology into human resource management (HRM) represents a significant shift in how organizations optimize and enhance workforce capabilities. This review explores the origins, applications, benefits, challenges and future prospects surrounding smart HRM 4.0. By reviewing existing literature, this paper examines the utilization of Artificial Intelligence (AI), Big Data analytics, machine learning (ML) and the Internet of Things (IoT) in HRM, specifically in talent acquisition, training, performance management, and rewards. Additionally, it addresses the implementation challenges including data quality assurance, skill shortages, and cultural resistance. The paper also emphasizes the importance of ethical considerations. In terms of future research, it highlights the necessity for ethically deploying Industry 4.0 and establishing robust AI governance frameworks. By combining technological innovation with ethical values, organizations can navigate the complexities of this integration, leading to a future characterized by workplace efficiency, accountability, and fairness.

Keywords: Industry 4.0, 4.0 technologies, Smart HRM 4.0, Ethical implications, Corporate digital responsibility.

1. Introduction and Background

In today's dynamic global business landscape, organizations around the world are experiencing significant transformations due to the disruptive impact of Industry 4.0. Within the context of these transformations, attention is directed towards the advent of progressive 4.0 technologies in boosting operational excellence (Calabrese et al., 2022). This era of technological disruption highlights the crucial need for firms to adapt and innovate to maintain their competitiveness (Marcon et al., 2022). As Industry 4.0 advances, the transformation goes beyond operational adjustments involving various business functions, including human resource management (HRM). Consequently, conventional practices are being re-examined, and innovative approaches powered by technological advancements are being explored (James et al., 2022 & Pillai et al., 2021).

Smart Human Resource Management 4.0 (Smart HRM 4.0) represents this shift by embracing advanced technology associated with Industry 4.0 in improving human resource (HR) functions and enhancing organizational performance (Duman & Akdemir, 2021; Verma et al., 2020). In the current climate of business uncertainty, the adoption of Smart HRM 4.0 is crucial for organizations seeking to navigate the complexities of the digital age while maximizing the full potential of their workforce. However, organizations often encounter various managerial challenges in transitioning to Industry 4.0, including hesitancy or resistance to adopt and implement these advanced technologies (Calabrese et al., 2022; Marcon et al., 2022). This underscores the significance of examining the adoption of I4.0 technologies and the barriers they present for the development of Smart HRM 4.0 along with its influence on HR and organizational performance.

As research on Smart HRM 4.0 is still in its initial phase, the comprehension of this concept remains limited, particularly regarding the influence of Industry 4.0 on HRM evolution and the changes it introduces to people management (Abellan-Sevilla & Ortiz-de-Urbina-Criado, 2023). Investigating this transformative wave raises several research questions to be addressed: (1) What are the key applications of Smart HRM 4.0? (2) Do these key trends enhance the strategic value of HRM? (3) What challenges do organizations face in adopting these smart working practices? (4) What future trajectories can be anticipated for these practices? Through a review of extant literature, this paper intends to offer valuable insights into the applications and benefits, challenges, and future paths of this developing practice. Additionally, it aims to shed light on the transformative impact of Smart HRM 4.0 and its implications for organizational success in the digital era.

2. Literature Review

Fourth Industrial Revolution: A shifting landscape from HRIS to Smart HRM 4.0: Introduced in 2011, Industry 4.0 was originally proposed as Germany's initiative to revitalize the industrial sector through the incorporation of disruptive 4.0 technology (Ghobakhloo et al., 2023; Sarbu, 2022; & Hoffmann Souza et al., 2020). As research on Industry 4.0 advances, a multitude of terms, technology, and areas of application linked to the same concept have emerged, each supporting different business functions (Culot et al., 2020; Duman & Akdemir, 2021). Among the various departments within an organization, the HR department holds a central position due to its responsibility for managing the organization's human capital. By integrating cutting-edge technology, HR functions can be streamlined effectively, resulting in reduced time required for its operations and ultimately contributing to industrial development and enhanced performance (Oswal et al., 2021).

Research on the utilization of HRM technologies has undergone significant evolution. The initial phase of IT integration in HRM dates back to the 1970s with the advent of Human Resources Information systems (HRIS), which computerize the process of HRM by electronically managing HR records and transactions (Hmoud, 2021). The studies predominantly centered on the value of HRIS and its potential to reform HRM practices in organizations (Maamari & Osta, 2021). Strohmeier (2020) and Shahreki et al. (2019) clarify that HRIS exerts a dual impact on HR functions; firstly, on relational dimensions encompassing recruitment, training, and performance management and secondly, on operational facets including administrative tasks, payroll management, and employee data maintenance. Given that HRIS gathers and stores timely data on employee-related matters, its adoption is deemed pivotal for the effectiveness of HR functions, contributing significantly to the precision of employee performance evaluations (Shahreki & Lee, 2024; Maamari & Osta, 2021). Additionally, HR data can be leveraged for strategic, tactical and operational decision-making (Shahreki & Lee, 2024).

In the early 1990s, research in HRM expanded beyond HRIS to include Electronic Human Resource Management (e-HRM), a comprehensive system that comprises diverse integrated mechanisms of HRM and information technologies (Hmoud, 2021; Al-Harazneh &Sila, 2021). In comparison to HRIS, e-HRM offers distinct advantages when it comes to integrating organizational data and improving the quality of HRM services (Zhou et al., 2022), By leveraging network technology such as the Internet in processing HR services and tasks, e-HRM permits employees to access HR data, carry out relevant HRM functions online, and engage with both internal and external stakeholders, such as job seekers, manager, and suppliers (Talukdar & Anirban, 2022).

The latest development of technology in HRM is Smart HRM 4.0, a smart working concept that is firmly grounded in the fourth industrial revolution (Pillai & Srivastava, 2024). This revolution is characterized by the incorporation of sophisticated 4.0 digital technology, including artificial intelligence (AI), robotics, Big Data analytics, machine learning (ML), and the Internet of Things (IoT) (Ogbeibu et al., 2021; Sivakumar et al., 2020). The current body of knowledge surrounding this integration in HRM has mainly focused on its transformative potential for HR operations.

Pillai and Srivastava (2024) pointed out that Smart HRM 4.0 enables organizations to upskill their workforce, while at the same time automating routine tasks. These implications not only optimize operational efficiency but also make the HR functions more agile and responsive to changing market demands. Additionally, the advanced analytical feature of Smart HRM 4.0 allows for a comprehensive insight into employee preferences and behavioral patterns, facilitating more personalized and effective HR interventions (Ganatra & Pandaya, 2023). This data-driven approach marks a substantial departure from traditional and generalized HR practices. The automation of routine tasks and the availability of sophisticated analytic tools enable HR professionals to redirect their focus towards more strategic aspects of their roles, such as talent cultivation and employee engagement. Therefore, Smart HRM 4.0 is recognized as a crucial strategy for addressing the challenges posed by the contemporary workforce (Pillai & Srivastava, 2023).

Reshaping HRM Functions through Smart HRM 4.0: Smart HRM 4.0 not only redefines conventional procedures but also introduces innovative solutions to effectively manage and enhance the workforce. At the core of Smart HRM 4.0 are several key HRM functions, including recruitment and talent acquisition (Pillai & Sivathanu, 2020), training and development (Soltani & Morris, 2020; Chen, 2022), compensation management

(Meijerink, 2021) and performance and predictive analytics management (Murugesan et al., 2023). These functions are seamlessly integrated with the progressive technologies of Industry 4.0 (Pillai et al., 2021).

One notable advancement facilitated by Smart HRM 4.0 is the utilization of ML, a subset of AI, which revolutionizes the talent acquisition process. According to Artar et al. (2024), machine learning algorithms have the ability to predict the success of potential candidates, thereby expediting recruitment processes and improving the quality of hiring decisions. For example, advanced programs that use ML algorithms have been developed to assess a person's skill level (Goretzko & Israel, 2022). Additionally, they can analyze future performance and counterproductive habits and convert a person's digital records into personality variables (Sahin et al., 2019). On another note, the combination of AI algorithms and big data analytics enhances recruitment efficiency by optimizing applicant screening and selection through comprehensive data analysis (Agarwal, 2023). Similarly, ML models in performance management empower organizations to analyze employee performance data, enabling informed decision-making and the customization of personalized development programs (Nayem & Udin, 2024). This approach ensures a more data-driven approach to HRM decision-making.

When it comes to the utilization of robots and robotic process automation (RPA), they have been implemented in the field of HRM to automate repetitive and time-consuming tasks such as payroll processing, benefits administration, and compliance reporting (Samarasinghe & Medis, 2020). This automation not only enhances productivity but also minimizes the risk of human error, ultimately strengthening the accuracy and reliability of HRM activities (Bankins 2021). The integration of the IoT on the other hand, holds promise for enhancing the personalization of training programs. Abdussamad et al. (2022) suggest that IoT-enabled data collection facilitates effective planning, organization, and coordination of training initiatives. By leveraging IoT devices, organizations can implement just-in-time training approaches, continuously monitor training outcomes, and provide real-time coaching and feedback to employees. This real-time analysis enables the identification of skill gaps or deficiencies, empowering organizations to address them promptly and effectively (Mohanty & Mishra, 2020).

The incorporation of progressive 4.0 technology into HRM functions presents a significant opportunity to improve operational efficiency, increase employee engagement, and improve strategic decision-making. If an organization is able to successfully use these technological breakthroughs while also tackling the issues that are connected with them, then they will be in a strong position to succeed in the competitive business environment. Nevertheless, successful implementation requires careful consideration of numerous challenges, especially within human resources.

Implementation Challenges of Smart HRM 4.0: The implementation of technological advancements, particularly the adoption of Smart HRM 4.0, demands a substantial investment in developing capabilities and entails the acquisition of new skills (Calabrese et al., 2021; van Dun & Kumar, 2023). As a result, companies are focusing on acquiring skilled talent to effectively utilize these technologies (Kamble et al., 2018). Therefore, it is crucial to understand the changes brought about by Industry 4.0 in terms of the competencies, skills, and attitudes required to identify the job profiles of the future (Flores et al., 2020). Process understanding, data security, programming, and the operation of emerging technologies such as cyber-physical systems, big data, IoT, and the cloud, are key hard skills that are indispensable in the context of Industry 4.0 (Nicolas-Augustin 2022; Matt et al., 2020). Digital literacy, which was once a strategic advantage in the Third Industrial Revolution (Sakurada et al., 2020), has now become essential for employees, particularly those who require reskilling. Beyond having digital literacy, employees must also be agile in adapting to the ongoing organizational changes brought about by automation's demands (Shet & Pereira 2021). The discussion concerning competencies holds substantial importance in the field of HRM due to its influence on organizations and its relevance to Industry 4.0. Consequently, HRM plays a crucial role in determining the competencies required by an organization and how they should be developed (Meddour et al., 2020). Competency development involves identifying the specific competencies that call for improvement, discerning the critical gaps that exist between the current competency level and the desired level, and subsequently bridging those gaps through suitable and targeted qualifications. This enables organizations to align their workforce with the challenges posed by Industry 4.0 (Abdeldayem & Aldulaimi, 2020).

Furthermore, to be able to accept these changes, there is a need for a cultural shift inside the organization. A major concern about the influence of organizational culture on digital transformation is the potential resistance to change due to shared beliefs and attitudes (Bockius & Gatzert, 2023). Some perspectives within the organization may embrace change, while others may cling to traditional norms, which can slow down the adoption of progressive 4.0 technologies (Agrawal et al., 2020). It is important to note that, a cultural shift that fosters a positive attitude towards change is imperative to establish an environment wherein employees feel empowered to explore new possibilities, acquire fresh knowledge, and readily adapt to innovative approaches (Bozkus, 2024). Hence, a transformation in organizational culture demands the implementation of effective change management methods to overcome opposition and cultivate a culture that values innovation and ongoing learning (Al-Khatib et al., 2021; Tang et al., 2020). Understanding these obstacles is essential for businesses that want to make effective use of 4.0 technologies to improve their HRM procedures.

Another significant technological-related issue often cited in the implementation of smart technology is the problem of data quality. For organizations to adopt big data and AI systems, especially those that are based on machine learning algorithms, they need vast amounts of high-quality data (Bohmer & Schinnenburg, 2023). It poses a challenge as numerous relevant data sets for HR big data are not integrated within HR systems but are rather scattered across different areas of the organization (Angrave et al., 2016; Marler & Boudreau, 2017). The performance of an individual is not only captured through appraisals and HR reports, but also in areas such as marketing, production, and customer service data, as workforce analytics inherently involve multiple functions (Hamilton & Sodeman, 2020). Given that data is dispersed throughout the organization, navigating data collection and determining the specific locations of data sets, compatibility of databases, and availability of data for analysis can prove challenging in certain contexts (McIver et al., 2018). Consequently, HR departments should make data management a crucial priority to ensure these systems are accurate.

3. Ethical Implications

The ethical implications of progressive 4.0 technology raise important concerns for organizations and governments alike (Chatterjee et al., 2021; Weiskopf & Hansen, 2022). Ethical considerations primarily revolve around issues of algorithmic bias and transparency (Hunkenschroer & Luetge, 2022; Pessach et al., 2020; Cheng & Hackett, 2019).

Within the HRM context, algorithmic bias refers to disparities between gender, ethnicity, or other characteristics concerning opportunities associated with employment, promotion and termination that result from the utilization of an AI system (Charlwood & Guenole, 2022). In recruitment and selection for example, algorithmic bias manifests when training data fails to accurately capture the skills and other relevant traits required for a given job, often due to under- or over-representation of certain demographic groups (Albaroudi et al., 2024). This raises significant concerns about fairness and discrimination in human resource practices (Hickman et al., 2021).

Compounding this issue is the lack of transparency in AI decision-making processes. The opaque nature of these systems makes it difficult to understand the rationale behind every decision generated by the AI system, undermining confidence and accountability (Rodgers et al., 2023). This lack of transparency can hinder technology acceptance, as HR practitioners need to learn methods for validating AI results and understand the basics of machine learning programming and algorithms (Bohmer & Schinnenburg, 2023). Considering the direct impact of HRM on individuals and the ethical and legal implications of data-driven decisions (Gal et al., 2020), it is crucial to establish a framework that enables HRM practitioners to fully understand and address the ethical considerations involved in using evolutionary algorithms for decision-making (Rodgers et al., 2023). Transparency is also key in presenting input data, data analysis procedures, and the connections between findings and conclusions, allowing for the validation of predictions (Heidemann, 2024). By enhancing transparency, organizations can build trust and ensure accountability, leading to a wider acceptance and ethical implementation of Smart HRM 4.0.

Another pressing concern in this digital era is the matter related to privacy and data security, given the growing dependence of organizations on the gathering and examination of extensive personal data to drive decision-making (Bozkus, 2024). The potential for misuse of such data, coupled with the threat of unauthorized access

by malicious parties, highlights the need to address ethical considerations surrounding data collection and surveillance (Mittelstadt et al., 2016). Consequently, organizations must implement robust privacy and security measures, be transparent about their data practices, and empower employees to maintain control over their personal information.

In response to these concerns, the concept of corporate digital responsibility (CDR) has been introduced. CDR entails the principles that govern a company's ethical, fair, and protective utilization of data and technology within its digital ecosystem (Hartley et al., 2024). Its objective is to ensure that companies operate with a sense of responsibility, prioritizing long-term sustainable business practices and growth in relation to their adoption and utilization of AI and other 4.0 digital technologies, as well as the underlying data (Hartley et al., 2024; Lobschat et al., 2021). It signifies a company's dedication to the responsible use of technology (Wirtz et al., 2023). CDR assists managers in ensuring the responsible use of new technologies for the benefit of organizations, society, and the environment while mitigating any negative consequences (Toth & Blut, 2024).

4. Limitations

The current study aims to provide an overview of Smart HRM 4.0 within the framework of Industry 4.0, to identify the key trends and challenges associated with the advanced technologies driving HR (such as AI, big data, robotics, and IoT). However, it is important to acknowledge the limitations of this review, which can be addressed in future research.

Firstly, the present study has relied solely on one database (Web of Science) for sourcing and examining relevant articles, potentially leading to the exclusion of important publications. To address this issue, future studies should consider incorporating articles from other influential databases, such as Scopus, ScienceDirect, and Springer, along with systematic literature review protocols and methods.

Furthermore, due to the limited empirical studies found (Chowdhury, 2023), the scholarly discussion primarily consists of conceptual papers and academic literature reviews. Thus, future research can build upon these findings by gathering empirical evidence from HR practitioners to further validate the practical applications of AI and other cutting-edge technologies in HRM.

5. Future Directions and Conclusion

The rapid incorporation of 4.0 technology, particularly AI into HRM has opened up new avenues for study, hinting towards a future in which HR practices would not only be more efficient but also more compassionate and personalized. Future studies may investigate the effectiveness of AI-or data-driven personalized learning and development programs as well as the impact of AI-powered personalized career pathing on employee retention and satisfaction. Research questions worth investigating in this direction include (1) What role does AI play in creating more compassionate and employee-centric HR practices, and how does this affect employee performance and retention? and (2) How does the integration of AI-powered personalized learning and development programs impact employee skill development and job performance? This research could lead to more tailored and effective HR practices that enhance employee experience and organizational performance.

As the field evolves, the importance of conducting research on the development of ethical, responsible, and unbiased systems related to the use of progressive technology in HRM should be emphasized. Both scholars and practitioners have been compelled to explore techniques that ensure AI systems in human resources are built with ethical considerations in mind (Hartley et al. 2024; Bujold et al., 2023). These investigations have been driven by concerns about algorithmic bias and the lack of transparency in decision-making. Hence, it is crucial to establish clear governance frameworks that outline the ethical use of AI technologies, and the responsibility to manage these tools as they become increasingly integrated into HR operations. Hence, future studies may focus on developing industry-specific models that govern the emerging innovation and technology in HRM, examining the role of HR professionals in overseeing AI systems and its impact on employee trust. Specifically, future researchers may address the following research questions: (1) how does the presence of algorithmic bias in AI systems impact decision-making processes in HRM, and what strategies can mitigate such biases? (2) How can governance frameworks be designed to ensure the ethical and responsible use of AI in

HRM, and what are the industry-specific challenges in establishing these frameworks? and (3) What role do HR professionals play in overseeing AI-driven HR systems, and how does their involvement influence the ethical management of these

technologies?

Finally, given the global nature of the topic, future research may also focus on the cross-cultural adoption of Smart 4.0 in HRM. This could include comparing AI and other progressive technology adoption rates in HRM practices across different cultural contexts, investigating the need for cultural adaptation of smart working systems in multinational organizations and exploring the impact of cultural values on employee acceptance of this technology in HR processes. Research questions that can be pursued by future researchers are (1) how do adoption rates of AI and other progressive technologies in HRM vary across different cultural contexts, and what factors contribute to these differences? (2) How do multinational organizations balance the need for standardized Smart HRM 4.0 practices with the requirement for cultural adaptation in different regions? And (3) How do employees from different cultural backgrounds perceive the integration of AI and Smart 4.0 technologies in HRM, and what factors influence their acceptance? Investigating these research questions may be essential in ensuring that Smart HRM 4.0 practices are effective and appropriate across diverse cultural contexts.

Conclusion

In a nutshell, this study offers valuable insights for HR specialists on practical applications of progressive 4.0 technologies in enhancing various HR functions. Smart HRM 4.0 has the potential to bring substantial gains, despite the challenges in implementation, cultural resistance, and ethical concerns. Insights from ongoing research will be crucial in harnessing the full potential of these technologies to build more efficient and responsive HR practices. Successfully navigating towards Smart HRM 4.0 requires a comprehensive approach to integrating technological advancement and commitment to ethical principles and human-centric values. The biggest risk lies in not capitalizing on the opportunities presented by these technologies for HR development, which could result in the failure to meet the evolving expectations of organizations and the labor market. Embracing 4.0 technologies in HRM is not just an option, but rather a need for sustaining competitiveness and relevance in the era of Industry 4.0.

Optimization of Warehouse Operations for Upstream Service Companies in the Oil & Gas Industry: A Case Study

Mohd Radzi Mohd Daud, Mohd Hafiz Zulfakar* Universiti Teknologi Mara, Puncak Alam, Malaysia *mohdhafiz@uitm.edu.my Corresponding Author: Mohd Hafiz Zulfakar

Abstract: The oil and gas (0&G) sector drives various parts of Malaysia's economy and accounts for 19% of government revenue in 2021. The volatility of oil prices and the COVID-19 pandemic problem in recent years has taught O&G enterprises, especially upstream players, to focus on business needs and employ cost optimization techniques to compete and survive uncertain circumstances. This study seeks to analyze and describe the warehouse operations setup of an onshore supply base service organization that manages and maintains offshore O&G facilities. This study examines space utilization variables from several supply chain perspectives, particularly operations performance. Semi-structured interviews, site observations, and documentation review are used to collect data for the single-case study. The study findings suggest the organization under study has a basic warehouse setup with lean operations staff to complete business functions. In general, the warehouse arrangement for the organization under investigation is comparable to a distribution center, where 70% of warehouse activities comprise, material receiving, handling, and distribution (loading) to several offshore locations. Findings also showed that two factors, namely: material handling flow and movement, and inventory movement affect warehouse space utilization. The volume of material handled by the warehouse based on business demand, as well as the seasonal trend from offshore activities contribute to the frequency of material loading and impact the material throughput and transit time, which were found to have an impact on space utilization too.

Keywords: Oil and Gas, Warehouse Optimization, Qualitative, Case Study, Supply Chain, Malaysia

1. Introduction and Background

The oil and gas industry is usually divided into three major sectors: upstream, midstream and downstream. The upstream sector mainly refers to exploration and production activities (E&P) to extract oil and natural gas from the ground, including the search for underwater and underground natural gas fields or crude oil fields and the drilling of wells to recover oil and gas. This sector also treats the crude, removes water or waste and gets it ready for midstream and downstream processes. The midstream sector is involved in safely moving these natural resources from upstream to downstream facilities where they are processed into fuels and finished products used by consumers. This study will focus on the upstream sector where the onshore warehouse functions play significant roles in supporting the activities at offshore locations.

Currently, the industry still facing a gradual recovery in activities, especially for the upstream sector. As the oil price uncertainty and the latest Coronavirus disease (COVID-19) pandemic outbreak, it is a clear reminder to industry players to stay focused on business needs, explore and adopt cost optimization initiatives and become more competitive to sustain the challenges during this unpredictable period. The statistics in Figure 1 show the Brent crude oil price (average monthly) fell beginning in January 2020 from USD67.31 per barrel to the lowest value of USD18.38 per barrel in April 2020 with a total price drop of 72.7%. The price rises gradually in quarter 3 of 2020 and remains stagnant at USD40 per barrel towards year-end.

Even though the crude oil price showed improvement in early 2021 and rose between USD80 to USD90 per barrel in 2022 post-pandemic (refer Figure 2), global supply chain uncertainty and prolonged Russia-Ukraine war conflicts may have risk and impact on current business strategy and practice. Considering the historical trend of economic downtime, business resilience is essential to ensure the company can absorb and adapt to a changing environment to achieve its objectives and deliver the products and services as per requirements during any market situation.

(Source: https://www.statista.com/statistics/262861/uk-brent-crude-oil-monthly-price-development/)

Most of the countries in this region have their own National Oil Company (NOC) which plays a vital role in managing the entire oil and gas resources and is responsible for developing and adding value to these resources. The country's wholly owned company often provides the major percentage of revenue and contributes a significant amount towards the national Gross Domestic Product (GDP).

In Malaysia, the term "upstream business companies" refers to PETRONAS-licensed enterprises that specialize in Oil and Gas Services and Equipment (OGSE). Malaysia Petroleum Resources Corporation (MPRC), an agency under the Ministry of Economic Affairs (MEA), has initiated and published the OGSE100, a list of Malaysia's top 100 OGSE companies rated by revenue from a total of 1,641 OGSE enterprises nationwide. The ranking establishes the industry's benchmark for how well each company is performing in the oil and gas market despite recent obstacles.

Regionally, Malaysian players were more affected by Asian market movements, with slower growth of 6.4% compared to 24.9% for their counterparts. According to an MPRC study and analysis published in November 2019, the total revenue of the top OGSE100 companies decreased by 2.2% to RM55.2 billion in FY2018. The lower crude oil price in 2020 increases the challenges for enterprises to be resilient and react to unanticipated developments, as well as sustain and remain competitive in the sector.

The company in this study (hereafter called the "XYZ" company, due to confidentiality requirements) is a leading services provider for operations and maintenance (O&M) of the offshore facilities in the upstream industry. Since its establishment in 2012, XYZ has been awarded contracts for O&M of offshore facilities, with a total project of more than 10 from 5 different clients (which own the asset or operate the oil and gas field) within Malaysia territory.

As an emerging service provider in the industry, XYZ faces a few business challenges. Some of these challenges include but not limited to: dynamic environment in fulfilling client requirements and contract obligations.

dynamic environment in fulfilling client requirements and contract ob

low-cost operations with business optimization.

flexibility to respond to business risks and opportunities.

limited size of organization (manpower and resources); and

capital investment for system and technology.

To compete in such a demanding environment, the overall supply chain elements connecting onshore activities and offshore operations need to be well-managed including its supply chain planning, contracting strategy, sourcing-to-delivery activities and warehouse operations. Therefore, as per the scope of this study, the supply chain manager and warehouse team must ensure the warehouse operates efficiently to fulfill the contract obligation, providing the responsiveness as required by projects/clients and at the same time controlling the cost to be competitive within the industry.

Similarly, to other OGSE companies, efficient warehouse operations and adequate warehouse space are required to ensure smooth material handling and good inventory management for maintenance, repair and overhaul (MRO) related spares to offer reasonable responsiveness to upstream business demand. It is part of a common preventive measure to avoid unplanned equipment downtime due to stock-out of mission-critical parts and spares. In most cases, these organizations are willing to spend some cost by allocating more resources (including warehouse space) purchasing extra safety stock and keeping the inventory in hand, rather than incurring costs due to the inability to fulfill the client's request and losing future business opportunities.

To accommodate the demand from offshore facilities and support daily operations and materials handling, physical warehouse facilities at onshore supply bases have been established in addition to office-based activities at headquarters, by client requests. These warehouses function as transit centers, storing materials that are received from vendors before they are loaded onto ships bound for offshore destinations. By the project requirements of each client, the materials managed include equipment, spare parts, and consumables that are requested by frontline personnel at offshore sites.

To optimize space utilization and further improve warehouse efficiency, it is imperative to implement the most recent technological innovations. Implementing AI-powered inventory management systems, utilizing IoT-enabled sensors for real-time monitoring, and investing in automated storage and retrieval systems (AS/RS) are all part of this solution. Ultimately, these technologies can contribute to cost savings and enhanced operational efficiency by reducing manual labor, improving accuracy, and optimizing storage space.

Bottom line, the company's warehouse should be able to fulfill its critical role as an onshore logistics hub integrating onshore supplies and offshore demand for ongoing oil and gas facility O&M activities to build a better upstream service sector. Therefore, this study aims to understand the current setup and concerns on warehouse space utilization optimization for service companies in the oil and gas industry, specifically under upstream business.

2. Literature Review

The existing literature shows that there are limited studies on warehouse operations particularly for companies dealing with O&M of the offshore facilities, particularly in Malaysia. Most of the previous studies concentrate on operations and management of warehouses for the manufacturing industry and business operations for logistics and distribution centers.

Despite an increase in warehousing research papers over the previous fifteen years (Koster, Johnson & Roy, 2017), many studies have focused on specific topics such as routing, layout, order picking, and automation. With the recent rise in consumer demand for e-commerce sales and virtual shopping platforms, the warehouse and logistics industry has mostly involved retail business activities. The impetus for this study stems from the fact that the upstream industry's warehouse setup and operations continue to rely on traditional rule-of-thumb and a lack of strategy.

The study conducted by Davarzani & Norrman (2015) suggests relevant warehousing research in the future for both academic development and practitioners' needs. The scope is limited to warehouse operations and internal support activities such as warehouse design, performance evaluation, human resource management, as well as direct interfaces to other departments or companies from a logistics and operations management perspective. However, this research does not include space utilization review and inventory management-related issues.

A complete review of warehouse operation, warehouse design, and performance evaluation has been presented, based on a previous literature study conducted by Gu, Goetschalckx, and McGinnis (2007, 2010). The difficulties are categorized based on the fundamental warehouse functions to establish a meaningful connection between academic researchers and warehouse practitioners. Nevertheless, this literature analysis is focused on publications that were published before the year 2000. There are significant disparities in the technologies used in warehouse operations 30 years ago, particularly in terms of resource management, inventory storage tactics, and material handling techniques.

Regarding this gap, recent studies have been conducted to enhance our understanding of how warehouse operations and design are influenced by the shift towards integrated omni-channels (Kembro, Norrman & Eriksson, 2018) and to survey warehousing strategies in the e-commerce era (Boysen, Koster & F Weidinger, 2019). There is a need for further research on current warehousing strategies, particularly during and after the COVID-19 pandemic. Logistics and supply chain managers want the most recent study on warehouse operations to effectively address the current issues in the developing logistics and warehousing industry.

Davarzani and Norman (2015) also proposed that there exists a substantial disparity between the number of studies employing a modelling method limited by assumptions and those grounded in the intricate reality of warehouses. Further investigation is needed in this field due to the dearth of empirical research, necessitating additional case and action research studies in the future. The study conducted in real-case situations and its resulting findings may directly assist practical applications, aiding the research community in gaining a deeper understanding of the difficulties linked to warehousing. This suggestion pertains to a case study that employs explanatory and descriptive research methods. The study utilizes both quantitative and qualitative data to investigate real-life warehouse scenarios. It involves observing and analyzing events or processes to collect and report data about the specific event or situation.

Davarzani and Norman (2015) argue that further empirical research is necessary to comprehensively comprehend and capture the intricacies of the actual world. The authors suggested that normative studies, which entail prescriptive theory, should be supported by practical applications to benefit both academia and practice. These applications should be founded on postulates, deals, assumptions, or values. Furthermore, the article indicated that by utilizing two approaches, namely a literature review and analysis of practitioners' perspectives, the suggested agenda for future research should address both the observed deficiencies in the existing literature and consider feedback from the industry. For this specific research, the planned method will include conducting interviews with individuals who are directly involved in the research topic, making observations at the research location, and reviewing relevant material. These activities will focus on gathering qualitative data. Subsequently, quantitative data analysis and modelling simulation studies will be conducted to support and strengthen the qualitative findings, providing valuable insights for both academic and practical applications.

Based on another prominent literature by Bartholdi & Hackman (2019, 2008) on warehouse design and operations topic, most current warehouse practices are based on rule-of-thumbs, industry benchmarking and operations-driven setup. This practice can cater to the essential needs of warehouse operations, but it will lead

to operational issues when the requirements and complexity increase in the long run. The literature suggested that mathematical models and simulation from the warehouse records and data will be able to help the practitioners tune their warehouse operations according to the business needs in meeting customer requirements. In line with this finding, the researcher will observe the current warehouse practice and gather the operations data, particularly on space allocation and utilization, material movement and inventory storage status for further analysis. Based on historical data analysis results, this study will present how the simulation model is developed for variable testing and process-based simulation on multiple scenarios. The results and findings from both historical data analysis and simulation models are expected to provide some recommendations for optimizing warehouse operations.

Bartholdi and Hackman (2019) also suggested that there are a few areas of concern for consideration about the good setup of warehouse operations. This includes but is not limited to:

- Warehouse issues, resources and processes
- Warehouse layout and slotting area
- Order-picking path and material handling
- Warehouse system and automation

Regarding warehouse layout, Bartholdi and Hackman (2019) suggested that storage models will play a significant role in determining layout design and allocation. A suitable warehouse layout should increase the throughput, reduce costs, improve the service provided to the customers and provide better working conditions (Richards, 2017). As a fact, the total area of warehouse space and its location will determine the fixed warehouse cost and any increase in space rental tariff will impact overall operations cost, where the comprehensive analysis of the different layouts provides opportunities to improve both ergonomics and economic performance (Calzavara, Glock, Grosse, Persona, & Sgarbossa, 2017). Thus, this study will explore the potential optimization of warehouse space allocation and possible improvement in space utilization will bring value to every cent spent on the warehouse setup.

Based on studies by Perera, Mirando, & Fernando (2022) and Bartholdi and Hackman (2008), allocating space in a forward pick area of a distribution center for small parts where the forward pick area of a distribution center is a cache of conveniently located products from which order pickers can quickly draw, but which must be replenished from bulk or reserve storage. Similarly, a temporary storage area for transit material is allocated near the receiving area and loading area to reduce material transfer handling duration and consolidation time. However, this paper discussed the stocking strategies commonly used by distribution centers where daily material transaction volume is relatively high compared to the material movement for the warehouse operation in this study. The service companies in the upstream business depend on the supply vessel scheduled for shipping out the material to offshore facilities (like a regional warehouse in the distribution center model). Normally the supply vessel departs from the onshore supply base to the offshore location with a frequency between 1 to 2 weeks each.

As cited by Koster, Johnson & Roy (2017) in their paper, optimizing space utilization is one of the main goals of warehouse design and operation. One of the findings suggests block-stack storage as an inexpensive storage system widely used in manufacturing operations for storing pallets, where this form of palletized storage does not require any type of storage equipment, and instead loaded pallets are placed directly on the floor and built-up in stacks to a maximum level permitted by the safety design. As earlier described by Pham, Nguyen, Doan, Thai, & Nguyen, (2019) and Derhami, Smith and Gue (2016), in a relevant paper specific to block stacking warehouses, they propose mathematical models to obtain the optimal lane depth using a simulation model to analyze the layout performance with stochastic input parameters.

Previous studies (Ferreira & Reis, 2023; Toorajipour, Sohrabpour, Nazarpour, Oghazi & Fischl, 2021). suggested warehouse management in the oil and gas industry has been transformed by artificial intelligence (AI) and machine learning, which have both offered substantial advantages and potential disadvantages. AI-powered systems can accurately forecast demand and optimize storage space, resulting in increased efficiency and reduced costs. Machine learning algorithms can guarantee the efficient positioning of items, thereby reducing the likelihood of equipment damage and improving safety. Real-time inventory visibility is facilitated by IoT-enabled sensors, which reduces the risk of equipment loss and enables proactive management.

Furthermore, these sensors can monitor environmental conditions, thereby preventing the deterioration of sensitive materials and guaranteeing adherence to safety regulations. Robotics and automation optimize material handling, thereby decreasing the likelihood of human injury and enhancing productivity (Tikwayo & Mathaba, 2023). On the other hand, cloud-based warehouse management systems (WMS) facilitate data-driven decision-making and provide real-time data, resulting in enhanced efficiency, regulatory compliance, and optimized space utilization (Tubis & Rohman, 2023).

These available literature materials are useful but only provide generic findings and solutions when it comes to explaining the warehouse operations for oil and gas companies serving the upstream industry. This case study to investigate and provide an explanation of warehouse setup, issues in space utilization and influencing factors on performance is expected to suggest possible optimization of warehouse operations. The outcome of this study will also contribute to the research knowledge as well as in practical terms specifically to warehouse operations and overall supply chain management.

3. Research Methodology

The study employs a single-case study approach and uses a multi-method research process including semistructured interviews, site observations and documentation review as the primary method of data collection. Based on this qualitative research approach, this study will investigate and seek an understanding of how the warehouse operations are being executed by XYZ company as services offered to their clients, involved in the oil and gas industry in Malaysia.

Three data collection methods used in this study are: Interviews, Field observation, and Document review and analysis.

This present study aims to understand the current setup and concerns on warehouse operations for service companies in the oil and gas industry, specifically under the upstream business as explained in the previous section. These data collection methods are chosen after considering the best possible method that can provide rich data. These methods also are the best possible method that can be able to help answer the research questions. Out of these three methods, data were mainly gathered through in-depth interviews. The variety of data collection methods enables the researcher to cross-examine the data to check the consistency of the findings, which is useful to support the study analysis (Long & Johnson, 2000; Denscombe, 2010).

One of the critical key instruments to unearth multiple perspectives amongst the participants, the researcher applies semi-structured interviews, particularly in understanding the warehouse setup and its functions as well as the factors and issues surrounding the warehouse operations. As opposed to a strictly organized interview method, semi-structured interviews provide flexibility to include extra or unstructured questions throughout the interview sessions.

Since the participants of this study vary in terms of their job level (from supervisory to assistant roles) and job responsibility, a different way of questioning styles and content is appropriate to gain each participant's unique experiences, thoughts and stories (Rubin & Rubin, 2012). The interview length varies from 15 minutes to more than 1 hour, with an average length of 30 minutes per interview. A unique code was assigned to each participant to ensure that the individuals and the company remained anonymous in this study, and this was agreed upon before each interview was conducted. Below is the brief profile of the participants involved in this study:

Code	Level	Roles	Function
IP#1	Supervisor	Warehouse & Logistics	Team leader overseeing overall warehouse operations, logistic planning and material movement coordination
IP#2	Executive	Warehouse	Warehouse operations, compliance and inventory management
IP#3	Coordinator	Warehouse	Warehouse receiving and material storage
IP#4	Coordinator	Logistics	Material consolidation, loading coordination and backload handling
IP#5	Assistant	Warehouse & Logistics	Material receiving, storage, consolidation and loading/backload handling
IP#6	Assistant	Administration	Documentation preparation and maintenance records

In addition, field observations were conducted at XYZ company's warehouse locations, in the form of a guided tour to obtain information that could not be covered during the interviews (Yin 2009). Field observations allow the researcher to visualize and learn about physical warehouse setup, process flow and overall warehouse operations. During the field observation also, the researcher can crosscheck and validate the information received from the participants (Tracy, 2020; Sandelowski, 2000), whether it indeed matches the actual activities happening at the warehouse facility. In the event of information uncertainty or any doubt about the process or events at the site, the researcher can seek out further verbal clarification immediately.

During the visit to the company's warehouse facility at the supply base area, the researcher was given access to the warehouse office, goods receiving and storage area. This provides first-hand, real-time information on the overall material flow process of purchased items from material receiving until it was accepted and allocated by relevant projects and facilities. During the observation, field notes were written and supported by photograph images taken within the premises upon agreement by the warehouse supervisor. However, any company logo or information must be removed (hidden) to ensure the company remains anonymous in this study.

No	Location	Activities and Processes Observed
1	Receiving Area Material unloading, receiving, inspection & accepta	
2	Transit Storage Area	Material transfer, segregation and tagging
3	Storage Racking Area Material storage, identification and preservation	
4	Consolidation & Loading Area	Offshore container handling and material preparation
5	Warehouse Office	Documentation updating and record keeping

 Table 2: XYZ Company's Site Observations and Activities

The third data collection method used to further assist the researcher in understanding the supply chain process and its warehouse operations was by reviewing relevant documents produced, referred and implemented by XYZ company. This includes XYZ company procedures, guidelines, warehouse reports and records to support the data collected from interviews and observations (Tracy, 2020; Yin, 2009).

This technique has been employed for the data collection process in this thesis and is based on some justifications. First, the review of relevant documents i.e., warehouse procedures gives a better understanding of the company's warehouse standard operations and procedures, including a fundamental technical understanding of how the warehouse was operated for upstream business, especially for offshore facility's operation and maintenance activities. The document also describes the process flow and various roles and responsibilities of warehouse personnel to ensure the compliance and integrity of supply chain processes for the company. Based on this understanding, the data collection process through interview and observation was facilitated as the researcher was able to confirm and corroborate issues.

Some of these documents are published by the company and some were only released to researchers

specifically for this study with the permission of the participants (Refer to Table 3).

No	Documents	Information / Scopes Reviewed	
1	Warehouse Procedures	Material process flow, warehouse personnel roles, responsibilities and functions.	
2	Material Movement Report	Material information, quantity, type (local or bonded) receiving date, loading date and project status.	
3	Inventory Report	Material information, quantity, storage location, movement (in/out) and project remarks.	
4	Supply Vessel Records	Vessel name, movement data, location to and from.	
5	Audit Report	Operational findings and suggestions for improvement.	

Table 3: List of XYZ company's Documents Obtained for	or the Study
---	--------------

4. Results

The first part of this section captures findings on physical setup and its process flow as well as operational challenges and influencing factors which will provide some discussion on the warehouse operations for the specific industry. In addition, several factors affecting warehouse space utilization and how to address these factors to increase the utilization will be presented accordingly.

Warehouse Setup

The XYZ company's warehouse under the study was established in the year 2015 in Kemaman Supply Base (KSB), Terengganu (approximately 300km from Malaysia's capital Kuala Lumpur); where the area was gazetting as a bonded supply base for oil and gas business operations for Terengganu offshore project. The establishment was to handle the material purchased by the company on behalf of the client where it involves basic material handling including receiving, temporary storage and transfer to the offshore facility located approximately 200km from the onshore supply base.

After XYZ company was awarded a second project, the operations were relocated to the bigger warehouse to cater to the second contract requirements including storage of project inventory on behalf of the client. Since then, this warehouse has been expanded a few times to cater to requirements for additional projects (third and fourth). The warehouse function is becoming more complex as the requirements also cover consolidation of material for loading, logistics planning and inventory monitoring for operations spare items.

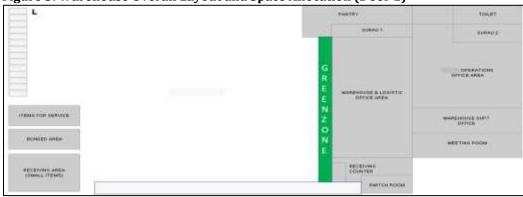

The latest warehouse expansion happened in 2018 where the warehouse has a proper office and layout including an allocated area for material receiving, loading and storage. As this study takes place, the current warehouse setup covers an area of 2,000 square meters (equivalent to 21,500 square feet) including a warehouse office, open space for receiving, temporary storage, loading and forklift movement and dedicated space for ten rows (aisles) of the 4-level racking system (in total 104 racking module). This setup was able to support material movement, handling and inventory storage for a total of five projects (for two contracts servicing two different clients). Table 4 below explains the details of the warehouse layout and its estimated space allocation.

Table 4: XYZ company's Warehouse	Layout and Space Allocation
----------------------------------	-----------------------------

Area Type	Area Function	Est. Space (sqm)	Allocation	
Operation Area	Receiving, storage and loading	400	20%	
Storage Racking	Inventory 4-tier racking module	400	20%	
Open Floor Area	Forklift movement zone/buffer	750	37.5%	
Non-activity Area	Office, Counter, Utility, etc.	450	22.5%	
	Total Area (sqm)	2,000	100%	

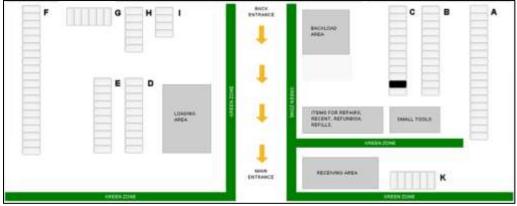

During a visit to the warehouse location, the researchers found that the warehouse was divided into 2 physical facilities. The first facility (Door 1) with an approximate total space of 800 sqm caters to a warehouse office, receiving counter, receiving area for small material (in boxes), open operations area, and 14 racking modules

(1 row). The second facility (Door 2 and 3) with an approximate total space of 1,200 sqm caters to the main receiving area (material on a pallet), pallet transit area, loading area, forklift movement area and a total of 90 racking modules (9 rows). Figures 3 and 4. show the visual warehouse layout including its functional area location and physical arrangement.

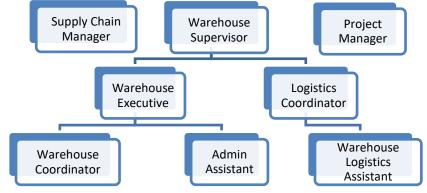

In terms of warehouse resources, the startup of basic warehouse operations employs two warehouse personnel to undertake the receiving and loading functions. As the warehouse function has expanded with more scopes defined under contract requirements, the manpower strength has been increased to cater to the operational tasks, administration and reporting to clients. Currently, the warehouse under study has a total of six personnel including one supervisor (as team leader). As per XYZ company organization chart (refer to Figure 5), the warehouse team reports directly to the supply chain manager and operationally reports to the operations department where all the daily project execution, monitoring and control is happening.

To support basic operations, this warehouse possesses basic material handling tools such as manual pallet jack, trolley, hand tools and packaging consumables. The advanced material handling equipment (MHE) such as forklift, crane and trailer (including equipment's operator) are provided by the supply base operator as chargeable services (pay per use as per timesheet) upon request from the company. As per rules defined by the supply base operator, the request for MHE shall be made one day in advance via the booking system (i.e., request to be made by 4.00 pm for the service to be available the next day at 8.00 am).

From a system perspective, the warehouse uses basic Microsoft Excel sheets as tools for recoding warehouse data including the material movement and its inventory listing. As updated during the interview, the company is currently developing an in-house warehouse management system to improve data recording and upkeep processes for better monitoring and reporting purposes. As part of the plan, this system will be extended to the headquarters office and offshore location for real-time information sharing and better visibility of materials to support the company's O&M activities at the site.

Warehouse Operational Process

During the interview, all participants explained the warehouse operations and their relevant processes by their respective functions. The warehouse operations can be divided into 3 main functions: material handling (receiving, transfer/transit and loading), material storage (inventory management) and logistics coordination (supply boat arrangement). However, the scope of this study only focused on material handling and storage where the processes happened within the company's warehouse space. The overall warehouse operations and process can be referred to as per Figure 6 below:

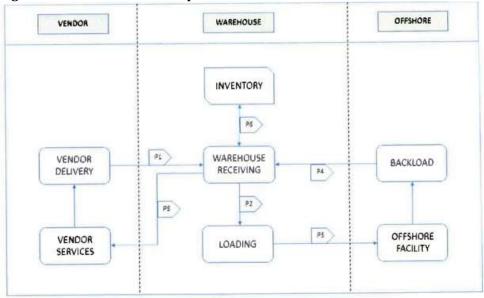

Figure 6: Warehouse Overall Operations and Process

Based on the above figure, the research scope only covers 3 processes (in oval shape) which include material receiving (Process P1), material loading (Process P2) and inventory material (Process P6). The details for each relevant process refer to the following:

Process P1: material receiving from vendor, inspection and acceptance by warehouse receiving, material handling and assigning to the allocated storage area by project and record updating.

Process P2: retrieval of material from the storage area, consolidation, preparing for material loading including packing and transfer of material into the container, container handling and shipping documentation and record updating.

Process P6: inventory material storage and preservation, material issuing in/out, inventory monitoring/updating and maintaining record/audit.

As the above process is defined in the company's Warehouse Procedures, the researcher has reviewed the documentation and found the activities explained by participants corroborate with the processes and functions defined in the procedures.

All the documentation for the above processes such as Purchase Order (PO), Delivery Order (DO), Commercial Invoice & Packing List (CIPL) and relevant material certificates are recorded and kept by the warehouse as project records for claim purposes and future references. Based on local authority requirements (Royal Malaysia Custom) for bonded supply base area, all documentation including Custom Form required to be kept by the warehouse office as evidence for audit and future purposes with minimum record retention of seven (7) years. The researcher also found that this is aligned with warehouse procedures which defined that the record retention of all documentation is seven years.

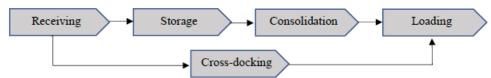

Factors Impacting Warehouse Space Utilization

In managing warehouse space and determining the functional layout, the Warehouse Supervisor and Supply Chain Manager need to identify the possible factors that impact the space utilization. The available warehouse area must be used in the best possible way so that the company will be able to do more with all the space on hand. Generally, the factors relevant to space utilization may include storage systems, as well as racking and pallet patterns. Based on interviews, site observation and documentation review conducted both virtually via desktop and physical process at the site, the current study has captured the applicable factors that affect the current warehouse space utilization.

Material Handling and Movement: Based on the warehouse setup explained in section 4.1, approximately 58% of warehouse space is allocated for material handling operation (20%) and open floor for forklift movement (38%). The space material handling operation includes the receiving area, loading area and temporary storage area for transit material while the forklift movement area includes a dedicated path for the forklift, green zone area and movement safety buffer between storage racking system. The utilization of this area mostly depends on the warehouse activities and its volume including incoming and outgoing materials.

From the interview, the material receiving happens almost every day and the volume (number of pallets) depends on the packing list provided by the supplier prior delivery process. The frequency of material deliveries depends on planned maintenance activities at the site and usually will be high within 2 to 3 days prior next supply boat schedule to the offshore location. In addition, the receiving volume will reach its peak when there are major planned maintenance activities (for example annual facility shutdown works) of certain projects. During site observation, the researcher found that the current receiving rate was minimal (less than five pallets a day) since the major maintenance work (integrated activities for 3 projects) had just been completed in previous months.

Figure 4: Material Handling Flow

The received material will be consolidated according to specific project and location 1 to 2 days prior loading date (Refer Figure 7). During this period, there are also instances where the material received in offshore containers belongs to a supplier for offshore work where this material is handled as per cross-docking operation. The loading schedule is planned by the logistics supervisor a month in advance based on logistic planning input from the client.

However, the final loading date is only made known to the company between 2-3 days in advance since the logistic scope i.e., supply boat to/from offshore location is determined by the client. as an order to transfer the material to a specific location (where consolidation is happened by project). Until the loading date is determined (as an order from the client), all transit material will temporarily occupy the open space allocated from the receiving date. Thus, the total transit time for each material (on a pallet) can be recorded as the loading

date minus the receiving date plus 1 day (1st day receiving). Below Figure 8 explains the timeline of material flow from receiving date to loading date and how to calculate the duration of transit time (TT).

Figure 5: Material Transit Time

Transit Time, TT (in days) = (Loading Date – Receiving Date) + 1

	Transit Time, TT		
Receiving date	Temporary Storage	Consolidation	Loading data
August 1	August 1	August 12	August 14
	Total duration, TT = (14/	08 – 01/08) + 1 = 14 days	

Due to material volume received within a week varying by project and the loading date not being determined upfront, the warehouse implemented a pool area on a sharing basis for temporary storage of transit material instead of specific allocation by project. The labeling tag was used to identify each material detail (i.e., PO and DO reference) and its belonging to which project. This method enables better utilization of pool space to cater to various volumes of transit material for consolidation before loading. Based on site observation, approximately 250 square feet of open floor space has been allocated for this purpose and this area can accommodate up to 150 pallets at one time.

Inventory Movement: In terms of inventory management function, this XYZ warehouse stores materials that have been purchased by clients as maintenance spares onshore for operating facilities usage upon requirement in the future. These inventories are categorized as MRO materials which include but are not limited to equipment/spare parts (including pumps and motor), special tools (for turbine/engine maintenance work) and common maintenance consumable supplies (such as gaskets, bolts and nuts). Some spares with high value (such as spare equipment and special tools) are considered as assets for the project.

As captured from the inventory data for Quarter 3 2022, Table 5 shows that the number of SKUs for spare equipment and parts dominates 61% of the inventory list followed by special tools (32%) and consumables supplies (7%). Based on input from the inventory management focal, most of the materials stored on the racking since the year 2018 are considered very slow-moving. The inventory retrieval only happens when there is a material request from the material coordinator at the site.

Type of Inventory	No. of SKU	Volume %
Equipment / Spare Parts	221	61%
Special Tools	115	32%
Consumable Supplies	25	7%
Total SKU (Q3 2022)	361	100%

Table 5: Inventory Categories, Total SKU and Volume

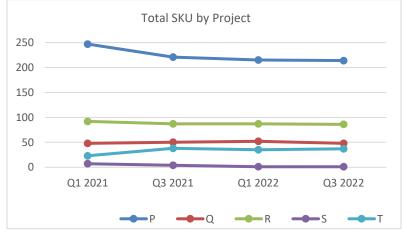

Table 6 shows a total number of SKU changes for a total duration of 18 months from March 2021 (Q1 2021) until August 2022 (Q3 2022), where the change in data presented based on bi-quarterly (e.g., Quarter 1, Quarter 3, 2021 and Quarter 1, Quarter 3, 2022). From the table also, the initial total SKUs of 418 in Q1 2021 is reduced to 361 in Q3 2022 with a total SKU movement rate of 14%. However, if the total SKU is segregated by project (Project P, Q, R, S, and T), each project shows a different trend. For instance, SKU for Project P has decreased by 23% (58 SKUs) and inversely SKU for Project T has increased by 61% (14 SKUs). Further reference made with inventory management focal clarified that there are surplus materials backloaded from offshore for Project T for storage on racking.

Project	Q1 2021	Q3 2021	Q1 2022	Q3 2022	
Р	247	215	190	189	
Q	49	50	49	48	
R	92	87	87	86	
S	7	1	1	1	
Т	23	38	35	37	
Total SKU	418	391	362	361	

Table 6: Total SKU by Project

Figure 8 shows a visualization of inventory movement trends by each project for the captured inventory monitoring duration of 18 months. About 52% of SKUs stored on the racking belong to Project P and they were inherited from the client during the project award (since year 2018). In addition, most of the materials stored on the racking were found with very slow-moving rates of 6% to 7% per year. The space allocated for inventory (which is about 20% of warehouse space) is considered fully utilized since the racking is permanently installed on the warehouse floor. Further utilization analysis by racking volume (space multiplied by height) to determine the actual capacity utilization will be explained in the next section under quantitative findings.

Warehouse Space Availability: As the previous section explains on few factors impacting warehouse space utilization, the researcher also captures some findings and concerns with regards to warehouse space availability based on information gathered during interviews and site observation. Based on the warehouse setup background and expansion happening earlier as described in Section 4.2, it was found that there are a few concerns which considered external factors impacting the warehouse space utilization. These factors are detailed below:

Warehouse space availability: There is limited space available to be leased within the supply base area, where priority is given to big oil & gas companies and offshore asset owners (clients).

Warehouse space suitability: Not all available space is suitable to cater to requirements for the company's warehouse operation, especially with a significant amount of inventory required to be stored as per contract obligation.

Business decision: The management prefers to operate the warehouse in a single-point location (including the warehouse office, operation area and storage) for better monitoring, management and cost efficiency.

Since the warehouse was established within the bonded supply base area, the available warehouse space depends on the offer given by the landlord. Based on historical events of warehouse relocation and expansion, the available and suitable spaces are limited and offered on a first come first served basis. For instance, this warehouse operates in two physical buildings (Door 1 is separated from Door 2 and Door 3) as explained in Section 4.2.1. This is happening to meet the company's management direction to have efficient operations of

the warehouse at a single location (in this case the closest space available for lease).

Discussion

Generally, the main goal of warehouse operations is to meet the demands and specifications of customers while making efficient use of the space, tools, and labor available in the warehouse. The corporation will receive and load the necessary goods in time for replenishment on the store at the offshore site for the planned O&M activities, according to this analysis, if warehouse operations are efficient.

The way a warehouse is set up at the beginning usually dictates how it will be used. The warehouse structure for the organization under investigation is based on a basic configuration with a lean operations team to complete the business function, based on results reported in the previous chapter. It is advised that the company set up its first warehouse activities to achieve its contractual obligations to complete the fundamental project needs. This is especially important as a transit point for the consolidation of materials at the onshore supply base before they are transferred to the offshore location.

However, as more contracts have been secured, the warehouse operations require expansion (physical & resources) and the project requirements becoming more complex, i.e., client's spares for storage, inventory management & reporting. Client's requirements are more stringent, especially with regards to new regulations by local authorities and compliance audits by governing bodies, i.e., new Custom regulations on the declaration for local goods before entrance to the supply base area.

In terms of facility and location, this warehouse is located within the preferred location for handling and storage of material for offshore operations. However, there are some limitations and relevant challenges for warehouse facilities located in the gazette supply base area (i.e., space availability against suitability, rules and regulations for bonded against non-bonded area). Contrarily, the company may opt to set up the warehouse outside the supply base without these limitations but may incur other possible operations challenges (i.e., additional cost for building construction/initial setup and logistics cost from the warehouse into the supply base area).

In terms of resources, this warehouse employs a basic operations structure which is commonly implemented to meet lean operations management. The warehouse personnel employed are adequate to perform the basic function of the warehouse from incoming material receiving to outgoing material loading. However, there are some concerns about manpower capacity and capability which limits the intended output of warehouse operations. In addition, the risk of overloading tasks assigned to these personnel may lead to unnecessary work pressure, an unhealthy working environment and unsafe working conditions.

This study also discovered that the warehouse still uses a basic spreadsheet to record transactional data and inventory levels. This arrangement duplicates manual data entry and may compromise warehouse information flow accuracy. Instead, the corporation may design its own WMS, including receiving and loading. The company might also subscribe to or outsource a better warehouse management system from a recognized third party that integrates with its supply chain system to maintain material requisition and PO issuance continuity.

Warehouse procedures, established by management, guide staff inefficient process execution. The warehouse procedures outline basic warehouse operations flow with appropriate roles and responsibilities of warehouse staff. The organization accepts this practice because there are no non-conformance findings from past audits.

Warehouse space utilization assesses how efficiently the warehouse stores goods and inventories. If the proportion is low, the warehouse may be larger than needed due to faulty inventory storage layout or space allocation based on demand predictions. According to the definition, warehouse space utilization is the percentage of warehouse or facility space used. This derives the formula as below:

Space Utilization % = (Amount of Warehouse Space Used ÷ Total Warehouse Space) x 100

Based on the above formula, the warehouse space is considered in use when the materials occupy the space for a specific time. In this study, it was found that 58% of total warehouse space was allocated for forklift movement and operations (material receiving, transit storage and loading activity) while 19% was installed

with storage racking. Thus, only 77% of floor space is available for warehouse operations purposes and the remaining 23% was a non-activity area which has been excluded from the calculation. From this finding, it was found that approximately 25% of the floor space has been fully utilized for racking and the utilization of balance 75% depends on daily activity volume and material movement trend. Refer to Table 7 for calculation details.

Area Type	Calculation	Space Utilization %
Storage Racking Space	19% ÷ 77% × 100 = 24.7%	25%
Operation Space	21% ÷ 77% × 100 = 27.3%	75%
Movement Space	37% ÷ 77% ×100 = 48.0%	7570

Table 7: Calculation for Warehouse Space Utilization

5. Managerial Implications and Recommendations

This study provides practical guidance for warehouse management and supply chain practitioners in identifying the aspects and difficulties related to warehouse operations. This study also aids practitioners by examining the correlation between these elements and difficulties and the success of warehouse operations, particularly in terms of warehouse space utilization.

This study demonstrates the significance of establishing a warehouse to the specific needs and service requirements of a firm. Furthermore, the successful and efficient execution of warehouse activities heavily relies on the proficient administration of warehouse resources.

This study provides a baseline understanding of warehouse operations for service companies in the upstream industry. The findings and outcome from this study may provide guidance and opportunities for future research in the following areas:

Although the study has identified two main factors impacting space utilization, the level of importance of each of the factors is not defined as the objective of this study is only to identify and explore the factors.

A larger scale study using a quantitative survey instrument involving more participants from various stakeholders can be carried out to further investigate more factors and the interrelation between these factors. The quantitative survey also may discover new factors or issues that have not been identified in this study.

For future research, further study could be carried out about warehouse layout design for warehouse set up within the same industry, with the expectation to determine the effectiveness, advantages and disadvantages of each layout. In addition, a similar study was to determine the impact of inventory management strategy for similar warehouse operations, where categorization and classification of inventory were made before organizing and storing them on allocated racking.

Conclusion

This study enhances the comprehension of warehouse operations for service companies, namely those involved in providing operations and maintenance (O&M) for offshore facilities in the upstream business. This study enhances our understanding of the specific requirements and approach for setting up warehouse operations to fulfill contractual obligations. This study is one of the first to examine and document how the organization determines the fundamental warehouse activities that can meet the business requirements while ensuring that the setup and functionality remain cost-effective. This study also revealed the diverse aspects and difficulties that impacted the utilization of warehouse space and the performance of operations.

The results of this study make a valuable addition to the existing information about how the arrangement of a warehouse, the process of handling materials, and the methodology of storing inventory impact the utilization of warehouse space. The warehouse in question utilizes a combination of a distribution center (DC) layout and an inventory storage layout. The transit material is managed according to the DC concept, while the inventory is housed on a 4-tier racking system. According to the researcher's expertise, this study is the first of its kind to be undertaken in both environments, offering significant insights to warehouse operations and supply chain management professionals.

Abstract: Patient satisfaction is a critical aspect of healthcare service quality that needs to be periodically evaluated and improved. Understanding various factors, including empathy, assurance, reliability, tangibility, and responsiveness, is necessary to enhance healthcare quality and improve patient satisfaction. This research aims to investigate the level of patient satisfaction and the relationship between patient satisfaction and service quality, using the five SERVQUAL model as a framework. A positivist approach was used to explore the relationship between variables. Data collection was carried out for two weeks using online questionnaires. For this research, 120 UiTM respondents were chosen using convenience sampling. Data was analyzed using SPSS version 29. The findings revealed a significant positive relationship between tangibility, responsiveness, and empathy with patient satisfaction. This study highlights the importance of regularly assessing patient satisfaction and identifying areas for improvement in healthcare service quality. University health centers can enhance patient satisfaction and provide better student healthcare services by focusing on tangibility, responsiveness, and empathy.

Keywords: Patient satisfaction; University healthcare center; SERVQUAL; Health service quality

1. Introduction and Background

Despite limited medical resources, providing the highest-quality healthcare services has long been the primary goal for healthcare systems worldwide. Providing high-quality healthcare services is fundamental to ensuring positive patient outcomes and overall population well-being. The most important aspect of healthcare delivery services is the patient's satisfaction, representing the whole experience and the standard of care received. Patient satisfaction, which reflects the degree to which a patient's expectations and perceptions of healthcare services are met, has emerged as a critical measure of healthcare quality.

As the demand for healthcare quality has increased, healthcare systems are constantly changing and improving, so it is necessary to find a way to assess outputs while evaluating patient satisfaction. Patient satisfaction impacts various aspects, including clinical outcomes, hospital reputation, and patient retention. Healthcare systems are constantly changing and improving, so finding a way to assess outputs while evaluating patient satisfaction is necessary. The need to monitor and assess patient satisfaction has increased along with the demand for healthcare quality, prompting the creation of guidelines for patient satisfaction monitoring (Gavurova et al., 2021; Al-Qudimat et al., 2024). Improving an understanding of and enhancing patient satisfaction can benefit healthcare organizations by increasing patient loyalty, producing better results, and enhancing their reputation (Ferreira et al., 2023).

Healthcare service quality in Malaysia's university healthcare centers is a crucial aspect that significantly affects the behavioral intentions of university students. While access to healthcare is guaranteed in Malaysia, there is a growing emphasis on evaluating the quality of services offered within higher education institutions. A survey on customer satisfaction is considered an effective way to provide healthcare service providers with beneficial information. As customers of the healthcare center, the students' views should be considered, as they can serve as strategic inputs in assessing their satisfaction. The issue of healthcare quality and student satisfaction has been studied by many researchers across the globe over the past few years (Alshurideh, 2014; Lee & Kim, 2017; Rezaian & Selamat, 2015; Abdullah et al., 2022). However, the study on the relationship between service quality and satisfaction, specifically in public universities, is limited and has inconsistent

findings.

In the contemporary healthcare landscape, the quality of services provided within health centers plays a pivotal role in shaping patient experiences and satisfaction. With the evolution of the healthcare system, particularly within university health centers that cater to diverse student populations, understanding the dynamics of service quality becomes increasingly important. Assessing customer satisfaction through surveys effectively gathers beneficial information for healthcare service providers (Marzo et al., 2021). Thus, it is essential to determine the influence of healthcare service quality on students' satisfaction. This study attempted to fill this gap by examining the impact of healthcare service quality on student satisfaction at UiTM Selangor Campus.

2. Literature Review

Patient Satisfaction

Research on patient satisfaction began in the early 1950s, focusing on the interaction between doctors and patients. It gained a significant increase in interest in the 1960s, with extensive studies conducted to explore various dimensions of patient satisfaction. Patient satisfaction has garnered significant interest in the healthcare sector because it is a critical indicator that captures the quality of care delivered and the overall patient experience. Traditionally, patient satisfaction was viewed as a customer service initiative, but recent research has highlighted its importance as a critical dimension of healthcare quality (Hefner et al., 2019).

The concept of patient satisfaction has been defined variably across studies. Generally, it reflects the degree to which patients' expectations regarding healthcare services are met (Al-Abri & Al-Balushi, 2014). Some researchers view it as a measure of attitudes toward care (Goodrich & Lazenby, 2023), while others define it as the congruence between patient expectations and their actual experiences of care (Agency for Healthcare Research and Quality, 2020; Lateef, 2011; El-Haddad et al., 2020), which posits that the gap between expectations and actual experiences influences satisfaction. These definitions illustrate the complexity of patient satisfaction, emphasizing its dependence on individual perceptions, expectations, and the specific attributes of care received. Understanding these nuances is essential for healthcare providers aiming to enhance patient experiences and satisfaction levels.

Patient satisfaction is a critical determinant of healthcare providers' success (Kalaja & Krasniqi, 2022), as it includes the treatment outcome, overall experience, and interactions with healthcare providers (Manzoor et al., 2019). It reflects the state of pleasure or happiness that patients experience while utilizing healthcare services (Manzoor et al., 2019). Moreover, patient satisfaction is a multi-aspect concept closely related to the main attributes of services and providers (Hussain et al., 2019). This emphasizes that patient happiness is an essential quality measure in healthcare settings. By integrating patient satisfaction metrics into healthcare assessments, healthcare providers can pinpoint development opportunities and elevate the general standard of care provision. Understanding and improving patient satisfaction will be essential as healthcare evolves, enhancing the quality of care and patient outcomes.

Service Quality Gap Model (SERVQUAL Model)

The service Quality Gap Model, or SERVQUAL model, developed by Parasuraman, Zeithaml, and Berry (1988), is a widely applied service quality framework to determine the level of satisfaction among patients across the globe (Alshrbaji et al., 2022). The SERVQUAL model represents service quality as the discrepancy between a customer's expectations of service offering and the customer's perceptions of the service received (Parasuraman et al., 1985). The SERVQUAL model includes five dimensions: tangible, reliability, responsiveness, empathy and assurance. The dimensions of the SERVQUAL model are explained in the following:

Tangible

Tangible is an essential factor in patient satisfaction and healthcare service quality. The term "tangibility" describes the physical spaces, tools, staff, and informational resources that patients encounter while receiving medical care. These specific factors greatly influence patients' opinions about the quality and satisfaction of the services they receive. To shape patients' views of service quality, for example, research by Parasuraman et al. (1985) highlights the significance of tangible cues, such as the appearance of medical equipment, the

cleanliness of facilities, and the professionalism of staff apparel. Modern facilities and well-maintained equipment are positive, tangible features that can boost patients' confidence in the healthcare provider and increase overall patient satisfaction.

Patient satisfaction in healthcare settings is intricately linked to the quality of services, particularly the tangible aspect of care. Tangible dimensions of healthcare quality, such as the physical environment, equipment, and facilities, are crucial in shaping patient perceptions and experiences (Suhadi et al., 2022). Studies have shown that the quality of amenities, which falls under the tangible dimension, positively influences patient loyalty and satisfaction (AlOmari & Hamid, 2022). Additionally, the tangible dimension is one of the critical components of service quality that significantly impacts patient satisfaction (Fadila et al., 2022). Therefore, the following research hypothesis is proposed:

H1: Tangible positively influences patient satisfaction

Reliability

The service's reliability means that patients receive the treatment they believe is correct for their health problems. Reliability in healthcare service quality is a crucial aspect that directly impacts patient satisfaction. The reliability of healthcare services is defined as their consistency and dependability in meeting patients' needs and expectations (Endeshaw, 2020). It is one of the critical dimensions used for measuring the quality of healthcare services (Endeshaw, 2020; Osarobo & Adekunle, 2022). Studies have identified reliability as a fundamental characteristic of high-quality healthcare services, alongside other dimensions like responsiveness, assurance, and empathy (Jordan et al., 2021). Ensuring reliability in healthcare services is essential for building patients' trust and delivering consistent care that meets their expectations (Endeshaw, 2020).

The relationship between reliability in healthcare service quality and patient satisfaction is intricate. Studies have shown that the reliability of healthcare services is positively associated with patient satisfaction (Endeshaw, 2020). When patients perceive healthcare services as reliable, consistent, and dependable, it enhances their overall satisfaction with their care (Endeshaw, 2020). Reliability builds patient trust, a critical factor in patient satisfaction (Endeshaw, 2020). Therefore, healthcare providers must ensure reliability to improve patient satisfaction (Endeshaw, 2020). According to the discussions, the hypothesis is proposed. **H2:** Reliability positively influences patient satisfaction.

Responsiveness

Responsiveness is the ability and willingness of healthcare providers to address patients' needs and concerns successfully. Responsiveness requires effective communication, which is also necessary to promote desirable patient-provider interactions. When healthcare services are responsive, patients feel valued, listened to, and cared for, leading to higher satisfaction levels (Ugwu et al., 2022). Healthcare providers are highly valued by their patients because they actively listen to their concerns, offer clear explanations, and involve them in decision-making. Renedo and Marston's (2015) article highlighted how communication influences patients' views of responsiveness and made the case that polite, honest communication increases patient satisfaction.

Responsiveness in healthcare service quality pertains to the promptness and willingness of healthcare providers to assist patients and deliver care when required. It encompasses timely appointments, quick responses to inquiries, and efficient handling of patient needs (Nguyen & Pham, 2023). Studies have consistently shown that responsiveness is a critical dimension of healthcare service quality that significantly influences patient satisfaction (Ugwu et al., 2022). Patients highly value healthcare facilities that are responsive to their needs and concerns, as they enhance their overall experience and perception of the care received (Kaur et al., 2022). A previous study by Chandra et al. (2019) and Uguwu et al. (2022) reported that patient satisfaction and responsiveness correlate positively. Patient satisfaction was more vital in healthcare facilities with higher responsiveness at the top of their service delivery structure to improve patient outcomes and satisfaction (Ugwu et al., 2022). Thus, it is hypothesized that:

H3: Responsiveness positively influences patient satisfaction

Assurance

Assurance is reflected in the patient's reliance on the doctor and hospital staff and their confidence in their qualifications and competence (Parasuraman et al., 1996). Assurance encompasses medical professionals' skills, service reliability, and patient-provider trust development. Patients are more likely to feel satisfied with the quality of care they receive when they have faith in the abilities and knowledge of their healthcare providers. Patients place a high value on reliability in healthcare settings because it eliminates ambiguity and cultivates trust in the healthcare system, increasing patient satisfaction with their care.

Assurance in healthcare service quality encompasses factors such as the competence of health workers, the courtesy of their behavior, reliability, and the safety of services provided. Patient satisfaction is a crucial outcome in healthcare services, influenced by various service quality dimensions, including assurance (Laela et al., 2022). The relationship between assurance and patient satisfaction is significant, as the ability of healthcare providers to convey trust and competence directly impacts how satisfied patients are with the care they receive (Laela et al., 2022). Patients who perceive high levels of assurance from healthcare providers are more likely to be satisfied with their care (Laela et al., 2022). This emphasizes the importance of delivering quality healthcare services and ensuring that patients feel confident in their care, which can positively impact their overall satisfaction with the healthcare experience. Therefore, it is hypothesized that: **H4:** Assurance positively influences patient satisfaction.

Empathy

Empathy in healthcare service quality refers to the ability of healthcare professionals to understand and share their patients' feelings, show compassion, and provide personalized care (Moudatsou et al., 2020). It is fundamental in establishing a therapeutic relationship between carers and patients, contributing significantly to better health outcomes (Moudatsou et al., 2020). Studies have consistently highlighted the importance of empathy in healthcare, emphasizing its role in optimal communication between medical professionals and patients (Haddad et al., 2023). Empathy is crucial for developing a positive patient-provider relationship, linked to improved patient outcomes, higher levels of patient satisfaction, and an enhanced sense of well-being among patients (Holmes & Starr, 2022).

The relationship between empathy and patient satisfaction is further supported by evidence showing that patient-perceived empathy is linked to reduced anxiety and distress and increased satisfaction (Hoffstädt et al., 2020). Additionally, empathy has been identified as a critical factor in determining the quality of service in healthcare, with aspects such as a calm working demeanor, effective communication, appealing appearance, and the ability to address patient concerns contributing to patient satisfaction (Laela et al., 2022). Moreover, empathy facilitates positive communication relationships, personal attention, and understanding of patient needs, all of which are essential for enhancing patient satisfaction (Simanullang et al., 2021). Therefore, this study proposed the following hypothesis:

H5: Empathy positively influences patient satisfaction.

Conceptual Framework

The conceptual framework of this study was guided by SERVQUAL, developed by Parasuraman, Zeithaml, and Berry in 1988. The SERVQUAL model, developed by Parasuraman, Zeithaml, and Berry, is widely used to assess and comprehend service quality from the consumer's viewpoint in various service industries, including healthcare. Figure 1 shows the conceptual framework of this study.

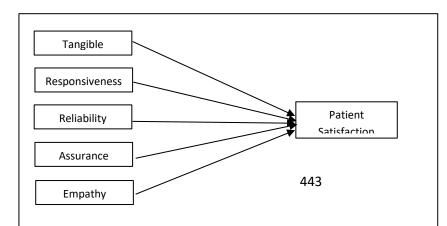

Figure 1: Conceptual Framework

3. Research Methodology

Design, Sample, and Setting

A positivist approach was used to explore the relationship between variables. The study was primarily conducted via a survey among students in UiTM Puncak Alam. The G*Power software was used to calculate the sample size for this study. The effect size was set at 0.15 (medium effect), α at 0.05, and power at 0.80; thus, the sample size is 92. However, the researcher distributed the questionnaire to 150 students to obtain an excellent response rate. The inclusion criteria were established to ensure that the sample accurately reflects the population of interests: 1) participants must have utilized the university health clinic UiTM Puncak Alam at least once during the academic year, and 2) willing to participate in the survey. This study utilized convenience sampling for data collection due to its accessibility, efficiency, and willingness to engage participants, aligning with research objectives and university context, making it a practical choice.

Instrument Development

The research instrument for this study was developed based on an extensive literature review that combined existing validated measurements. The questionnaire, which consisted of seven sections measuring demographic data, namely tangible, reliability, responsiveness, assurance, empathy, and patient satisfaction, was used to collect the data. The respondents were requested to complete the questions about their demographic backgrounds, such as gender, age, semester, type of residency, and faculty. A total of 37 items were adapted from Abdullah et al. (2023) to measure all the variables. The researchers employed a five-point Likert scale ranging from strongly disagree to agree.

Data collection procedures

Data was collected from the respondents using an online survey via Google Forms. The questionnaire was distributed via WhatsApp. The respondents took approximately 5 to 10 minutes to complete the questionnaires. One hundred fifty questionnaires were distributed via Google Forms to the respondents, and only 120 were returned.

4. Results

Data were analyzed using SPSS version 26.0. Most of the respondents were female, in semester five from the Faculty of Business and Management, aged 18-23 years old and staying in the college residency. The results are presented in Table 1.

Variable	Frequenc	Percentage
	У	(%)

Table 2 below presents the descriptive statistics results of the study, including mean, standard deviation, skewness, kurtosis and Cronbach's alpha value. The normality test was run to determine the distribution's shape. The assumptions were tested by running the descriptive statistics, and the Skewness and Kurtosis results were presented. The normality test shows that the data was generally distributed since the value of the skewness and kurtosis was ± 3 for each variable (Ng & Coakes, 2013). In this study, reliability analysis was performed by computing Cronbach's alpha values for each variable. The findings revealed that the scale has good internal consistency.

Information Management and Business Review (IMBR) Vol. 16, No. 3(S), Sep 2024 (ISSN 2220-3796)

Variable	Mean	SD	Skewness	Kurtosis	No of Item	Cronbach Alpha
Tangible	3.885	0.764	-0.661	1.126	6	0.912
Reliability	3.892	0.814	-0.715	0.829	7	0.949
Responsiveness	3.892	0.814	-0.670	0.719	7	0.937
Assurance	4.063	0.790	-0.898	1.084	5	0.953

Table 2: Descriptive Statistics

The association between the independent and dependent variables (patient satisfaction) was investigated using the Pearson product-moment correlation coefficient. Preliminary analyses were performed to ensure no normality, linearity and homoscedasticity assumptions were violated. The findings revealed a strong positive correlation between all independent and dependent variables. A summary of the correlation result is presented in Table 3.

Table 3: Pearson correlation coefficient

Tuble 5.1 curson com	clation cot	merene				
	1	2	3	4	5	6
Tangible	1					
Reliability	.906**	1				
Responsiveness	.906**	1.000**	1			
Assurance	.822**	.898**	.898**	1		
Empathy	.829**	.896**	.896**	.914**	1	
Patient Satisfaction	.865**	.897**	.897**	.885**	.899**	1

Multiple regression analysis was used to measure the relationship between the variables. This multiple regression addressed which variable in a set of independent variables can be considered the best predictor or most significant factor influencing the dependent variable. Table 4 shows the results of the multiple regression

analysis conducted in this study. The result shows no collinearity problem as the value of the VIF was less than ten, and the tolerance value was below 1.0, given from the three independent variables. The R2 value of 0.871 indicates that 87.1 percent of the variation in the dependent variable is explained by the independent variables. Another 12. percent of the variance in patient satisfaction was explained by other factors. The F-test is significant at the p-value <0.05 (0.000); therefore, the linear model is valid overall.

	Standardized	Т	sig	Lower	Upper	Tolerance	VIF

Table 4: Multiple Regression

As specified in Table 4, the result from multiple regression analysis revealed no significant relationship between reliability and patient satisfaction (β =0.120, p>0.05) and assurance and patient satisfaction (β =0.159, p>0.05). However, this study indicated a significant relationship between tangible (β =0.223, p<0.05), responsiveness (β =0.190, p<0.05) and empathy (β =0.096, p>0.05). Table 5 shows the results of the summarised hypotheses of this study.

Table 5: Summary of Hypotheses

Hypotheses	Results
H1: There is a significant relationship between tangible and patient satisfaction.H2: There is a significant relationship between reliability and patient satisfaction.H3: There is a significant relationship between responsiveness and patient satisfaction.	Supported Rejected Supported
H4: There is a significant relationship between assurance and patient satisfaction. H5: There is a significant relationship between empathy and patient satisfaction.	Rejected Supported

Discussion

Tangible elements such as the physical environment, equipment quality, staff appearance, and overall ambiance are integral to patient satisfaction. Tangible forms the first impression of a healthcare facility and can substantially impact a patient's overall experience. The findings revealed a positive relationship between tangible and patient satisfaction. The finding observed in this study mirrors those of previous studies, which show that tangibles significantly influence patient satisfaction (Purwanti et al., 2019; Koampa et al., 2023; Zuriati & Chiew, 2020; Abdullah et al., 2022; Fadila et al., 2022; AlOmari & Hamid, 2022; Jha et al., 2020). There are several possible explanations for this. First, when patients perceive the physical environment as clean, well-maintained, and modern, their satisfaction levels tend to increase. Second, adequate facilities, such as waiting areas and examination rooms, contribute to a positive patient experience. This strong relationship highlights that patients' perceptions of tangible factors can significantly shape their overall satisfaction with healthcare services, making it a critical area for continuous improvement and investment. Improvements in these areas can lead to higher satisfaction as patients associate their experiences with the quality of care.

Reliability is a service provider's ability to consistently and accurately deliver promised healthcare services. This dimension is critical for fostering patient trust and satisfaction. Key components of reliability encompass timely and accurate diagnoses, consistent treatment outcomes, and effective communication, which significantly shape the overall patient experience. Our study examined the reliability dimension and surprisingly found that reliability is not a significant predictor of patient satisfaction. However, this result has not been previously described (Smith et al., 2020; Abdullah et al., 2022; Jordan et al., 2022; Endeshaw, 2020;

Zuriati & Chiew, 2020). The demographic characteristics of the respondents might influence a possible explanation for this. Their age and healthcare experience may influence their perception of reliability and satisfaction. Additionally, the context of a university health center, often characterized by limited resources and staff, can impact service delivery and, consequently, patient perceptions of reliability and satisfaction. To further enhance reliability in healthcare settings, it is recommended that regular staff training be provided and a comprehensive feedback mechanism be implemented to improve service quality. Implementing strategies that enhance reliability can lead to improved patient satisfaction outcomes. As reliable healthcare services foster greater patient trust, satisfaction, and loyalty, healthcare providers must prioritize enhancing reliability in their service delivery.

Responsiveness, encompassing aspects such as timely care, effective communication, and attentiveness to patient needs, emerges as a critical determinant of patient satisfaction in healthcare settings. The findings show a positive significant relationship between responsiveness and patient satisfaction. This result generally replicates that of past research (Ugwu et al., 2022; Kaur et al., 2022; Li et al., 2023; Abdullah et al., 2022). The analysis highlights the importance of healthcare providers and staff being responsive to patient concerns and needs, as it directly influences overall satisfaction levels and perceived quality of care. This may be explained by the fact that when patients feel their healthcare providers are responsive, they are more likely to trust and adhere to medical advice, further reinforcing the positive relationship. Thus, healthcare institutions aiming to improve patient satisfaction should prioritize improving responsiveness to patient needs. It is recommended that university healthcare centers prioritize and enhance their responsiveness strategies to foster better patient satisfaction outcomes. Research by Smith et al. (2020) highlights several practical approaches, including improving staff communication skills, optimizing appointment scheduling processes to minimize waiting times and implementing systems to promptly resolve patient queries and concerns. These strategies improve patient experience, operational efficiency, and quality of healthcare service. Furthermore, cultivating a patient-centered culture in which responsiveness is ingrained as a core value among healthcare providers and staff can significantly improve patient satisfaction metrics. Continuous monitoring and feedback mechanisms should be implemented to gauge responsiveness levels and identify areas for improvement, ensuring ongoing enhancement of patient satisfaction in university healthcare settings.

Assurance encompasses aspects such as the competence of healthcare providers, their ability to instill confidence and trust, and the clarity of communication about medical procedures and diagnoses. According to the findings, assurance is not a significant predictor of patient satisfaction. However, the current study's findings do not support the previous research. The studies conducted by Laela et al. in 2022, Abdullah et al. in 2022, and Smith et al. in 2021 do not support the current findings. A possible explanation for the finding might be due to the environment of a university health center, as healthcare centers often operate with limited resources and staff, which may affect the ability of healthcare providers to instill confidence in their patients. If students experience long wait times or feel that their concerns must be adequately addressed, this can diminish the perceived importance of assurance in their overall satisfaction. This highlights the importance of healthcare providers ensuring clear communication, competence in medical care, and demonstrating empathy towards patients to improve overall satisfaction levels. Implementing strategies to enhance assurance can lead to improvements and outcomes, reinforcing the critical role of healthcare quality assurance in patient-centered care (Smith et al., 2021). By focusing on factors such as staff competence, communication, and the ability to inspire trust, healthcare providers can enhance the overall satisfaction levels of their student patients. Understanding the importance of assurance in this context can help healthcare professionals tailor their services better to meet university students' needs and expectations.

Empathy involves understanding and sharing another person's feelings, translating to providers listening attentively, showing concern, and addressing patients' emotional and medical needs (Hojat et al., 2011). Consistent with the literature on the association between empathy and patient satisfaction (Johnson et al., 2021; Abdullah et al., 2022; Holmes & Starr, 2022; Rajput et al., 2020; Laela et al., 2020; Haddad et al., 2023), this study confirms that empathic care by healthcare providers influenced patient satisfaction, which is an important outcome measure for healthcare quality. Patients who perceive their providers as empathetic are more likely to report positive experiences and outcomes, including increased trust, better adherence to treatment plans, and overall satisfaction with their healthcare encounters (Johnson et al., 2031; Derksen et al., 2013; Kim et al., 2017). Fostering empathy among healthcare professionals is crucial for enhancing patient

satisfaction and improving the overall quality of healthcare delivery. Therefore, strategies that enhance empathy in university healthcare centers should be implemented to improve patient satisfaction levels further. The recommendations include providing healthcare workers with ongoing empathy training to help them develop their interpersonal skills, implementing patient feedback mechanisms to regularly assess and improve empathetic communication, and cultivating a culture of compassionate care by encouraging policies and procedures. These programs are essential to developing a compassionate healthcare environment that enhances patient happiness and experiences.

5. Managerial Implications and Recommendations

The managerial implications of research on patient satisfaction are profound for enhancing healthcare services and the overall performance of healthcare organizations. By identifying the primary determinants of patient satisfaction, providers at university health centers can optimize resource allocation, thereby improving patient experiences and satisfaction levels. Moreover, the insights derived from such research can serve as strategic guidelines for university healthcare centers, particularly regarding quality improvement initiatives, promoting patient-centered care, and implementing staff engagement training programs.

The findings enrich the existing literature on healthcare service quality and patient satisfaction and provide a nuanced understanding of the interplay between these elements within the specific context of university health centers. This research contributes to establishing best practices in healthcare management and lays a foundation for future inquiries into this critical area. The emphasis on patient satisfaction as a key performance indicator underscores its significance in fostering patient loyalty and enhancing the reputation of healthcare institutions. As healthcare environments become increasingly competitive, measuring and responding to patient satisfaction will be crucial for healthcare organizations' long-term success and sustainability.

To fully understand the dynamics of patient satisfaction among university students, further research is needed to investigate additional factors that may influence their experiences, including trust and patient-centered care. Trust plays a crucial role in shaping students' perceptions of service quality. Establishing a trusting relationship between healthcare providers and students can significantly enhance satisfaction. A patient-centered approach where individual needs and preferences are prioritized can also lead to more positive outcomes. Engaging students in their care and actively respecting their unique circumstances fosters a sense of ownership and satisfaction. Future studies should also consider assessing patient satisfaction across different campuses. This comparative analysis can provide valuable insights into how varying service quality and institutional practices impact student experiences. By examining satisfaction levels in diverse settings, researchers can identify best practices and areas for improvement, ultimately contributing to enhanced service quality and student wellbeing. Future research can inform strategies to improve healthcare services and enhance student satisfaction outcomes.

Conclusion

The research findings underscore the critical relationship between service quality dimensions and patient satisfaction within university health centers, particularly at UiTM Puncak Alam Campus. The study identifies tangible aspects, responsiveness, and empathy as significant predictors of patient satisfaction. This indicates that the physical environment of the health center, the staff's willingness to assist patients, and the compassionate demeanor of healthcare providers are pivotal in shaping patient experiences. Given the increasing importance of patient satisfaction as a critical performance metric in healthcare, these insights are particularly relevant for university health management. Enhancing service quality improves patient outcomes and influences healthcare institutions' overall reputation and financial viability. The findings suggest that university health centers should enhance their healthcare facilities and staff training programs to foster a more supportive and effective patient care environment. While this study primarily focuses on assessing the service quality of the university health center, it does not explicitly compare these services to those offered by external healthcare providers. However, valuable insights can be drawn by examining service quality across various universities and healthcare settings. In conclusion, this research highlights the necessity for university health centers to adopt a proactive approach in addressing the identified service quality dimensions. These institutions can significantly enhance patient satisfaction by investing in tangible improvements and fostering a culture of responsiveness and empathy among healthcare providers. This, in turn, will lead to better health

outcomes, increased patient loyalty, and a stronger competitive position in the healthcare market.

Fostering Future Investors: Analysing Determinants of Stock Market Participation Among Malaysian Students using PLS-SEM

Suhaily Maizan Abdul Manaf, Mohd Talmizie Amron*, Zalinawati Abdullah, Zuraida Mohamad, Sahaida Laily Md Hashim University Teknologi MARA, Puncak Alam Campus, Selangor, Malaysia *talmizie@uitm.edu.my Corresponding Author: Mohd Talmizie Amron

Abstract: Participation in the stock market is crucial for financial engagement and wealth creation. However, specific population segments, such as students from higher learning institutions, may exhibit lower stock market participation levels. Addressing this issue, this study uses the behavioral finance theory to examine how financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, social interaction, and investment intention influence stock market participation. Data was collected through a self-administered questionnaire distributed to 669 university students in Malaysia aged 17-30 years old. The findings reveal that financial literacy, herding behavior, risk tolerance, and social interaction positively influenced investment intention. The study also discovered that investment intention positively influences stock market participation. This study has made significant contributions to both theory and practice. Theoretically, this study contributes to the literature by confirming the positive relationship between financial literacy and investment intention. This study contributes to the development of more effective interventions and policies that not only educate students about an essential aspect of financial literacy but also prepare them for a financially secure future.

Keywords: Stock market participation, investment intention, higher education institution, behavioral intention

1. Introduction

The stock market is a public platform where buyers and sellers of stocks (also called shares) come together to trade. Stocks represent ownership claims on businesses; investors can own a piece of a company by buying stocks. Jaiyeoba and Haron (2016) stated that comprehending the investment decision-making behavior of stock market participants extends beyond merely examining their priorities.

The Malaysian government has encouraged investment in the stock market throughout the years, particularly among university students who allocate their investment funds towards various savings schemes that yield minimal returns. The National Strategy for Financial Literacy 2019-2023 illustrates a national initiative to promote and foster a culture of savings and investments among Malaysians. Hence, it is imperative to comprehend the financial aspect of human behavior and decision-making and scrutinize the determinants that impact the inclination of Malaysian undergraduate students toward investing in the stock market. (Yang et al., 2021). Furthermore, it is paramount to ascertain the influence of these factors on the involvement of unemployed individuals in the Malaysian stock market.

According to the CGS-CIMB Retail Investors' Sentiment Survey, only 17% of Malays participate in stock market activities, compared to 76% of Chinese, 4% of India, and 3% of other ethnicities in Malaysia. Furthermore, the survey highlights that 25% of the investors surveyed are under the age of 31. This suggests that most investors are relatively young and may have different investment preferences and risk tolerances than older investors. Surprisingly, the survey also reveals that only 5% of the investors identified themselves as students with either rudimentary knowledge or no knowledge of stock investment. This implies that most investors surveyed possess at least some level of understanding or experience in stock investing.

Evidence of determinant factors, namely financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, and social interaction, that influence stock market investment intention and participation has not been fully addressed, especially from the perspective of Malay Bumiputra and young people in Malaysia. Based on the financial behavior theory (Thaler, 1999), this study tries to answer the following research questions: (a) How do determinate factors, namely financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, and social interaction toward influence stock market investment intention? (b) Does investment intention influence stock market participation?

Thus, this study seeks to fill in the literature gap by examining how financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, and social interaction influence investment intention, as well as how investment intention influences stock market participation. The study provides significant contributions to both theory and practice. From a theoretical perspective, this study enhances understanding of the influence of financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, social interaction on stock market investment intention, and the influence of investment intention on stock market participation. From a managerial perspective, the findings provide guidelines to help financial and educational institutions develop their comprehensive approach, which makes the initiative more aligned with contemporary trends such as digitalization and more appealing to a generation that is increasingly conscious of sustainability.

2. Literature Review

Stock market participation

The stock market serves as a platform for individuals and institutions to buy and sell securities, such as stocks and bonds, intending to generate returns on investment. Understanding the stock market and its impact on investment intention is crucial for individuals seeking to participate in financial markets (Jain et al., 2022). The stock market is a crucial instrument in equity investments. It attracts significant funding from financial institutions and retail investors (Sabiran et al., 2023), particularly in developing countries, as it represents the country's economic performance (Murthy et al., 2016).

Gaining insights into the determinant factors that influence stock investment intention holds paramount importance for various stakeholders, as the participation of stock investors plays a pivotal role in determining the stock market's success (Yoopetch & Chaithanapat, 2021). A higher number of investors, from individual to institutional to international investors, could assist in the stock market growth and improve market efficiency. It asserts that people are more motivated to take the necessary measures to enter the stock market and make investments when they genuinely want to invest and intend to do so. This goal may motivate people to do a thorough analysis, get the essential information, seek advice, and get beyond entry-level obstacles, increasing stock market participation. The extent to which a person participates in the stock market has a significant impact on how much money she/he can accumulate and spend (Mehra & Prescott, 1985).

Investment Intention

Investment intention refers to an individual's inclination or desire to invest in financial instruments, such as stocks, bonds, or mutual funds, intending to generate long-term capital growth or income. (Ghosh, 2022). Recent research has focused on various factors influencing investment intention in the stock market. One important factor is financial literacy, which refers to an individual's knowledge and understanding of financial concepts, products, and investment strategies. (Dorina et al., 2022). Research has consistently revealed a positive association between higher levels of financial literacy and investment intention in the stock market. (Jain et al., 2022; Lin & Bates, 2022). Individuals with excellent financial knowledge and understanding are likelier to have a positive attitude toward stock market investing and express an intention to invest.

In the context of Malaysia, as a developing nation, Ahmaed and Noreen (2021) Expressed that investors need help making investment decisions due to the high volatility and vast heterogeneity of investor behavior. Given the influential role of financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, and social interaction in shaping investment decisions, the study puts forth the following hypotheses with the research model as shown in Figure 2:

Financial Literacy

Financial literacy refers to acquiring a comprehensive range of competencies and information, enabling individuals to make judicious and efficient choices regarding their financial assets. Enhancing financial literacy levels enables individuals to make more informed decisions regarding their financial investments (Bayar et al., 2020). Ahmad and Shah's (2022) Research uncovered a noteworthy positive correlation between financial literacy, investment choices, and investment outcomes.

In addition, Bayar et al. (2020) Econometric analysis findings suggest a positive relationship between financial risk tolerance, financial literacy level, and educational level. This relationship is attributed to the fact that these factors facilitate making complex financial decisions. Furthermore, Mishra (2018) Disclosed that individuals must augment their financial literacy and awareness by participating in financial education programs or seminars offered by diverse organizations. The inadequate level of financial literacy among individuals poses a significant challenge to their preparedness to engage in stock market investment, which necessitates a comprehensive grasp of fundamental concepts about the economy, industry, and companies.

Financial Well-being

Financial well-being refers to an individual's overall satisfaction and sense of security regarding their financial situation. It encompasses various dimensions, including financial stability, financial security, and financial freedom. (Diener & Biswas-Diener, 2008). Understanding and promoting financial well-being is important as it is closely linked to an individual's overall life satisfaction, psychological well-being, and overall quality of life (Brailovskaia et al., 2022).

Financial literacy is a crucial aspect of financial well-being, which refers to an individual's knowledge and understanding of financial concepts, products, and decision-making skills (Kumar et al., 2023). Numerous studies have emphasized the positive association between financial literacy and financial well-being. Higher levels of financial literacy are linked to better financial management practices, reduced financial stress, and improved financial decision-making (Cossa et al., 2022; Van Nguyen et al., 2022).

Additionally, financial behaviors play a vital role in determining financial well-being. Research has shown that responsible financial behaviors, such as budgeting, saving, and prudent debt management, positively impact financial well-being. (Bhatia & Singh, 2023; Mousavi & Rasaeimanesh, 2023). Conversely, impulsive spending, excessive debt, and inadequate savings contribute to financial distress and hinder financial well-being.

Herding Behavior

Herding behaviors are the propensity for people to rely on their investment choices on the actions and behaviors of others, especially in ambiguous or uncertain circumstances. Jaiyeoba et al. (2020) Detailed that it is a scenario in which rational investors disregard their information and instead adopt the judgments of others when making investment decisions. This phenomenon occurs when the impact of external information or decisions outweighs investors' private information. To be clear, people are more likely to form an intention to invest when they obtain support or encouragement to engage in herding behavior through social cues or recommendations from reliable sources. Bakar and Yi (2016) defined herding behavior as the tendency for an individual to conform to the decisions of the majority, which are assumed to be correct. The perception of a consensus or majority partaking in a specific investing activity can foster trust and confidence, improving one's intention to invest.

The influence of herding behavior on investors' stock market participation decisions has been affirmed in multiple studies (Ahmaed & Noreen, 2021; Pahlevi & Oktaviani, 2018; Yang et al., 2021). Thus, the phenomenon of availability bias occurs when an individual's decision-making process is influenced by easily accessible and recent information. The findings of Ahmaed and Noreen (2021) shed light on the behavior of individual investors in the Pakistan Stock Exchange, indicating a strong alignment with various factors. Specifically, investors demonstrate agreement with the impact of other investors' decisions regarding stock selection and stock volume on their investment decisions. This suggests a manifestation of the herding effect in their behavior, as they also exhibit agreement with other aspects associated with herding. Yang et al. (2021) concurred that a lack of knowledge and limited access to information leads many investors to mimic the actions of others. The strong alignment of investors with the factors mentioned above holds significance due to the presence of the herding effect. This phenomenon highlights investors' tendency to follow others' decisions and behaviors, further emphasizing the impact and relevance of the identified factors.

Conversely, Bakar and Yi (2016) discovered that herding does not significantly influence investors' decisionmaking. On the other hand, availability bias occurs when individuals base their actions on readily accessible and recent information. The findings suggest disparities exist between retail and institutional investors concerning their tendencies towards herding behavior and religious bias. Retail investors are advised to acquire knowledge or seek guidance from institutional investors to mitigate the occurrence of excessive herding in the market.

Overconfidence bias

The overconfidence bias describes a person's propensity to exaggerate their skills, expertise, and the precision of their judgments. The concept discussed is associated with the self-attribution bias, whereby individuals tend to overestimate their abilities by attributing their successes to their skills and capabilities while attributing their failures to external factors such as 'poor luck' (Bakar & Yi, 2016). Investors who exhibit overconfidence tend to misconstrue the precision of the information presented and overrate their analytical abilities when scrutinizing such information. Jaiyeoba et al. (2020) Indicated that mounting evidence from many parts of the world suggests investors have excessive confidence. In addition, this phenomenon leads individuals to overestimate their level of expertise, underestimate potential hazards, and amplify their perceived capacity to manage circumstances.

Studies by Bakar and Yi (2016), Jaiyeoba et al. (2020), and Pahlevi and Oktaviani (2018) found overconfidence to have a significant positive impact on investors' decision-making to participate in the stock market. In previous investigations conducted by Jaiyeoba et al. (2020), it was discovered that overconfident bias, anchoring bias, and representative heuristics have similar impacts on both retail and institutional investors. Therefore, it becomes crucial for retail investors to actively work on reducing the influence of these biases when making investment decisions rather than solely relying on guidance from institutional investors.

In contrast, the studies conducted by Ahmad et al. (2022), Fagerström (2008), and Kafayat (2014) revealed a detrimental effect of overconfidence on decision-making. It asserts that individuals become more careful and methodical in their investing decisions by acknowledging and lowering overconfidence, which increases their propensity to engage in investment activities. Ahmad et al. (2022) proved that the quality of investment decisions is substantially impacted by overconfidence, which negatively correlates with investment decision-making.

Risk Tolerance

Risk tolerance is the capacity of a person to accept and withstand possible setbacks in the pursuit of greater financial returns. People are more likely to decide to invest when they receive assistance in understanding and controlling their risk tolerance through risk assessment tools, instructional materials, or individualized guidance. It implies that improving people's risk comprehension and comfort level with taking calculated risks makes them more likely to indicate an intention to engage in investment activities.

Studies by Ahmad & Shah (2022) and Yang et al. (2021) demonstrated the noteworthy positive impacts of risk tolerance on investment intention in the stock market. Risk perceptions related to investment choices and performance significantly influence the decision-making process. One decides to refrain from investing if they believe a high risk is involved with their investment selection and performance. Mishra (2018) also found that households with a higher risk tolerance are more likely to participate in stock markets. Ahmad and Shah (2022) identified a robust correlation between risk tolerance, investment decisions, and investment performance. In essence, individuals who perceive a higher level of risk associated with their investment decisions and performance tend to make more informed decisions and experience improved investment success.

Social Interaction

Support for social interaction entails allowing people to interact meaningfully, exchange personal stories, and seek counsel from others on financial concerns. When assisted in fostering social contacts and participating in an investor community, people are more likely to establish a favorable desire to invest. Besides, people can learn important lessons, boost their self-esteem, and increase their understanding of investment techniques through social interaction. As a result, people are more likely to want to engage in investing activities.

Previous studies revealed that social interaction notably impacts individuals' inclination towards investing and participating in the stock market (Shanmugham & Ramya, 2012; Yang et al., 2021). This specific discovery corroborates the results from Wu et al. (2018), which posited that social interaction significantly influences individuals' investment intentions in the stock market. Novice investors may derive elevated levels of both

utilitarian and hedonic values from social values, and hedonic values primarily drive the inclination towards investing in the stock market. Experienced investors tend to prioritize utilitarian values to a greater extent. Furthermore, Shanmugham and Ramya (2012) demonstrated that engaging in social interaction, such as utilizing social media and receiving information from close acquaintances, fosters an inclination towards investing in the stock market and consequently enhances participation in the stock market.

Theoretical framework and hypotheses development

Conventional financial theories are built upon the assumption that participants in financial markets behave rationally, operate within efficient market environments, and consistently make rational judgments. Investors exhibit irrational market behavior: they trade excessively, acquire stocks without considering their fundamental value, purchase the same stocks as their friends, base their decisions on past performance, and retain losing stocks while selling winning ones. The concept of investment decision remains elusive, as discussions on its various facets have not yet yielded definitive principles or theories that can be universally applied (Ahmad et al., 2022). Furthermore, most researchers also stated that the feelings, human behavior, and perspectives an investor brings to the investment process should not be overlooked by research (Ahmaed & Noreen, 2021; Amin & Pirzada, 2014; Yang et al., 2021).

The effect of behavioral factors such as financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, and social interaction on investment intention to participate in the stock market was explored by various investigators (Ahmaed & Noreen, 2021; Bakar & Yi, 2016; Yang et al., 2021). Understanding investors' behavior is more important than understanding stocks; therefore, understanding such behaviors is vital. Even experienced investors usually fail because they permit their cognitive biases to determine their decisions (Jaiyeoba & Haron, 2016).

Therefore, comprehending the investment decision-making behavior of Malaysians may facilitate the implementation of measures that encourage investors to engage actively, aligning with their long-term investment objectives while considering their short-term requirements (Mishra, 2018). Applying the financial behavior theory in the context of this study, it is proposed that financial literacy, financial well-being, herding behavior, overconfidence bias, risk tolerance, and social interaction influence stock market investment intention and participation. Concerning the financial behavior theory, the following theoretical framework and hypotheses were proposed for this study, as shown in Figure 1.

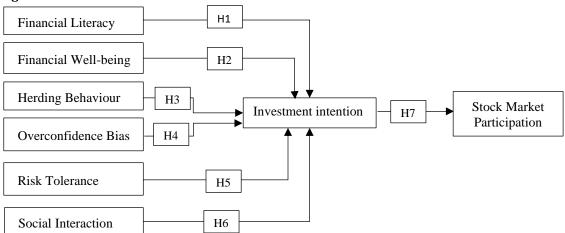

Figure 1: Research model

Therefore, based on the financial behavior theory and past literature, the following hypotheses were developed:

- H1 Financial literacy has a positive influence on investment intention
- H2 Financial well-being has a positive influence on investment intention.
- H3 Herding behavior has a positive influence on investment intention.
- H4 Overconfidence bias has a positive influence on investment intention.

- H5 Risk tolerance has a positive influence on investment intention.
- H6 Social interaction has a positive influence on investment intention.
- H7 Investment intention has a positive influence on stock market participation.

3. Methodology

Sampling

This study utilized a quantitative research approach with a recommended sampling method by Hulland et al. (2018). The study used G*Power application tools to determine the minimum sample size needed, which was 98 respondents for one independent variable and two dependent variables, using a medium effect size (f2) of 0.15. However, 690 questionnaires were collected through an online questionnaire for two months.

Measurement Items

Data were collected using a well-structured and self-administered questionnaire with questions in a prearranged order. The questionnaire items were developed by the researchers for this study. The questionnaire was divided into nine main areas. Section A dealt with the demographic profile, which included students' general information such as gender, race, age, education level, and others. Section B represented the dependent variable, which was stock market participation. Section C touched on the variable, which was investment intention. Meanwhile, Section D focused on the students' financial literacy.

On the other hand, Section E highlighted the third determinant factor, which was students' financial well-being. Next, Section F emphasizes herding behavior. Then, Section G focused on overconfidence bias. Section H consists of risk tolerance and Section I highlights the factor that emphasises social interaction. All items in Section B until F were measured on a five-point Likert. Scale ranging from 1-strongly disagree, 2-disagree, 3-Moderate, 4-Agree, and 5-Strongly Disagree. The average time taken by each respondent was almost 10 to 15 minutes. A total of 700 questionnaires were distributed, and 690 (9%) were returned. However, 21 sets were discarded due to incompetent data, resulting in merely 669 usable responses.

Data Analysis

Data analysis is vital in uncovering valuable insights and reaching conclusive findings. In this section, we describe the data analysis methods employed in our study, emphasizing using two essential tools: Statistical Package for the Social Sciences (SPSS) for descriptive analysis and SmartPLS software for model analysis. This comprehensive approach enabled us to thoroughly examine the research variables, evaluate their interrelationships, and assess the validity of our proposed theoretical model. By leveraging these analytical techniques, we were able to gain a deeper understanding of the data and extract meaningful findings.

This study employed SmartPLS software, a powerful statistical tool that utilizes a partial least squares (PLS) approach to evaluate the proposed theoretical model and explore the relationships between variables. This approach is particularly well-suited for exploratory research and complex latent variable models. The model analysis consisted of two main components: the measurement model analysis and the structural model analysis.

4. Results

Demographic Profile

Descriptive analysis is an essential step in any empirical study as it provides an initial understanding of the data and facilitates the exploration of patterns and trends within the variables of interest. We used SPSS, a widely recognized statistical software, to conduct descriptive analysis in our research. This involved calculating measures of central tendency (e.g., mean, median) and dispersion (e.g., standard deviation, range) for the research variables.

To test the proposed hypotheses, a survey questionnaire was administered to university students in Malaysia, focusing on individuals aged 17-30 years. A total of 669 students actively participated in the study, with an intriguing distribution of respondents: 31.5% were males (211), while 68.5% were females (458). The ethnic distribution indicated that 99.4% of the participants identified as Malay (665), while the remaining 0.6% were

of Chinese ethnicity (4%). Regarding residential areas, approximately 54.6% of the respondents resided in rural regions, whereas 45.4% lived in urban areas. Furthermore, educational levels varied among the participants, with 47.4% at the diploma level, 48.6% pursuing a degree, and 3.9% enrolled in pre-diploma or certificate programs.

Measurement Model

The measurement model analysis assessed the research constructs' reliability, validity, and associated indicators. Following the guidelines proposed by Hair et al. (2017), the study examined convergent validity using measures such as factor loading, average variance extracted (AVE), and composite reliability (CR). The analysis findings affirmed that all the criteria successfully met the necessary standards. Notably, the factor loadings surpassed the recommended threshold of 0.7, the AVE values were higher than 0.5, and the CR values exceeded 0.7. These findings indicate that the scale measurements demonstrated satisfactory convergent validity, as depicted in Table 1.

Table 1: Convergent validity for scale measurement

The study employed the heterotrait-monotrait (HTMT) ratio of correlations based on the multitraitmultimethod matrix to ensure discriminant validity, as Henseler et al. (2015) recommended. Discriminant validity is considered questionable if the HTMT value exceeds the threshold of HTMT.85 (0.85) suggested by Goodboy & Kline (2017) Or HTMT.90 (0.90), as proposed by Gold et al. (2001). As illustrated in Table 2, the results reveal that all the HTMT values are below the HTMT.85 threshold, indicating the presence of discriminant validity.

Table 2: HTMT ratio of correlations									
	Variable	а	b	С	d	е	f	g	h
а	Financial Literacy

hla D. HTMT . ..

Structural Model

The structural model analysis aimed to examine the relationships between the latent variables and test the proposed hypotheses. SmartPLS facilitated the estimation of path coefficients and provided measures such as the significance levels (p-values) and effect sizes. Furthermore, the significance and reliability of the structural model's relationships were evaluated using bootstrapping techniques. To evaluate the R2, standard beta, and t-values of the structural model, a bootstrapping procedure with 10,000 resamples was conducted. Additionally, as recommended by Hair et al. (2017), the predictive relevance (Q2) and effect sizes (f2) were examined. Detailed results can be found in Table 3.

Table 3. Structural model	Table	3.	Structural	model
---------------------------	-------	----	------------	-------

Hs	Relationship	Std.	SE	t-value	Decision	f2	R2	VIF	Q2
		beta							
H1	FL \rightarrow INT	0.176	0.045	3.879**	Supported	0.034		2.402	
H2	$FW \rightarrow INT$	0.038	0.034	1.135	Unsupported	0.002		1.586	
H3	HB \rightarrow INT	0.132	0.049	2.673**	Supported	0.017		2.716	
H4	$OB \rightarrow INT$	-0.015	0.05	0.301	Unsupported	0.000		2.921	
H5	$RT \rightarrow INT$	0.287	0.037	7.819**	Supported	0.121		1.94	
H6	SI \rightarrow INT	0.326	0.051	6.358**	Supported	0.114		2.735	
H7	INT \rightarrow SMP	0.679	0.029	3.642**	Supported	0.856	0.607	2.735	0.593

Note: ** p<0.01

Based on the structural model analysis findings, as shown in Figure 2, several factors were significant predictors of investment intention, which in turn was found to predict stock market participation strongly. Financial literacy (β =0.176, p<0.001) was found to have a significant positive effect on investment intention, suggesting that individuals more financially literate are more likely to express an intention to invest. Herding behavior (β =0.132, p=0.004) was also a significant predictor of investment intention, indicating that individuals who perceive others in their social networks to be investing are more likely to express an intention to invest themselves. Additionally, risk tolerance (β =0.287, p<0.001) and social interaction (β =0.326, p<0.001) were also significant positive predictors of investment intention.

Furthermore, the analysis showed that investment intention had a strong positive effect on stock market participation. This suggests that individuals who intend to invest are more likely to participate in the stock market. Therefore, H1, H3, H4, H6, and H7 ware supported the study hypotheses. On the other hand, financial well-being (β =0.038, p=0.128) was an unsupported predictor of investment intention. Similarly, overconfidence bias (β =-0.015, p=0.382) was also found to be an unsupported predictor of investment intention, indicating that these factors did not significantly affect investment intention. Thus, H2 and H5 have not supported the study hypotheses.

The study employed the blindfolding procedure to evaluate the model's predictive relevance. A commonly used technique, Stone-Geisser's Q2, was applied as a criterion for assessing predictive relevance and examining the R2 values. This approach, as emphasized by Henseler et al. (2009), serves as a valuable measure for evaluating the model's predictability. By employing the blindfolding procedure, Q2 assesses the model's predictive validity using PLS analysis.

Typically, the Q2 is computed with a leave-one-out cross-validation approach, with a recommended omission distance of 5-10 in PLS analysis (Akter et al., 2013). If the resulting Q2 value exceeds 0, the model holds predictive relevance for a specific endogenous construct (Hair et al., 2017). Notably, the analysis findings demonstrate a O2 value of 0.593 for stock market participation, surpassing zero and indicating a substantial level of predictive relevance within the model. According to the guidelines provided by Hair et al. (2017), a Q2 value of 0.02, 0.15, or 0.35 represents small, medium, or large predictive relevance, respectively, between an exogenous construct and a specific endogenous construct. Hence, this model has large predictive relevance.

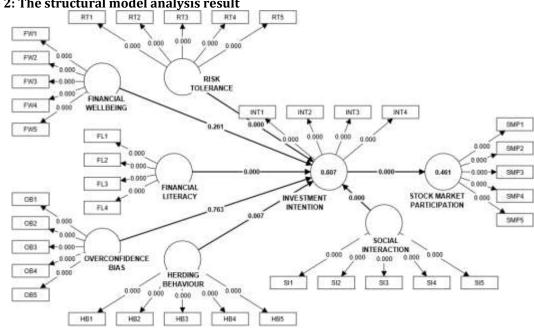

Figure 2: The structural model analysis result

Discussion

The findings derived from the structural model analysis and the results presented in the table offer several implications and predictions in real-world contexts. One of the most significant implications is that financial literacy positively influences investment intention. Implementing financial literacy programs and interventions can enhance individuals' inclination to invest. This finding aligns with previous research, consistently demonstrating a positive association between financial literacy and investment behavior.

In addition, the analysis reveals that financial well-being does not significantly influence investment intention, indicating that improving individuals' financial well-being may not necessarily translate into an increased inclination to invest. This finding is unexpected, as financial well-being is often considered a significant predictor of financial behavior. However, it is possible that other factors, such as financial literacy or risk tolerance, exert a more substantial influence on individuals' investment intentions.

Furthermore, the positive relationship observed between herding behavior and investment intention suggests that the investment decisions made by others can influence individuals. This finding aligns with previous research, which has consistently demonstrated the significant impact of social factors on shaping individuals' financial behavior.

Moreover, the study highlights that investment intentions positively influence stock market participation, indicating that increasing individuals' investment intentions can effectively promote greater engagement in the stock market. This finding holds significant implications for policymakers and financial institutions aiming to stimulate stock market participation.

Additionally, the non-significant relationship observed between overconfidence bias and investment intention suggests that overconfidence may not necessarily increase individuals' investment intentions. This finding is unexpected, considering that overconfidence bias is a commonly observed cognitive bias in financial decision-making. However, it is plausible that other factors, such as financial literacy or risk tolerance, exert a more substantial influence on shaping individuals' investment intentions.

Finally, the compelling positive associations observed between risk tolerance, social interaction, and investment intention imply that individuals with a higher propensity for risk-taking and with extensive social networks are more inclined to express an intention to invest. These findings align with prior research emphasizing the influential roles of risk tolerance and social influence in shaping financial behavior. Overall, the findings presented in the structural model have important implications for individuals, financial professionals, and policymakers interested in promoting greater investment intention and stock market participation.

A deeper understanding of the factors influencing investment intention opens up opportunities to devise more impactful interventions and policies to encourage individuals to invest in their financial future. With this knowledge, policymakers and financial institutions can develop targeted strategies to address barriers, enhance financial literacy, promote risk awareness, and cultivate social networks that support investment decision-making. By aligning interventions with the key drivers of investment intention, such as risk tolerance, social interaction, and financial literacy, stakeholders can effectively empower individuals to make informed investment choices and participate in the stock market. This can contribute to the overall financial well-being of individuals and the broader economy.

5. Conclusion and Implications

The results suggest that financial literacy, herding behavior, risk tolerance, and social interaction positively influence investment intention. In contrast, financial well-being and overconfidence bias have no significant impact. Additionally, investment intention has a strong positive influence on stock market participation. These findings can help financial institutions and policymakers develop targeted interventions to encourage investment behavior among individuals. For example, financial literacy programs can be developed to increase financial knowledge among individuals, and social interaction programs can be created to encourage investment among peer groups.

Future research could explore the impact of financial education interventions on financial literacy, financial well-being, and investment behavior. Furthermore, exploring the connection between overconfidence bias and investment behavior in greater detail would be valuable, as the present study did not reveal a significant relationship. Finally, the influence of social interaction on investment behavior could be studied in more detail, focusing on the role of social media and online communities in shaping investment decisions.

Acknowledgment: Our heartfelt gratitude goes out to all individuals who contributed to the successful completion of this study, including the participants and reviewers, for their valuable contributions. The support and guidance from colleagues are also greatly appreciated. It is worth mentioning that this study was conducted independently without any sponsorship.

Analyzing the Impact of Financial Liberalisation on Malaysian Bank's Performance: Quantile Regression Analysis

Nur Afizah Muhamad Arifin^{1*}, 'Ismah Osman¹, Norhasimah Shaharuddin¹, Fauzias Mat Nor² ¹Faculty of Business and Management, Universiti Teknologi MARA, Malaysia ²Faculty of Economics and Muamalat, Universiti Sains Islam Malaysia ^{*}fizaarifin@uitm.edu.my Corresponding Author: Nur Afizah Muhamad Arifin

Abstract: This study employs quantile regression analysis to examine the impact of financial liberalization on the performance of Malaysian banks, focusing on how these effects vary across different performance levels. A liberalized banking sector prompted commercial banks to intensify risk-taking activities, which ultimately could affect the bank's performance. Using quantile regression analysis, it shows that only the middle quantile indicates all the significant variables for both OLS and quantile analysis. This study found that lower-performing banks may face adverse effects, including increased risk and deteriorating performance, due to heightened financial liberalization. The findings highlight the differential impact of financial liberalization across the performance spectrum and suggest that while liberalization can drive economic growth targeted regulatory measures are necessary to support less and mitigate potential risks to overall financial stability in Malaysia.

Keywords: Financial Liberalisation, bank performance, quantile.

1. Introduction and Background

A strong financial system is essential for bank performance and financial stability, which influence investor confidence, economic growth, and overall economic stability. Banks can run effectively and profitably when the financial system is stable. Banks serve as financial intermediaries that facilitate the implementation of monetary policy within the financial system to ensure financial stability. However, the shift from financial repression to financial liberalization, which encourages the movement of capital across borders and the expansion of the financial sector, has led to substantial transformations in the global financial system. Hence, the transition from financial repression to financial liberalization, characterized by the deregulation and reform of the domestic financial sector, will inevitably impact the stability of the financial system. Hence, preserving financial stability requires a thorough understanding of bank performance.

The seminal works of Shaw (1973) and McKinnon (1973) gave rise to the financial liberalization theory. These academics contend that financial repression will hinder financial sector development. Consequently, they recommend financial liberalization policies will boost investment and savings as well as economic growth. According to Hamdi and Jlassi (2014), financial liberalization is the process of putting in place several policies aimed at getting rid of the different controls and limitations that a nation has placed on its financial sector to promote economic growth. Reforming the financial system and financial liberalization are related. Unite and Sullivan (2003) state that the reforms take the form of lowering barriers that allow foreign banks to enter the domestic market and relaxing or eliminating restrictions on foreign investment. Deregulation, which permits foreign-controlled banks to operate in the country, and regulation, which provides incentives for foreign ownership of a portion of domestic banks, are two possible forms of this reform. To facilitate the process of financial liberalization for an integrated global financial market, the government drives and supports it through policy reform.

The Central Bank of Malaysia formerly known as Bank Negara Malaysia (BNM), declared the commencement of its financial liberalization in the year 2009. The announcement of liberalization measures intends to improve Malaysia's economic ties with other nations and highlight the financial sector's crucial role as a catalyst and facilitator of economic progress. The goals outlined in the Financial Sector Master Plan (FSMP) in the year 2001, to create a strong, diverse, and effective financial sector are aligned with these liberalization initiatives. The primary goal of further liberalization is to create a more robust, diverse, and effective financial industry. Furthermore, the goal of financial liberalization is to make domestic and international financial institutions more competitive to maintain overall financial stability and soundness. The most recent stage of financial

liberalization has been centered on improving the resilience and efficiency of the system. The Financial Sector Blueprint 2022-2026 of Bank Negara Malaysia (BNM) remains committed to enhancing financial inclusion and strengthening digital and innovative financial services to meet the dynamic demands of the market. Overall, Malaysia has changed its approach to financial liberalization from initial market liberalization and deregulation to a more balanced approach that takes sustainability, innovation, and stability into account. The country continues to adapt its financial policies to adhere to global standards and address emerging challenges.

Shehzad and Haan (2008) and Daniel and Jones (2007) contend that financial liberalization and financial stability are related and that one will cause the other. Gruben, Koo and Moore (2003) provide more evidence in favor of this theory, concluding that the likelihood of bank collapse increases under liberalized regimes. Hence, financial liberalization would support financial development and boost economic progress even if it is associated with financial instability (Ranciere, Tornell, and Westermann, 2006). Therefore, the research gap is unified by an understanding of how financial liberalization affects banks at various performance levels is made possible by quantile analysis. This approach looks at the effects at different places in the distribution of bank performance indicators, such as return on assets (ROA), rather than just concentrating on average effects (Koenker & Hallock, 2001).

Quantile regression studies by Nguyen, Skully, & Perera (2021) have demonstrated that there may be substantial variation in the impact of financial liberalization on return on assets (ROA) between quantiles. The impacts of financial liberalization on bank performance have been the subject of a recent study (Shen, Chen, & Chen, 2020). These findings imply that while financial liberalization can raise efficiency and profitability, it can also increase risk-taking. Quantile analysis has emerged as a valuable tool in this context, allowing researchers to examine how liberalization affects banks across different levels of performance and risk. Using quantile regression analysis, Claessens and van Horen (2014) explore how financial liberalization impacts bank performance and find that this effect varies significantly across different quantiles of the bank performance distribution.

Therefore, this research intends to add to the growing body of knowledge on financial growth and economic policy by offering empirical data on the connection between financial liberalization and bank performance in Malaysia. It aims to provide insights into the diverse consequences of liberalization policies by concentrating on the quantile effects. These insights can then be used to generate more focused regulatory and policy actions that promote the banking sector's sustainable growth. Therefore, the rest of the work is divided into subsequent sections: the second section examines the existing literature; the third section provides a comprehensive explanation of the data and methodology, and the fourth section discusses the conclusions and analysis. The study's implications are discussed in the fifth and concluding section.

2. Literature Review

Research has demonstrated that financial liberalization may have both beneficial and bad consequences on bank performance. According to Levine et al. (2000), there is a possibility that it will improve bank efficiency and competitiveness through the removal of regulatory barriers to innovation. Yet, if robust regulatory frameworks aren't in place, it can encourage risk-taking and financial instability (Demirgüç-Kunt & Detragiache, 1998). For instance, if regulatory supervision is insufficient, liberalization may cause crises in emerging economies even if it can also increase efficiency (Rajan & Zingales, 2003). According to Hellmann et al. (2000), the regulatory environment's resilience has a critical impact on the overall impact of financial liberalization on bank performance.

Recent research has also explored the impact of financial liberalization on bank performance, offering insights from both Malaysian and global perspectives. Rathnayake et al. (2022) conducted a study on interest rate liberalization and commercial bank performance in Chinese A-Share banks, utilizing a Generalized Method of Moments (GMM) framework. The results indicated that interest rate liberalization and the removal of specific entry barriers enhanced competition and efficiency in the banking sector, leading to reduced bank interest margins. In a study focusing on Malaysian commercial banks, Ma & Soh (2021) examined the impact of liberalization on the determinants of bank efficiency. The research highlighted financial liberalization as a beneficial factor that stimulates the development of the financial sector by eliminating repressive policies,

thereby fostering efficiency and market liquidity. This study underscores the positive effects of liberalization on enhancing the operational efficiency and competitiveness of banks in Malaysia. Financial liberalization can improve asset quality and liquidity by promoting better risk management practices and access to diversified funding sources. This aligns with findings from (Farhat, 2023), who emphasizes that financial liberalization is a crucial determinant of banking sector development in emerging economies. 's study indicates a significant correlation between banking sector growth and financial liberalization, suggesting that liberalization facilitates better access to capital and promotes competitive practices among banks, ultimately leading to improved financial performance. Moreover, the entry of foreign banks, as noted, introduces advanced management practices and technology, further stimulating the development of the Malaysian banking sector.

Financial liberalization has significantly impacted the performance and stability of banks in Malaysia. Abdullah et al. (2004), for example, look at how financial liberalization affected the Malaysian banking industry and discover that although it increased competitiveness and efficiency, it also brought new risks and vulnerabilities, which were especially noticeable during the 1997–1998 Asian financial crisis. To reduce those risks, the study highlights the necessity of efficient regulatory structures. The study conducted by Elryah (2014) offers empirical data about the effects of liberalization and reforms on the performance of Islamic banks in Malaysia. The study employed a panel regression model to examine the relationship between Islamic banks' performance and financial liberalization and reforms. The Z-score was utilized to quantify the association between the banks' equity and return on assets. The results show that profitability, return on assets, financial liberalization and openness, and inflation all statistically positively affect the performance of Islamic banks.

Andries and Capraru (2011) examine how financial liberalization affected the performance of 236 banks from 17 countries in Central and Eastern Europe between 2004 and 2008. Their findings demonstrate that nations with higher degrees of liberalization and openness may boost their economies and provide their customers with more affordable services. Additionally, the degree of bank reform, the soundness score, bank safety, and the interest rate liberalization indicator all positively affect banks' productivity development. Andri et al. (2012), Examined the effects of the banking reform on the financial performance of five Central and Eastern European nations between 2001 and 2008. The evidence shows that the bank performance index, which is based on the cost of intermediation, operational performance, and return on assets, is positively impacted by the financial and banking reform indices. Recent empirical evidence, Nguyen, Skully, and Perera (2021), Kim, Lin, and Suardi (2022), and Shen, Chen, and Chen (2020), among others, supports the results by demonstrating the intricate interactions between financial liberalization, bank performance, and risk-taking behaviors. Their findings suggest that while liberalization can drive efficiency, it also necessitates stringent regulatory oversight to mitigate associated risks (Arestis & Phelps, 2019). This is echoed by Moyo & Roux (2020), who conducted a study revealing that although financial liberalization can lead to improved efficiency, it simultaneously increases the potential for financial instability without adequate regulatory frameworks.

A meta-analysis of the effects of financial liberalization on bank risk-taking is presented by Shen et al. (2020), who contend that although liberalization can increase efficiency, it also calls for strict regulatory monitoring to control the risks involved. Using a quantile regression technique, Nguyen et al. (2021) show that middle quantile banks in Asia-including Malaysia-benefit most from liberalization in terms of return on assets (ROA). Further elaborating on these findings, Kim et al. (2022) demonstrate that the sequencing and timing of liberalization measures have a significant impact on their results. Kim et al. (2022) further elaborate on these findings, showing that the timing and sequence of liberalization measures critically affect their outcomes, with phased liberalization proving more beneficial for bank performance. Their research indicates that a phased approach to liberalization tends to yield more favorable outcomes for bank performance, suggesting that the order and timing of reforms are critical in determining their effectiveness (Wang & Luo, 2023). This aligns with the broader literature on financial liberalization, which posits that the regulatory environment significantly influences the outcomes of such reforms (Moyo & Roux, 2020). Additionally, Moyo & Roux (2020) argue that the interaction between financial liberalization and regulatory quality is crucial, noting that stronger regulatory frameworks can mitigate the risks associated with liberalization, thereby reducing the likelihood of financial crises. Similarly, Wang & Luo (2023) highlight that while financial liberalization can stimulate growth, it also poses risks that need to be managed effectively to ensure banking stability.

The relationship between asset quality and bank performance is well-documented in the literature, highlighting the critical role that asset quality plays in determining profitability and stability. Roman and Danuletiu (2013) demonstrate that banking liquidity, asset quality, and management quality are the primary determinants of banks' profitability and stability, while economic growth rate and banking concentration are the external factors that have the greatest impact on banks' profitability. High asset quality typically leads to lower provisioning for bad debts, higher profitability, and enhanced bank stability. Poor asset quality, on the other hand, increases the risk of defaults, requiring higher provisions and reducing profitability. Studies from both Malaysian and global perspectives have shed light on the impact of asset quality on bank performance (Aldizar & Agustina, 2022). Aldizar & Agustina, 2022) found that asset quality has a significant negative effect on profitability, emphasizing the importance of maintaining high asset quality levels for improved financial performance. Similarly, Samail et al. (2018) highlighted a significant relationship between asset quality and liquidity management in influencing the performance of Islamic banking in Malaysia, underscoring the critical role of asset quality in shaping bank performance that can be measured using a bank's profitability.

Further literature reinforces these findings by exploring the broader implications of asset quality on banking performance. Muriithi & Waweru (2017) examined liquidity risk and its impact on financial performance, revealing that effective liquidity management is closely tied to asset quality, which ultimately influences profitability. Additionally, Gharaibeh et al. (2022) discussed how various risks, including asset quality, affect the stability of banks, suggesting that maintaining high asset quality is vital for enhancing bank stability and profitability. Moreover, the CAMEL framework, which includes asset quality as a key component, has been widely used to assess bank performance and stability, indicating that banks with higher asset quality tend to exhibit better financial health and resilience against economic shocks (Kočenda and Iwasaki, 2021). These studies collectively underscore the importance of asset quality in shaping the financial performance and stability of banks, reinforcing the need for effective asset management strategies to mitigate risks and enhance profitability.

To explore the impact of liquidity on bank performance, various studies have provided valuable insights from both Malaysian and global perspectives. A study by Arif & Anees (2012) found that liquidity risk significantly affects bank profitability, with factors such as liquidity gap and non-performing loans exacerbating this risk. Similarly, Yahaya et al. (2022) revealed a significant negative association between liquidity risk and bank performance, highlighting the importance of effective liquidity management for improved financial performance. These findings emphasize the critical role of liquidity management in influencing bank performance. Sufficient liquidity ensures that a bank can cover withdrawals from customers and reduce the risk of a bank run. However, holding too much liquidity can reduce profitability since liquid assets often yield lower returns. Conversely, insufficient liquidity can lead to solvency issues and higher funding costs. Recent studies further elaborate on these themes, highlighting the nuanced relationship between liquidity and profitability. Ahmad (2023) discusses how banks with lower liquidity thresholds rely on profitability to enhance their stability and attract deposits, thereby improving liquidity and reducing exposure to liquidity risk. In a broader context, Mohammad (2024) examines the relationship between liquid asset holdings and profitability in South Asia, indicating that banks with higher liquid assets may engage in riskier behaviors, which can impact their overall performance. Additionally, Ben-Ahmed (2023) explores the interplay between credit and liquidity risks, revealing that increased liquidity risk negatively affects bank profitability, particularly in the context of Tunisian banks. These findings collectively underscore the critical importance of liquidity management in shaping bank performance, as banks must navigate the delicate balance between maintaining sufficient liquidity and optimizing profitability.

Studies also have extensively explored the relationship between capital adequacy and bank performance from both Malaysian and global perspectives. For instance, Odekina (2019) highlighted that capital adequacy significantly stimulates and enhances the financial performance of commercial banks, underscoring the importance of sufficient capital and effective management in driving improved performance. Strong capital adequacy improves a bank's ability to absorb losses reduces the likelihood of insolvency and enhances overall stability. However, maintaining high capital ratios can also limit the return on equity (ROE) by reducing leverage. This assertion is supported by findings from Amissah & Opoku (2023), who reported an inverse relationship between the capital-to-asset ratio (CAR) and return on equity (ROE) among selected banks in Ghana, indicating that higher capital levels may limit profitability due to reduced leverage. Similarly, Balami &

Chalise (2023) found that while capital adequacy is essential for financial stability, its impact on profitability can be complex, suggesting that excessive capital may hinder banks' ability to optimize returns on equity. These studies collectively highlight the dual role of capital adequacy in promoting stability while potentially constraining profitability.

Further research has expanded on these themes, illustrating the nuanced dynamics between capital adequacy and bank performance across different contexts. For instance, Setiawan & Muchtar (2021) demonstrated a positive relationship between return on equity and capital adequacy in Indonesian banks, suggesting that profitable banks tend to maintain higher capital levels. In contrast, Sah & Saud (2022) found a significant negative association between capital adequacy and ROE in Nepalese commercial banks, indicating that while capital is crucial for stability, it may also impose constraints on profitability. Additionally, Harkati et al. (2020) explored the differential impacts of capital adequacy on risk-taking behavior in conventional and Islamic banks in Malaysia, revealing that adequate capital can mitigate risk-taking tendencies, thereby enhancing overall financial performance. This body of literature underscores the importance of capital adequacy as a determinant of bank performance, highlighting the need for banks to strike a balance between maintaining sufficient capital for stability and optimizing returns for shareholders

The relationship between non-performing loans (NPLs) and bank profitability remains a critical area of inquiry in the banking literature. Athanasoglou, Brissimis, and Delis (2008) and Dietrich and Wanzenried (2011) have established that higher NPL ratios negatively impact profitability by increasing provisions for loan losses and reducing income from interest-bearing assets. Recent studies, such as those by (Wang & Luo, 2019), have further explored this relationship, indicating that financial liberalization can exacerbate NPL issues if not accompanied by robust regulatory frameworks. Their findings suggest that while liberalization can enhance competition and efficiency, it may also lead to increased risk-taking behaviors among banks, resulting in higher NPL ratios and subsequent profitability challenges. This underscores the importance of effective risk management practices in navigating the complexities introduced by financial liberalization.

The link between asset quality, liquidity, capital adequacy, non-performing loan and financial liberalization is dynamic and significantly influencing bank performance. Maintaining a balance among these elements is crucial for ensuring the stability, profitability, and resilience of banks. Effective regulatory frameworks and prudent risk management practices are essential to maximize the benefits of financial liberalization while mitigating potential downsides. By offering empirical insights into the distinct effects of financial liberalization on Malaysian banks, this study adds to the body of knowledge on financial development and economic policy. To ensure sustainable growth and stability in the banking industry, more effective policy interventions can be informed by the more detailed knowledge of these impacts provided by the quantile analysis technique.

3. Research Methodology

This study considered Malaysian samples, where data was collected from 2012–2022. For this study, the Malaysian market offers an interesting setting for several reasons. The sampling criterion for this study is to include all commercial banks in Malaysia. The variable that will be considered in this study is the bank's performance measured using return on assets (ROA). The ROA is the dependent variable and the independent variable is financial liberalization quantified using the financial freedom index. An index with a value between 0 and 100 reflects the degree to which banks are subject to regulatory constraints on their financial freedom. More freedom and less restrictions are indicated by a higher value (Berger et al., 2009; Sufian and Hassan, 2012). Meanwhile, several control variables that could influence financial stability are asset quality, liquidity, capital adequacy, and non-performing loans. The definitions and measurements of each variable used in this study are shown in Table 1.

Variables	Description	Data source
DV: Bank's Performance (ROA)	Return on Assets (ROA) based on commercial bank	Bank Report
Financial Liberalisation (FL index)	Index of financial liberalisation (FLIB)	Heritage.org
Asset quality (ASQUAL)	Bank Specific data (Impaired loans / Gross loans)	Bank Report
Liquidity (LRATIO)	Bank Specific data (Loan/ Total Deposit and Borrowing)	Bank report
Capital adequacy ratio (CAR)	Bank Specific data (Total Equity / Total Assets)	Bank report
Non-performing loan (NPL)	Bank Specific data (non-performing loan/ Gross loans)	Bank report

Table 1: Definition and sources of variables

This study employs an empirical methodology that utilizes panel data analysis and quantile regression. Quantile regression, initially introduced by Koenker and Bassett in 1978, is a method that expands upon the traditional least squares estimation of the average value to encompass a range of models for various conditional quantile functions. Traditional least squares regression provides an approximation of the conditional mean and conditional median, which are placed at the center of the distribution. However, this only offers an imperfect description of the conditional distribution (Mosteller and Tukey, 1977). Quantile regression is employed to obtain specific details about points in the conditional distribution, apart from the conditional mean. This approach, as demonstrated by Buchinsky (1994, 1995) and Eide and Showalter (1997), effectively reflects the entire distribution. Quantile regression is used to estimate different quantiles within a population.

Furthermore, the quantile regression possesses various advantageous characteristics. The quantile regression estimator minimizes the weighted sum of absolute residuals instead of the sum of squared residuals. As a result, the predicted coefficient vector is not affected by outliers. Furthermore, a quantile regression model utilizes a linear programming form, which facilitates analysis. Furthermore, this technique is especially valuable in cases where the conditional distribution deviates from a typical form, such as being asymmetric, having fat tails, or being truncated. The utilization of quantile regression enables a more comprehensive understanding of the impact of explanatory variables on the dependent variable. The quantile regression method enables us to determine the impact of the covariates at various points in the conditional distribution of the dependent variable.

Specification of the estimation model is used to analyze the relationship between financial liberalization on bank performance, especially for selected commercial banks in Malaysia. The estimation models of this study are as follows:

$$ROA = \beta_0 + \beta_1 flindex_{it} + \beta_2 asqual_{it} + \beta_3 lratio_{it} + \beta_4 car_{it} + \varepsilon_{it}$$
(1)

This study employs quantile regression. Quantile regression (QR) analysis to measure the impact of financial liberalization in conjunction with other factors affecting the bank performance using ROA. Quantile regression (QR) is an extension of the ordinary least squares (OLS) estimation of the conditional mean to a collection of models for various conditional quantile functions and purposes by Koenker and Bassett (1978). Moreover, when the error term is non-normal, the quantile regression estimator can provide a more reliable and effective substitute for OLS (Buchinsky, 1995). Based on equations (1), this study extended the model of Koenker and Bassett (1978) to estimate the model separately for sukuk yield using the QR estimator as follows:

$$\gamma = V_t'\beta_0 + \mu_{\theta t}; Quant_\theta \left(\frac{\gamma_t}{V_t'}\right) = V_t'\beta_\theta \tag{2}$$

Where *V*' is the regressor set of the financial liberalization and other control variables, $B\theta$ is the slope coefficient quantifying the level of the financial liberalization on the bank performance in quantile θ , is the conditional quantile of bank performance, μ is the error term. The estimator for the QR involves minimizing the sample size β and minimizes the weighted absolute values of the residuals using all available data (Buchinsky, 1995; Koenker & Bassett, 1978), as shown in equations (5) and (6), where the θ -th quantile regression yields $0 < \theta < 1$.

$$Min \sum_{\substack{\theta \in V_t \in V_t' \\ \beta \in V_t' \\ \theta \in V$$

Where $\gamma \ge V'\beta$ and $\gamma < V'\beta$ are indicator functions, which describe a positive and a negative value of residuals contingent on the value of θ . As a quantile θ increases from 0 to 1, one can find the total conditional distribution of profitability based on bank performance, which depends on the regressor group of the financial liberalization. Instead of squaring all errors, this method gives a weight of $(1-\theta)$ to positive residuals and a weight of $(1-\theta)$ to negative residuals. In this study, the regression estimation was performed for five different quantiles based on the 10th, 25th, 50th (median), 75th, and 90th percentiles of the profitability spillover distribution of bank performance. The use of a proxy for return on an asset in the set of regressors implies that even within a given conditional quantile, the response of bank performance spillovers varies depending on the level of financial liberalization.

4. Results and Discussion

The empirical investigation is conducted using estimates. Equations (1) and (2) for the 10th, 25th, 50th (median), 75th and 90th quantiles. This allows us to examine the effects of the explanatory variables at different points in the relationship based on the impact of financial liberalization on bank performance. The empirical results discussion between the independent variables and dependent variables are shown in Table 4. The OLS estimates are shown in the last columns of Table 4 for comparison purposes.

Table 2 provides the descriptive statistics for the variables used in the analysis. Overall, the Descriptive analysis describes and summarizes the characteristics of the data set used. The mean value for all proxies of financial liberalization is 53 for ASQUAL is 2.0882 meanwhile for LRATIO is a positive value of 67.07 and CAR is 15.36. All the variables have a positively skewed distribution with a long right tail. Therefore, the assumption of a normal distribution of the error terms in ordinary least squares (OLS) is not assured and may lead to misleading outcomes. Quantile regression can address these issues and offer a more adaptable and comprehensive analysis for examining the influence of financial liberalization on bank performance. Meanwhile, the value of kurtosis measures the peak or flatness of the distribution of the series. The value equal to 3 shows the normal distribution of the series while the negative value shows the platykurtic series. Based on the Correlation matrix Table 3 is a statistical tool that measures the strength and direction of relationships between dependent and independent variables. The result shows all the indicators have a negative relationship with dependent variables.

The empirical investigation is conducted by estimating equations at five quantiles, namely the 10th, 25th, 50th, 75th and 90th. Table 4 reports the results. For comparison purposes, we also provide the OLS estimates which are reported in the last columns of tables. In addition, this study also reports the statistical comparison of regression coefficients indicating the difference in the coefficients for each variable. Not all of the variables show significance for all the quantile phases. Moreover, the inter-quantile coefficient test further confirmed the differences among all of the coefficients in terms of the signs positive and negative. Although most of the coefficient is not significant for all quant, the coefficient of financial liberalization (FLindex) indicates the difference results for quant 10, 25 and 90 which is an insignificant negative sign.

Furthermore, the estimated coefficients on ASQUAL and LRATIO show a decreasing value and are insignificant at the 25th quantiles but for LRATIO it is not significant at the 10th and 25th. Meanwhile, the estimated coefficient on ASQUAL and LRATIO show different results on OLS and quantiles regression thus a significant negative impact on ROA. This implies that the impact of financial liberalization on ROA significantly at the middle of the quantile as supported by Nguyen et al. (2021) demonstrates that, in terms of return on assets (ROA), medium quantile banks in Asia—including Malaysia—benefit the most from deregulation. Bumann, Hermes, and Lensink (2013) in their studies, mentioned that Following liberalization, banks in developing nations show that those in the middle quantile see a significant improvement in ROA. Accordingly, the regression results for CAR have a statistically significant negative impact on ROA for the fourth phase of quantile. This study is also consistent with. Levine (2005) where banks in liberalized environments may experience greater instability and lower profitability due to heightened competition and risk-taking behaviors. This shows that the variable of CAR is influenced by the impact on ROA. The result is the same referred to the approach on OLS and quantile regression. This shows that the role of indicator CAR is vital and aligns with previous studies mentioned (Balami and Chalise, 2023).

Based on the result estimated above it shows that only the middle quantile indicates all the significant variables for both OLS and quantile analysis. According to this, banks operate best in environments with moderate degrees of financial liberalization, where advantages like greater efficiency and competition are realized without posing undue risk or instability (Ghosh, 2014). Banks can benefit from better market conditions and operational efficiency in this medium quantile, which will increase their performance and profitability (Fung & Fung, 2016). However, excessive liberalization could put banks at higher risk of instability, which emphasizes the necessity for a balanced approach. According to Chen et al (2017), quantile regression sheds light on the limitations of ordinary least squares (OLS) in capturing the subtle effects of liberalization. It suggests that policies should be aimed at achieving a balanced level of liberalization to maximize bank performance while preserving stability. Therefore in the Malaysia market to safeguard financial stability Considerable government interference is needed. This study employs a quantile technique to examine the relationship between financial liberalization and return on assets (ROA). It not only gives useful insights into how financial liberalization affects ROA and their co-movement but also sheds light on the behavior of these variables and the extent to which their reactions endure over time.

5. Conclusion

The empirical findings can be succinctly described as follows: The research identifies a consistent relationship between financial liberalization and return on assets (ROA) using both ordinary least squares (OLS) and quantile regression methods. The results indicate that the impact of financial liberalization on bank performance, as measured by ROA, is particularly significant at the middle quantile. Banks may have increased competition, pressure on profit margins, and difficulties with risk management and regulatory supervision at this moderate degree of liberalization (Liu, 2016). This study emphasizes several significant implications for financial institutions and governments. It implies that the impacts of mild financial liberalization are not consistent at different performance levels, even while it can greatly improve bank performance, especially at the middle quantile. This emphasizes the necessity of customized financial strategies to deal with particular regulatory and risk management issues that banks encounter in different stages of liberalization. To maintain public trust and economic stability, policymakers should balance regulatory control with liberalization. Furthermore, the study supports the use of more complex analytical techniques in financial research and policy development by demonstrating the superiority of quantile regression over conventional OLS methods in capturing the complex effects of financial liberalization. To summarize, while financial liberalization can enhance the performance of Malaysian banks, its impact is not entirely uniform. Both policymakers and banks should carefully assess the many impacts to optimize the advantages of liberalization and protect financial stability.

Developing a Framework for Technopreneurial Behavior: The Mediating Role of Technopreneurial Intention and Moderating Role of Attitudes

*Nur Atiqah Zakiyyah Ramlee, Hardy Loh Rahim, Nursaadatun Nisak Ahmad Faculty of Business and Management, Universiti Teknologi MARA, Malaysia *nurat3842@uitm.edu.my, hardy@uitm.edu.my, nursa040@uitm.edu.my Corresponding Author: Nur Atiqah Zakiyyah Ramlee

Abstract: Technopreneurship is a combination of technology and entrepreneurship. Entrepreneurs who are involved in technology-based ventures called technopreneurs employ technology throughout their venture operations and produce technology-based services or products. In the era of globalization, especially post-COVID-19 pandemic, technopreneurship has become more significant as it can drive economic growth. Hence, it is very crucial to further investigate technopreneurship behaviour among university students, as they are the future generation that will lead the development of the country and magnify globalization. Few technopreneurs studies have been conducted previously, however, technopreneurs in the Malaysian context are scarce. Thus, this study proposes to investigate the relationship between subjective norms, perceived behavioural control, and technopreneurs' education towards technopreneurs' behaviour, to ascertain the mediating effect of technopreneurs intention between subjective norms, perceived behavioural control, and technopreneurs behaviour, and lastly to determine the moderating effect between attitudes, technopreneurs intention, and technopreneurs behaviour, that is based on the Theory of Planned Behaviour. This study proposed a research method through a survey via questionnaire. In determining the sample size, the software of Raosoft is proposed, and for data analysis, the study has proposed SPSS for data screening and PLS-SEM for the main analysis.

Keywords: Technopreneurs' behaviour, technopreneurs' intention, theory planned behavior

1. Introduction

The post-COVID-19 pandemic has had an impact on the technological landscape as the world has experienced the transition after post pandemic era ended. The world is evolving rapidly in fostering the adoption of digital technology and reshaping the global economy Brynjolfsson et al. (2020). The Ministry of Higher Education (MOHE) in Malaysia has made entrepreneurship education one of its top agendas in its effort to promote the nation's economic growth and human capital formation. This is agreed by Farinha et al. (2020) who emphasize that entrepreneurship able to promote economic growth and development, particularly by generating innovation and creating jobs, which are crucial for retaining competitiveness in the global market. MOHE is also keen on technology entrepreneurship (technopreneurship) among university students, and specific KPIs (Key Performance Indicators) have become their annual target to be achieved to portray their seriousness in ensuring technopreneur-ship among future generations. Two out of seven of their annual KPIs highlight technopreneurship which are the number of students participating in the technopreneurship programs and also the number of technology-based start-ups among students (MOHE, 2021). The universities play a pivotal role in cultivating future technopreneurs among students by comprehending the factors that influence students' technopreneurs' behaviour for developing successful educational programs and policies. The role of the Ministry of Education as a policymaker and the universities is where the place students can thrive in their technopreneurship. Universities play a crucial role in fostering technopreneurship by designing interdisciplinary curriculums that combine technology skills and training (Hisrich, Peters, and Shepherd, 2017), as incubators and accelerators that provide mentorship and platform among student start-ups (Mian, Lamine and Fayolle, 2016) and to become R&D centre that focused on fostering technopreneurship ecosystem and support students in transforming their idea into viable business (Audretsch, 2020).

According to the Theory of Planned Behaviour (TPB), behavioural intentions drive individual behaviour and are influenced by subjective norms, perceived behavioural control, and attitudes (Ajzen, 1991). In the context of technopreneurship, these constructs have significantly influenced students' intentions and behaviour in setting up technology-based businesses. However, the existing research lacks a comprehensive framework that conducted the factors that influence technopreneurial behaviour, as agreed by Fayolle and Gailly (2015), most of the studies concentrate on specific variables such as educational interventions or personality without

examining the broader impact on entrepreneurial behaviour. The existing empirical studies on technopreneurship are scarce and tend to rely on self-reported intention rather than the ultimate actual behaviours. Bagheri and Pihie (2014) stated that limited research has delved into how individuals take action from intention to behaviour and what specific behaviours and approaches they engage in the process.

Technopreneurial studies are crucial as it driven by social missions and technology adoption can promote technological entrepreneurship, address social challenges, offer job opportunities, stimulate technology transfer and innovation, and contribute to national economic progress (Pratiwi et.al, 2022). Technopreneurial study has been conducted by researchers which mostly focuses on technopreneurial intention rather than perceived actual behaviour or perceived behaviour. Previous researchers determined technopreneurial intention by technopreneurial self-efficacy, entrepreneurial learning (Hoque et al., 2017), environment, attitudes (Utami and Brawija, 2019), education, university support, university research excellent (Yordanova et al., 2020), personal social training, negotiated enterprise and contextual learning (Nurhayati and Machmud, 2019). Unfortunately, to date, the study on technopreneurials is very limited. Previous studies on technopreneurship have underpinned their study by the Theory of Planned Behaviour (TPB). However, very limited research has been conducted on technopreneurial behaviour. Therefore, this study aims to conduct a study with the outcome of TPB which is Technopreneurial Behaviour.

This study aims to propose a comprehensive framework for technopreneurial behaviour among students. The objective of the study is to investigate the relationship between subjective norms, perceived behavioural control and technopreneurial education towards technopreneurial behaviour, the mediating effect of technopreneurial intention between subjective norms, perceived behavioural control and technopreneurial behaviour and also the moderating effect of attitudes between technopreneurial intention and technopreneurial behavior.

Proposed Research Objective

This conceptual study intended to propose a framework for technopreneurial behaviour study. The illustration of the framework for this study can be referred to in the next section. The proposed research objectives are as follows:

To determine the relationship between subjective norms and technopreneurs' intention

To determine the relationship between perceived behavioural control and technopreneurs' intention

To determine the relationship between technopreneurs' education and technopreneurs' intention

To determine the relationship between technopreneurs' intentions and technopreneurs' behavior To investigate whether attitudes moderate the relationship between technopreneurial intention and technopreneurial behavior.

To investigate whether technopreneurial intention mediates the relationship between subjective norms, perceived behavioural control and technopreneurial education with technopreneurial behavior.

2. Hypotheses Development

The objective of the research is to identify the relationship between subjective norms, perceived behavioural control and technopreneurial education towards technopreneurial behaviour, mediates by technopreneurial intention and moderates by attitudes.

Subjective Norms

The first proposed variable for the study is the subjective norm that refers to a close person to someone that significantly important to his or her life including family, friends, or any individual that may influence someone's decision whether to become an entrepreneur or not (Al-Jubari, 2019). Typically, people seek advice or opinions from people surrounding them to make important life decisions since humans need a reference that encourages their desire to succeed. Ayeh, Simpson and Baah (2022) added the degree of peer pressure or support varies frequently from one individual to another and they can also act as a reference while making life decisions.

Haryanto et al. (2023) have demonstrated the significant influence of subjective norms on entrepreneurial intentions, underlining the crucial role in fostering entrepreneurial behaviour. However, a study conducted

among SMEs demonstrated that subjective norms particularly family and friends have a poor impact towards behaviour (Selamat, 2023). Moreover, (Dewantara et al., 2024) have emphasized the importance of offering supportive surroundings to accelerate confidence and entrepreneurial intention which has a role in mediating the impact of subjective technology entrepreneurship behaviour. Therefore, understanding and leveraging subjective norms that refer to the influence of family and close acquaintances can significantly influence technopreneurial intention and technopreneurial behaviour subsequently.

H1: Subjective Norms have a positive effect on Technopreneurial Intention

Perceived Behavioral Control

The second variable is perceived behavioural control which refers to a person's impression of their ability to regulate their behaviour acts as an indicator of their self-efficacy, and self-confidence plays a critical part in influencing technopreneurial behaviour Astuti and Fatimah (2022). Perceived behavioural control includes students' perceived ease of forming a business, students' preparation, capacity to regulate the creative process, adequate knowledge, knowledge of how to construct technopreneurs' endeavours, and belief in high odds of success Al-Jubari (2019).

Perceived behavioural control has played a significant role towards technopreneurial behaviour, mediated by technopreneurial intention. This is agreed by Dewantara et al., (2024), Simamora and Sulistyo (2023), and Tsaknis and Sahinidis (2024) stated that perceived behavioural control favourably influences entrepreneurial intention, which affects the entrepreneurial subsequently. Although the influence between perceived behavioural control and behaviour has been demonstrated by many studies, nevertheless, a study conducted by Ogiemwonyi et.al (2022) found that there is no relationship between perceived behavioural control and green behaviour. As the result was found inconsistently, hence further investigation is needed to discover more evidence.

H2: Perceived Behavioural Control has a positive effect on Technopreneurial Intention

Technopreneurial Education

Technopreneurial education plays an important role in fostering technopreneurship behaviour. Yan, Huang and Xiao, (2022); and Sampene et al., (2022) stated entrepreneurship education may encourage graduates to develop their ventures and boost their entrepreneurial talents, knowledge and attitudes. After understanding the importance of this discipline for economic growth, educational institutions throughout the world have begun to provide students with training in technopreneurship (Hoque and Awang, 2017). Belmonte et al. (2022) have stated that technopreneurship education enables the identification of business-related opportunities, technopreneurship education improves students' skills, knowledge, and interest in entrepreneurship, and triggers interest in technopreneurship.

Wang et.al (2023); Hoang et. al (2020) emphasize the critical role of entrepreneurship education in boosting students' entrepreneurial intents and recommend that universities and policymakers should focus on building creative, technology-based curricula to promote students' engagement in entrepreneurship education. H3: Technopreneurial Education has a positive effect on Technopreneurial Intention

Technopreneurial Behaviour

Technopreneurial behaviour is the main objective of this study. It refers to overt behaviour that reflects a person's reaction to something that he or she considers favourable. Mok (2022) addresses technopreneurial behaviour, including inventive thinking, risk-taking, and the ability to navigate the use of technology in business goals such as internet advertising, data analytics, and automated machines, which drive corporate performance. As a result, technopreneurs' activity has a tremendous influence on the national economic landscape, not only improving the quality of life but also magnifying economic growth.

The entrepreneurial behaviour in technology-based businesses evolves. In early phases, entrepreneurs display strong self-confidence and rapid decision-making, whereas later stages observe increasing determination, group activity focus, and task timeliness (Michelin et al., 2023).

H4: Technopreneurial Intention has a positive effect on Technopreneurial Behavior

Attitudes

Attitudes are what individuals may have perceived about what is or is not good in practice, as well as thoughts

about the consequences of performing specific actions Setiaji (2018). Ayeh, Simpson and Baah (2022) mentioned that attitude plays an important role since it can influence the decisions made whilst starting a business and attitude training is necessary. Attitudes refer to specific habits or actions, such as entrepreneurship, that represent individuals' views (Al-Jubari, 2019). Such habits can be positive or negative, and as a result, they influence how people participate in a particular event, whether they act or not.

The role of attitudes is suggested in this study as an attitude can influence an individual's decision towards certain circumstances. Ajzen (1991) who introduced the Theory of Planned Behaviour highlighted that people with more favourable attitudes reflect their behaviour, and the more their intention to accomplish it should be. Thus, having favourable attitudes indicates that the individuals have favourable intentions to accomplish their behaviour to perform (Koe et al., 2018).

H5: Attitudes moderate the relationship between technopreneurs' intentions and technopreneurs behavior

Technopreneurial Intention

Technopreneurial intention is a personality attribute in individuals who embrace the way of their thinking in stressing the potential to produce a new value and develop their profession, especially for Malaysian graduates (Mohd and Shamsudin,2017). Technopreneurial intention is the students' learning session to become entrepreneurs, the efforts they put to become entrepreneurs, opportunism to seize every opportunity, entrepreneurship is their priority after graduation, and the best investment in life Hassan, Sade and Migin (2020).

Technopreneurship has to become prominent to improve societies and economies throughout the world in the age of technology globalisation (Hoque, Awang & Siddiqui, 2017) Hence it is very important to investigate students' technopreneurial intention as it could affect the economy subsequently. Entrepreneurial motivation, cognitive traits and opportunities for entrepreneurship have a substantial impact on the entrepreneurial mindset, which then drives technopreneurial intention (Rumangkit and Hadi, 2023). Rozan (2001) mentioned that cultural variations may influence entrepreneurial behaviour and intention, with perceived desirability demonstrating significant values in connection to race among IT technopreneurs in Malaysia. The findings of the technopreneurial behaviour study may contribute to the understanding of the technopreneurial process to magnify technology entrepreneurship programs in universities.

H6: Technopreneurial intention mediates the relationship between subjective norms, perceived behavioral control and technopreneurs education with technopreneurs' behavior

Conceptual Framework

Figure 1 demonstrates the conceptual framework developed for this research. The framework is designed and based on a thorough review of literature to examine the inclination for technopreneurial behaviour.

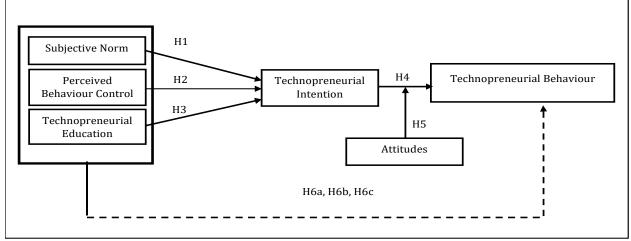

Figure 1: Proposed Conceptual Framework

3. Proposed Direction for Future Research

The conceptual framework of this study was designed through a comprehensive literature review from various sources and authors. The quantitative method is deemed to be the research method for empirical study in the future. The framework can be applied among undergraduate universities, especially those who enrol in a technology entrepreneurship course or subject. The best research strategy for future studies is the research conducted through a survey or questionnaire to be distributed among university students. In determining the sample size, the software of Raosoft is suggested, as this software is suitable for a known number of populations as compared to GPower, which is more suitable if the total population is unknown. The use of this software will allow the researcher to expedite the process of calculating the sample size. For the sampling technique, simple random sampling is suggested as all cases in the sample will get equal chances to get selected as a respondent. Lastly, for data analysis, Statistical Package for Social Sciences (SPSS) software (latest version) is suggested for data screening, and the main analysis is to employ Partial Least Squares Structural Equation Modelling (PLS-SEM) via SmartPLS software that comprises a measurement model and a structural model as well as hypotheses testing.

4. Study Implications

The findings of this study may be useful for future research in the area of technopreneurship or technology entrepreneurship. The government has spent a lot and introduced various technology entrepreneurship programs to instil technopreneurship intention among students and to encourage a greater number of technology-based start-ups produced among students. The result may help the Ministry of Education as a policymaker and the universities that are responsible for ensuring the ministry's annual target is achieved. This can be fulfilled by understanding students' behaviour and how their family and friends, perceived behaviour control, and technopreneurship education provided by their college influence their intention to become technopreneurs.

On the other hand, this study will benefit academicians by providing analysis information on previous studies on technopreneurship. The data may supplement the current research findings and assist researchers in improving their current research.

Conclusion

In a nutshell, this research on technopreneurial behaviour offers strong recommendations for students who want to pursue a career in technopreneurship or become entrepreneurs who venture into technology-based business. Stronger technopreneurial behaviour would boost national productivity and contribute to economic growth. It also assists prospective graduates in determining their career paths after graduating from current schooling. In this study, the proposed objective is to investigate the relationship between subjective norms, perceived behavioural control and technopreneurial education towards technopreneurial behaviour, to ascertain the mediating effect of technopreneurial intention between subjective norms, perceived behavioural control and technopreneurial behaviour, and lastly to determine the moderating effect between attitudes technopreneurial intention and technopreneurial behaviour.

Influence of Industrial Relations with *Ukhuwwah* (brotherhood), 'Adl (justice) and *Ihsan* (benevolence) among Islamic Universities

Suhaimi Mhd Sarif¹, *Sharifah Fazirah Syed Ahmad², ³Dolhadi Zainudin¹, Yusof Ismail¹, Yayan Firmansah³ ¹Kulliyyah of Economics and Management Sciences, International Islamic University Malaysia, Malaysia ²Faculty of Business and Management, Universiti Teknologi MARA, Malaysia ³University of Darussalam (UNIDA) Gontor, Indonesia suhaimims@iium.edu.my, *fazirah@uitm.edu.my, dolhadi@iium.edu.my, yusof.edu@gmail.com, yayanf@unida.gontor.ac.id Corresponding Author: Sharifah Fazirah Syed Ahmad

Abstract: The existence of industrial relations with the industrialization drivers has been argued with the persistent competition among different entities, including workers, capitalists, bureaucrats, and authorities, to reduce operating costs while maximizing financial profits. While industrial relations have been relevant through the human resource management of organizations, from the perspectives of Islam, three core values, *ukhuwwah* (brotherhood), *'adl* (justice), and *Ihsan* (benevolence) are essential in establishing a harmonious and ethical relationship between employers and employees, which serves as a solid foundation for creating a positive work environment. This study used the grounded theory method through focused group discussion to explore the integration of Islamic values into the industrial relations of Islamic universities. It focuses on insights from participants who emphasized the significance of promoting positive human relationships, incorporating Islamic teachings, and maintaining a balance between procedural work and community-building activities. The study's findings suggest that incorporating these principles can establish a cohesive and morally upright work environment that is advantageous for both employees and organizations. Suggestions for the industrial relations unit, top management, board of governors, and the government involve cultivating strong unity through team-building, maintaining fairness with clear and open policies, and promoting excellence by supporting professional growth and empathetic work conditions.

Keywords: Ukhuwwah, 'Adl, Ihsan, Industrial Relations

1. Introduction and Background

The basis for industrial development from conventional human resource management perspectives is rooted in ongoing conflict between various entities such as employees, employers, capitalists, bureaucrats, and authorities. The main objective of this endeavor is to minimize operational expenses while maximizing financial gains. According to Arudsothy (1990), industrial relations arise from the struggles of workers influenced by political and bureaucratic controls.

Conversely, in Islamic teachings, industrial relations are based on the values of *ukhuwwah* (brotherhood), *'adl* (justice), and *Ihsan* (benevolence), prioritizing a harmonious and ethical connection between employers and employees. These ideas, rooted in Islamic beliefs, offer a strong basis for cultivating a favorable work atmosphere. According to Akhtar (1992), Islamic teachings emphasize the employer-employee relationship with the three values of *ukhuwwah* (brotherhood), *'adl* (justice), and *Ihsan* (benevolence), prioritizing a harmonious and ethical connection between employers and employees. The study also highlights how these principles can foster a harmonious working environment.

Zakiyy (2021) employs a qualitative method of document analysis to identify relevant principles used by the Industrial Court in Malaysia and from the Al-Qur'an, assessing whether Quranic values can be integrated into current practices for resolving disputes in collective agreements. Zakiyy (2021) finds that the values of equity, fairness, benevolence, and mutual understanding mentioned in the verses of the Al-Qur'an align with the objectives of the Industrial Relations Act 1967 in Malaysia and the principles applied by the Industrial Court in adjudicating trade disputes. Similarly, Abd Razak and Nik Mahmod (2021) emphasize the importance of Islamic principles of social justice in the Malaysian trade union movement, while Ahmad (2024) discusses enhancing trade union leadership through lessons from past experiences. Al-Twal, Alawamleh, and Jarrar (2024) investigate the role of *Wasta* social capital in enhancing employee loyalty and innovation in organizations, showing how cultural factors influence industrial relations.

Problem statement

Organizations in the Association of South East Asian (ASEAN) region frequently experience an ongoing conflict in its industrial relations involving employees, employers, capitalists, bureaucrats, and authorities. The main driving force behind this conflict is the aim to reduce operating costs while maximizing financial profits (Arudsothy, 1988; Sharma, 1989; Bhopal, 1997; Hess, 2008; Shahiri, Osman, & Park, 2016; Kuruvilla & Arudsothy, 2005; Warner, 2014; Kumar et al., 2013; Shahiri et al., 2016).

In contrast, Islamic teachings suggest a different system for industrial relations that is founded on the principles of ukhuwwah (brotherhood), 'adl (justice), and Ihsan (benevolence). These principles emphasize the need to create harmonious and ethical relationships between employers and employees, which in turn promotes a positive work environment (Akhtar, 1992). The incorporation of Islamic values into industrial relations can enhance equity, fairness, benevolence, and mutual understanding, which are in line with the goals of the Industrial Relations Act 1967 and the principles upheld by the Industrial Court in Malaysia (Zakiyy, 2021; Abd Razak & Nik Mahmod, 2021; Ahmad, 2024; Al-Twal, Alawamleh, & Jarrar, 2024).

The conflict issue stems from the contradictory paradigms of traditional workplace relations, characterized by adversarial dynamics and commercial motivations, as opposed to the ethical and peaceful values promoted by Islamic teachings. This discrepancy emphasizes the necessity for a thorough analysis of how Islamic principles can be methodically incorporated into the policy and implementation of industrial relations to address conflicts, advance social equity, and improve organizational commitment and creativity. This need is especially pertinent in the context of Islamic universities in two ASEAN countries, specifically Malaysia and Indonesia.

Research Questions

There are two research questions identified in the study. First, how do employees' understandings of the principles of ukhuwwah (brotherhood), 'adl (justice), and Ihsan (benevolence) influence employee-employer satisfaction and contribute to workplace harmony in Islamic universities? Second, how do Islamic universities effectively implement strategies to incorporate the principles of ukhuwah (brotherhood), adl (justice), and Ihsan (benevolence) into their industrial relations procedures to enhance employee productivity and organizational commitment?

Research Objectives

Two research objectives were developed. Firstly, the study aims to explore the understanding of the concept of principles of ukhuwwah (brotherhood), 'adl (justice), and Ihsan (benevolence) among employees to increase employee-employer satisfaction and create workplace harmony in Islamic universities. Secondly, the research seeks to recommend effective strategies for Islamic universities to integrate the principles of ukhuwwah, 'adl, and Ihsan into their industrial relations practices to enhance employee productivity and organizational commitment.

Significance of the Study

This study has two significant reasons. Its primary objective is to further develop perspectives related to ethics in industrial relations. Its main goal is to promote more ethical industrial relations by linking Islamic concepts, namely *ukhuwah* (brotherhood), *adl* (justice), and *Ihsan* (benevolence), into industrial relations policies and practices. By implementing this strategy, the study aims to achieve its objective of distinguishing profit-oriented practices that often lead to disputes and employee dissatisfaction. Conversely, this study advocates for an ethical and harmonious framework that prioritizes equity, justice, and mutual understanding. The results could offer significant perspectives for policymakers and practitioners in the ASEAN region, specifically in Malaysia and Indonesia, to establish more sustainable and equitable industrial relations systems.

Secondly, this study aims to promote organizational loyalty and innovation. The incorporation of Islamic principles into industrial interactions can greatly improve organizational loyalty and innovation. Organizations can enhance employee morale and commitment by cultivating a work atmosphere that promotes mutual respect, justice, and charity. This is particularly important in the context of Islamic universities. Thus, this study aims to investigate the systematic integration of these values into the industrial relations frameworks of Islamic universities in Malaysia and Indonesia. The acquired knowledge could assist educational institutions and other organizations in the area to establish work environments that are more encouraging and inventive, thereby enhancing organizational performance and employee contentment.

2. Literature Review

This section delineates the epistemological discussion of Industrial Relations with Islamic perspectives and values.

Nature of Industrial Relations

Industrial relations is a field of study that falls under the broader discipline of human resource management. It is also available at law schools as a component of labor law. There is a variation in the method of studying industrial relations among these faculties (Lim et al., 2012; Aminuddin, 2024). Law faculties prioritize the study of the legal components of industrial relations within the framework of labor law. This includes analyzing regulations, ensuring adherence to them, and resolving disputes. On the other hand, management faculties prioritize the practical aspects of industrial relations in the context of human resource management. They concentrate on implementing methods and techniques to effectively handle relationships between employers and employees in organizations. Industrial relations refers to the complex web of relationships and interactions between employers, employees, trade unions, and the government within the workplace. It encompasses the study and practice of managing these relationships to ensure a harmonious, productive, and legally compliant working environment.

Components of Industrial Relations

Industrial relations involve various aspects, including how employers and employees interact, negotiate, and resolve conflicts (employee-employer relations); the legal framework governing employment, including labor rights, working conditions, and dispute resolution mechanisms (labor laws and regulations); the process by which employers and trade unions negotiate wages, working hours, and other employment terms (collective bargaining); methods and processes used to address and resolve conflicts or grievances between employers and employees (workplace dispute resolution); organizations that represent employees' interests, advocate for their rights, and engage in collective bargaining with employers (trade unions); and the role of government agencies and institutions in regulating, monitoring, and influencing industrial relations practices to ensure fairness and compliance with laws (government and institutional role).

According to Aminuddin (2024), the study of Industrial Relations incorporates management and industrial relations with industrial relations and employment law. Likewise, Lim et al. (2012) emphasize the importance of a partnership approach in labor relations, highlighting that collaborative strategies can lead to a strategic competitive advantage. Industrial relations aim to balance the interests of various stakeholders, promote fair treatment of workers, and maintain industrial peace and productivity.

Traditional Viewpoints of Industrial Relations

The traditional viewpoints on industrial relations are based on the notion of an ongoing conflict between various entities, such as workers, capitalists, bureaucrats, and authorities. The main objective of this endeavor is to minimize operational expenses while maximizing financial gains. According to Arudsothy (1990), industrial relations arise from conflicts and discussions that are impacted by political and bureaucratic restrictions. The dynamic nature of industrial interactions in the ASEAN region has been examined by several researchers, such as Arudsothy (1988), Sharma (1989), Bhopal (1997), Hess (2008), and Shahiri, Osman, & Park (2016). These studies highlight the fact that the establishment of industrial relations in various countries is greatly influenced by their distinct historical and economic circumstances. For example, Bhopal (1997) and Kuruvilla & Arudsothy (2005) analyze the impact of these circumstances on labor relations and the dynamics between workers, employers, and governments. Warner (2014) and Kumar et al. (2013) emphasize the varied methods and results of industrial relations practices in different countries within the area. Shahiri et al. (2016) enhance the existing research by examining current problems and patterns in industrial relations, offering a thorough comprehension of how past and economic influences persistently influence the sector.

Islamic Institutional Relations Perspectives

Industrial Relations, based on the values of *ukhuwwah* (brotherhood), *'adl* (justice), and *lhsan* (benevolence), prioritize a harmonious and ethical connection between employers and employees. These ideas, which are based on Islamic beliefs, offer a strong basis for cultivating a favorable work atmosphere.

Ukhuwwah, which refers to the concept of brotherhood, promotes a feeling of camaraderie and reciprocal assistance among colleagues in the workplace. This principle promotes a perspective where employees and employers perceive each other as members of a broader family, emphasizing the utmost importance of mutual respect, support, and cooperation. Ukhuwwah fosters a sense of belonging and unity, hence establishing a workplace atmosphere that promotes value and respect for all individuals. Consequently, this fosters collaboration elevates team spirit and cultivates a collective commitment to attaining mutual objectives.

'*Adl*, which refers to the concept of justice, guarantees impartiality and fairness in all interactions inside the workplace. This principle requires companies to ensure fair treatment for all employees, assessing them based on their abilities and contributions rather than showing favoritism or prejudice. Equitable remuneration, equitable working conditions, and unbiased conflict resolution are fundamental elements of 'adl. By maintaining fairness and impartiality, companies can cultivate trust and devotion among employees, ultimately resulting in increased job satisfaction and productivity. When employees are aware that they are being treated equitably, they are more inclined to feel inspired and dedicated to their jobs.

Ihsan, which refers to benevolence, motivates individuals to surpass their fundamental obligations and exhibit compassion and kindness. This concept highlights the significance of prioritizing the welfare of others and fulfilling one's obligations with a strong sense of moral accountability. In the realm of industrial relations, Ihsan refers to the demonstration of empathy, comprehension, and assistance between employers and employees. This may entail offering aid to coworkers in need, establishing a nurturing work atmosphere, and cultivating a culture characterized by benevolence and magnanimity. By placing a high importance on the welfare of others, Ihsan contributes to the establishment of a workplace that is more compassionate and considerate. This can have a substantial positive impact on employee contentment and the unity of the organization.

Collectively, these principles establish a harmonious and ethically sound structure for industrial relations that is by Islamic beliefs. This framework not only fosters a constructive and respectful work environment but also guarantees that the organization functions in an ethical and socially responsible manner. By incorporating the principles of *ukhuwwah* (brotherhood), *'adl* (justice), and *Ihsan* (benevolence) into their operations, organizations can foster a work culture that is not only efficient but also ethically upright, resulting in enduring prosperity and viability.

Islamic Institutional Framework

Akhtar (1992) provides an Islamic framework for employer-employee relationships, highlighting how these principles can foster a harmonious working environment. Akhtar (1992) explains that in Islamic teachings, the employer-employee relationships are based on three fundamental principles: *ukhuwwah* (brotherhood), *'adl* (justice), and *Ihsan* (benevolence). These principles are essential for creating a fair, balanced, and compassionate employment environment.

Ukhuwwah (brotherhood) refers to the strong bond and sense of unity that exists between individuals. It represents a deep connection and mutual support among people. *Ukhuwwah* fosters camaraderie and underscores the significance of unity and reciprocal assistance among all individuals in the community, including within the professional setting. It promotes the practice of treating colleagues with respect, empathy, and cooperation, acknowledging that all individuals are members of a wider community united by common beliefs and principles. In a professional context, this means creating a nurturing and cooperative work atmosphere where both employees and employers prioritize each other's welfare.

'*Adl*, which translates to justice, is a concept that refers to the quality of being fair, impartial, and equitable. Adl is a term that encompasses the principles of justice and fairness. Ensuring equitable treatment and upholding the rights of all individuals is of utmost importance. Within the framework of employer-employee relationships, 'adl imposes a structure of individual and societal obligations, guaranteeing that both parties fairly complete their duties and responsibilities. This entails providing equitable compensation, implementing clear and open guidelines, ensuring impartial treatment, and fostering a harmonious and equitable workplace where the rights of all individuals are upheld.

Ihsan, also known as benevolence, refers to the act of doing good or showing kindness and compassion towards

others. It encompasses the concept of going above and beyond what is expected, and *Ihsan* is the fundamental concept of exhibiting kindness and performing virtuous actions. In the workplace, Ihsan promotes the idea of employers and employees willingly relinquishing their rigid entitlements for the benefit of others, demonstrating acts of righteousness and ethical superiority. For example, a company may offer supplementary assistance to an employee in need, or an individual may voluntarily assist a colleague without anticipating any reciprocation. Ihsan cultivates a culture characterized by empathy and altruism, which improves the overall synergy and efficiency of the workplace.

Islamic Values into Industrial Relations

According to Islamic teachings as well, employees are required to maintain elevated moral principles, including truthfulness, honesty, and responsibility. The Qur'an and hadith stress the significance of these attributes as *al-quwwah* (strength) and encourage individuals to exert themselves diligently to provide for themselves and their families, considering such endeavors as striving for the cause of Allah. The Prophet Muhammad emphasized the importance of obtaining a legitimate income, considering it to be equivalent in significance to the act of jihad from the perspective of Allah. Employees should possess qualities of trustworthiness and productivity. The most exemplary workers are those who demonstrate *al-quwwah* (strength) and *al-qudrah* (capability). *Al-quwwah*, also known as strength, encompasses an employee's physical and mental fortitude, capacity to withstand difficulties and general energy in carrying out responsibilities. It includes not just physical endurance but also moral and ethical fortitude, such as integrity, dependability, and the capacity to maintain high moral principles, including candor and honesty.

Al-qudrah, also known as capability, refers to an employee's aptitude, expertise, and mastery in their specific areas of work. It entails possessing the requisite knowledge, competence, and proficiency to carry out responsibilities with effectiveness and meet job requirements. An *al-qudrah* employee is characterized by their adeptness in handling responsibilities, comprehensive understanding of task subtleties, and fruitful contributions to the organization.

In addition, an employee must possess a clear understanding (الانت فايم) of their obligations and carry out their tasks with proficiency (النت عنه) as seen in the Qur'anic verse, "Appoint me over the storehouses of the land. Indeed, I will be a knowing guardian" (Surah Yusuf, verse 55). Zakiyy (2021) employs a qualitative method of document analysis to identify the relevant principles used by the Industrial Court and from the Al-Qur'an, assessing whether Quranic values can be integrated into current practices for resolving disputes in collective agreements. This study finds that the values of equity, fairness, benevolence, and mutual understanding mentioned in the verses of the Al-Qur'an align with the objectives of the Industrial Relations Act 1967 and the principles applied by the Industrial Court in adjudicating trade disputes. Similarly, Abd Razak and Nik Mahmod (2021) emphasize the importance of Islamic principles of social justice in the Malaysian trade union movement, while Ahmad (2024) discusses enhancing trade union leadership through lessons from past experiences. Al-Twal, Alawamleh, and Jarrar (2024) investigate the role of Wasta social capital in enhancing employee loyalty and innovation in organizations, showing how cultural factors influence industrial relations. Based on the epistemological discussion, the study posited that the industrial Relations. Figure 1 shows the epistemological framework of Islamic-oriented Industrial Relations.

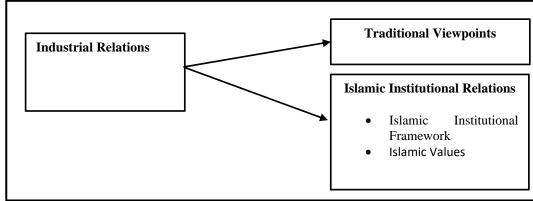

Figure 1: Islamic-Oriented Industrial Relations

3. Research Methodology

This study employed a qualitative research methodology using the grounded theory technique. Grounded theory is a method that involves collecting and analyzing data at the same time to develop theory. It uses a combination of induction and deduction, known as abductive reasoning (Corley, 2015; Glaser & Strauss, 2017). The main objective of these simultaneous endeavors is to construct a theory that is profoundly influenced by the evidence, resulting in a theoretical output that is firmly based. This grounded theory method used a focus group discussion with selected staff of Islamic Universities.

The first phase in the grounded theory method started with a preliminary literature review to understand the context and identify gaps in existing knowledge related to the research topic within Islamic universities. Then the study developed a research design that outlined the objectives, research questions, and the grounded theory approach. The research instruments have been validated by independent researchers. The study secured informed consent from the participants. The data collection method focused on group discussions.

In the data collection phase, the study conducted a focus group discussion with a small and diverse group of staff members. The lead researcher became the facilitator and guided the discussion, ensuring that all participants had the opportunity to share their views. These discussions are recorded and transcribed. Participants were encouraged to elaborate on their experiences and perceptions.

As for the data analysis phase, there were several processes, namely initial coding or open coding, where the collected data was divided into discrete parts and coded for significant concepts and themes. Constant comparison was used to continuously compare new data with existing codes to identify similarities and differences. Then, the axial coding, identified relationships among the initial codes and grouped these codes into broader categories and subcategories. The context and conditions under which the phenomena occur were considered for interactions and consequences.

Finally, selective coding involved the identification of a core category that represented the central phenomenon of the study and integrated other categories around this core category, refining the theory to ensure it was coherent and comprehensive. At the theoretical development phase, data collection and analysis continued until no new significant themes or insights emerged, indicating theoretical saturation. A grounded theory that is well-supported by the data is constructed, explaining the central phenomenon and its related categories. The validation and refinement phase, involved checking and verification, where findings were shared with participants. Feedback was gathered to ensure the accuracy and relevance of the theory, and the theory was refined based on participant feedback and further analysis. Figure 2 depicts the grounded theory method process.

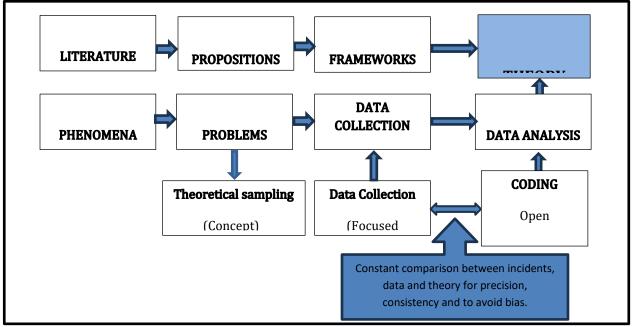

Figure 2: Grounded Theory Method Process

4. Results and Discussion

The focus group discussion began with participants introducing themselves and describing their roles at their respective Islamic universities. The participants included NH from the IT department, MA from security advisory, YR from knowledge repository services, ZF from financial services, LH from corporate services, ZW from health services, and IH from corporate services. With extensive experience ranging from 10 to 20 years, the participants provided a rich foundation for discussing industrial relations in the context of Islamic principles.

Contractual Relationships

When asked to provide insights on industrial relations within Islamic universities, participants collectively defined it as a relationship based on employment contracts, social contracts, and Islamic faith contracts. NH emphasized the harmony between employer-employee relationships aimed at attaining the Pleasure of Allah. NH stated, "The harmony between employer-employee relationships should be aimed at attaining the Pleasure of Allah. This spiritual goal should be central to our interactions and management practices." Supporting NH's view, MA emphasized, "Both employers and employees must work in harmony to ensure smooth industrial processes. Without this cooperation, achieving our operational goals becomes much harder."

YR added, "Fostering good human relationships within organizational structures is vital. When we build strong, positive relationships, it benefits everyone and helps the university function more effectively." ZF concurred with YR, NH, and MA, saying, "We need to integrate Islamic teachings in managing people. These principles guide us to be fair, compassionate, and just in all our dealings, which is essential for a healthy work environment."

LH highlighted, "Our work should be procedural and target-oriented, involving employers, employees, and the government. Clear procedures and objectives help ensure that everyone is on the same page and working towards common goals." ZW noted, "The regulated nature of these relationships is important. Regulations provide a framework that ensures fairness and consistency in how we manage our staff and operations." IH concluded the arguments by other colleagues by saying, "Islamic universities have a unique vision and mission to achieve goodness. This mission should guide all our actions and decisions, aligning them with our core values and objectives."

In essence, MA highlighted the need for both employers and employees to work in harmony to ensure smooth industrial processes. YR noted the importance of fostering good human relationships within organizational structures. ZF pointed out the integration of Islamic teachings in managing people. LH discussed the procedural and target-oriented nature of work involving employers, employees, and the government. ZW remarked on the regulated nature of these relationships, while IH underscored the unique vision and mission of Islamic universities to achieve goodness.

Ukhuwwah-Adl-Ihsan Approach

The discussion then turned to incorporate the principles of *ukhuwwah* (brotherhood), *'adl* (justice), and *Ihsan* (benevolence) into the industrial relations at Islamic universities. Participants argued that *ukhuwwah* can be integrated into the operations of Islamic universities by fostering a strong sense of community and mutual support among staff. This principle encourages teamwork, collaboration, and the sharing of knowledge and resources. NH from the IT department emphasized the importance of creating an environment where staff feel valued and supported, which can lead to higher job satisfaction and productivity. MA, YR, ZF, LH, ZW, and IH shared similar insights, noting that regular team-building activities and opportunities for staff to engage in social and professional networks can enhance this sense of brotherhood.

According to NH, "When we talk about integrating the principle of ukhuwwah, or brotherhood, into our industrial relations, it is crucial to focus on creating an environment where staff feel valued and supported. At my department, I have seen how much of a difference it makes when team members know they can rely on each other. This not only boosts morale but also leads to higher job satisfaction and productivity."

MA responded: "I completely agree with NH. At my department, the sense of brotherhood is essential. When staff members feel that they are part of a community, they are more likely to go above and beyond their duties. We need

to have regular team-building activities and opportunities for social interaction to strengthen these bonds."

YR agreed with NH and MA by saying, "Yes, fostering good human relationships within our organizational structures is vital. At my office, we have started implementing more collaborative projects, which has helped in building trust and cooperation among the team. Encouraging teamwork and the sharing of knowledge and resources is key to embodying the principle of ukhuwwah." ZF responded: "From a financial services perspective, integrating Islamic teachings in managing people is fundamental. The principles of fairness and compassion are at the heart of our work. By fostering a strong sense of community and mutual support, we can ensure that our staff feel respected and valued. This not only aligns with the principle of ukhuwwah but also enhances our overall work environment."

While concurred with other colleagues, LH emphasized by saying: "Our work should be procedural and targetoriented, but that doesn't mean we can't also focus on building a sense of brotherhood. In corporate services, we have found that clear procedures and objectives help, but it's the mutual support and teamwork that truly drive success. We should encourage regular team-building activities and create opportunities for staff to engage in both social and professional networks." As for ZW, ZW said: "I've seen how important it is for staff to feel supported by their colleagues. The regulated nature of our relationships helps ensure consistency and fairness, but we also need to foster a sense of community. Regular team-building activities and a supportive work environment can go a long way in enhancing this sense of brotherhood."

IH said: "Islamic universities have a unique vision and mission to achieve goodness, and this should guide all our actions and decisions. By integrating the principles of ukhuwwah, 'adl, and Ihsan into our industrial relations, we can create a more harmonious and ethically sound work culture. It's about aligning our core values with our everyday practices to foster an environment where everyone feels valued and supported."

While agreeing with IH, MA pointed out that: "I also think we need to consider how we can implement the principle of 'adl, or justice, in our industrial relations. This means establishing clear and transparent policies that govern employment practices, conflict resolution, and performance evaluation. Fair treatment and equitable distribution of resources and opportunities are essential to fostering a culture of fairness and trust."

YR mentioned: "Incorporating the principle of Ihsan, or benevolence, is also important. This involves going beyond the minimum requirements and striving for excellence in all our actions. Providing continuous professional development opportunities and support for personal growth can make a significant difference in staff morale and motivation." ZF supported YR's opinion by saying: "Yes, fostering a compassionate work environment where staff feel cared for and motivated to perform their best is essential. This not only benefits the individual staff members but also contributes to the overall success of the university."

LH said: "By focusing on these principles, we can create a more supportive and productive work environment. It's about aligning our operations with our core values to foster a sense of community, fairness, and excellence." ZW mentioned that: "Regular team-building activities, clear and transparent policies, and a commitment to professional development are all crucial to integrating these principles into our industrial relations." Indeed, IH pointed out that: "Ultimately, it's about creating a work culture that reflects our Islamic values and promotes a harmonious and ethically sound environment for everyone."

Integrated Approach

NH emphasized the importance of integrating the principle of ukhuwwah, or brotherhood, into industrial relations by creating an environment where staff feel valued and supported. In the IT department, NH has observed the positive impact when team members know they can rely on each other, which not only boosts morale but also leads to higher job satisfaction and productivity. MA agreed, stating that in a security advisory, the sense of brotherhood is essential. When staff members feel part of a community, they are more likely to go above and beyond their duties. MA highlighted the need for regular team-building activities and opportunities for social interaction to strengthen these bonds.

YR echoed these sentiments, noting that fostering good human relationships within organizational structures is vital. In knowledge repository services, collaborative projects have helped build trust and cooperation among

the team. Encouraging teamwork and the sharing of knowledge and resources is key to embodying the principle of ukhuwwah. From a financial services perspective, ZF emphasized that integrating Islamic teachings in managing people is fundamental. The principles of fairness and compassion are at the heart of their work. By fostering a strong sense of community and mutual support, staff feels respected and valued, aligning with the principle of ukhuwwah and enhancing the overall work environment.

LH discussed the importance of balancing procedural and target-oriented work with building a sense of brotherhood. In corporate services, clear procedures and objectives are essential, but mutual support and teamwork drive success. LH suggested encouraging regular team-building activities and creating opportunities for staff to engage in both social and professional networks. ZW, reflecting on health services as a dental therapist, highlighted the importance of staff feeling supported by their colleagues. While regulations ensure consistency and fairness, fostering a sense of community is also necessary. Regular team-building activities and a supportive work environment enhance this sense of brotherhood.

IH pointed out that Islamic universities have a unique vision and mission to achieve goodness, which should guide all actions and decisions. By integrating the principles of ukhuwwah, 'adl, and Ihsan into industrial relations, a more harmonious and ethically sound work culture can be created. Aligning core values with everyday practices fosters an environment where everyone feels valued and supported. MA added that implementing the principle of 'adl, or justice, requires establishing clear and transparent policies governing employment practices, conflict resolution, and performance evaluation. Fair treatment and equitable distribution of resources and opportunities are essential to fostering a culture of fairness and trust.

NH supported this, emphasizing that ensuring all staff members have access to the same opportunities for advancement and are evaluated based on their merit and contributions is critical. This creates an environment of trust and fairness. YR added that incorporating the principle of Ihsan, or benevolence, involves going beyond minimum requirements and striving for excellence in all actions. Providing continuous professional development opportunities and support for personal growth can significantly boost staff morale and motivation.

ZF agreed, noting that fostering a compassionate work environment where staff feel cared for and motivated to perform their best is essential. This benefits individual staff members and contributes to the overall success of the university. LH concluded that focusing on these principles can create a more supportive and productive work environment. Aligning operations with core values fosters a sense of community, fairness, and excellence. ZW reiterated the importance of regular team-building activities, clear and transparent policies, and a commitment to professional development in integrating these principles into industrial relations. IH ultimately emphasized that the goal is to create a work culture reflecting Islamic values and promoting a harmonious and ethically sound environment for everyone.

In terms of *'adl* (justice), participants argued that *'adl* is crucial in ensuring fairness in all dealings within the university. This principle can be implemented by establishing clear, transparent policies and procedures that govern employment practices, conflict resolution, and performance evaluation. MA emphasized the need for fair treatment and equitable distribution of resources and opportunities. NH, YR, ZF, LH, ZW, and IH echoed these concerns, stating that all staff members should have access to the same opportunities for advancement and be evaluated based on their merit and contributions, fostering a culture of fairness and trust.

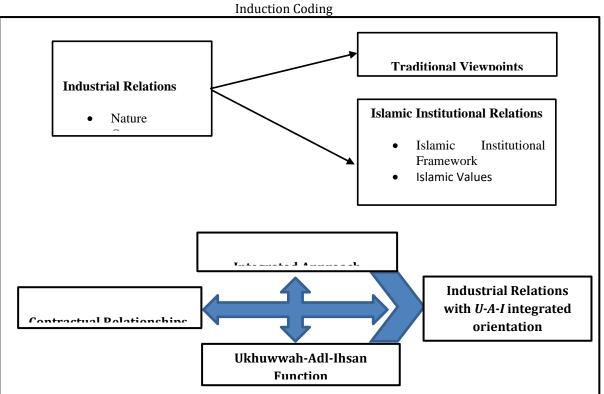

As for *Ihsan* (benevolence), participants argued that *Ihsan* involves going beyond the minimum requirements and striving for excellence in all actions. This can be reflected in the university's commitment to the welfare and development of its staff. YR pointed out the importance of providing continuous professional development opportunities and support for personal growth. NH, MA, ZF, LH, ZW, and IH agreed, emphasizing that fostering a compassionate work environment where staff feel cared for and motivated to perform their best is essential. By integrating the principles of *ukhuwwah*, *'adl*, and *Ihsan* into their operations, Islamic universities can create a harmonious and ethically sound work culture that benefits both the staff and the institution. **Table 1**, depicts a summary of analysis based on the emergent themes that incorporated inductive and deductive codes derived from the interviews. The table shows that most data codes were found suggesting a convergence of the study findings.

Table 1: Mapping Cross Analysis

Open Coding	Code	Theme
 Contractual Relationship (Employment, social and faith) Harmonious and cooperative relationships for operational efficiency. 		
 Strong and positive Relationships 	The understanding of the Islamic	
 An integration of Islamic Guidance 	Concept of Industrial Relations	
 Clear procedure and Result Oriented 		 Contractual Relationship
 Fairness and consistent regulation framework 		 Integrated Approach
A guided mission		 Ukhuwah (Brotherhood) Adl (Justice)
 Valuing staff and supportive environment 		 Ihsan (Benevolence)
 Sense of community and mutual support 		
 Collaboration and teamwork 		
 Incorporate Fundamental Islamic teaching 	The practise (Implementation) of the Islamic Concept of Industrial Relations	
Conflict Resolution	- Ukhuwah- Adi- Ihsan	
 Fairness in Policy 		
Equitable opportunities		
Excellence and beyond minimum		
 Compassionate Environment 		
 Professional Development 		

Through the combination of the induction framework with the deduction framework, the study developed Industrial Relations with U-A-I integrated orientation. Figure 3 depicts the grounded theory industrial relations theory with an emphasis on *ukhuwwah*, *'adl* and *ihsan*.

5. Managerial Implications and Recommendations

The Industrial Relations Unit of Islamic universities is recommended to cultivate *ukhuwwah* (brotherhood) with consistent team-building exercises and social engagement opportunities that effectively enhance the connections among staff members. Efforts that actively promote cooperation, collaboration, and the exchange of knowledge and resources will contribute to the development of a supportive community. In addition, the implementation of mentorship programs guarantees that employees feel appreciated and assisted, resulting in a substantial increase in job satisfaction and productivity. To uphold the principle of *'adl* (justice), it is necessary to establish explicit and transparent regulations that govern employment practices, conflict resolution, and performance evaluation. It is imperative to ensure that all staff members are treated fairly and that resources and opportunities are distributed equitably among them. Regularly reviewing and updating policies is necessary to sustain a culture characterized by fairness and trust. To foster *lhsan* or benevolence, it is essential to offer ongoing professional development opportunities and assistance for personal advancement. An empathetic work atmosphere that cultivates a sense of real concern for staff well-being and fosters motivation for optimal performance should be nurtured. It is crucial to motivate employees to pursue excellence in all their actions, surpassing the minimum expectations.

To the top management of Islamic universities, it is essential to include Islamic principles in leadership. Top management should demonstrate exemplary behavior, reflecting the concepts of *ukhuwwah*, *'adl*, and *Ihsan* in all interactions and decision-making processes. It is important to actively promote a culture of leadership that places a high emphasis on ethical conduct, compassion, and justice. In addition, the top management also needs to improve communication and promote transparency. Thus, the top management must maintain open channels of communication with personnel to keep them informed about policy changes, chances for career progression, and organizational objectives. In addition, it is crucial to foster a transparent atmosphere in which employees feel at ease expressing their problems and suggestions.

Moreover, the top management also should facilitate the advancement of one's professional skills. There is a need for the allocation of resources for staff training and development programs that are by Islamic principles. Acknowledging and incentivizing the contributions and accomplishments of employees will strengthen a culture characterized by exceptional performance and *lhsan* (benevolence).

Conclusion

The conventional viewpoint on industrial connections, marked by discord and motivated by economic goals, dramatically differs from the Islamic approach, which prioritizes harmonious and ethical relationships. The principles of *ukhuwwah* (brotherhood), *'adl* (justice), and *Ihsan* (benevolence) offer a comprehensive foundation for establishing a healthy and productive work environment in Islamic universities. The study participants emphasized the importance of these concepts in promoting a favorable work culture.

To uphold the principle of *ukhuwwah*, the Industrial Relations Unit should provide frequent team-building activities and social contact opportunities, fostering teamwork, cooperation, and the exchange of resources. It is important to establish mentorship programs to enhance staff's sense of worth, which will result in higher levels of job satisfaction and productivity. It is crucial for *'ADL* to establish explicit and open policies that regulate employment procedures, conflict resolution, and performance evaluation. It is important to guarantee just treatment and equal allocation of resources and opportunities, with policies constantly assessed to sustain a culture of justice and trust.

Advancing *Ihsan* entails offering ongoing chances for professional development and fostering personal improvement. Thus, there is a of creating a nurturing work atmosphere that prioritizes the well-being and motivation of personnel is crucial. Likewise, motivating employees to consistently pursue excellence in all endeavors will yield advantages for both individuals and the university as a collective entity. Top management needs to include Islamic values in their leadership style, exemplifying ethical conduct, compassion, and fairness in all their dealings. In addition, it is important also for the top management to keep communication lines open and promote transparency to ensure that staff members are well-informed and feel comfortable expressing their concerns.

Apart from the top management, the Board of Governors also should ensure that the strategic objectives and policies align with Islamic beliefs, while consistently evaluating their influence on staff morale and achievement. The process of policy formulation should include a wide range of stakeholders, to provide thorough and inclusive governance. In doing so, there is a need to ensure sufficient resources to be assigned to projects that promote community, equity, and professional growth. The government should establish and uphold labor regulations that align with Islamic ideals in educational institutions. Thus, universities that promote ethical work cultures should receive additional financial support and incentives. In addition, there should be nationwide training programs for workers and management on Islamic values.

Islamic universities can establish a harmonious and morally sound work culture by incorporating the principles of *ukhuwwah*, *'adl*, and *ihsan*. This will improve staff well-being, encourage fairness and justice, and create a friendly and productive atmosphere that aligns with Islamic ideals.

How Individual Factors Shape Innovative Work Behavior in Malaysian HEIs: The Role of Innovation Capability, Knowledge Sharing and Psychological Empowerment

Irzan Ismail¹, *Zarina Begum Ebrahim^{1,} Erne Suzila Kassim² ¹Faculty of Business and Management, Universiti Teknologi MARA, Cawangan Melaka, Kampus Bandaraya Melaka, Malaysia ²Faculty of Business and Management, Universiti Teknologi MARA, Cawangan Selangor, Kampus Puncak Alam, Bandar Puncak Alam, Selangor, Malaysia irzan@uitm.edu.my, *zarina148@uitm.edu.my, ernekassim@uitm.edu.my Corresponding Author: Zarina Begum Ebrahim

Abstract: This study investigates the factors driving academics' innovative work behavior (IWB) in Malaysian Higher Education Institutions (HEIs), focusing on individual innovation capability, psychological empowerment, and knowledge sharing. The respondents comprised 382 academics from 24 Malaysian universities listed in the QS World Ranking 2023, selected through convenience sampling. Data were collected via a Google Form questionnaire distributed by email. The descriptive analysis assessed individual innovation capabilities, psychological empowerment, and knowledge-sharing levels, and their impact on IWB. The findings indicate high engagement in innovative activities, with academics demonstrating strong innovative capabilities, a sense of empowerment, and active knowledge-sharing practices. These individual factors significantly contribute to fostering IWB, highlighting the importance of continuous professional development, supportive institutional environments, and collaborative cultures in promoting innovation within HEIs. This study provides valuable insights for policymakers and university administrators to enhance the innovative potential of academics, ultimately contributing to the advancement of knowledge and improvement of educational practices in Malaysian HEIs. Future research should explore longitudinal effects and potential moderating factors to further understand innovative work behavior dynamics in academic settings.

Keywords: Innovative Work Behavior, Individual Innovation Capability, Psychological Empowerment, Knowledge Sharing, Higher Education Institutions, Malaysia

1. Introduction and Background

In the last two decades, academics have devoted more emphasis to studying innovative work behavior (IWB) due to the demonstrated influential effects of IWB on individual and organizational results (Afsar et al., 2020; Rajandran & Subramaniam, 2023; Sari et al., 2021; Usmanova et al., 2020). The organization's growth and survival are contingent upon IWB, as behavior plays a crucial role in organizational transformation (Zainal & Matore, 2019). In addition, IWB has the potential to transform the work environment by encouraging teamwork, which in turn boosts productivity (Supriyanto, 2019). With the growing recognition of the significance of IWB, non-profit and for-profit organizations are actively searching for effective techniques to encourage their staff members to demonstrate IWB (Choi et al., 2021; Srirahayu et al., 2023). Although much research has been conducted on IWB, there is still a paucity of studies focusing on understanding the process that leads to it (Riaz et al., 2018). Prior research on factors influencing IWB has primarily concentrated on Western nations (Zhou & Velamuri, 2018), and less effort was given to service industries (Javed et al., 2017). Mohammed Afandi & Mohd Effendi Ewan, (2020) Pointed out in their research that there is still a dearth of and a restricted amount of discussion on IWB in the context of education and academia.

The urgency of research on IWB among academics in Malaysian higher education institutions (HEIs) cannot be overstated. As the country strives to become a regional education hub and adapt to the challenges of the Fourth Industrial Revolution (IR 4.0), fostering innovation among academic staff becomes imperative (Rahman Ahmad et al., 2020; Rajandran & Subramaniam, 2023). Besides, to satisfy the current requirements of the market, universities must establish a competitive edge and develop the ability to recover quickly from challenges, which highlights the importance of effectively managing their human resources (Wahab et al., 2024). Due to this, HEIs are increasingly pressured to adapt and innovate to remain competitive and relevant. Because of the fast-paced changes in the labor market and digital transformation, academics are facing immense pressure to improve their teaching methods and instructional materials to keep up with students, particularly at universities (Atatsi

et al., 2021). According to Wahab et al., (2024), academics must demonstrate IWB to better adapt to new situations and be an asset in making their institutions more competitive. Employees who exhibit IWB are those who are constantly thinking of new ways to solve problems or meet the needs of others, and who are also able to recognize when a trend has changed and adapt their thinking accordingly (de Jong & Hartog, 2007).

Thus, to ensure the education system is always competitive, academics should have innovative attitudes or behaviors (Rajandran & Subramaniam, 2023; Wahab et al., 2024). However, existing literature indicates a scarcity of local research on IWB, notably in the context of academic environments (Hashim et al., 2019; Ibus et al., 2020; Johari et al., 2021). This suggests a lack of comprehensive exploration of IWB in Malaysian education. Researchers still have ample space and opportunity to delve deeper into the IWB of academics, as their understanding of how to enhance innovative academic methods remains incomplete (Mohammed Afandi & Mohd Effendi Ewan, 2020). In line with this phenomenon, this paper aims to address the knowledge and empirical gaps surrounding academics IWB in educational institutions, which are responsible for designing and delivering valuable and useful knowledge to students.

Bos-Nehles & Veenendaal, (2019) Observe a lack of knowledge regarding the cultivation of innovation at the individual level. According to a bibliometrics review by Farrukh et al., (2022) The antecedents of IWB at the individual level are the least explored research areas. Luu, (2019) Also emphasizes that employees' use of IWB has not received as much attention as a team or organizational innovation. Previous studies have highlighted the need for focused research on IWB at the individual/personal level (De Jong & Den Hartog, 2010; Farrukh et al., 2022) and therefore the present study will focus on the individual level.

A thorough examination of the literature indicates that knowledge sharing (KS) significantly influences IWB (Aldabbas et al., 2021; Alshahrani et al., 2023; Chen & Pongtornkulpanich, 2024; Islam et al., 2022). Organizations that actively nurture a culture of knowledge sharing are also able to enhance the utilization of IWB (Mustika et al., 2020). According to Nugroho, (2023), asserts that knowledge sharing greatly aids in improving academics' IWB. This includes its ability to encourage teamwork, facilitate the sharing of information and experience, spark new ideas, and aid in the development of novel approaches. As a result, there is limited research on KS in education settings, particularly among academics (Abdullah & Omar, 2020), providing an opportunity to further study in HEIs.

Conversely, psychological empowerment (PE) has been extensively researched and has demonstrated its importance to IWB. However, the results remain uncertain. Some studies show a significant relationship (Helmy et al., 2019; Park & Kim, 2022; Pham et al., 2024; Yadav et al., 2023) while other studies show a negative relationship (Sinaga et al., 2021; Zhang et al., 2021). This has led to a research vacuum on the testing of sophisticated models that can help us better grasp the link between psychological empowerment and IWB among academics at universities.

Another factor that has been overlooked in IWB studies is individual innovation capabilities (IIC). A greater ability for innovation can enable individuals to effectively address work-related challenges, thereby improving both the quality and quantity of their output (Fauziyah & Rahayunus, 2021). According to Nugroho et al., (2021), academic IIC has become a driver of business sustainability. Therefore, organizations regard IIC as a useful asset to establish and maintain a competitive edge and enhance firm performance. The emerging topic of study focused on innovation capability has garnered significant attention from numerous scholars (Chotivanich & Phorncharoen, 2023; Fauziyah & Rahayunus, 2021; Ferreira et al., 2020; Nham et al., 2020). Notwithstanding these significant advancements, there remains a dearth of agreement among scholars. Therefore, this paper seeks to bridge this gap by examining the interplay between psychological empowerment, knowledge sharing, and individual innovation capabilities in fostering academic IWB within Malaysian HEIs.

2. Literature Review

Innovative Work Behavior: Organizational success in today's distribution environment is dependent on having an innovative workforce in an age of digitization, globalization, and fast changes (Udin, 2022). As a result, scholars and organizational practitioners in the fields of management and distribution science have been interested in employees' IWB. Janssen, (2000) defines IWB as employees deliberately generating, proposing,

and implementing new ideas at work, either individually or within a team or organization, to enhance performance. Similarly, Jong & Hartog, (2007) describe IWB as individuals deliberately acting to introduce or implement new ideas, services, methods, or procedures within their job roles, departments, or organizations.

While there is significant scholarly interest in studies on IWB, research specifically focused on IWB in higher education institutions (HEIs) remains limited (Ayoub et al., 2023; Messmann et al., 2018). HEIs undoubtedly contribute significantly to the performance of innovation (Ibus, Wahab, & Ismail, 2020). According to Roffeei et al. (2018), education is crucial since it serves as a reservoir of knowledge and helps shape people's attitudes and talents to become knowledge workers. Given that education is crucial for promoting creative and innovative thinking among students, academics' IWB is critical in the changing environment. This will aid academics in developing a creative attitude, reframing the role of the university in society, and assisting universities in transitioning from traditional to entrepreneurial universities (Farrukh et al., 2022). According to a study by Ebrahim et al., (2023) Knowledge sharing and psychological empowerment are among the most prominent factors in IWB studies. While study by Nham et al., (2020) Highlighted the lack of research specifically examining innovation capability at both personal and organizational levels, even though individual innovation capability is crucial for driving organizational innovation.

Psychological Empowerment: Psychological empowerment (PE) is a process that involves an individual's subjective, cognitive, and attitudinal experiences, enabling them to feel capable, competent, and authorized to complete activities (Llorente-Alonso et al., 2024). Conger & Kanungo, (1988) are widely recognized as the first authors to introduce the notion of PE. Further Thomas & Velthouse, (1990) consider empowerment as a motivating element associated with intrinsic task motivation which consists of four components namely impact, competence, meaning, and self-determination. Spreitzer, (1995) further developed the idea of empowerment by specifically examining its use in the workplace in which the research built upon earlier studies conducted by Thomas & Velthouse, (1990). Spreitzer, (1995) Explains that meaning is how well an employee thinks their values, beliefs, attitudes, and actions match up with their job duties. While Thomas & Velthouse, (1990) refer to competence as an individual's ability to effectively perform job-related tasks when applying effort. Meanwhile, self-determination refers to an employee's perspective on how to carry out their responsibilities, encompassing aspects such as initiative, action, task behavior, and methodology and lastly impact refers to the degree to which an employee can influence the results or outcomes within the company (Spreitzer, 1995). In the past two decades, extensive research on psychological empowerment has provided compelling evidence of its significant impact as a motivational element in influencing IWB (Gultom et al., 2022; Yadav et al., 2023). Afsar & Masood, (2018) Reported employees are likely to demonstrate higher levels of IWB. When an employee has a sense of empowerment, they perceive their job as having a more significant purpose, exhibit increased levels of skill in their work, possess a larger ability to affect outcomes, and have a wider range of options for completing tasks (Nasir et al., 2019).

Knowledge Sharing: Knowledge sharing (KS) is a collaborative process in which employees within an organization exchange knowledge, resulting in the creation of new knowledge (Van Den Hooff & Ridder, 2004). The KS process consists of two distinct phases: knowledge donating and knowledge collecting. Knowledge collection involves engaging and inspiring individuals to share their knowledge or intellectual resources, whereas knowledge donation refers to the transfer of one's intellectual assets to others (Van Den Hooff & Ridder, 2004). To be more specific, knowledge collection and knowledge donation are practices carried out by employees to acquire and share new information, enhancing the overall comprehensiveness of everyone's knowledge (Nham et al., 2020). Almulhim, (2020) states that knowledge sharing may be incredibly beneficial to partners or employees when it comes to solving problems, implementing policies, or developing new ideas. Higher education institutions are classified as knowledge-intensive enterprises due to their significant involvement in knowledge generation, development, and dissemination through teaching, learning, and research (Chen & Pongtornkulpanich, 2024). Hence, academics should possess the skills to effectively administer and harness knowledge, as well as disseminate it, to optimize its utilization and generate groundbreaking results. Knowledge sharing has been evaluated as a foundation for innovation and has demonstrated its ability to enhance the effectiveness of research and development in organizations (Nugroho, 2023). Empirical findings indicate that the act of sharing knowledge, which includes both donating and collecting knowledge, plays a significant role in enhancing employees' IWB (Akram et al., 2018; Chen & Pongtornkulpanich, 2024; Khan et al., 2023; Natsir & Yunus, 2023).

Individual Innovation Capabilities: Lathong, (2021) defines IIC as the ability of employees to conceptualize and implement novel ideas. According to Basadur et al., (1982), for employees to participate in innovative activities, they need to have creative thinking skills that include both divergent and convergent thinking abilities. Divergent thinking refers to the capacity to generate multiple alternative solutions or perspectives, while convergent thinking employs analytical and judgemental skills to assess the value of an idea or pinpoint the root causes of problems (Basadur & Finkbeiner, 1985; Scott et al., 2004). Both sets of capabilities are essential for generating innovative and potentially feasible ideas. Therefore, for an employee to innovate, they must possess both types of talents. Academic staff must be adaptable and innovative to survive in an unpredictable environment under IR 4.0 (Hussein et al., 2016). It is mainly because the ability of staff to innovate is a major factor in an organization's innovation (Zhao et al., 2020). Enhanced capacity for innovation can assist individuals in resolving work-related challenges, thereby improving the quality and quantity of their output (Fauziyah & Rahayunus, 2021). Academic innovation capability becomes a driver of business sustainability (Nugroho et al., 2021). Thus, individual innovation capability is considered a valuable asset for firms to provide and sustain competitive advantage in the implementation of the entire strategy. Researchers have looked at how IIC affects many things, such as knowledge sharing, hard and soft skills, organizational learning, employee performance, transformational leadership, organizational culture, and individual and organizational drives (Ben Moussa & El Arbi, 2020; Fauziyah & Rahayunus, 2021; Iddris et al., 2022; Imron et al., 2021; Lathong, 2021; Lei et al., 2020; Nham et al., 2020; Nugroho et al., 2021; Wibowo et al., 2020). However, not much research has been done on the relationship between IIC and IWB. Studies on the use of IIC to strengthen IWB are even more limited in the education field.

3. Research Methodology

This study employs a quantitative research design to examine the factors driving academics' IWB in Malaysian Higher Education Institutions (HEIs). In particular, the study focuses on three independent variables: individual innovation capability, psychological empowerment, and knowledge sharing, as well as the dependent variable, IWB. The intended target population consists of academics from 24 Malaysian universities listed in the QS World Ranking 2023. The study's sample size consists of 382 respondents who were selected using convenience sampling, a non-probability selection technique that allows for convenient access to participants. Data were collected using a structured questionnaire that was developed through Google Forms. Academics from various disciplines and faculties received the questionnaire via email. The survey items were adapted and adopted from validated scales in existing literature to ensure reliability and validity. The data were analyzed using SPSS 29.0.

Measurements

Innovative Work Behaviour: The 10-item scale from De Jong and Den Hartog (2010) was used to evaluate the employees' IWB. Participants were required to indicate how frequently, using a 5-point Likert-type scale ranging from 1 (never) to 5 (always), they manifest the behaviors mentioned in the survey. A sample item is "I generate original solutions for problems".

Psychological Empowerment: Psychological empowerment is assessed using the scale developed by Spreitzer, (1995). This instrument comprises 12 items, with three items measuring each of the four dimensions of psychological empowerment: meaning, competence, self-determination, and impact. Respondents will rate their agreement with each statement on a Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). Examples of items include "The work I do is meaningful to me" (meaning), "I am confident about my ability to do my job" (competence), "I have significant autonomy in determining how I do my job" (self-determination), and "My impact on what happens in my department is large" (impact).

Knowledge Sharing: The measurement scale used to assess knowledge sharing was adopted from Van Den Hooff & Ridder, (2004). The questions were extensively employed by numerous prior investigations. (De Vries et al., 2006; Nham et al., 2020). The questions were examined according to knowledge donating and knowledge collecting. The measurement consists of eight items. These items are rated on a Likert scale ranging from 1 (indicating strongly disagree) to 5 (indicating strongly agree). Examples of items include "When I've learned something new, I tell my colleagues about it" and "When I need certain knowledge, I ask my colleagues about it".

Individual Innovation Capabilities: Individual innovation capabilities are measured using a modified version of the scale originally developed by Hurt et al., (1977) and subsequently adapted by An et al., (2015) and Ganesan & Weitz, (1996). This unidimensional measure consists of 6 items and uses a Likert scale from 1 (totally disagree) to 5 (totally agree). The items are designed to gauge the degree to which respondents believe they are involved in creative and innovative activities. Sample items include "I enjoy trying out new ideas" and "I frequently improvise methods for solving a problem when an answer is not apparent". This scale has been validated and shown to be reliable in previous research (Nham et al., 2020).

4. Findings

The background of 382 respondents is described through a table based on the demographic characteristics of gender, age (years), service duration, academic qualification, and position. It is analyzed according to the frequency and percentage as stated in Table 1. Firstly, the majority of the respondents are female academics with 259 (67.8%) while 123 academics (32.2%) are male academics. In terms of age, it states that most of the respondents in this study are between the age of 40-49 years with 169 respondents (44.2%) and between age 30-39 years with 117 respondents (30.6%). The remaining are between ages 50-59 years with 48 respondents (23.3%) followed by between age 20-29 years with 4 respondents (1.0%) and above 60 years with the least number of 3 respondents (0.8%). Next, majority of the respondents have more than 20 years of service duration with 93 respondents (24.3%) followed by 16-20 years of service duration with 77 respondents (20.2%), 11-15 years of service duration with 76 respondents (19.9%), 1-5 years of service duration with 71 (19.1%) and 6-10 years of service duration with 63 respondents (22.5%) are Master holders. Lastly, for positions, most of the respondents are senior lecturers with 181 respondents (47.4%) followed by Associate Professor Madya Dr. with 80 respondents (20.9%), a lecturer with 68 respondents (17.8%), PhD Dr. with 38 respondents (9.9%) and the lowest is Professor with 15 respondents (3.9%).

Item		Frequencies (n)	Percent (%)
Gender	Male	123	32.2
	Female	259	67.8
Age	20-29 years	4	1.0
	30-39 years	117	30.6
	40-49 years	169	44.2
	50-59 years	48	23.3
	More than 60 years	3	0.8
Service Duration	1-5 years	73	19.1
	6-10 years	63	16.5
	11-15 years	76	19.9
	16-20 years	77	20.2
	More than 20 years	93	24.3
Academic	Master	86	22.5
Qualification	PhD	296	77.5
Position	Lecturer	68	17.8
	Senior Lecturer	181	47.4
	PhD Dr.	38	9.9
	Associate Professor Dr.	80	20.9
	Professor	15	3.9

Reliability Analysis

Considering the overall reliability of the observable variables, every observable variable has a high level of reliability between .741 and .968. The results show that Cronbach's Alpha for all variables is acceptable, good, and excellent since the value of Cronbach's Alpha is more than 0.7. Hence, the actual study is reliable.

Table 2. Reliability Analysis (N=502)			
Variables	Number of items	Cronbach's Alpha	
Innovative Work Behavior	10	.904	
Individual Innovation Capabilities	7	.927	
Psychological Empowerment	12	.903	
Knowledge Sharing	8	.891	

Table 2: Reliability Analysis (N=382)

Descriptive Analysis

For this study, the mean score is used to evaluate the level of IWB, psychological empowerment (PE), knowledge sharing (KS) and individual innovation capabilities (IIC) practice of academics of HEIs in Malaysia. The data were analyzed descriptively using mean through SPSS version 29.0. The Mean Score Interpretation Table constructed by Moidunny (2009) was used in this study to measure the mean score. The Mean Score Interpretation Table is shown in Table 3 while Table 4 shows the descriptive analysis. According to Table 4, academics in Malaysia HEIs have high levels of IWB (M = 3.82), high levels of PE (M = 4.14), high levels of KS (M = 3.95), and high levels of IIC (M = 4.12). It can be concluded that the mean score for IWB and all the independent variables is high.

Table 3: Mean Score Interpretation Table

Mean Scale	Level
1.00 - 1.80	Very Low
1.81 - 2.60	Low
2.61 - 3.20	Medium
3.21 - 4.20	High
4.21 - 5.00	Very High

Table 4: The Total Mean Score of Variables

Descriptive Statistics										
	N Mean Std. Deviation Interpretation Level									
Mean_IWB	382	3.8296	.61122	High						
Mean_PE	382	4.1440	.53087	High						
Mean_KS	382	3.9496	.64269	High						
Mean_IIC	382	4.1248	.66139	High						
Valid N (listwise)	382									

Descriptive Analysis of Innovative Work Behavior

Table 5 explains the descriptive statistics for the question set on Innovative Work Behaviour designated for this study. The descriptive statistics for Innovative Work Behavior (IWB) among academics reveal interesting insights into how lecturers in Malaysian universities engage with innovation within their institutions. For example, among the IWB practices in organizations, question set (Q2) shows the highest mean (M=4.24) with 136 respondents strongly agreeing that they always want to know how things can be improved in their workplace. It shows a high engagement of academics in continuous improvement. This high level of engagement can be attributed to the intrinsic motivation of academics to continuously enhance their work environment. In academia, there is a strong emphasis on quality improvement and staying updated with the latest developments. With education changing constantly, sticking to one method is not feasible. (Mohammed Afandi & Mohd Effendi Ewan, 2020). Academics often seek to refine their teaching methods, research practices, and administrative processes, leading to a high mean in this category.

While examining Q3-Q5 the result shows high engagement in searching for new methods with (M=4.14, M=3.88, M=4.01) respectively. The majority of the respondents agree with the statements for example for Q3 around 200 respondents often search for new working methods, techniques, or instruments in their institutions. The advancement of education technology, expanding branches of knowledge, and increasing challenges in education require our education system to be innovative to remain competitive (Mohammed Afandi & Mohd

Effendi Ewan, 2020). Next, for Q4, 193 respondents agreed they often generate original solutions for problems. For Q5 almost 210 respondents agreed that they often find new approaches to executing tasks. The high engagement in these areas can be linked to the dynamic nature of academic work, which requires constant innovation to stay relevant and effective. Academics are encouraged to explore new pedagogical strategies, research methodologies, and technological tools. Thus, educational institutions can facilitate and encourage innovation by providing academics with the necessary resources and equipment to experiment with new teaching methodologies (Carvalho et al., 2023).

Meanwhile, Q6 and Q7 also show high engagement in influencing others. Almost 149 respondents agreed they often make important organizational members enthusiastic about innovative ideas while Q7 shows 162 respondents stated they often attempt to convince people to support an innovative idea. The high engagement in influencing others reflects the proactive role that academics play in advocating for innovation within their institutions. This can be attributed to their commitment to improving their work environment and the desire to see innovative ideas come to fruition. Influencing colleagues and administrative staff requires strong interpersonal skills and a supportive organizational culture. Academics often utilize their credibility and expertise to persuade others, fostering a collaborative environment that is conducive to innovation.

Following the rest of the questions, high means for Q8 (M=3.68), Q9 (M=3.80), and Q10 (M=3.93), with many respondents systematically introducing, contributing to, and developing new ideas with 167 respondents,182 and 194 respondents respectively. The practical application of innovative ideas is crucial in academia, where research findings and new teaching practices need to be integrated into everyday work. This high level of engagement demonstrates that academics not only generate ideas but also take steps to implement them, ensuring that their innovative efforts have tangible outcomes. According to Kleysen & Street, (2001), idea implementation is a difficult phase because so many proposed ideas will never see the light of day.

However, Q1 shows lower engagement in non-daily work issues. The lowest mean (M=3.58) with 143 respondents stated only sometimes they pay attention to issues not part of their daily work. This lower engagement might be due to the heavy workload and time constraints faced by academics, making it difficult to focus on issues beyond their immediate responsibilities. Additionally, the academic environment often prioritizes specific tasks related to teaching, research, and service, leaving little room for attention to peripheral issues. Academics are often required to perform challenging tasks in a high-pressure setting, which encompass conducting demanding research, publishing scholarly work, fulfilling teaching and supervisory duties, securing research funding, and managing administrative tasks. (Janib et al., 2021). The total mean score for IWB is (M=3.83), which indicates a significant level of innovative activity but also offers an opportunity for further improvement. The relatively high mean indicates that academics have a proactive approach towards innovation, which is essential for the ongoing enhancement of teaching and research processes within higher education institutions (HEIs).

Descriptive Statistics									
Statement	N	Std. Deviation	Mean	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	
I pay attention to issues that are not part of my daily work.	382	.996	3.17	18 (4.7%)	76 (19.9%)	143 (37.4%)	113 (29.6%)	32 (8.4%)	
I wonder how things can be improved	382	.672	4.24		7 (1.8%)	30 (7.9%)	209 (54.7%)	136 (35.6%)	
I search for new working methods, techniques, or instruments.	382	.725	4.14	1 (0.3%)	6 (1.6%)	53 (13.9%)	200 (52.4%)	122 (31.9%)
