INFORMATION MANAGEMENT AND BUSINESS REVIEW

SUPPLY CHAIN MANAGEMENT AND TECHNOLOGY ADOPTION: EMPOWERMENT AND DIVERSIFICATION

Editorial

Information Management and Business Review (IMBR) provides a digital forum for researchers to share their knowledge and publish research work in the fields of information management, business, management and related disciplines. The work submitted for publication consideration in IMBR should address empirical and theoretical developments in the subjects related to the scope of the journal in particular and allied theories and practices in general. Author(s) should declare that work submitted to the journal is original, not under consideration for publication by another journal and that all listed authors approve its submission to IMBR. It is IMBR policy to welcome submissions for consideration, which are original, and not under consideration for publication by another journal at the same time. Author (s) can submit: Research Paper, Conceptual Paper, Case Studies and Book Review. The current issue of IMBR is comprises papers of scholars from different universities of Malaysia, Indonesia, China, England, Turkiye and Belgium. Social Media Influence on Quality of Life, Characteristics of Successful Asnafpreneurs, Gig Economy, Root Causes of Project Delay, Brand Equity and Purchase Intention, Innovation in Organizations and Human Resource Management, Livestreaming Commerce, Quality of Work Life and Employee Engagement, Promoting Psychological Well-Being, Organic Food Choices, Supply Chain Safety, Resilience & Technology Adoption, Determinants of Monetary Policy, Study of Convenience Stores, Repurchase Intention, Halal Purchasing Strategies, Coverage in Motor Insurance, Impact of Macroeconomics Factors on Carbon Emissions, Employees' Psychological Capital and Mental Well-Being, Government Expenditure & Economic Growth, Factors of Income Distribution, Work Stress and Work Environment, Social Embeddedness and Quality of Life, Knowledge Management Capacity, Technological-Organizational-Environmental Factors, Determinants of Bank's Liquidity, Employee Retention & Resilience, Role of Gender in Managing Finances, Cross-Cultural Adjustments, Psychological Contract Theory, Personal Bankruptcy Prediction, AI Revolution, Navigating Digital Banking, Influence of Technostress on Employee Well-Being, Hybrid Working and Employee Job Performance, Personalization Marketing & Consumer Purchase Intention, Culture and Sustainability, Impact of Social Media on Mental Health, Online Purchase Behavior, Tourism Experience Quality, Net Exports of Oil Palm Industry, Navigating Urban Mobility, Consumer Green Products, Public Perception Towards Insurance Companies, Perceived Enjoyment and Promotion Focus, Empowering Entrepreneurial Ecosystem, Impact of Visual Stimuli on Online Shopper's Emotion, Indeginous Tourism Industry, Public Transport Mobility, Health Communication Competence, Smart Organization Movement, Human Capital Investment Determinants, Navigating the Social Shift, Influence of Leadership Styles on Innovative Work Behavior, Islamic Microfinancing Initiatives, Job-Hopping Intentions, Government Health Expenditure, Determinants of Online Dating Application, Counterfeit Fashion Products, Stress Relief Applications, Workplace Mistreatment and Suicidal Ideation, Determinant of Family Takaful Adoption, Price of Crude Oil and Gold Price Volatility, Determinants of Inflation Rate Fluctuations, Information Technology Ethics and Netizenship behavior, Addressing Job Burnout, Effect of Artificial Intelligence (AI) on Students' Learning, Foreign Direct Investment and and Its Determinants, Sustainable Supply Chain Management, Customer Loyalty in Online Banking, University-Industrial Collaboration, Corporate Information Transparency, Open Market Share Repurchase Activity, Macroeconomic Forces Affecting Islamic Performance Indices, Women Homepreneurs on the TikTok, Enterprise Risk Management, Exploring E-Customer Satisfaction, Foreign Workers Remittances, Awareness of Sexual Transmitted Infections, Mindful Transportation, Adoption of Cashless Payment, Service Experience Equity on Repatronage Intention, Innovation and Renewable Energy, Boardroom Diversity and Whistleblowing Disclosure, Exploring Authentic Home-Cooked Recipes, Emotional Instability and Weight Fluctuations and Innovating Community Engagement are some of the major practices and concepts examined in these studies. All the submitted papers were first assessed by the journal committee and then the external editorial team for relevance and originality of the work and then blindly peer-reviewed by external reviewers depending on the subject matter of the paper. After the rigorous peer-review process, the submitted papers were selected based on originality, significance and clarity of the purpose. The special issue will therefore be a unique proposition, where scholars will be able to appreciate the latest results in their field of expertise and to acquire additional knowledge in other relevant fields.

Abstract: Breast cancer disease remains a significant burden in global public health, affecting women with new cases and mortality. In 2018, Malaysian women of different races, like Malays, Chinese, and Indians, were diagnosed with breast cancer, approximately 17,000 in total. The consequence is that their quality of life was affected, especially in physical and emotional health. Nowadays, the use of social media among users is increasing, and in healthcare, it examines the role of social media in patient education and social support, which highlights the importance of modern digital technology. This conceptual study examines the factors affecting quality of life, moderated by the role of social media influence. Sociodemographic, psychological state, self-care behaviors, social support, and healthcare support systems were among the factors identified. The study relies on the integration of the quality-of-life model and social cognitive theory in conducting the literature review. Furthermore, this study has implications for improving the quality of life through social media, promoting patient-doctor engagement with social media, supporting policymakers in improving public health outcomes, and identifying potential future research topics. Theoretical contributions with integrated frameworks and an innovative approach to breast cancer survivorship were also identified. Policymakers and healthcare professionals have an opportunity to make practical contributions through the use of social media. The study's limitations were a narrow focus on cancer research, limited generalisability, and a broad range of social media investigations

Keywords: *Quality of life, social media, education, support, breast cancer*

1. Introduction and Background

Breast cancer is the most common type of cancer among women worldwide. Similar to the majority of developing countries, Malaysia is currently experiencing an epidemiologic transition in which lifestyle-related diseases, particularly cancer and cardiovascular disease, have become more prevalent (Ministry of Health Malaysia, 2021). Malaysia is also included in the list of countries that are affected by breast cancer (International Agency for Research on Cancer, 2022). A study from Malaysia on cancer survivors identified the top five cancers with high chances of 5-year relative survival rates namely thyroid at 82.3%, prostate at 73.0%, corpus uteri at 70.6%, breast at 66.8% and colon cancer at 56.8%. In the meantime, cancers of the lung, trachea and bronchus were found to be slow in survival time with 11.0%. Among ethnic populations, Chinese women (76.5%) have the highest 5-year relative survival rate for breast cancer, followed by Indians (70.5%) and Malays (57.9%) (National Cancer Registry Department, 2018a). The quality of life (QOL) of breast cancer survivors has emerged as a matter of concern. The quality of life for breast cancer survivors can be substantially influenced by the transition from patient to survivor. It is important to offer active support and assistance to help these individuals regain their previous lifestyles and improve their overall well-being (Park et al., 2021). Quality of life is associated with a variety of factors, such as sociodemographic, psychological factors, self-care behaviors, social support, and healthcare support. People perceive social media as a personal communication tool making it essential to protect the information shared on any platform. Women can utilize social media to facilitate the management of specific aspects of their self-care. On the other hand, this is frequently overlooked (Jain et al., 2021; Ure et al., 2020)

2. Literature Review

Quality of Life in Breast Cancer
Quality of life establishes a foundation for the patient's health requirements, therapeutic objectives, and patient-centered treatment by taking into account the patient's feelings, attitudes, and opinions during the

decision-making process (Elegbede et al., 2019). Costa et al. (2017) Conducted a study on the quality of life of breast cancer survivors and discovered that patients with distant metastases have a lower functional capacity (mean = 75.3), a lower functional scale (mean = 57.0), lower global health (mean = 51.3), and a higher number of symptoms (mean = 37.0) compared to those without distant metastases (mean = 90.5). A previous study in Malaysia assessed a study related to quality of life using the QLQ-C-30 survey. It has resulted that Chinese individuals reported the highest overall health, followed by Malay and Indian. The survey also revealed that respondents gave positive feedback on the quality of life in terms of functionality but not on the symptom scale. Common symptoms included dyspnoea, constipation, diarrhea, vomiting, and discomfort (Ganesh et al., 2016a). Lua et al. (2020) conducted a more recent study on the quality of life of breast cancer survivors in a public hospital. Most of the participants reported a high quality of life in all dimensions, including global health status (p = 0.261), functional measures (p = 0.926), and symptom scales (p = 0.477).

The survival rates for breast cancer cases in Malaysia are unsatisfactory, due to the increasing number of new cases and deaths. In comparison, Australia (89.5%), China (83.2%), Hong Kong China (83.3%), Japan (89.4%), Korea (86.6%), New Zealand (87.6%), and Singapore (80.3%) achieved 5-year net survival rates that exceeded 80% from 2010 to 2014. In contrast, Malaysia (65.0), India (66.1), and Thailand (68.7) achieved survival rates that were less than 70% (OECD/WHO, 2020).

Factors Influencing Quality of Life

Breast cancer survivors encounter a multitude of obstacles in their pursuit of recovery and the preservation of a high quality of life (Cimprich et al., 2002). Many contributing factors lead to the challenges. One of the primary factors that can have a substantial impact on the quality of life of breast cancer survivors is their demographic profile, which encompasses age, marital status, education level, financial status, and occupation. While the number of survivors has slightly increased as a result of technological advancements in cancer treatments, the quality of life outcome for each patient varies based on the cancer stage, long-term disease-free survivorship, and first recurrence of the cancer (Chopra & Kamal, 2012; Costa et al., 2017). The quality-of-life scores of breast cancer survivors were found to be higher when they were elderly, Chinese, single/divorced/widowed, and had permanent employment, according to a study conducted in Malaysia. Conversely, a comparable investigation conducted in Vietnam discovered that breast cancer patients who were younger, married, had a moderate income, and had concluded at least six months of treatment had a superior quality of life. These results indicate that the quality of life of breast cancer survivors in various countries may be influenced by cultural and socioeconomic factors (Ganesh et al., 2016a; Tran et al., 2019).

Fear is another psychological factor that influences the quality of existence. There are numerous varieties of fears that may arise, and this is the point at which patients may experience emotional and physical challenges. Previous research has indicated that certain women are apprehensive about mastectomy and surgery, which can negatively impact their body image and create the impression that their companions will abandon them (Brinton et al., 2014; Koboto et al., 2020). Additional instances of fear have been documented, such as the dread of a cancer diagnosis and the fear of the proposed treatment. Depending on the patient's condition, this may involve the decision to undergo a lumpectomy, axillary dissection, or other related procedures. One of the reasons for patient delays to the hospital and reduced effort to perform BSE, CBE, or mammograms is the fear of discovering a tumor. Consequently, they may maintain a denial regarding their connection to cancer. To maintain the patient's psychological well-being, they must be assisted in comprehending the recovery process, which may require a longer time to enhance their quality of life (Paraskevi, 2012; Salem & Daher-Nashif, 2020). Additionally, the dread of breast cancer has influenced the decision of women to forgo early screening, as the disease is commonly perceived as a cause of death, as per Kissal et al. (2018) and Lexshimi et al. (2014). Moreover, the patient's low self-esteem is a result of their dread of social stigma, which can delay screening and affect their psychological well-being and quality of life.

Next, these cancer patients must acquire knowledge in health literacy, as they must be informed about the cancer that has affected them. A survey was conducted in Turkey to evaluate the level of knowledge of gynecological cancer patients regarding cancer prevention. It was found that the majority of respondents (87.9%) concurred that early screening can save lives, that 57.3% comprehend that being obese increases their likelihood of developing cancer and that over 50% were unaware of the symptoms of gynecological cancer, which include bleeding between two menstrual periods. A higher quality of life was observed among

respondents who scored high on cancer knowledge, as indicated by an additional study (Adamowicz et al., 2020; Evcili & Bekar, 2020). In another instance from Malaysia, it was asserted that breast cancer awareness is inadequate, despite the existence of a variety of media platforms that are employed to enhance knowledge, including technological platforms like WhatsApp and smartphone applications (Nasution et al., 2021). There is still room to enhance the awareness of breast cancer and its knowledge among local women, as there are numerous clinical presentations and risk factors (Lee et al., 2019).

In addition to possessing knowledge about breast cancer, weight should also be considered a factor in self-care behavior. Another risk factor for the development of breast cancer is obesity (Gnagnarella et al., 2016; Lajtman, 2020; Lee et al., 2019). Numerous prior investigations investigating the relationship between obesity and cancer patients have determined that individuals who are obese or overweight are less inclined to pursue early cancer detection screening and maintain a healthy lifestyle. This is because prior research has demonstrated that the density of women's breasts decreases as their adipose tissue content increases, thereby simplifying the process of detecting cancer (Lee et al., 2019). A study in Slovakia examined the relationship between quality of life and obesity among endometrial cancer survivors. The findings showed that patients with level III obesity had a low level of quality of life compared to those with normal weight. This encompassed physical, emotional and social functioning. In the interim, they endure dyspnoea, fatigue, and pain, which are prevalent among obese cancer patients (Lajtman, 2020).

Social support is the fourth factor that influences quality of life. It can be interpreted as a cognitive evaluation of the sense of connection to others and the knowledge that assistance is available in the event of a need. This support can be provided by both informal networks of friends and family and formal networks of health care or social work practitioners (Shen et al., 2020). A robust bond of support has been identified between patients and their families and acquaintances in previous research. The investigation did indicate that the relationship is strong regardless of the presence of the disease. Consequently, it is advised that patients enhance their relationships with their family and acquaintances to enhance their quality of life (Lewandowska et al., 2020; Zhang et al., 2020). Additionally, the same results were identified with the assistance of the group's intervention. Group support roles have been shown to improve the patient's quality of life by offering them additional information, appropriate knowledge from medical doctors and nurses, and support from friends. The investigation also demonstrated substantial modifications that were implemented before and following the intervention, which significantly improved their quality of life (Dominic et al., 2018; Smith et al., 2018).

Many empirical studies have demonstrated that healthcare support, which is listed as the fifth factor, in addition to family and acquaintances, contributes to the development of positive social support. By utilizing technological platforms such as WeChat or other social media, healthcare professionals and patients can enhance patient interaction and, as a result, increase medical adherence. This is because certain patients may struggle to communicate in person but may thrive when utilizing this medium through messaging. The presence of healthcare professionals can enhance the level of knowledge among patients, thereby facilitating a more comprehensive comprehension of the disease (Benjamin, 2020; Wu et al., 2020). Additionally, numerous studies asserted that a positive relationship between a patient and a physician can result in increased treatment effectiveness, reduced recovery times, and enhanced physical and mental health. The patients' perceptions of their healthcare were also influenced by their interactions with healthcare professionals. These advantages are primarily associated with the quality of life of patients (Lubasch et al., 2022).

How Social Media Help
Social media has the opportunity to alter health behaviors, thereby enhancing the quality of life for its consumers. For instance, a prior study conducted in the United States that examined the use of the Internet for health-related purposes among adults revealed that 80% of them utilized the Internet to locate information. Nevertheless, only 20% of respondents reported utilizing social media to access health-related information. The same is true in Malaysia, where the general public prefers to consult with doctors rather than pursue health information (Calixte et al., 2020; Dawood et al., 2017). However, prior research has shown that social media can have a positive impact on the changes in the health-related behavior of users. For example, a study conducted in Turkey to gather perspectives from cancer patients regarding COVID-19 revealed that the media used to obtain information is primarily television (91.9%) and social media (43.8%) (Guven et al., 2020; Korda & Itani, 2013).

In particular, social media is crucial for sharing online health education with all people, including those affected by cancers, as a result of its extensive resources and beneficial content. For example, the majority of Twitter users agreed with the concept of creating a welcoming forum for education and support, and their understanding of breast cancer significantly increased. Besides disseminating valuable information, social media platforms can also distribute immediate results to the community at a quicker pace than traditional methods. Consequently, it encourages users to spend more time on social media, and a higher quality of life can be accomplished by fully utilizing it as an educational platform (Attai et al., 2015; M.-K. Smith & Denali, 2014). The majority of respondents in a previous survey regarding the efficacy of social media as an educational tool concurred that it can be effective. They identified Facebook, Pinterest, and Instagram as the most frequently used platforms for education (Pizzuti et al., 2020). Even though users in Malaysia demonstrated a satisfactory level of social media usage, particularly on Facebook, there is a dearth of prior research that has examined the potential of social media to enhance factors affecting the quality of life for breast cancer patients (Malaysian Communications and Multimedia Commission, 2018; Tobi et al., 2017).

Online support is highly significant in addition to the pursuit of online patient education. Some patients reported that face-to-face support was either unavailable or ineffective in satisfying their requirements (Mikal et al., 2019). In the past, breast cancer survivors who participated in semi-structured interviews regarding the use of online mediums to care for themselves and seek support expressed their reluctance to disturb nurses, as they were busy with clinical routines. Rather, they utilized it to solicit the guidance of other cancer survivors. Other than that, they can obtain a speedier response by participating in virtual communities on social media. Not only can they feel empowered, but they can also supplement additional social support without having to rely solely on healthcare providers by utilizing online social media (Ure et al., 2020). Through the virtual presentation of embraces, expressions of warmth, and the delivery of strong comments, emotional support was demonstrated (Harkin, 2017).

The factors that influence quality of life underscore the importance of social media. The sociodemographic profile which encompassed age, educational background, various occupations, and income, was used to demonstrate their willingness to become one of the respondents for treatment of HR+/HER2 preferences and strategy to seek health information. This is attributable to the women's robust self-efficacy in utilizing and gaining knowledge from social media to enhance their quality of life (Calixte et al., 2020; Stellato et al., 2021).

Psychological issues, including foreboding and seeking support from other cancer users, can also be discussed by cancer patients on social media. Informational, emotional, general guidance and resource support are among the recognized forms of assistance that are accepted. The vast majority of cancer patients employ social media platforms to articulate their anxiety regarding the disease, as indicated by prior research. Posting and hashtags are employed to disseminate information (Bergerot et al., 2020; Cho et al., 2018; Lee et al., 2020; Mikal et al., 2019).

Additionally, the utilization of this virtual social media has the advantage of enhancing self-care behaviors in terms of weight management and knowledge. The virtual medium can be used to enhance the knowledge of users in the knowledge domain through e-health learning. A Facebook program for adolescents with cancer was the subject of a prior study conducted in Korea. This mixed-method study determined that the intervention program is usable and that users can become more familiar with the program's navigation, improve their knowledge of the program, reduce costs for developers, and improve intervention program management through social media by utilizing Facebook (Park et al., 2020; Smith & Denali, 2014). According to certain research, the majority of breast cancer patients are obese. (Gnagnarella et al., 2016; Pakiz et al., 2016; Smith et al., 2018). The role of social media in helping them lose weight through a weight-loss program is implemented. Previous research has shown that social media can help patients become more engaged, track their progress within groups, and be a cost-effective tool for improving their health and quality of life (Hopkinson et al., 2020; Lozano-Chacon et al., 2021; Rumbo-Rodríguez et al., 2020).

In addition to self-care behaviors, the function of social media can be evaluated in terms of its potential to enhance the patient's online support. A study was conducted in support of National Cancer Survivors Day 2018 to examine what survivors shared on content on Twitter and Instagram. It was found that breast cancer survivors were more active on social media (16%) than other types of cancer survivors like prostate and

ovarian both with 3%, colorectal 2%, cervical and lung cancer both with 1% and the rest like oesophageal and eye both have 0.5%. Moreover, about 74% of image content shared by Instagram, followed by textual content on Twitter at 56% and video content on Instagram at only 9%. On the support system, the support group (11%) made the most significant contribution to information exchange, followed by family and friends (6%) and medical doctors and nurses (6%). (2%). This support has several positive effects, such as the fact that they have individuals who can assist during challenging periods, the enhancement of their self-efficacy through the bonding process, and the positive motivation that is derived from the comprehension of family and friends (Cherian et al., 2020). In three consecutive years, from 2011 (28,275 tweets) to 2014, online participation, such as on Twitter with the hashtag #BREAST CANCER, exhibited a positive trend, as concurred upon by Attai et al. (2015). Although previous research has been conducted on the use of social media to communicate with cancer patients (Mikal et al., 2020; Oh et al., 2020; Shen et al., 2020; Williams et al., 2018) and how social media enhances one's quality of life (Afsar, 2013; Basirat et al., 2020; Makady et al., 2018), there is a lack of research on the most effective use of social media to guide users, including patients, carers, and physicians (Han et al., 2018; Stellefson et al., 2020). In Malaysia, even though users showed satisfactory usage of social media, especially on Facebook, there was a lack of past research investigating how social media can improve the quality of life among breast cancer patients (Malaysian Communications and Multimedia Commission, 2018; Tobi et al., 2017), and few past studies discussed the role of social media as a mediator between factors affecting quality of life, especially among Malaysian breast cancer survivors.

Underpinning Theory: Quality of Life Model
Breast cancer cases have been responsible for a high prevalence in women worldwide for over a decade. Women who are diagnosed with breast cancer may find it difficult to carry out their daily responsibilities, such as working and spending leisure time with family and friends. Breast cancer is one of the chronic diseases in which patients must wait longer for treatment to be completed; thus, the adverse effects and radiation exposure they receive may have an impact on their overall quality of life. As a result, improving quality of life became the primary goal for the majority of cancer patients in the cancer and survivorship studies (Lavdaniti, dan Tsitsis, 2015; Mokhatri-Hesari & Montazeri, 2020) Even though the number of survivors has increased slightly due to technological advancements in cancer treatments, the quality of life outcome for each patient differed due to cancer stage, long-term disease-free survivorship, and first recurrence of cancer (Chopra & Kamal, 2012; Costa et al., 2017).

Since the concept of quality of life first emerged in the 1920s, there has been no specific way to define quality of life. Those existing definitions are always derived from the impact of patients' health status on their normal routine (Lavdaniti, dan Tsitsis, 2015). In general, quality of life has been defined as a subjective measurement or indicator of the health status of cancer survivors (Firouzbakht et al., 2020). The World Health Organization (2019) provided another well-known concept for quality of life. It is concerned with the perception of individuals of their position in life in terms of the culture and value system they lived in and about their goals, expectations, standards, and concerns. This can be explained by a cancer patient's journey of recovery, which includes emotional exhaustion, pain, frequent follow-up appointments, loss of appetite, nausea, breathing difficulty, and other related factors such as changes in body image and low self-confidence. This multifaceted concept of quality of life was related to their personal goals, expectations, standard norms, and concerns. All the patient's side effects had a significant impact on his or her quality of life.

The WHO Quality of Life was developed by expert teams from various countries to be applicable in any part of the world, and it is available in nearly 40 languages. This 26-item questionnaire included a 5-point Likert scale for each of the tested domains. The reliability and validity checks were also successful. The overall concept of quality of life is well-defined, with excellent proposals (Bakas et al., 2012; Huang et al., 2017; Theofilou, 2013). .

Table 1: Quality of Life Model by the World Health Organization

Domain	Facets incorporated within domains
Physical Health	Activities of daily living
	Dependence on medical substances and medical aids
	Energy and fatigue
	Mobility
	Pain and discomfort
	Sleep and rest
	Work capacity
Psychological	Bodily image and appearance
	Negative feelings
	Positive feelings
	Self-esteem
	Spirituality/religion/personal belief
	Thinking, learning, memory, and concentration
Social Relationships	Personal relationships
	Social support
	Sexual activity
Environment	Financial resources
	Freedom, physical safety, and security
	Health and social care; accessibility and quality
	Home environment
	Opportunities for acquiring new information and skills
	Participation in and opportunities for recreation/leisure activities
	Physical environment (pollution/noise/traffic/climate)
	Transport

(World Health Organization, 1996)

Previous research has revealed how some factors relating to cancer patients positively or negatively impact their quality of life, which serves as the foundation for the quality of life model fit into this study. The study, which was conducted in Malaysia, sought quality of life among 223 breast cancer patients from oncology clinics, wards, and a daycare center in a public hospital. It was discovered that sociodemographic factors such as older age (55 years old and above) (mean score = 66.7), Chinese patients (mean score = 67.8), marital status of single, divorced, or widowed (mean score = 66.7), and having permanent better employment (mean score = 72.6) resulted in a higher quality of life score in comparison to other groups. (Ganesh et al., 2016b). The same study was also conducted among Vietnamese breast cancer patients in 2019. However, some differences in results were observed from the same type of study. This study was conducted in Vietnam, and it looked at the quality of life of Vietnamese breast cancer patients. It was discovered that being younger (mean score = 55.0), married (mean score = 55.2), having a moderate income (mean score = 55.7), and having completed at least 6 months of treatment (mean score = 55.6) were all associated with good quality of life (Tran et al., 2019).

Fear is the second factor that falls under the psychological state that affects the woman's quality of life. Several types of fears are involved, and this is where it may challenge the patient both physically and emotionally. According to previous research, some women are afraid of surgery and mastectomy, which can hurt their body image and give them the impression that their partners will leave them (Brinton et al., 2014; Koboto et al., 2020). Another type of fear also has been reported including the fear of cancer diagnosis and the planned treatments, including lumpectomy, axillary dissection, or other related surgeries based on the patient's condition. Fear of finding a lump also can become one of the reasons why the patient delays seeking help, other than less effort on performing BSE, CBE or mammogram. As a result, they may live in denial about their association with cancer. To keep the patient's psychological state in good shape, they must be helped to understand the recovery process, which may take longer than expected to improve their quality of life (Paraskevi, 2012; Salem & Daher-Nashif, 2020). Furthermore, women's fear of breast cancer has influenced their decision to forego early screening because the disease has a common perception of death. Furthermore,

the patient's fear of social stigma leads to low self-esteem, which delays screening and has an impact on their psychological well-being and quality of life (Kissal et al., 2018; Lexshimi et al., 2014).

Next, learning knowledge in health literacy is important because these cancer patients must notice and be aware of information about the cancer that has attacked them. For example, in Turkey, a survey was implemented among gynecological cancer patients to assess their level of knowledge about cancer prevention. It was found out 87.9% of the majority of respondents agreed that early screening can save lives, 57.3% understand that being obese increases their chances of getting cancer, and more than 50% did not know about the signs of gynecological cancer, which is bleeding between two menstrual periods. According to another study, respondents who scored high on cancer knowledge had a higher quality of life (Adamowicz et al., 2020; Evcili & Bekar, 2020).

However, the knowledge level among cancer patients was not always comparable to the outcome of healthy living among them. Obesity is another risk factor for developing breast cancer (Gnagnarella et al., 2016; Lajtman, 2020; Lee et al., 2019). Several previous studies on obese and cancer patients concluded that obese or overweight people are less likely to follow a healthy lifestyle and are less likely to seek early cancer screening. This is because previous research found that the fattier tissue women have, the less dense their breasts are, making cancer detection easier (Lee et al., 2019). A previous study in Slovakia among endometrial cancer survivors investigated the relationship between obese cancer patients and quality of life. The finding revealed class III obese cancer patients had the lowest quality of life as compared to normal weight. Physical, emotional, and social functioning are all included. Meanwhile, they experience pain, fatigue, and dyspnoea, which is common in obese cancer patients (Lajtman, 2020).

Another factor that affects quality of life is social support. It can be interpreted as a cognitive appraisal of being connected to others and knowing that help is available if needed, which can be provided by both informal networks of friends and families and formal networks of health care or social work practitioners. (Shen et al., 2020). Previous research has found a strong bond of support between patients and their families and friends. They did mention in the investigation that the relationship is good whether with or without the disease, and thus it is recommended to improve the relationship between patients and their family and friends to achieve a better quality of life (Lewandowska et al., 2020; Zhang et al., 2020). Furthermore, the same findings were discovered with intervention support from the group. It has been demonstrated that group support roles improve the quality of life among patients by sharing more information, receiving proper education from healthcare professionals, and receiving motivation from peers. The study also revealed significant changes made from pre- to post-intervention and how it greatly aided them in terms of quality of life (Dominic et al., 2018; Smith et al., 2018).

Many previous publications acknowledged good social support is not only found among the nearest circle like family and friends but also in a healthy environment. The relationship between patients and doctors or nurses can improve interaction and thus medical adherence among patients is good by using technological mediums such as WeChat or other social media. This is because some patients may not be able to communicate well in person but may do well when using this medium through texting. Having healthcare professionals on hand raises the level of knowledge among patients, which can lead to a better understanding of the disease (Benjamin, 2020; Wu et al., 2020).

Furthermore, the influence of social networking can lead to the possibility of changing health behavior, thereby improving the quality of life for its users. This also contributes to preventing patient delays because when healthcare professionals agree to share health education online, the possibility of patient delays is reduced. After all, information is shared without delay. In the United States, for example, a previous study that investigated health-related Internet use among adults revealed that 80% relied on the Internet to find information. However, only 20% reported using social media for health-related information. The same is true in Malaysia, where the general public prefers to consult with doctors rather than seek health information. (Calixte et al., 2020; Dawood et al., 2017). Nonetheless, previous research indicates that social media can positively influence users' health-related behavior change; for instance, a study in Turkey was done to seek perspectives among cancer patients on COVID-19, and it highlighted that seeking information is dominated by media such as television (91.9%) and social media (43.8%), respectively (Guven et al., 2020; Korda & Itani, 2013).

In addition, this was proved based on the sociodemographic profile of social media users, consisting of age, education, occupation, and monthly income to participate in the study of treatment HR+/HER2 preferences and the seeking of health information online. This is due to the women's strong self-efficacy in engaging in and learning from social media to improve their quality of life (Calixte et al., 2020; Stellato et al., 2021).

Furthermore, the increased use of social media can undoubtedly improve e-health learning among users to improve knowledge. A previous study in Korea looked into a Facebook intervention program for children with cancer. This mixed methods study found that the intervention program is usable and that by using Facebook, users could become more familiar with the program's navigation, improve knowledge from this program, reduce costs for developers, and researchers can improve intervention program management through social media (Park et al., 2020; Smith & Denali, 2014).

Body weight management via social media and mobile applications can also be viewed as motivating users to make an effort for improved quality of life. Through this medium, they can share their journey to a healthy lifestyle and make people aware of the food choices they can make other than setting goals, such as calorie counting, portion control, and the ability to read and understand nutritional labels. Aside from that, it can help to create a social support environment within the Facebook group to do healthy diet and fitness challenges posted by fitness coaches, such as the challenge of not eating candies for 2 weeks, using stairs to burn some calories, and recording calorie intake and sharing it on the group (Ghelani et al., 2020; Godino et al., 2016).

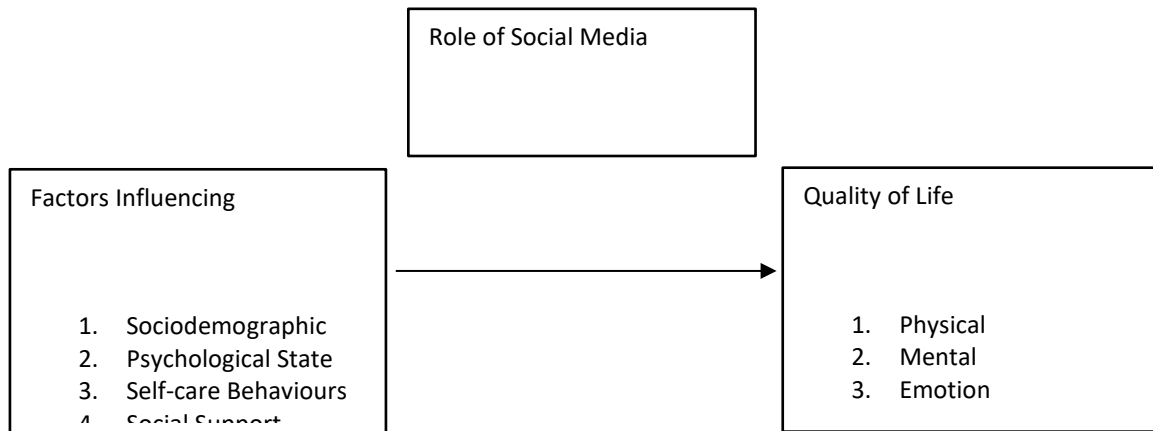
Last but not least, consider how the use of social media can help patients with online support. In conjunction with National Cancer Survivors Day 2018, a study was conducted to investigate the content shared by survivors on Twitter and Instagram. It was discovered that 16% of breast cancer survivors engaged actively on social media compared to other types of cancer survivors such as prostate (3%), colorectal (2%), lung (1%), cervical (1%), ovarian (3%), kidney, oesophageal, and eye, each of which is 0.5%. Instagram showed the highest rate for image content (74%) and video content with 9%. This result was followed by Twitter with textual content of 56%. On the support system, the support group (11%) contributed the most to information sharing, followed by family and friends (6%) and healthcare professionals (6%). (2%). Some of the positive outcomes of this support include the fact that they have people who can support them during difficult times, that the bonding created improves their self-efficacy, and that the understanding shown by family and friends brings positive motivation (Cherian et al., 2020). This is agreed by Attai et al. (2015) Online participation, such as Twitter with the hashtag #BREAST CANCER, demonstrated a positive trend in three consecutive years, from 2011 (28,275 tweets) to 2014 (85, 972 tweets).

Social Cognitive Theory
Albert Bandura's Social Cognitive Theory (SCT) is an interpersonal behavior theory that employs the concept of reciprocal determinism to explain how personal factors such as beliefs and attitudes, as well as environmental and behavioral factors, interact with one another. That does not imply that reciprocal causation contributed equally because one factor may have a greater influence than others at times (Bandura, 1989). In other words, SCT is a term used to describe how people learn behavior by observing others.

This theory was proposed for this study because it provides an understanding of how social media influences people's behavior to act in a certain way. By sending communication in two different ways, social media leads to behavioral change. The first involves guiding users to cope with new behavioral actions by informing, sharing, and motivating them to act with them; the second involves users adopting, supporting, and sharing the behaviors they adopted with others. This social media role has evolved into an environmental factor that influences both the user's personal beliefs and attitudes toward receiving health education and support, as well as shaping the behavioral outcome through observational learning (Li & Liu, 2020). Through observational learning, SCT is said to emphasize peer influences and social norms for behavioral outcomes(Healy & Marchand, 2020). The healthcare domains have expanded their investigation into the use of SCT in social media, particularly behavior analysis. A portion of them was to investigate the causes of online engagement, health promotion, and disease prevention (Bashir, 2020; Yoon & Tourassi, 2014). SCT has been used to study behavior in non-healthcare areas, with a particular focus on Chinese social media discontinuance. SCT is a suitable tool for examining online behavior on social media (Gan et al., 2024).

Previous research demonstrated how this theory aided social media or application influence for behavioral change for better health status. The use of the MapMyFitness mobile application and Facebook by breast cancer survivors in preventing recurrence has shown self-regulation in improving their quality of life by performing physical activities. It is also discovered that this technologically-based medium provides survivors with health education and support for them to care for themselves(Pope et al., 2019). Nevertheless, the majority of previous research on using SCT has focused on Western countries, leaving a significant knowledge gap about the topic in the Malaysian context. Moreover, there is a lack of consistency in the advantages of social media across studies, making it difficult to generalize the findings. This review aims to bridge these gaps by implementing behavior analysis in social media among Malaysian breast cancer survivors. In addition to supporting the application of the theory in this investigation, this study can offer insightful results regarding the influence of social media on the quality of life of breast cancer survivors. Furthermore, the study might provide information regarding the various factors that contribute to the inconsistent use of social media. In simpler terms, the use of social media by users, particularly patients, may or may not be useful.

Proposed Conceptual Framework
In this study, we introduced a conceptual framework to ascertain the factors that influence quality of life in the context of breast cancer and the impact of social media. Our framework posits that the quality of life of Malaysian breast cancer survivors can be influenced by five factors: demographic profiles, healthcare professional support, self-care behavior, psychological state, and social support. Although the relationship between those determinants was investigated, social media has been instrumental in fostering a more positive relationship, which will lead to a higher quality of life for more survivors. Furthermore, the influence of social media in this context is associated with two functions: online support and patient education. The framework assists stakeholders in gaining a more comprehensive understanding of the interactions between factors that influence quality of life and the role of social media in supporting breast cancer survivors in the digital era.

Figure 1: Proposed Conceptual Framework


3. Research Methodology

To respond to designated research objectives, the researcher will use a quantitative research design. This study will use Malaysian breast cancer survivors' data from a non-profit organization's cancer registry to fill out the surveys. The purposive sampling method was applied to this study due to the inclusion and exclusion criteria listed. Inclusion criteria require applicants to be female, over 18 years old, breast cancer survivors, not currently hospitalized, have at least one social media account, be in stages I-IV of breast cancer, have completed conventional treatment, and have survived at least six months post-treatment. Exclusion criteria include being male, under 18, survivors of other cancers, currently hospitalized, lacking a social media account, not having completed conventional treatment, being critically ill, or being unable to participate in the survey. The population of breast cancer survivors in Malaysia as of 2018 is 17,009 (National Cancer Registry Department, 2018b). Green (1991) states that 97 samples can be collected to accommodate the six predictors with a medium-sized effect. This study will run the analysis using SPSS and Smart PLS version 4.

4. Relevant Implications

This study focuses on the important function of social media in moderating the factors that influence the quality of life among breast cancer survivors. The findings imply that social media platforms can be a very effective and promising strategy for improving quality of life in terms of physical, emotional, and mental health through online knowledge sharing and emotional support from the online community. Certain types of information are presented, such as general cancer information, treatment options, and coping strategies. They can also access videos and professional advice through the platform. Other survivors on social media share the same problems and experiences with cancer, and they may help each other to have a better quality of life. It can lead to a reduction in isolated feelings that are not comforting. Support is also provided through online support groups, where members can share stories, express their opinions, and get inspiring words. The study also supports the integration of the Quality-of-Life model and Social Cognitive Theory, which focus on complex patient relationships and the role of social media in examining health outcomes. It will assist in proposing future research and interventions.

Aside from that, two important stakeholders, healthcare providers, and policymakers, may collaborate to promote patient-centered care through the social media platform. Healthcare professionals may create personalized social media accounts connected to their patients. This is intended to increase patient involvement with their providers. Healthcare practitioners can offer instructional materials, reminders for patient visits, and beneficial suggestions for managing chronic diseases. Next, doctors may launch a live video to establish real-time interaction, allowing for a quicker response to the patient's questions. Meanwhile, policymakers can improve their policies by soliciting feedback from social media users, resulting in a better understanding of the current healthcare system's requirements and weaknesses. They can also use this platform for public health campaigns, particularly breast cancer interventions. Despite numerous health efforts, the number of cases remains high. Thus, integration with social media and new campaign ideas is required. The policy can help address the gap in healthcare access by improving accessibility to underserved people, such as those living in rural locations or having difficulty seeking treatment owing to inadequate transportation.

Integrating social media use into healthcare settings may lead to the finding of relevant research topics. The first is to investigate how social media can be used to manage psychological issues such as anxiety and fear. The study could focus on the efficacy of online group support or virtual counselling in reducing patients' anxiety and fear and improving their quality of life. It may help to identify any benefits and drawbacks to using social media in the study. Next, future research can look into how social media might help with weight management by monitoring online behaviors or implementing diet challenges. Studies on the impact of fitness levels among cancer survivors may also be worth investigating. Another interesting area for additional investigation is the role of social media. This research focused on online information and support. Thus, future researchers can explore the impact of these on quality of life. These future studies can provide valuable information on the complex interactions between factors affecting quality of life, which ultimately lead to more effective patient-centred strategies.

5. Conclusion

This conceptual study has revealed significant factors that affect the quality of life among breast cancer survivors. Demographic elements like age, marital status, education level, income, and job type play a significant role in impacting quality of life. Psychological factors can disrupt the quality of life by avoiding the willingness to seek treatment. Self-care behaviors, through knowledge and body weight, are critical aspects in leading to quality of life. Social support from family, friends, and group support is vital for enhancing survivors' emotional and social functioning. Healthcare professional support is also important to motivate the survivors to improve their quality of life through their beneficial advice. Healthcare professionals are also helpful in motivating survivors with health-related concerns. Social media has demonstrated a positive impact on these factors by educating patients and providing online support. Despite these benefits, there is a need for more research on the most effective ways to use social media in guiding relevant parties like patients and carers.
The proposed conceptual framework effectively integrates different factors that affect the quality of life for breast cancer survivors while emphasizing the role of social media in the relationship. It comprehensively

addresses sociodemographic, psychological state, self-care behaviors, social support, and healthcare support on quality of life in terms of physical, mental, and emotional. By leveraging social media for patient education and online support, this framework demonstrates how the platforms can improve understanding of chronic conditions, improve adherence to treatment plans, and provide emotional and psychological support. This comprehensive approach makes a reliable model for enhancing the quality of life among the survivors.

For theoretical contribution, lies in the integration of the Quality-of-Life Model and Social Cognitive Theory in proving a holistic understanding of the factors affecting quality of life, moderated by social media. The Quality of Life offers a structured approach to assess the multifaceted impact of breast cancer on survivors' lives, while the Social Cognitive Theory emphasizes the role of personal (factors affecting the quality of life) and environmental (social media) factors in managing this chronic condition. This dual-framework approach not only introduced the importance of quality of life from the physical and mental perspectives, but it also provided actionable ways for interventions aimed at improving survivors' outcomes. By integrating social media, this study demonstrates how it can enhance patient education, support, and engagement, ultimately leading to a better quality of life. This contributes a novel perspective that can improve future research in the field of health management.

Three practical implications were stated. The Ministry of Health can play an important role in investigating technological advancement. By using its official website, myHealth Portal and developing new social media mainly for cancer survivors, it shows the continuous support for these groups. Some of it is sharing accurate health information, success stories from various cancer survivors, healthy lifestyle tips and a few types of fun physical activities to perform. As more users rely on mobile technology to monitor health, these resources will become useful and valuable.

Ultimately, this investigation would be advantageous to both the general population of young women and the broader community. By expanding their range of alternatives, this investigation will serve to improve the quality of life for young women and the community. Next, healthcare professionals can use social media platforms to continuously deliver accurate and timely health information to patients. This technique is suitable for patient education and support while motivating them to be more concerned with their healthcare. What the professionals can share are important cancer information, cancer updates, and useful prevention care recommendations. Moreover, establishing online support groups can be a practical approach, especially with peers, while encouraging family and friends to join to improve on continuous emotional support and motivation. The combination of peers and family or friends in online support can create a good support system that addresses both the emotional and practical needs of the survivors, which will reduce isolation and sadness and improve quality of life.

The scope of future research for this study has been established. Future researchers can make significant contributions to the field of breast cancer survivorship by conducting several studies. This study can be improved by examining the effects of social media at various points throughout the survival years. Currently, survival rates are counted within one, three, and five years. As a result, future research can look into whether there has been any difference in how people use social media to improve their quality of life throughout the years. Furthermore, specific social media platforms can be analyzed to see the sort of content published and how it corresponds with the survivor's experiences using the platform. The findings will help establish whether a specific platform is the appropriate medium for breast cancer survivors. Finally, examines the efficiency of social media and other offline coping mechanisms about factors affecting survivors' quality of life. In this regard, the study could include cognitive behavioral therapy as an offline strategy for improving quality of life. It can then be compared to the use of social media to evaluate which coping method is most helpful in assisting the survivors. Nevertheless, there are limitations to address. As a conceptual study, this research does not present any empirical data to support the literature review claims. Further research is needed by conducting surveys to compile the data and test the hypotheses. Other than that, this study focused solely on breast cancer, limiting the generalisability of findings and results to other types of cancer. Finally, this research is not specifically focused on a particular social media platform, which may lead to differences in the study for every type of social media platform.

Abstract: The study explores a characteristic of successful asnafpreneurs to address the number of registered asnafpreneurs seeking aid more than the number of successful asnafpreneurs produced in Southern Malaysia. However, the current industry can still not completely produce an independent business owner based on the Asnaf title. The study aims to determine successful entrepreneurs' internal and external characteristics in Southern Malaysia. A quantitative method was used in this study. Respondents were chosen using the non-probability sampling method. SPSS software was used for data analysis. Descriptive analysis (frequency and percentage) and hypothesis testing (chi-square test, correlation, and regression) were utilized to solve the research topic. Study finds that internal factors and external factors play an important role in asnafpreneurs success. Chi-square Test analysis revealed that Pearson's significant value was at the 0.00 level. This indicates that it is less than 0.05 at this level. This test successfully rejects H0, which means there is no correlation between internal factors with a successful characteristic of asnafpreneur and there is no correlation between external factors with a successful characteristic of asnafpreneur. Other authors may study the other geography parts and new challenges for asnafpreneurs to succeed in the future.

Keywords: *Successful Business Person, Asnafpreneurs, Zakat, Quantitative, Technology, Agency Authorities*

1. Introduction

According to MAIWP (2022), there are eight different categories of asnaf: needy, poor, amil, mualaf, Al-niqab, Al-gharimin, Fisabilillah, and lastly, Ibnu Sabil. This study only covers the poor and needy category. Flood victims were not included in this study because they were categorized as asnaf al-Gharimin as zakat recipients (Siti Fariza, 2016). Asnaf and entrepreneur are combined to form the phrase asnafpreneur. Asnaf entrepreneurs, according to Zuriyati and Muhd Adnan (2018), are people who have gone through the process of starting a business, can fulfill their obligations, and are motivated to try their hand at trading with support and encouragement from zakat institutions in Southern Malaysia, particularly the impoverished and destitute. Zakat is said to be able to assist the Asnaf in developing prosperous Asnaf entrepreneurs. Islam has established some financial regulations to raise income for the benefit of Muslims. Therefore, by preventing asnaf entrepreneurs from becoming entangled inthe riba problem through loan assistance methods (cardhul al-Hasan), the capital aid from this zakat fund can prevent asnaf from remaining asnaf of zakat. One significant tool in the development of a poor Muslim community is Qard al-Hasan. Through several products and initiatives, including pawnbroking and sukuk, the Qard al-Hasan method was also incorporated into the Islamic financial system in Malaysia (Norajila, 2015).

Asnaf Muslim entrepreneurs are taught to run halal as well as ethical businesses to get the Almighty's blessing [mardhatillah] and to generate enough money to assist a large number of people. "O you who have believed, do not consume one another's wealth unjustly, but only [in lawful] business by mutual consent," says Surah An-Nisa 4:29. And don't murder yourself [or each other]. Indeed, Allah is eternally merciful to you". According to Amin (2022), this study focuses on a group of asnafs who are willing to engage in entrepreneurial activities to support their lifestyles without heavily relying on monthly zakat aid, which is static and fixed and may not considerably improve their quality of life. He did, however, employ the phrase asnaf Muslimpreneur as a synonym for asnafpreneur, although Abdul Halim et al. (2012) use Entrepreneurial Asnaf. The phrase asnafpreneur comes from the Federal Territory Islamic Religious Council's (MAIWP) Asnafpreneur Program, which was inspired by the name asnaf entrepreneur. With the arrival of the COVID-19 pandemic, the number of successful traders has also decreased (UNICEF, 2021).

Most Asnaf who do business on a small scale do not use technology and assistance from external parties to

develop their business. Nowadays, small businesses can also be simplified with the availability of current technology. In addition, asnafpreneurs lack confidence in themselves and cannot develop their business to a higher level. Thus, there are fewer and fewer businesses that will succeed among asnafpreneurs in Southern Malaysia. Except for the asnafpreneurs themselves, who will help the asnafpreneurs find this formula for success, who else would stand up for their fate? (Munahar et al., 2022). They are ready to change the fate of their lives but it is impossible to succeed without their strength and the right formula. Support from outside parties also plays an indispensable role for successful asnafpreneurs. It is the local academics' role too.

These days, an entrepreneur needs to be proficient in digital to succeed in marketing, business, and related fields. While comprehending contemporary technology such as smartphones, digital devices, and the internet is necessary, entrepreneurs also need to incorporate several auxiliary systems and programs into their business operations. For instance, to support entrepreneur-owned enterprises, research on Accounting Information Systems (AIS) has been done by Mu'is and Hamidah (2020). To compete in the digital economy, entrepreneurs needto be knowledgeable about and comfortable with digital technologies. Finding out how accepting they are of technology is essential, as it will indicate whether or not they are prepared to use it. Many frameworks and models have been developed to explain how users adopt new technology based on early research. Some models include additional elements that may affect user adoption, such as the Technology Adoption Model (TAM).

2. Literature Review

Previous Studies of Successful Characteristics of Asnafpreneur: The most obvious reasons why an entrepreneur fails to launch a successful business are (1) lack of capital, (2) improper education, (3) lack of or limited experience in business-related activities, and (4) personality that is far from that of a convincing entrepreneur, according to Afif Muhamat (2013) prior research. Most people agree that Lembaga Zakat Selangor (LZS) needs the research factors of (1) capital, (2) training, and (3) knowledge to help the zakat recipients establish profitable businesses that eventually lead to a greater standard of living. Only (1) capital and (3) an asnaf's expertise is significant in determining an asnaf's entrepreneurial success, according to regression research, with training being insignificant (Afif Muhamat et al., 2013). In addition to providing financing, Baitul Maal Wa Tamwil (BMT) in Indonesia also helps its asnafpreneurs by offering them access to infrastructure, training programs, and other resources (Wulandari and Kassim, 2016).

The outcome is also consistent with the research conducted by Abdul Halim et al. (2012), which found that effective asnafs are (1) willing to go above and beyond. (2) Take a risk to expand their company. They also (3) possess a certain amount of business imagination, (4) consistently believe that their company will succeed in the future, and (5) are proud of what they do. The following factors influence the success of asnaf entrepreneurship: (6) capital aid, (7) knowledge of entrepreneurship, (8) support, and (9) assistance from family members and partners. The most significant internal component is the application of Islamic teachings in daily life, such as (1) donating to charity, (2) praying all five times a day, and (3) having true intentions. Moreover, four attitudes and five business interests are internal determinants that influence their success (Abdul Halim et al., 2012). The Asnaf Muslimpreneur Success Index (AMSi) uses four main factors to quantify the success of Asnaf Muslimpreneurs. Among the elements of successful Asian Muslim entrepreneurs are (1) business experience, (2) business justice, (3) well-being, and (4) financial wisdom (Amin, 2022). A Few Features of Supporting Characteristics of Successful Asnafpreneur from Past Research.

Internal Factors (Thoughts and Feelings): Abdul Halim et al. (2012) examined the characteristics of prosperous asnaf enterprises and explored the prospects and remedies for zakat organizationsin Malaysia. Based on the 39 respondents randomly selected from successful entrepreneurial asnaf, the results indicated that these individuals have a particular degree of entrepreneurship orientation, are willing to take risks to grow their business, and have a unique marketing approach. They also take pride in their company's ownership, continually foresee its future, and demonstrate inventiveness in the commercial sector. The results also show that asnafs that are successful have more innovative products than average.

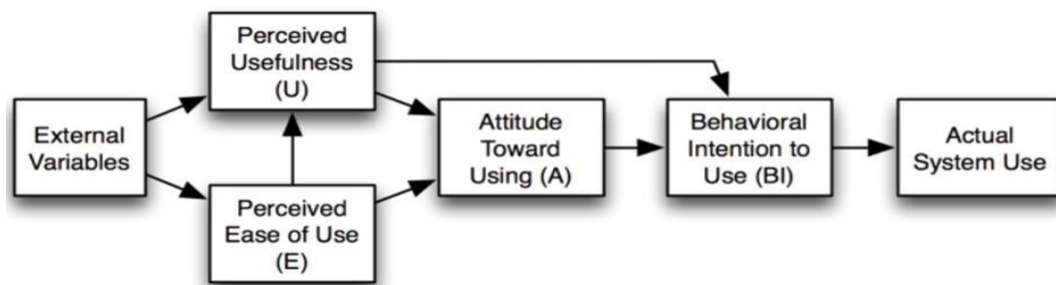
Afif Muhamat (2013) looked into an assessment of the Selangor Zakat Board's contribution to the success of the company's entrepreneurial asnaf. The focus is on the state because of the many success stories of

asnafpreneurs that are arranged by the organization that helps the asnafs escape abject poverty. This study suggests that an asnaf's ability to manage and oversee their organization in line with the previously established business strategy is influenced by their level of business expertise. Research indicates a connection between Asnafs's business success and their level of knowledge. Their results are consistent with previous studies conducted by Abd Rahman and Ahmad (2011), who argued that relevant knowledge and training play a critical role in determining the success of Asian Muslim entrepreneurs in the economic world.

According to a study by Naito and Washizu (2021), Japanese people tend to focus on, pick out, and remember good memories of significant events since they have a limited lifespan. Islam, which maintains that everyone should always keep death in mind and make an effort to behave in line with Islamic law, shares this belief. The asnaf characteristics have a big impact on an asnafpreneur's success. The following attributes are required of them: (1) a high level of initiative or effort; (2) a willingness to take significant risks; (3) sacrifice; creativity and imagination; (5) the capacity for problem-solving; (6) convictions and (7) self-assurance; (8) commitment and (9) earnestness; 10) honesty and (11) dependability (Fauziah Ibrahim et al., 2013).

External Factors (Technology): Utilizing science, technology, and innovation will be more important for a nation's development in an increasingly competitive global economy (Kementerian Sains, Teknologi Dan Inovasi, 2021). Because of this, companies in today's fast-paced business climate need to adjust to the rapid rate of technological advancement. These are obstacles that entrepreneurs need to go past to navigate the current economic environment. The information era, internet development, and globalization provide challenges for entrepreneurs competing in the market. Due to competition, businesses need to be innovative and creative to respond swiftly to changes in the market. It turns out that most companies today place a high value on staff creativity (De Jong and Hartog, 2010). This is done for the company to gain from its innovative work practices and improve performance as well as its ability to compete globally (Noorsafiza et al., 2013). The explanation claims that a successful asnafpreneur's firm depends heavily on technology adaptation. Respondents' perception levels were measured using the Technology Acceptance Theory (TAM) instrument developed by Davis & Davis (1989) and processed according to the suitability of the study by the researchers (Khadijah Muda et al., 2013).

Technology Acceptance Model (TAM)

Figure 1: Original Framework of Technology Acceptance Model


Source: Davis & Davis (1989)

The Technology Acceptance Model (TAM) (figure 1), created by Davis & Davis (1989), is one of the most widely used models to explain user acceptance behavior. The original TAM established the concepts of perceived usefulness (PU), perceived ease of use (PEOU), attitude, and behavioral intention to use. The two structures, PU and PEOU, generate views from end users about technology and forecast their attitude towards it, hence predicting its adoption. Though perceived usefulness refers to the conviction that the technology employed would enhance the performance of a specific work, perceived ease of use refers to the user's capacity to finish the task with minimal effort. This model could be able to explain why, if asnafpreneurs embrace the use of technology in their operations, the level of asnaf business will rise in the future. This is because technology facilities are being used more and more frequently these days. Data from (Ma and Liu, 2004) show that usefulness is critical for IT adoption and that end users' assessments of a system's usefulness are highly impacted by its ease of use.

According to Ibrahim et al. (2022), digital marketing, digital payments, and digital finance all had a favorable and substantial influence on financial performance. The fundamental premise of the study is that digital payments and SMEs can enhance firm performance by concentrating on SME digitization and financial literacy among SME entrepreneurs. The restrictions on using the internet to distribute surveys have aided in-depth research on the phenomenon of SME behavior as compared to conducting in-person interviews. The Islamic banking industry is seen as one of the most effective mediums in da'wah and can facilitate the business system by using online money transfer technology provided by banks (Mohamad, Borhan, Mohamad, 2012). SME bank also assists in the success of the Asnaf business development (Hibrahim, 2021).

Mobile Marketing Technology Model (MMT)

Figure 2: Technology-Organization-Environment (T-O-E) framework and Mobile Marketing Technology Model (MMT)
Source: (Sunday, 2022)

The popularity and widespread use of mobile marketing technologies and devices have attracted the attention of researchers and practitioners, particularly in small and medium-sized businesses (SMEs), where budgetary constraints and a lack of human capital can make these technologies extremely beneficial. In an attempt to increase sales of goods and services, SMEs can improve their sales promotion methods by utilizing mobile marketing tools (figure 2) (Sunday, 2019). Utilizing qualitative methods, both studies (Sunday, 2019, 2022) show how important it is for businesses to employ technology to assist them in widely promoting their products.

Mobile marketing technology adoption and usage by small and medium-sized enterprises (SMEs) is increasing (MMT). To forecast and explain the adoption of MMT by small service organizations, this study aims to learn more about the proposed use of a grounded theory approach for examining elements within the Technology-Organization-Environment (T-O-E) framework (Sunday, 2022). To satisfy the contemporary desire for greater social interaction, this theory provides a more thorough and holistic framework with solid theoretical and empirical evidence. It fits nicely with the contemporary technological period, where the shift to the digital age has happened quickly on a global scale.

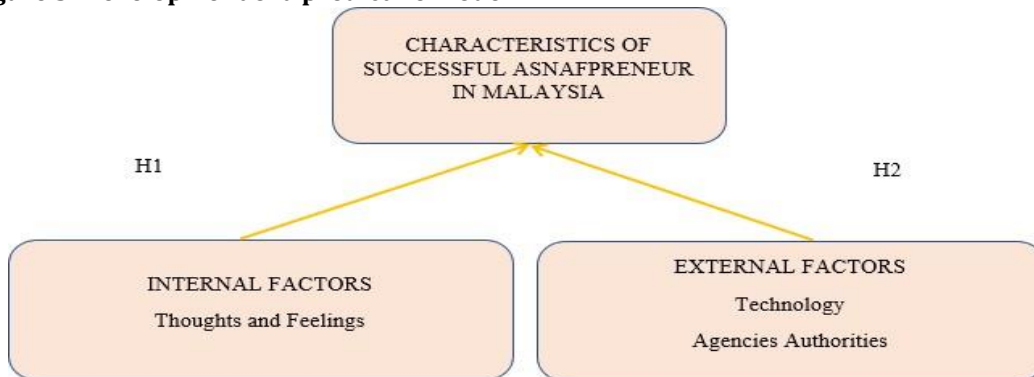
External Factors (Agencies Authorities): Asnaf entrepreneurs are generally asnaf, especially the underprivileged and needy who want to start their businesses. For this reason, the Zakat institution will give this group all of its support and attention (Ahmad, 2012). Esrati et al. (2018) concluded that factors other than capital could have a significant impact on a business's success. Zakat authorities need to address these factors to increase the likelihood of business success for Asnaf enterprises. Corporate involvement is crucial for ending poverty, promoting economic expansion, and bolstering the Muslim economy overall. The Asnaf Entrepreneurs Community Association of Melaka's (PKUANM) struggle is carried on by Koperasi Usahawan Asnaf Melaka Berhad (KUASA). On October 7, 2020, the cooperative was formally founded to advance agricultural goods (KUASA, 2022). The items include premix, cooking oil, cordial, ready-to-eat (RTE), and ready-to-drink (RTD).

The zakat party offers business knowledge courses and skills to help do business for asnafpreneurs. Teaching people to be independent is the best approach to assist them. According to Rahman, et al. (2008), the needy and impoverished are the main target groups of the receivers of zakat help in the form of a business support scheme. Because the conditions are simple and simply demand a business permit as proof, those in need and

the impoverished have responded favorably to the business capital support project. Not only is there no need for a business plan, collateral, or guarantor, but most importantly, the help is given without any conditions attached and at no cost to the recipient.Here's an instance of how the relevant parties have commended the Zakat officials. Since the start of PPZ-MAIWP in early 1991, corporate zakat management, such as having professionals in the workforce, has greatly assisted the organization's growth and development (Alias, 2016).

As part of their strategic partnership, SME Bank and Yayasan Pembangunan Ekonomi Islam Malaysia (YaPEIM) expanded the Asnaf Entrepreneurship Program (ISHRAF) initiative's execution. As part of a plan designed to foster asnafpreneurs, asnafpreneurs from six states—Perlis, Kedah, Negeri Sembilan, Melaka,Sabah, and the Federal Territory of Kuala Lumpur—were included in the new project (Hibrahim, 2021). Depending on the kind of business and appropriateness, Selangor offers entrepreneurs between RM 2,000 and RM 50,000 in capital. An extra RM 5,000 in capital will be provided if the business expands. To help asnafpreneurs grow their businesses, the Lembaga Zakat Selangor (MAIS) will keep an eye on their operations and offer entrepreneurial support under the direction of MARDI, MARA, and other organizations (Abd Rahman, R., and Ahmad, S. 2011). With the Baitulmal Entrepreneur Tunas Program (TUB), whichwas launched in 2019, SME Corp. Malaysia and the Federal Territory Islamic Religious Council (MAIWP) are working together to change MAIWP asnaf entrepreneurs "From Zakat Recipients to Zakat Payers" by providing them with entrepreneurial training. The Baitulmal Entrepreneur Tunas Program (TUB) has assisted 84 asnaf entrepreneurs in improving their business operations by using the idea and model of the Bumiputera Youth Entrepreneurs Program.

In addition to offering zakat support, the Negeri Sembilan Islamic Religious Council (Muttaqin, Sidik, Sidek, 2021) also offers numerous entrepreneurial programs, including marketing tactics using the WhatsApp application, tomentor aspiring entrepreneurs. The initiative gave participants exposure to and opportunities to master various ways of marketing through the WhatsApp app, involving thirty asnafpreneurs. In addition, copywriting techniques and the Google Contact phone number storage feature are taught to the participants. The National Entrepreneurship Institute (INSKEN) and the Asnaf Profiling and Entrepreneurship Unit of the MAINS Distribution Division collaborated to organize the program.

Figure 3: Development of a predictive model


3. Methodology

To meet its stated goals, this study uses quantitative methodologies. The framework will be constructed using both primary and secondary data, with the built model being based on selected indicators identified from past research aims. Therefore, a structured Google form questionnaire will be created for asnafpreneur and distributed to around 90 asnafpreneur respondents who have been suggested by state zakat authorities as the primary data gathering strategy. The total number of respondents gathered is 84 people. For this study, secondary data will be obtained through data and information searches on the internet and in library activities.

The researcher will choose respondents for this study using a technique called purposeful sampling, which is sometimes referred to as non-probability sampling, based on their distinctive characteristics. Put differently, purposive sampling involves the "on purpose" selection of units. The zakat officer selected the research participant, who is an asnaf who owns a business. By using intentional sampling, the researcher will be able to

choose a particular example because it exemplifies a process or other related features that the researcher is interested in.

A non-probability selection technique will be used to select 20 to 30 asnaf as responders in each state. Sekaran (2010) states that there are between 30 and 500 responders. Professional recommendations from the State Religious Islamic Councils (SIRCs) officer determined who was chosen to answer. The Statistical Package of Social Science (SPSS) software will be used for quantitative data analysis to address the research questions and objectives.

Hypothesis Testing: In this study, two hypotheses have been proposed. The null hypothesis (H0) of each hypothesis states that there is no relationship between the independent and dependent variables, while the alternative hypothesis (Ha) contends that there is a significant relationship. Below are the alternate hypothesis and null hypothesis. The first independent variable hypothesis is:
H0: Internal factors did not influence the successful characteristics of asnafpreneur in Southern Malaysia
H1: Internal factors can influence the successful characteristics of asnafpreneur in Southern Malaysia
The second independent variable hypothesis is:
H0: External factors did not influence the successful characteristics of asnafpreneur in Southern Malaysia
H2: External factors can influence the successful characteristics of asnafpreneur in Southern Malaysia

4. Analysis and Findings

Table 1: Reliability test

	N	%
Cases Valid ExcludedTotal	84	100.0
	0	.0
	84	100.0

a. Listwise deletion based on all variables in the procedure.
Scale: All Variables-Case Processing Summary

Reliability Statistics

Cronbach'sAlpha	No of items
.970	80

The Cronbach's alpha values of all the factors for the variables were compiled in Table 1 above, and all of them were safely over the 97% threshold, indicating that the reliability data have outstanding reliability. This implies that additional data analysis can rely on the data.

Respondent Profile: A total of 90 sets of questionnaires were sent out through 'The *WhatsApp group'* chat room to the selected respondents. The total data respondents had collected are 84 sets. According to the study, 70 respondents, or 83.3% of the total, are female. With 34 respondents (40.5%), the highest age range of respondents in this survey is 41 to 50 years old. Out of the total 49 responders, or 58.3%, the majority are married. The monthly business income of 43 entrepreneurs is less than RM 1,000 (51.2%). RM 1,000 a month is still insufficient to meet their family's needs, considering that the minimum monthly basic pay in 2023 will be RM 1,500.

A respondent profile such as type of business, total of workers, highest education level, and experience of being an entrepreneur is also been study as well. Approximately 58 responders, or 69% of the sample, work for businesses in the "Food and Beverage" (F&B) industry. Of all the responses, 79 have fewer than two employees on their premises, accounting for 94% of the total. 45 respondents (53.6%) had equal certificate levels, with SPM/SPMV being the average highest education level among the respondents. With 38 respondents (45.2%), the majority of respondents have at least two to five years of experience as entrepreneurs.

Next to be studied are several households, and opinions on whether the business can take you out of the asnaf category and occupied state. The highest number of households is 3 to 5 people with 47 people (56.0%). Most

ofthe respondents agree that the business they run can take them out of the asnaf category with 76 respondents (90.5%). The highest number of respondents came from Johor with 30 respondents (35.7%).

Table 2: Level of Successful Asnafpreneur (Dependent Variables)

Successful Asnafpreneurs Characteristics	Strongly Disagree (%)	Disagree (%)	Between Agreeing or Disagreeing (%)	Agree(%)	Strongly Agree (%)	Ranking (%)
I feel that internal behavior plays an important role in the successof asnafpreneurs in their business	1.2	1.2	1.2	26.2	**70.2**	1
I feel that external behavior playsan important role in the successful of asnafpreneur in their business	0.0	2.4	2.4	31.0	**64.3**	2
The mean average of 84 respondents	0.0	1.2	2.4	21.4	**75.0**	

As an example, we only show the dependent variable input, 2 elements in the respondent's opinion on the Successful Asnafpreneurs Characteristics analyzed (Table 2). The majority of respondents stated Strongly Agree against all those elements. The 84 respondents put a 75.0% average for the Successful Asnafpreneurs Characteristics.

For an independent variable, 21 elements in the respondent's opinion on the internal inputs analyzed in the studyare the respondent stated highly in 'Strongly Agree' against all those elements. The 84 respondents put a 51.2% average for the internal inputs. 32 elements in the respondent's opinion on the external analysis the respondent stated highly in 'Agree' against all those elements. The 84 respondents put a 66.7% average for the external inputs which are technology and agency authorities.

Highest and Lowest for Internal and External Factor: The highest component among internal variables according to the answer of this study is the first, 'I am an honest person in business'. Meanwhile, the lowest element in internal factors is 'I have the support of friends to do business', meaning that, indicating that most entrepreneurs do not agree with this statement. From a technological perspective, "I need to adapt my business conditions in line with the current age of digitalization" is a crucial component of an external factor for entrepreneurs. One aspect of the externaltechnology issue that many entrepreneurs are not as familiar with is the "software system that is in theinformation and communication technology equipment." It indicates that they are aware that, to remain competitive in the corporate world, they must embrace technology.

Agency authorities successfully apply an important element of external factor in asnafpreneurs which is that they know that 'paying zakat is my duty once I am able/successful in business'. Less important in terms of external information related to agency authorities is 'The zakat has provided a business space/site for asnaf entrepreneurs'. Because the majority of aspiring entrepreneurs were unable to reap the rewards, this element had a low response rate.

Hypothesis Testing: Below shows the relationship between internal factors towards characteristics of successful asnafpreneurs

Table 3: The Relationship between Internal Factors and Characteristics of Successful Asnafpreneurs

		Internal Factors (IV1)			
		Strongly Disagree	Agree	Strongly Agree	Total
Successful Asnafpreneur(DV)	Disagree	1	0	0	1
	Between Agreeing or Disagreeing	0	2	0	2
	Agree	0	15	3	18
	StronglyAgree	0	23	40	63
Total		1	40	43	84

Chi-Square Tests

	Value	df	Asymp. Sig.(2-sided)
Pearson Chi-Square	98.672[a]	6	.000
Likelihood Ratio Linear-by-Linear	26.892	6	.000
Association	29.299	1	.000
N of Valid Cases	84		

a. 8 cells (66.7%) have an expected count of less than 5. The minimum expected count is 0.1.

Cross-tabulation analysis between Internal Factors with Characteristics of Successful Asnafpreneurs is shown in Table 3. The analysis found that the majority of respondents' views were at the Agree and Strongly Agree levels. Where 15 respondents express Agree to Internal Factors, simultaneously Agree in Successful.

Characteristics in Asnafpreneurs. While 23 respondents agreed with Internal Factors also stated that Strongly Agree with Successful Characteristics in Asnafpreneurs.

Additionally, three respondents indicated that they Strongly Agree with Internal Factors and Strongly Agree with the Successful Characteristics of Asnafpreneurs. 40 respondents expressed Strongly Agree for both Internal Factors variables with the Successful Characteristics in Asnafpreneurs. We can formulate the following hypothesis to determine how these two variables relate to one another:

H_0: There is no correlation between Internal Factors towards Successful Characteristics of asnafpreneurs in Southern Malaysia
H_1: There is a correlation between Internal Factors towards Successful Characteristics of Asnafpreneur in Southern Malaysia

Chi-square Test analysis revealed that Pearson's significant value was at the 0.00 level. This indicates that it is less than 0.05 at this level. This test successfully rejects H_0, as demonstrated next. Internal factors and the successful traits of an entrepreneur are related. This implies that if internal factors improve, the successful characteristics of entrepreneurs in the studied area will also change. Below is the relationship between external factors towards characteristics of successful asnafpreneurs.

Table 4: The Relationship between External Factors towards Present Characteristics of Successful Asnafpreneurs

		External Factors (IV2)			
		Disagree	**Agree**	**Strongly Agree**	**Total**
Successful	Disagree	1	0	0	1
Asnafpreneur (DV)	Between Agreeing or Disagreeing	0	2	0	2
	Agree	0	15	3	18
	Strongly Agree	0	39	24	63
Total		1	56	27	84

Chi-Square Tests

	Value	df	Asymp. Sig.(2-sided)
Pearson Chi-Square	87.964[a]	6	.000
Likelihood Ratio Linear-by-	15.612	6	.016
Linear Association	13.934	1	.000
N of Valid Cases	84		

a. 8 cells (66.7%) have an expected count of less than 5. The minimum expected count is 0.1.

Table 4 displays a cross-tabulation analysis of external factors and successful entrepreneur characteristics. According to the analysis's findings, most respondents had opinions that fell between those of Agree and Strongly Agree. When fifteen respondents state that they Agree with external factors, they also agree that

entrepreneurs who are successful share certain characteristics. While 39 respondents agreed with External Factors and also stated that Strongly Agreed with Successful Characteristics of Asnafpreneurs.

Furthermore, 3 respondents stated Strongly Agree in External Factors and Strongly Agree for the Successful Characteristics in Asnafpreneurs. 24 respondents expressed Strongly Agree for both External Factors variables with the Successful Characteristics in Asnafpreneurs. To see the relationship between these two variables, we can form a hypothesis as follows:

H0: There is no correlation between External Factors towards Successful Characteristics of asnafpreneurs in Southern Malaysia

H2: There is a correlation between External Factors towards Successful Characteristics of Asnafpreneur in Southern Malaysia

Chi-square Test analysis revealed that Pearson's significant value was at the 0.00 level. This indicates that it is less than 0.05 at this level. This test successfully rejects H0, as demonstrated next. External factors and the successful traits of an entrepreneur are related. This implies that changes in the research area's successful entrepreneur characteristics will follow improvements in external factors.

Table 5: The Coefficient Research Variables

Model	Unstandardized Coefficients		Standardized Coefficients			95.0% Confidence Interval for B	
	B	Std. Error	Beta	t	Sig.	Lower Bound	Upper Bound
1 (Constant)	2.188	.437		5.008	.000	1.319	3.057
InternalFactors	.519	.107	.567	4.831	.000	.305	.733
External Factors	.045	.127	.041	.352	.726	-.208	.297

a.   Dependent Variables: Successful Asnafpreneurs Characteristics

Table 5 shows the coefficients among all variables involved in the study, Successful Asnafpreneurs Characteristics (SAC), Internal Factors (IF), and External Factors (EF). Based on the coefficients of analysis, a formula can be formed as follows:

SAC = 2.2 + 0.5IF + 0.0EF

5. Conclusion and Recommendations

Conclusion: The level of dependent variables (successful asnafpreneurs characteristics) and independence variables (internal factors and external factors) are 75% of the respondents strongly agree that internal and external inputs are important in developing successful asnafpreneur characteristics. 51.2% of the respondents strongly agree and 47.6% of the respondents agree that the internal inputs listed are the key to building their good internal factors. For external factors, 66.7% of the respondent agree that external inputs also help to gain a good successful asnafprenur and their characteristics. The Cronbach's alpha values of all the factors for the variables were safely over the 97% threshold, indicating that the reliability data have outstanding reliability. This implies that additional data analysis can rely on the data.

Chi-square Test analysis revealed that Pearson's significant value was at the 0.00 level. This indicates that it is less than 0.05 at this level. The relationship between successful asnafpreneurs' characteristics with independence variables is (1) there is a relationship between internal factors and successful asnafpreneurs characteristics (have a relationship because H0 is rejected) and (2) there is a relationship between external factors and successful asnafpreneurs characteristics (have a relationship because H0 is rejected). Characteristic of successful asnafpreneurs formula is SAC = 2.2 + 0.5IF + 0.0EF.

Limitations of Study: The study's time constraint stems from the need to gather all the data from entrepreneurs in every state. Researchers should consistently remind entrepreneurs in the "WhatsApp Group" to respond to the survey questions during their free time. Additionally, researchers must frequently clarify or expand on the meaning of any terms used in survey questions. The majority of participants are between the

ages of 41 and 50, thus they frequently seek clarification on what they comprehend. Additionally, the majority of the respondents had SPM/SPMV level academic qualifications. As they did not use the word frequently, they most likely could have forgotten a few unusual words in a phrase.

Suggestions for Future Research: Due to time constraints, this study solely looks at Negeri Sembilan, Melaka, and Johor, the three southern states of Peninsula Malaysia. Additional researchers could examine the northern states of the Malaysian Peninsula and identify trends in entrepreneur behavior, as well as the distinctions and similarities among the management of each State Islamic Religious Council. Since this study solely employed quantitative methods, other researchers may choose to conduct their research using qualitative methods, or they may choose to combine qualitative and quantitative methods. Aside from that, academics are encouraged to investigate a variety of topics from many angles, including politics, economics, government policy, and much more. Waqf also has been proven as one of the tools for alleviating poverty around the world (Ibrahim and Rafien, 2017).

This framework can also be incorporated by the State Islamic Religious Council offices into the asnaf entrepreneur training module, which will assist asnafpreneurs in recognizing the critical personal attributes that they should work on developing to accomplish more in the future. The significance of paying zakat directly to the zakat centre might also be known by the general public. This is intended to support aspiring and established business owners by offering funding to expand their ventures.

Gig Economy: Is It a Trap or Stepping Stone for the Informal Sector?

Nazurah Abdul Malek
Faculty of Business and Management, Universiti Teknologi MARA, Cawangan Selangor, Kampus Puncak Alam,
Puncak Alam, Selangor Darul Ehsan, Malaysia
nazurah.malek@uitm.edu.my

Abstract: The informal sector and technology have complex interactions, shaping economic activity, job trends, and social outcomes, especially with the rise of the "gig economy", in which individuals work on an as-needed basis through online platforms. This article explores several theoretical frameworks, such as modernization theory, dependence theory, structuralist approaches, and post-structuralist viewpoints, and investigates how different frameworks explain the effects of technology on informal economic activity. This article also reviews for comprehending the correlation between the informal sector and technology. Besides that, this article explores the dual nature of the gig economy, examining whether it serves as a trap that perpetuates the vulnerabilities of the informal sector or as a stepping stone toward more excellent economic stability and mobility. Although the gig economy provides opportunities for income generation, skill development, and flexible working conditions, it also presents substantial challenges, such as job insecurity, a lack of benefits, and potential exploitation. This paper also addresses the implications for policy and future research directions by the sustainable development goal (SDG) of fostering sustainable, inclusive, and long-term economic growth, as well as full and productive employment and decent work for all.

Keywords: *Gig Economy, Informal Sector, Labor Economics, Informal Employment.*

1. Introduction and Background

For the past decades, the booming of the digital economy has offered new jobs for individuals involved in formal and informal sectors. The combination of rapid digital transformation, the expansion of information and communication technologies, and the extended period of economic inactivity in the manufacturing industry has significantly transformed the worldwide labor market and employment trends (Donovan et al., 2016; Stewart & Stanford, 2017; Kassi & Lehdonvirta, 2018). Indeed, the expanding relevance of the digital economy is crucial for the country to offer jobs, especially for the growing technologically savvy educated labor force. It also supplements the rising number of self-employed individuals who rely on the Internet to communicate with potential clients. As a result, the informal sector's scope and employment quality are also affected by the digital revolution of labor.

In recent years, an increasing number of people have joined the gig economy, searching for additional income or as their primary source of income. Moreover, it is influenced by the flexibility of working hours and location and the freedom to select the type of job (Stefano, 2016). After the COVID-19 crisis and the subsequent spike in unemployment, many professionals and skilled laborers started working online to maintain their standard of living. Consequently, it allowed the gig economy to proliferate quickly, creating bottom-up demand and supply in the online market. Many people, including students looking for employment, retirees, and those with low and high skills, also turn to gig work to make a living. Gig work has opened up new opportunities for underemployed or jobless people to transition from full-time employment to a new online-based flexible employment (Huang et al., 2020).

The term "gig economy" refers to this short-term job phenomenon, a metaphor taken from the music business, in which musicians are paid to play live shows. It was first driven by experienced IT professionals who began using online digital platforms to hunt for gig economy opportunities. The gig economy is often referred to as the 'platform economy', 'on-demand economy', or 'sharing economy'. It relates to the demand and supply of temporary or task-based labor (Howe, 2006; Cherry, 2016; Felstiner, 2011; Bergvall-Kåreborn & Howcroft, 2014; Eurofound, 2015).

As stated by ILO (2020), while the gig economy is an attractive alternative source of income, data reveal that on a worldwide scale, the gig economy tends to attract more young individuals, those aged 25 to 34 (46.2%) and 35 to 44 (32.5%). Pew Research Center (2016) found that 24% of Americans made money via the digital

'platform economy' the previous year. According to the study, this source of income is crucial for younger individuals. Meanwhile, according to the McKinsey Global Institute (2016), approximately 20-30% of the working-age population, or up to 162 million individuals in Europe and the United States, are involved in some form of independent work.

Because of internet technology and social media growth, younger adults have quickly adopted this new way of life. According to Hershatter & Epstein (2010), the gig economy frequently arises due to its online platform element, enabling millennials to utilize their talents and abilities, such as freelance photographers and videographers, social media content creators and influencers. This argument highlights the fact that many millennials are leaving traditional jobs for freelance work, which provides them with greater freedom and flexibility. Research published in the Harvard Business Review (2018) revealed that gig workers value flexibility, independence, and the opportunity to pursue their passions, with over 74% of respondents reporting high satisfaction with gig employment.

Given the limited evidence of the relationship between the gig economy and the informal sector, this paper seeks to investigate two questions. Firstly, how does technology affect the informal sector? Secondly, what are the gig economy's implications for the informal sector? This paper addresses critical questions about its role in economic development and social protection. This study also contributes to the literature in two ways. Firstly, this paper provides a theoretical framework for comprehending the direction of the gig economy in the informal sector. Secondly, this research illustrates both the advantages and disadvantages of the gig economy. The remainder of the study is presented as follows. The following section elucidates a comprehensive literature review of conceptual approaches defining the informal sector and technology. The third part discusses the technological impacts on the informal sector. The fourth section comprises the intersections between the informal sector and the gig economy. The following section discusses the challenges and risks of the gig economy. Finally, the last section summarises the implications and discussion by presenting a brief conclusion, limitations, and possible future studies.

2. Conceptual Approaches: Defining the Informal Sector and Technology

The informal sector, which includes non-regulated or recognized economic activities, plays a significant role in global labor markets, especially in developing nations. The rapid advancement of technology, mainly digital technologies, has brought new modifications to the informal sector, influencing how informal businesses operate and interact with formal economic systems. Technology refers to digital tools and innovations, including mobile phones, internet access, digital platforms, and financial technologies (fintech). The informal economy's technology integration can potentially influence economic activities and employment patterns in a transformative and disruptive manner. This section explores the conceptual approaches to understanding the intersection of the informal sector and technology, providing insights into the theoretical frameworks that guide this understanding.

Modernization Theory: The word "modernization theory" originates from older concepts of economic development (Geertz, 1963; Lewis, 1954; Rostow, 1959). The informal sector is viewed as a step in the market economy's developmental process (Lewis, 1954; Rostow, 1959; Harris and Todaro, 1970; Rauch, 1991). In this view, informal activities will cease to exist as a result of economic development in emerging nations. Workers with lower levels of human capital are more likely to find employment in informal and smaller firms that receive lower wages. On the other hand, workers with higher levels of human capital are more likely to find employment in larger, more productive firms, where they receive higher wages.

Based on this theory, the informal sector is said to result from a surplus of labor supply. As the economy becomes more modernized, the "excluded" informal laborers will eventually find employment in the formal market. Modernization theory suggests that economic development and technological advancement are inherently linked, with technology driving progress and modernization. From this perspective, adopting technology in the informal economy is seen as a pathway to formalization and economic development. Technology is expected to increase productivity, enhance market access, and integrate informal businesses into the formal economy.

Consequently, according to the modernization theory, the adoption of technological advancements has the potential to assist in bridging the gap between the informal and formal sectors, hence fostering economic growth and development. Bosch, Goni-Pacchioni, and Maloney (2012) conducted an empirical study that utilized data from Latin American countries, which showed that the impact of economic growth, industrialization, and technology adoption had reduced informal employment. Technology helped informal laborers in Brazil and Chile migrate to salaried jobs. Over a decade, informal employment in Brazil dropped 10% due to policies that formalized businesses and labor. This corresponds with modernization theory's assumption that economic development, driven by technological advances, facilitates the progressive shift of labor from the informal to the formal sector. Policies should, therefore, focus on facilitating access to technology and supporting digital literacy among informal workers.

Dependency Theory: This approach emerged as a counterpoint to modernization theory, which views technology as a universal driver of progress. Dependency theory originated in the 1960s and 1970s, primarily through the works of scholars such as André Gunder Frank and Immanuel Wallerstein. The theory proposes that the disparities in global economic conditions result from historical colonialism and economic exploitation processes. According to this theory, developed countries (the core) exploit developing countries (the periphery) through unequal trade relationships and the extraction of resources and labor (Frank, 1967; Wallerstein, 1974). This dynamic creates a dependency that hinders the economic development of peripheral countries and continues to maintain their inferior status.

In addition, dependency theory offers a contrasting view, arguing that technological advancement can boost existing inequalities and dependencies. From this perspective, integrating technology into the informal sector may lead to the exploitation and marginalization of informal workers. Technological tools and platforms, often controlled by large corporations, can extract value from informal labor without offering equivalent benefits. In brief, dependency theorists argue that technology controlled by developed countries and large corporations might contribute to the ongoing marginalization and exploitation of workers in developing nations and informal sectors. Subsequently, the dependency theory highlights the risks of exploitation and disparities in development associated with technological adoption in the informal sector.

To support this argument, the World Bank (2019) highlighted the widening digital gap in Sub-Saharan Africa, where urban elites can access internet infrastructure while rural informal laborers do not. Technological integration favors urban populations but not rural laborers, worsening regional inequality. This example emphasizes the unequal distribution of technological benefits within developing countries, where access to technology remains concentrated among privileged populations, further marginalizing informal laborers in rural areas. Additionally, the OECD Development Centre's (2020) findings are consistent with dependency theory, as they illustrate how dependency relationships can be worsened by reliance on foreign technology, which in turn keeps developing countries reliant on developed nations for essential technological infrastructure. Therefore, the empirical studies suggested that the policies should protect informal workers from exploitation and ensure that technological advancements are inclusive and equitable.

Structuralist Approaches: Moser (1978) and Castells and Portes (1989) promoted the structuralist school. Structuralist approaches focus on the structural conditions that shape economic activities and labor markets. These approaches emphasize the role of institutions, regulations, and economic structures in determining the outcomes of technological integration in the informal economy. Technology can either reinforce existing structures of inequality or disrupt them, depending on how it is implemented and regulated.

Chen et al. (2004) discussed that according to this theory, informal economic units (micro-enterprises) and employees are subjugated to minimize input and labor costs, enhancing major capitalist firms' competitiveness. The informal economy may be seen as a structural component of the modern development of capitalism. By exploiting unprotected informal laborers (such as women, youth, immigrants and unskilled), capitalist businesses aim to decrease wages, and labor safety requirements, and increase flexibility with the government's assistance. The informal sector is viewed as a consequence of globalization and capital accumulation, where it is not a phase in the transition from a traditional to a modern economy. It is not dependent on the formal economy's failure to absorb workers or on the voluntary decision of self-employed individuals. Therefore, according to structuralists, the informal sector is common in developed nations.

A study by Tokman (2007) found that multinational firms in Latin America minimize production costs by using informal laborers with lower labor standards, especially in textiles and manufacturing. Supporting the structuralist perspective, this study showed that even when technology and automation reduced manufacturing costs, informal laborers continued working in vulnerable conditions and earning low salaries. In addition, Chant and Pedwell (2008) found that communication and microfinance technology have created economic opportunities for women in informal businesses in Sub-Saharan Africa, but the lack of regulatory oversight leaves them vulnerable to exploitation. Despite technological advances, women in agriculture and handicrafts are underpaid and excluded.

These studies support the structuralist claim that institutional frameworks influence technological uptake where the lack of regulatory protections perpetuates the informal sector exploitation of workers. In short, structuralist approaches propose that institutional and regulatory frameworks operate as intermediaries in influencing the effect of technology on the informal sector. Policies should, therefore, focus on creating supportive regulatory environments that facilitate positive outcomes from technological adoption.

Post-Structuralist Perspectives: Post-structuralism emerged as a critique of structuralist theories, which tended to view social and economic structures as stable and deterministic. Instead, post-structuralists argue that social and economic realities are constructed through language, power relations, and cultural practices and are, therefore, fluid, contingent, and subject to constant change (Foucault, 2013; Derrida, 2016). However, post-structuralist viewpoints require a more refined understanding to comprehend the informal sector and its interaction with technology fully.

In the informal sector and technology context, post-structuralist perspectives focus on how technological advancements disrupt traditional jobs and create new forms of economic activity. Post-structuralist perspectives challenge the dual distinctions between formal and informal economies, emphasizing economic activities' fluid and dynamic nature. These perspectives highlight the diverse and context-specific ways in which technology interacts with informal economic activities. Technology can enable new forms of informal work, create hybrid economic spaces, and redefine the boundaries between formal and informal sectors. This is where the gig economy comes in the way laborers frequently work in an ambiguous space: they are not exclusively formal or informal employees.

To support this argument, digital freelancing platforms like Upwork and Freelancer in India have blurred the lines between formal and informal labor, according to Aneesh (2015). These platforms employ workers in flexible, non-formal roles without contracts, job security, or benefits. These platforms have produced a hybrid economy where freelancers switch jobs based on their skills and technology. Meanwhile, Grab and Gojek have altered Southeast Asia's transportation business, establishing hybrid economic activities where these p-hailing and e-hailing drivers deliver their jobs informally yet use formal digital platforms. Lim (2018) found that many drivers or riders work under informal conditions with flexible hours and no formal employment status, even though the platforms require registration and legal compliance.

These scenarios show how post-structuralists see technology disrupting economic systems. Ride-sharing platforms connect informal workers to structured digital systems, fluidizing labor markets. Therefore, they suggest that policies should be flexible and context-specific, recognizing the diversity of informal economic activities and how technology can be integrated.

To summarise, the effects of technology on informal economic activity can be viewed through different perspectives of the various theoretical frameworks—modernization theory, dependency theory, structuralist approaches, and post-structuralist viewpoints. Collectively, these frameworks offer a thorough comprehension of the diverse, complex, and frequently conflicting ways in which technology influences informal economic activities, thereby highlighting the necessity of inclusive, adaptive policies that respond to particular countries.

Technological Impacts on the Informal Sector
The informal sector is subject to significant and varied effects brought about by technology, which in turn affects how workers in the informal sector conduct business, access markets, and interact with formal economic structures. This section aims to investigate how technology influences the informal sector, stressing

both the positive and negative implications of these changes.

In particular, technology can enhance productivity and economic growth within the informal sector by improving business communication, marketing, and operations. Digital platforms can provide informal businesses with new markets and customer bases (Heeks, 2017). Social media platforms such as Facebook, Instagram, and WhatsApp also serve as marketing and sales channels for informal businesses, allowing them to advertise their products and engage directly with customers (Donner & Escobari, 2010). These platforms, including the growing and popular TikTok platform, enable informal sector workers to access more extensive and diverse markets. Besides that, marketplace platforms like eBay, Amazon, and local equivalents allow small-scale producers and sellers to sell their products online, attractive to customers outside of their geographical region (Graham et al., 2017).

In addition, technology can facilitate job creation and entrepreneurship in the informal sector. Digital platforms like ride-sharing and e-commerce sites offer new opportunities for income generation (Graham et al., 2017). Mobile technology can support micro-entrepreneurs by providing access to information and resources that were previously unavailable (Donner, 2007). Digital platforms such as Uber, Upwork, Grab, Foodpanda and TaskRabbit have created new opportunities for informal workers to engage in gig and freelance work. These platforms provide flexible work arrangements and the ability to earn income task-by-task (De Stefano, 2016). Advances in communication technologies have also enabled telecommuting and remote work, offering informal workers opportunities to participate in the global economy from their local contexts (Kässi & Lehdonvirta, 2018). This transition can enhance work-life balance and diminish the necessity for migration to urban areas. However, it also presents concerns regarding the digital gap and inequitable technological access (Graham et al., 2017).

Technology can also facilitate skill development and education for informal sector workers. Online learning platforms and mobile apps can provide training and resources to improve business practices and technical skills (Aker et al., 2016). In addition, mobile learning applications allow informal sector workers to learn at their own pace and on their schedule, offering flexible learning opportunities that can be customized to meet their specific requirements (Aker & Mbiti, 2010). Hockly (2018) added that microlearning platforms that offer short, targeted learning modules are especially suitable for informal workers. These platforms provide quick lessons on specific skills that can be immediately applied, enhancing job performance and productivity. Virtual simulations and video tutorials are essential for developing skills that require visual demonstration, including carpentry, plumbing, and electrical work (Traxler & Kukulska-Hulme, 2007).

ICTs, including smartphones and internet access, enable informal workers to access information on market prices, weather conditions, and best practices in their respective industries. This information can improve decision-making and increase productivity (Aker & Mbiti, 2010). Technology also facilitates better supply chain management and inventory control for informal businesses, reducing waste and improving efficiency (Qiang et al., 2011). Automation and digital tools can also streamline administrative tasks such as bookkeeping and tax filing, allowing informal businesses to operate more effectively and potentially transition to formality (Heeks, 2017). In addition, mobile applications facilitate the efficient management of appointments, deliveries, and customer feedback by informal businesses, thereby directly influencing customer satisfaction and productivity (Donner, 2007).

Financial technology (fintech) innovations, such as mobile money and digital payment systems, have significantly increased financial inclusion for informal sector workers. These technologies enable secure transactions, savings, and access to credit, which can support business growth and resilience (Jack & Suri, 2011). Besides that, these services offer a secure and efficient means of transferring money, saving, and accessing credit, which are crucial for business operations (Donovan, 2012). Financial inclusion through mobile money reduces the reliance on cash transactions, lowers transaction costs, and enhances the ability of informal workers to invest in their businesses, indirectly improving business productivity by reducing the necessity for physical travel, lowering transaction costs, and providing a secure method of saving money (Suri & Jack, 2016). Digital credit platforms provide small-scale loans to informal workers who typically do not have access to traditional banking services. This access to capital is crucial for expanding business operations and improving efficiency (Galbraith, 2017).

In conclusion, technology significantly impacts the informal sector, offering opportunities for market access, productivity improvements, and new employment forms such as gig employment. In the next part, we will discuss the intersections between the informal sector and the gig economy due to the impact of technological progress.

3. Intersections Between the Informal Sector and the Gig Economy

The gig economy and the informal sector are two dynamic components of the global labor market. While the informal sector has long been a feature of economies, particularly in developing countries, the rise of the gig economy has introduced new dimensions to informal employment. This section aims to synthesize existing research on the relationship between the informal sector and the gig economy, exploring how these two sectors interact and the implications for workers and economic development.

Informality is still relevant today because of the widespread and increasing incidence of various forms of informality. Compared to the past, informal workers nowadays are associated with individuals in the informal sector, such as traditional street vendors or home-based workers, and contract or gig workers hired by formal businesses (Sazali & Gen, 2019). The altering nature of work was recognized at the 2018 International Conference of Labour Statisticians (ICLS), which recommended a new classification to reflect the blurring lines between formal and informal employment. For example, there is a distinction between self-employed or entrepreneurs and contract workers in the case of platform workers such as e-hailing drivers and p-hailing riders. In general, the informal sector encompasses economic activities that are not subject to formal business regulation or taxation and are not monitored by the government. Workers in this sector usually do not have secure employment contracts, legal rights, or social protections. Both sectors involve flexible, non-traditional employment forms. However, the gig economy is often mediated through digital platforms, differentiating it from the broader informal sector, which might not utilize digital means.

According to Heeks (2017), the International Labour Organization (ILO) recognizes gig workers as a vulnerable labor market sector because of the chronic precariousness and structural inequities caused by informal employment. In brief, the gig economy comprises short-term contracts or freelance work instead of permanent jobs, facilitated mainly through digital platforms. De Stefano (2016) considered "crowd work", which refers to working activities including the completion of several tasks via online platforms and "work-on-demand visa applications". The work is accomplished through apps managed by businesses, examples of work that can be performed in the gig economy. This sector is characterized by on-demand work that provides flexibility but lacks traditional employment protections. Most gig workers combine multiple tiny "gigs" to make a living since they have to compete with many other workers for jobs, which further worsens their sense of exclusion (Tran & Sokas, 2017). Gig employment may be well-paid and safe. Nevertheless, both sectors experience income instability compared to formal employment due to the transient nature of job opportunities and the absence of employment benefits.

Work processes have been transformed due to the growth of business models based on smart platforms in the digital era (Scuotto et al., 2020). There is a gap in the global landscape in which this phenomenon cannot be conceptually described and statistically assessed uniformly to produce a comparable metric across nations. According to Messenger (2018), gig workers are typically independent, geographically dispersed, and in direct competition with each other. Hence, they are frequently categorized as independent contractors. Gig employment is often performed on a task- or event-by-task basis, and it has a more significant presence in online and offline platforms for labor (De Stefano, 2018). The on-demand labor force prefers non-traditional employment, which promotes the flexibility of both income and working hours (Gleim et al., 2019). Similarly, the digital economy environment enables the gig economy's growth and a peer-to-peer design to increase information sharing and social decision-making processes (Kaine & Josserand, 2019).

According to MacDonald and Giazitzoglu (2019), the gig economy may bring about new economic gains but also give rise to new economic challenges. Ravenelle (2019) says that platforms for the gig economy can be seen as a "psychological contract violation" for workers and a barrier to the spread of individual loci of knowledge, which makes jobs less secure and lower-quality entrepreneurial activities more common. On the other hand, Burtch et al. (2018) say that platforms for the gig economy reduce the number of low-quality

entrepreneurial activities since they choose only the most solid business ideas. Because of this, it is now widely acknowledged that the gig economy is a new employment structure brought about by the rise of new technology (Gleim et al., 2019; Maalaoui et al., 2020).

To sum up, digital platforms offer access to a broader range of jobs and clients, potentially increasing earnings and reducing the dependence on local markets (Heeks, 2017). The gig economy and the informal sector offer flexibility and autonomy in work. This flexibility can benefit workers with caregiving responsibilities or those seeking to supplement their income. However, this often comes at the cost of job security and stability (Graham et al., 2017). The gig economy can facilitate skill development and entrepreneurial activities within the informal sector. Platforms like Upwork and Fiverr allow workers to market their skills globally, build their portfolios, and gain experience in various fields (Donovan et al., 2016). Therefore, the gig economy can provide new income-generating opportunities for workers in the informal sector.

4. Challenges and Risks

While technology can create jobs, it can also lead to job displacement and exacerbate inequality. Automation and digitalization may replace certain types of informal work, leading to unemployment and income loss for low-skilled workers (ILO, 2018). The benefits of technology are often unevenly distributed, with those lacking digital literacy or access to technology being left behind (Graham et al., 2019). The digital divide remains a significant challenge, particularly in developing countries. Limited access to technology and the Internet can prevent informal sector workers from fully benefiting from technological advancements. Therefore, cost, infrastructure, and digital literacy contribute to this divide (World Development Report, 2016).

While the gig economy can offer pathways for economic mobility for informal sector workers by providing access to higher-paying gigs and opportunities for skill development, the lack of stability and benefits can limit long-term economic advancement (Farrell et al., 2018). The gig economy can exacerbate income inequality, as workers with higher skills and better access to technology are more likely to secure well-paying gigs, while lower-skilled workers may struggle to find sufficient work (Schwellnus et al., 2019). The informal nature of gig work often means that workers do not have access to social protection and security such as health insurance, retirement benefits, or unemployment insurance. The absence of these benefits also places a greater burden on public resources, potentially increasing the costs to society in the long term. This lack of social safety nets can increase vulnerability and poverty (Berg, 2015).

One of the primary challenges of the gig economy for informal sector workers is job insecurity. Gig work is often characterized by irregular income, lack of benefits, and minimal labor protections, which can exacerbate the vulnerabilities associated with informal work (Rosenblat & Stark, 2016). Digital platforms can create power imbalances between workers and employers, leading to potential exploitation. Gig workers may face issues such as low pay, unfair working conditions, and lack of bargaining power (Wood et al., 2019). The rapid growth of the gig economy has outpaced regulatory frameworks, leading to gaps in labor rights and protections for gig workers. This regulatory lag can leave informal sector workers without legal recourse in exploitation cases or unfair treatment (Codagnone et al., 2016). Gig workers may be misclassified as independent contractors rather than employees, leading to exploitation and denial of workers' rights and protections (Rosenblat & Stark, 2016).

The lack of stable, predictable employment can lead to economic uncertainty for workers, which may negatively impact consumer spending and hinder long-term economic planning (Kalleberg, 2011). These effects can be particularly pronounced during economic downturns, where gig jobs are often the first to be cut, exacerbating economic instability (Wood et al., 2019). This issue can perpetuate the vulnerabilities associated with informal work. Therefore, the rapid pace of technological change poses challenges for regulation and policy. Governments often struggle to keep up with the innovations in the informal sector, leading to gaps in protection and oversight (Heeks, 2017).

Besides that, the informal nature of gig work also complicates taxation and regulation, often leading to lower tax revenues than traditional employment sectors. Tax authorities struggle with enforcement, as tracking income generated through these platforms can be elusive due to the lack of formal reporting mechanisms and

the use of third-party payment processors (Smith, 2016). Many gig workers are either unaware of their tax obligations or deliberately evade taxes due to the perceived transience of their jobs (Oei & Ring, 2017). This loss of revenue can affect public investment in infrastructure, education, and health, which are critical for sustainable economic growth (Schwellnus et al., 2019). The evasion of income taxes and related contributions affects the ability of governments to fund essential public services and infrastructure, which are crucial for long-term economic growth (Auerbach & Hassett, 2015). The lack of clear regulatory frameworks can hinder the sector's development and contribute to market inefficiencies (Prassl & Risak, 2015). Thus, the decentralized and informal nature of gig work complicates tax compliance.

Even though technology can boost productivity, generate employment opportunities, and advance financial inclusion in the informal sector, it also poses substantial threats, such as the displacement of jobs, inequality, unfair treatment of workers, and loss of tax revenue.

5. Implications for Policy and Future Research

The gig economy, characterized by flexible, on-demand work facilitated through digital platforms, offers significant potential to formalize aspects of the informal sector. There are several ways in which the gig economy can contribute to this formalization process, such as improved tracking and documentation and access to financial services. Typically, gig economy platforms require participants to register and log their activities digitally. This process generates a record of their work history and earnings, creating a verifiable digital footprint often lacking in traditional informal work settings. By partnering with gig economy platforms, governments can facilitate formalization efforts. These partnerships could focus on ensuring that platforms operate within legal frameworks, contribute to tax collections, and provide necessary data to local authorities to help in policymaking and planning.

Policies should also ensure that technological advancements are inclusive and beneficial for all informal sector workers. This includes promoting access to technology, digital literacy, and financial inclusion. Many gig platforms offer training to their workers to ensure quality service. This training helps workers develop professional skills that can elevate their employability and transition them into more formal roles within or outside the gig economy. Some platforms provide certifications for completed training, which can be recognized by other employers and institutions, further integrating workers into the formal economy. Governments can invest in education and training programs to support workers transitioning from the informal to the formal gig economy. These programs would focus on digital literacy, rights awareness, and specific skills training to increase the employability and productivity of workers within the gig economy.

In addition, governments should develop regulatory frameworks that protect informal workers from exploitation and ensure fair treatment. This includes addressing issues such as job security, benefits, and labor rights. While the gig economy presents opportunities for formalization, it also poses challenges such as job insecurity and potential exploitation. Therefore, policy interventions are crucial to ensure that the transition from informal to formal work within the gig economy is beneficial, sustainable, and inclusive. Governments can use data and insights from gig economy platforms to craft policies that better meet the needs of flexible and informal workers, ensuring they receive legal protections and benefits. By leveraging technology, regulatory reforms, and strategic partnerships, the gig economy can play a transformative role in reducing informality and integrating more workers into the formal economy, ultimately contributing to broader economic development and stability.

Future research should adopt an intersectional approach, considering how factors such as gender, age, and ethnicity intersect with technology and informality because different countries might develop and experience different factors and impacts of informality. This can provide a more comprehensive understanding of the impacts of technology on the informal sector.

Conclusion
The relationship between the informal sector and technology is complex and multifaceted, influenced by various conceptual approaches. While technology has the potential to enhance productivity, create jobs, and promote financial inclusion in the informal sector, it also presents significant risks, including job displacement,

inequality, and exploitation.

The gig economy can serve as a stepping stone for some workers in the informal sector. By providing opportunities for income generation, skill development, and entrepreneurial endeavors, gig work can help individuals transition to more stable and formal employment. The digital nature of gig platforms can also facilitate greater access to economic opportunities for marginalized groups. Conversely, for many workers in the informal sector, the gig economy can be a trap that perpetuates their vulnerabilities. The lack of job security, benefits, and protections can leave gig workers in a precarious position, struggling to make ends meet and vulnerable to exploitation. Moreover, the gig economy's flexibility can be illusory, as workers may have little control over their working conditions and earnings.

Other than that, creating supportive environments for technological adoption in the informal sector can help maximize its benefits. This includes providing infrastructure, training, and resources for informal workers. Policymakers and stakeholders must navigate these dynamics carefully, ensuring that technological advancements are inclusive and beneficial for all informal sector workers. Future research should continue to explore technology's diverse and context-specific impacts on the informal sector, address existing gaps, provide insights that can inform effective policies and interventions, and offer deeper insights into the long-term and diverse impacts of the gig economy on the informal sector.

Abstract: The study aims to identify and analyze the reason for the project delay in ABC Company located in the heart of Malaysia specializing in oil and gas and oil and gas-related products. The study utilized observation techniques and data from an official report. The observation was done on an ongoing project and the assessment of record was done on previously completed projects. The outcome of such observation was analysed and simplified using a tool namely the Cause and Effect Diagram or Fishbone Diagram. The study found that shortage of manpower, local authority approval, improper planning, and the COVID-19 pandemic as the root causes that led to project delay.

Keywords: *Fishbone diagram, cause and effect diagram, project delay, project management, root causes of delay*

1. Introduction

General project planning, coordination, and control from beginning to end are all included in the definition of construction project management, which also embraces innovation, growth, and modification in operational activities (Al Jashaami, 2021). Its goal is to satisfy the client's requirements by producing a physically usable construction project, finished within the project's allotted time, and compliant with established costing, quality, and standards (Romzi & Doh, 2022, Khahro & Memon, 2018). Construction delays cost money, therefore completing projects on schedule benefits both the project and the construction crew. Along with cost and quality, project scheduling is commonly acknowledged as a critical element of the construction management life cycle and one of the criteria that determines a project's success (Hamzah et al., 2011). Despite its significance, project delays affect most construction projects (in both developed and developing countries), which is a serious issue (Tariq & Shujaa Safdar Gardezi, 2022). Thus, this paper's goal is to pinpoint the different reasons behind project delays and recommend preventative measures that should be taken. Another way to describe construction delays is when a project is completed after its scheduled completion date (Yap et al., 2021). Researchers have examined construction delays in a variety of ways. While other research clarified the numerous approaches to mitigate it, some studies explored the various reasons for delay in various parts of the world and various project formats (Khahro & Memon, 2018).

Hamzah et al. (2011) outlined the main reasons behind project delays in Malaysia's construction sector. These include subpar site management, poor planning, a lack of labor, insufficient client financing and payments for finished work, issues with subcontractors, insufficient contractor experience, a shortage of materials, the availability and malfunction of construction equipment, a breakdown in communication between parties, and mistakes made during the building stage. Likewise, Ansari et al (2019) determined the main reasons for building project delays in Saudi Arabia, a questionnaire survey was done. Lack of funding to complete the job and red tape were found to be the two main factors contributing to project delays. In Pakistan, Wahdan, Abu Yousef, and Farid (2019) conducted a similar analysis, and the following conclusions were deemed to be the most significant: problems with finances and payments, poor planning, a natural disaster, bad site management, a shortage of supplies and equipment, and contractors with insufficient experience. Conversely, there have also been delays in construction projects due to the COVID-19 pandemic. A few of the projects are getting postponed and terminated (Romzi & Doh, 2022). Similarly, Gara et al. (2022) said that projects are suspended, and delays are unavoidable due to lockdowns and restriction controls in the majority of countries. Due to the requirement for construction workers to maintain social distancing to prevent viral illnesses, production will also be restricted (Yin et al., 2022).

2. Literature Review

Project delay
One of the main issues that project managers frequently face is delay. Delays in construction projects usually have negative consequences for the parties involved (Serrador & Turner, 2015). Additionally, it's believed that the consequences of construction delays are what follows when a project's delays have unclear causes (de Almeida et al., 2021). These outcomes usually have a significant impact on a project's end (Nabilla et al., n.d.).

A delay can be defined as a time overrun or extension of time to complete the project (Shah Ali et al., n.d.). It is impossible to completely prevent construction delays, particularly when they are caused by events outside of our control. As a result, a delay occurs when a construction project's actual progress lags its anticipated timeline or when it is completed later than expected. Delays can occur for a variety of reasons and events (Al-Mohammad & Jamaludin, 2018a).

Delays can be frustrating and costly (Ren et al., 2008). There are several reasons why projects veer off course and miss their deadlines. Therefore, before beginning to address the delays, managers and the project management team must comprehend the reasons behind project delays.
For this study, the authors identified four common causes that can be applied to the company's project:

Manpower: Some can focus on a task for longer than necessary. Alternatively, they might lack knowledge and expertise (Al-Mohammad & Jamaludin, 2018b).
Planning: The dynamic nature of a project creates flexible planning that requires some alterations. Time is always the arch enemies of a project manager especially in the distribution of tasks (Agyekum-Mensah & Knight, 2017).
Third-party factors: Most projects include outside parties, and although these parties typically don't have complete knowledge of your objectives, strategies, or crucial project milestones at this point, they are often the ones who hold the key to making the project happen. They do not participate in discussions that happen in your team (Nabilla et al., n.d.).
Unforeseen circumstances: Natural catastrophes or weather-related interruptions might occur at any time. They could put your project behind schedule. Do not forget the political and investment environment as well (Yin et al., 2022a).

3. Methodology

Data Collection
Research data is the collection of data that has been condensed into a narrative and is then interpreted to yield insights. It makes sense that the data analysis method helps to divide large amounts of data into more manageable chunks (de Almeida et al., 2021). Three key processes occur during the data analysis process: data organization, summarization, and categorization, which together make up the second best-known technique for data reduction. It facilitates the identification and connecting of data by assisting in the discovery of patterns and themes. Data analysis is the third and final method that researchers use. They can perform it both top-down and bottom-up (Ren et al., 2008). This study focuses on 20 completed projects and 5 ongoing projects that have been marked delayed ranging from 2019-2021. The policy of the company stated that project delivery that exceeds 30 days of projected progress will be marked as late, and thus considered delayed. The reason behind the delay is reported in the project progress report and classified into common causes of project delay.

Cause and Effect Diagram
When problems develop and their underlying causes are identified, the Ishikawa diagram also called the Fishbone diagram, is a visual aid that may be utilized in any kind of work to help with the mental organization and processing of concepts, points of view, and conclusions (Liliana, 2016). The aforementioned chart serves as a useful tool for the rational and methodical analysis of the causes and sub-causes of specific issues or impacts that impact a certain activity, irrespective of its nature (Satya, 2016). Ishikawa diagrams, also known as fishbone diagrams, herringbone diagrams, cause-and-effect diagrams, or Fishikawa, are causal diagrams that illustrate the reasons behind a particular event that were made by Kaoru Ishikawa in 1968. The Ishikawa diagram is often used to identify the sources of an overall effect in product design and quality fault avoidance. Every imperfection's cause or source offers diversity. To discover these sources of variance, causes are typically

divided into broad groups. For this study, the data is further analyzed to find the root causes of project delay to fulfill the objective of the study.

4. Findings

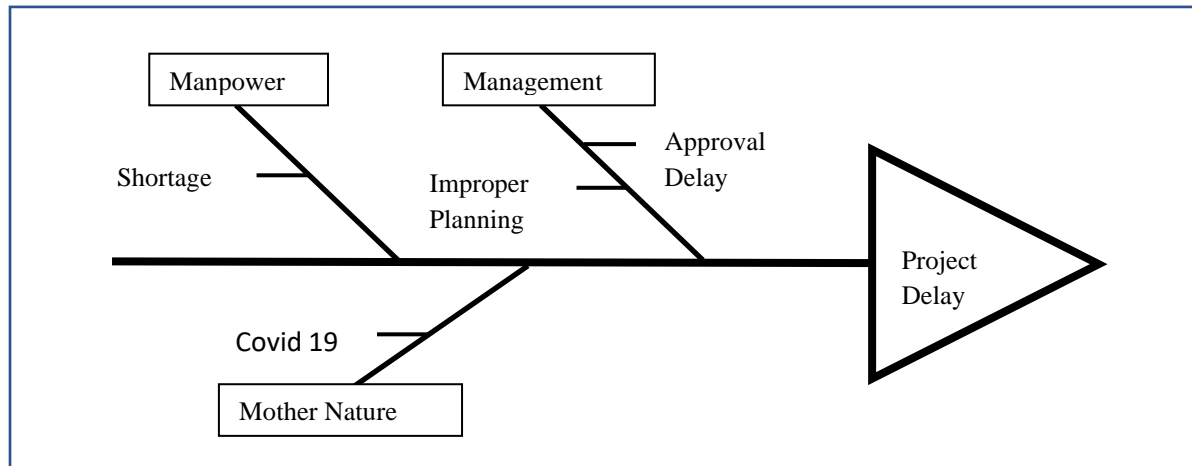
Table 1, presents a list of 25 ABC Company projects from 2019 to 2021 that had a marked delay, indicating that the project was not completed on the anticipated or contractually required date.

Table 1: Project Delay and Causes for Company ABC

Types of projects	No of delays	Cause of delay	Causes frequency
Distribution Pipe Replacement	11 times	1. Approval from the local authority for digging and road closure	5 times
		2. Delayed work tender and authorization	3 times
		3. Different project scopes issued	2 times
		4. Late progress report submission	1 time
Valve and sensor replacement	7 times	1. Delayed work tender and authorization	4 times
		2. Incorrect product specification	2 times
		3. Late progress report submission	1 time
Leakage and pipe pressure maintenance	5 times	1. Shortage of vendor's manpower	2 times
		2. Lockdown	2 times
		3. Approval from local authority	1 time
Distribution Pump replacement	2 times	1. Product delivery delayed due to lockdown	2 times

An analysis of the causes of delays is performed so that this matter can be monitored more effectively and help the Project Control Team make more accurate forecasts so that the project can be delivered on time.

Root causes of delay
A further investigation was made to determine the real reason that triggered the cause of delay. The information is analyzed from various records on the projects that have been marked delayed. The researcher examines all the records accessible to establish the root causes for the delay. The process of determining the underlying reasons for unfavorable occurrences and preventing them from recurring in the future is known as root cause analysis (Yap et al., 2021). The root cause is the most profound underlying reason (or causes) for any process's positive or negative symptoms that, if addressed, would result in the elimination or considerable decrease of the symptom (Hamzah et al., 2011). We have to dig the deepest to uncover most of the roots. Often, they are not the closest, most evident, or most direct reasons. They usually exist i). The structure at three, four, or five layers deep (Ansari et al., 2019). The root causes are then recategorized into a proper group and summarized using Fishbone diagrams shown in Figure 1.

Figure 1: Fishbone diagram of root causes for project delay


Shortage of Manpower
Due to the labor-intensive nature of the construction sector, a labor shortage directly affects project performance (Mohd-Rahim et al., 2016). Many managers and supervisors mistakenly believe that a worker's size and degree of performance on the job are inversely related. Work commitments are making up a larger portion of the workload, which is typical in many organizations these days. Workload inside an organization rises when employees perform and finish more tasks than is expected of them. A staffing shortage causes an organization to have more work and less supervision.

The company won about 600 projects from 2019 to 2021. One project engineer is expected to manage 10 projects each year with the help of a team of project engineers that has roughly 20 members. Since all projects take a very long time to finish, this is seen as being quite taxing on the personnel. This problem is exacerbated by the fact that several projects that were awarded in 2021 were postponed until 2022 due to unanticipated circumstances, such as obtaining municipal approval, and were not completed in that year. The problems get worse when the team, which usually has 5 to 7 people, is reduced to 3 or 5 because there is an increase in projects during certain times. Due to the labor-intensive nature of the construction sector, a labor shortage directly affects project performance (Głuszak & Lešniak, 2015). Referring to Table 1, when the client side is experiencing a labor shortage, the situation sometimes becomes beyond the company's control. Even though it has only happened once, it is important to pay attention to the problems to reduce the likelihood that they may return at a later date.

Local Authority Approval Delay
Delays in obtaining authority approval have become a major issue for the management of the company. The COVID-19 viral pandemic is currently affecting the entire planet, which is making this issue worse and out of control. This has a big effect on how well all of the company's initiatives perform. Routine approval has taken a little bit more time thus contributing to the overall performance of the company's projects. While the number of occurrences is considered small, projects have a critical impact on the profit and the company's image which are the two most important elements of sustainability (Azli Mohd-Rahim et al., 2016). The table below compares the time taken takes to obtain each type of approval from the local authority as of October 2021.

Table 2: Forecasted and actual period of acquiring approval from local authorities

Type of Approval	Forecast Duration	Actual Duration
Minor Work Permit	Min: 56 days	Min: 20 days
	Max: 70 days	Max: 156 days
Building Layout	Min: 70 days	Min: 31 days
	Max: 140 days	Max: 180 days
Approval to Plan and Design Layout for Building	Min: 117 days	Min: 88 days
	Max: 140 days	Max: 172 days

From table 2, it displays the anticipated and actual length of the local authorities' approval process. The number of working days needed to process the approval guidance and release from the local government is used as the minimum projected duration. However, it will take less time to approve a project if it has already been approved in the past. A small percentage of projects are new and take longer than expected, increasing the number of working days needed for approval and approving a small number of projects after the allotted number of working days has passed. The project management team must find a solution so that the delay in getting authority approval to carry out the project cannot negatively impact the project and does not become a recurring issue in project management, even though it is impossible to control the delay in getting authority approval to carry out the project. This is because project management success is measured in terms of three main objectives: time, cost, and technical results (Haseeb et al., 2011). Failure to plan the correct time for project completion forecasting will hurt an organization's performance, particularly in organizations whose operational nature is project management (Głuszak & Lešniak, 2015).

Improper Planning

The manner the company's project managers conducted themselves demonstrates this problem. It may be challenging for them to spend time working in the office and interacting with other teams since they have too many projects to manage. They routinely visit the job site to keep an eye on their projects, based on observation. As a result, they had little opportunity to establish more effective communication, and these chances were lost. There may be four to five projects operating concurrently for a project manager over four to six months. Sometimes a more important project will receive considerably more attention, which causes errors and delays for other initiatives. This can be seen from Table 1 where 11 projects were delayed due to different product specifications, late submission of progress reports, and delayed work tender progress. Time is essentially critical for success in project management and the burden on the one in charge may help to jeopardize the issue (Mofleh, 2021).

Additionally, some of them must go a great distance from the Kuala Lumpur office because the company's project encompasses the entirety of Malaysia. Project managers should step in at this point to keep the executive engineers and site supervisors motivated to complete their work. The team's assignments were made according to first come, first served, which required some employees to go to other states two or three times each week when it might have been given to someone already overseeing the project in that area to cut down on travel time and eventually decrease costs. The majority of the projects were unexpected, therefore without appropriate preparation, their job may not be productive, and their current workload may cause them stress. This is also being commented on by (Haseeb et al., 2011) which essentially emphasizes that planning is essential for a business that manages multiple tasks at once. They must consider the complexity of the execution, not just the project's scope but also the associated activities.

Covid19 Pandemic

The COVID-19 pandemic has affected all sectors of society, sparing no one and permanently altering how we live, interact, and work (Gara et al., 2022). While some of us now work from home or telecommute, others have lost their jobs and faced protracted layoffs. In one way or another, we have all felt the devastating impact of businesses collapsing because of unstable economic conditions. For project managers, COVID-19's consequences on operations have been catastrophic. Reliance on remote work has hampered the collaborative tactics that are commonly employed in a traditional team setting (Haas & Markovič, 2021). Lockdowns and border closures have significantly interrupted supply chains, while project management and corporate operations have become riskier (Alenezi, 2020).

Due to two key factors, the Covid-19 lockout has had a significant negative impact on the business. The project that was started has been suspended, which is the first factor. This indicates that all processes were put on pause and all actions ceased, regardless of the project's stage. The failure to finish the projects also shows that project delivery and progress payment are inevitable. This will influence both the contractor and the project owner. Due to lockdowns, all projects were at a standstill making the supply chain of the network completely halted (Yin et al., 2022b). The second reason is the suspension of all incoming projects. Contractors and clients are waiting to see how long the lockdown will last because of this uncertainty (Gara et al., 2022). Even though the organization only had a few active projects at the time, losing a future project is still considered a missed opportunity. The impact was not only felt during the lockdown; when it was lifted and normal operations resumed, problems including a lack of face masks or other facial coverings caused further delays. The completion date has been delayed due to material shortages for the projects and the affected border control strategy.

5. Conclusion and Implications of the study

Determining the root causes of project delays has profound implications for both companies and nations. For companies, addressing these causes is crucial for mitigating financial impacts such as increased costs and penalties that arise from extended timelines. By identifying inefficiencies and systemic issues, companies can streamline operations, enhance productivity, and improve resource allocation, ultimately boosting profitability and operational efficiency. Additionally, understanding the root causes helps safeguard a company's reputation, as persistent delays can damage client trust and stakeholder relationships (Yin et al., 2022b). Improved project management practices foster better employee morale by reducing the stress associated with

delays, which in turn enhances overall productivity. Furthermore, a thorough analysis of delays strengthens risk management strategies, helping companies anticipate and mitigate future risks more effectively.

On a national level, project delays can significantly impede economic growth, particularly when they involve critical infrastructure or development projects. Efficient project execution is vital for supporting economic activities and enhancing national competitiveness. Delays in public projects, such as those related to transportation or healthcare, can negatively affect the quality of essential services and infrastructure, impacting public well-being. By resolving the root causes of these delays, nations can ensure the timely delivery of crucial projects and improve the overall investment climate, attracting both domestic and international investors. Moreover, addressing delays reflects positively on government efficiency and governance, leading to better public sector performance and contributing to strategic development goals (Głuszak & Lešniak, 2015). In essence, tackling project delays helps both companies and nations achieve their objectives more effectively, fostering overall progress and development.

Conclusion
According to the report, there are four main reasons why projects are delayed for the company: a lack of labor, a delay in receiving approval from the local government, poor planning, and the COVID-19 pandemic. According to the data above, delays could happen frequently in every construction project and turn into the most frequent problems that have detrimental effects on the organization and its participants. A construction limitation will have an impact on the three main project components of cost, scope of work, and time, which will result in a low productivity rate. To assist the teams in completing a project successfully, the project management process includes the monitoring and controlling phases. This study also effectively showed that, even if management faced the issue of uncontrollable delays, the source of the delays could still be determined from the management side of the organization itself. As a result, it should not be left to management to inquire about uncontrollable concerns. A major and well-known corporation needs improvement measures badly if it wants to increase performance. This can benefit the business's reputation, enable it to continue to be competitive in its job, and serve as an example for consultants and contractors.

Abstract: The market value of a brand is reflected by brand equity. It signals consumers' recognition and preferability toward certain brands. In a highly competitive market, brand equity becomes crucial as it can lead to customer loyalty and product resilience. Strong brand equity helps a company to stand out among competitors and can significantly influence financial performance by driving higher sales volume and profitability. As more Malaysians shift their lifestyles and become more health-conscious after the COVID-19 pandemic, the demand in the healthcare market has expanded massively. By focusing on the healthcare market, especially on dietetics and nutrition consultation services, this paper seeks to evaluate how brand equity influences consumers' intention in making purchases. Four dimensions of brand equity will be investigated, consisting of perceived quality, brand awareness, brand association and brand image. A total of 194 data were collected using the convenience sampling method in the Subang Jaya region, Malaysia. The findings of this study showed that perceived quality, brand awareness, and brand association have a positive significant impact on purchase intention for dietetics and nutrition consultation services while brand image was found to be insignificantly influencing purchase intention. This provides insight and implications for the dietetics and nutrition consultation services market and practitioners, especially in formulating their marketing strategies.

Keywords: *Brand equity, Purchase intention, Dietetics, Nutrition consultation services, Healthcare market, Marketing strategies*

1. Introduction

In a highly competitive market, brand equity becomes a crucial differentiator for businesses. A company requires strong brand equity to retain customers. How consumers perceive a brand, put trust in its quality and have higher preferability towards one brand over another are significant factors in business. A product with higher recognition has a higher value in the market. It will give a company a significant advantage as it could intensify its financial performance, especially in terms of sales volume, profitability and market share. Building and maintaining brand equity is crucial for long-term success and competitive advantage in the marketplace (Kellar & Lehmann, 2009; Sohaib et al., 2022; Shi, 2022). Brand equity is often regarded as an essential element in shaping a consumer's inclination towards a specific brand, hence influencing their purchasing decisions. A robust brand possessing substantial brand equity has several advantages, such as enhanced profitability, the possibility for brand expansion, effective communication, increased consumer preferences, and heightened purchase intentions (Le-Hoang et al., 2020).

As Malaysians become more health conscious, the market for healthcare and wellness products is growing at a rapid pace in this country. According to The Sun (2023), due to the Covid-19 pandemic, 79% of Malaysians have become more aware of their health. While FurleyBio (2023) reported that the retail sales for vitamins and dietary supplements in the Malaysian market have increased substantially from RM940.4 million in 2005 to RM7.481 billion in 2022. As more and more people embrace a proactive approach to their well-being, shifting their lifestyle to be more active and healthier, and seeking more dietetics and nutrition consultation services, the industry continues to respond with diverse healthcare product offerings. With more industry players, the market competition will be bigger. When it comes to healthcare products, a well-established brand will likely be more trusted by consumers particularly one that they can assure of its safety, effectiveness, and reliability.

Henceforth, brand equity plays a crucial role in enhancing a product's market value. Strong brand equity helps a brand to establish trust and assurance among consumers. There is no research on the dietetics and nutrition consultation services industry from the aspect of consumers' purchase intention in Malaysia. The findings from

this paper would be beneficial for the industry players and healthcare marketers to understand the market better and to assist them in formulating marketing strategies to strengthen their brand equity and product recognition. To achieve this objective, this paper seeks to evaluate how brand equity influences consumers' intention in making purchases for dietetics and nutrition consultation services. Four dimensions of brand equity will be investigated consisting of perceived quality, brand awareness, brand association and brand image.

2. Literature Review

Brand Equity and Purchase Intention

Mat et al. (2020) defined purchase intention as the extent of customer's willingness to spend their money to buy goods and services which depends on internal and external factors. One of the factors that gained interest from many scholars is brand equity. In marketing, brand equity is an important concept that reflects how consumers perceive the values of goods or services. It is the recognition that a brand gains due to its market worth (Rungsrisawat & Sirinapatpokin, 2019). Previous studies showed brand equity has a strong influence over purchase intention (Rizwan et al., 2021; Senthilnathan & Tharmi, 2012; Ashil & Sinha, 2004). However, brand equity does not only relate to how consumers think, feel and act towards a brand. Scholarly articles also emphasize how brand equity brings both tangible and intangible benefits to a company, along with consumer loyalty, product pricing, profitability and market share (Mikul & Mittar, 2023; Wood, 2000; Foroudi et al., 2018; Jeon, 2017). Various dimensions of brand equity have been studied by past researchers. Through comprehensive literature reviews, Shariq (2018) has identified 11 essential dimensions of brand equity. The 11 brand equity dimensions highlighted were 1. Quality 2.Associations 3. Loyalty 4. Awareness 5.Image 6.Personality 7.Attitude 8. Trust 9. Satisfaction 10.Esteem 11.Attachment. However, the significant impact of the dimensions varies among different studies.

Brand Association

Brand association is connected to brand equity because it improves the understanding and awareness of a brand (Rungsrisawat & Sirinapatpokin, 2019). According to Chakraborty (2019), brand association describes how consumers view their connections with a brand. It includes any information that consumers think of when they hear or see a brand name based on their experiences, knowledge and interactions with the brand. Brand association becomes important in marketing because consumers are inclined to choose brand names that they associate with positive product features and attributes. Rizwan et al. (2021) stated that if consumers associate a health brand with being natural and effective, they are more likely to purchase products from that brand, believing the products will be beneficial for their health. Lee et al. (2019) also found a positive link between brand association and purchase intention. However, customers' association with a brand can only be developed once they are aware of the brand (Dada, 2021).

Brand Awareness

Brand awareness indicates the extent to which individuals become aware and familiar with certain brand names (Ramadhan et al., 2020; Chakraborty, 2019). It happens when consumers recognize and can remember a specific name of a product or service. Brand awareness is related to purchase intention as it conveys significant information about a brand in a customer's perception. Customers exclusively purchase brand names that are familiar to them, and they are only familiar with brands that they perceive as being of high quality (Rizwan et al., 2021). Advertising or promotional strategies are often used in the market to distinctly create a positive image of the brand in the minds of consumers. According to Nurhayati and Hendar (2020), brand awareness assists customers in purchase decision-making, especially when they are having difficulty in deciding to buy products or services that offer a similar quality. Rahmi et al. (2021) and Supiyandi et al. (2022) found a positive influence between brand awareness and purchase intention where a higher purchase intention can be influenced by a higher brand awareness. However, Azzari and Pelissari (2020) found that brand awareness alone does not directly affect purchase intention, instead, its impact becomes significant only when mediated by three other brand equity dimensions: associations, loyalty and perceived quality. They concluded that brand awareness is important as the initial step in creating brand value for consumers. In addition, Rizwan et al. (2021) found that brand awareness is positively related to purchase intention for health takaful products in the United Arab Emirates.

Brand Image
Brand image refers to a set of connections (Chi et al., 2020) and mental representations (Benhardy et al., 2020) that consumers have in their minds about certain brands. These were created by experiences and interactions consumers had with the brand (Kotler, 2001). Stronger favorable exposures that are retained in customer memory will create a stronger brand image and hence brand equity (Chi et al., 2020). Previous studies on the effect of brand image on purchase intention however showed mixed results. Pandey and Srivastana (2017) found that brand image contributed the highest value to the purchase intention of healthcare products where consumers considered it as the priority. Cuong (2022) also found a positive relationship between brand image buying decisions and rebuying intentions. However, Saputro and Setyaningrum (2023) indicated that brand image did not affect purchase decisions. The study highlighted the impact of brand image in influencing purchase decisions weakened in a pandemic situation as compared to other variables.

Perceived Quality
Perceived quality refers to a consumer's overall impression of a brand of goods or services that shows how effectively a brand meets customers' wants, expectations and requirements (Lee et al., 2019; Padhy & Sawlikar, 2018). Garrido-Morgado (2016) stresses that consumer's perception of product quality is a cognitive factor that influences their purchasing decisions, making them more likely to buy the product with superior characteristics. A highly perceived quality product enhances the perceived value of a brand, while a low perceived quality product can damage the reputation of a brand (Vera, 2015). In the healthcare industry, perceived quality is regarded as a crucial element of brand equity (Chahal & Baha, 2010). In fact it is the strongest factor that influences consumer's intention in making purchase decisions (Qiyu Yu, 2023; Lee et al., 2019). As consumers become more health-conscious, they seek products that not only promise efficacy but also deliver on quality.

Hypotheses of the study are developed as follows:
H1: Brand association has a positive effect on purchase intention for dietetics and nutrition consultation services.
H2: Brand awareness has a positive effect on purchase intention for dietetics and nutrition consultation services.
H3: Brand image has a positive effect on purchase intention for dietetics and nutrition consultation services.
H4: Perceived quality has a positive effect on purchase intention for dietetics and nutrition consultation services.

The research model of the study is presented in Figure 1 below. The four dimensions of brand equity examined are: brand association, brand awareness, brand image and perceived quality. These dimensions are the independent variables in this study. Whereas the purchase intention for dietetics and nutrition consultation services is the dependent variable.

3. Methodology

This is a quantitative cross-sectional study. Data was collected using the convenience sampling method through an online survey in the Subang Jaya region, Malaysia. The minimum sample size required of 119 was calculated using G*Power 3.1.9.7 (Faul et al., 2007) with an effect size of 0.15 and power of 0.95 for 3 predictors. A total of 194 respondents have participated in the data collection process. As the data were collected based on a single source, common method bias Kock and Lynn (2012), and Kock (2015) were assessed using the Full Collinearity test as shown in Table 1. As the VIF is less than 5 indicates single source bias is not a serious issue with our data.

Table 1: Full Collinearity Test

Variables	VIF
Brand association	3.301
Brand awareness	2.902
Brand image	3.804
Perceived quality	2.805
Purchase intention	2.634

Measurement items for constructs used in the questionnaire were adapted from previous studies. Five items to measure brand awareness were adapted from Rungsrisawat and Sirinapatpokin (2019) and Foroudi (2018); six items to measure perceived quality were adapted from Rungsrisawat and Sirinapatpokin (2019), Foroudi (2018) and Zhou (2021); four items to measure brand association were adapted from Rungsrisawat and Sirinapatpokin (2019), Pourazad (2019) and Karulkar (2021); seven items to measure dietetics purchase intention were adapted from Rungsrisawat and Sirinapatpokin (2019), Foroudi (2018) and Konuk (2018).

Data analysis was conducted by applying the Partial Least Square Structural Equation Modelling (PLS-SEM) technique. The PLS-SEM analysis consists of a measurement model and a structural model. The measurement model assesses reliability, convergent and discriminant validity, while the structural measurement tests the developed hypotheses.

The demographic characteristic analysis results are presented in Table 2. Approximately 60% of the respondents are female and a majority of them are within the age range of 18 to 30 years old. Almost 80% of them were from the B40 group. Half of the respondents work in the private sector.

Table 2: Demographic characteristic analysis

Variable	Frequency (n = 194)	Percent (%)
Gender		
Female	112	57.73%
Male	82	42.27%
Age		
18 to 30 years old	138	71.13%
31-40 years old	20	10.31%
41-50 years old	19	9.79%
51-60 years old	13	6.70%
61 years old and above	4	2.06%
Race		
Malay	159	81.96%
Chinese	17	8.76%
India	13	6.70%
Others	5	2.58%
Monthly Income		
Less than RM 4,849	152	78.35%

RM 4,850 - RM 10, 959	34	17.53%
RM 10,960 and above	8	4.12%
Occupation		
Government Sector	15	7.73%
Private Sector	106	54.64%
Self Employed	13	6.70%
Students	42	21.65%
Others	18	9.28%

4. Data Analysis

The PLS-SEM technique was used to assess the effects of brand awareness, perceived quality, brand association, and brand image on purchase intention for dietetics and nutrition consultation services. Normality test examined using WebPower power analysis, the multivariate Mardia's skewness (β = 5.987, p<0.001) and kurtosis (β = 48.037, p<0.001) indicating non-normality of data can be applied using PLS-SEM technique.

The measurement model analysis results of convergent validity of loadings, average extracted (AVE) and composite reliability (CR) are presented in Table 3. The outer loading values$\geq$, CR values $\geq$ 0.7 and AVE values $\geq$ 0.5 support the convergent validity.

Table 3: Measurement Model

Variable	Item	Loading	CR	AVE
Brand association	BAS1	0.829	0.914	0.727
	BAS2	0.874		
	BAS3	0.845		
	BAS4	0.862		
Brand awareness	BAW1	0.708	0.910	0.590
	BAW2	0.804		
	BAW3	0.82o		
	BAW4	0.781		
	BAW5	0.729		
	BAW6	0.748		
	BAW7	0.783		
Brand image	BI1	0.848	0.931	0.692
	BI2	0.818		
	BI3	0.851		
	BI4	0.799		
	BI5	0.827		
	BI6	0.846		
Perceived quality	PQ1	0.682	0.917	0.650
	PQ2	0.753		
	PQ3	0.869		
	PQ4	0.860		
	PQ5	0.880		
	PQ6	0.771		
Purchase intention	PI1	0.645	0.894	0.551
	PI2	0.644		
	PI3	0.599		

PI4	0.741
PI5	0.867
PI6	0.829
PI7	0.825

Furthermore, discriminant validity was measured using the Heterotrait-Monotrait ratio of correlations (HTMT) criterion (Henseler et al., 2015) and the HTMT values were greater than 0.85 (as shown in Table 4). The convergent and discriminant validity results indicate that measurement items are valid and reliable.

Table 4: HTMT Criterion

	Brand association	Brand awareness	Brand image	Perceived quality
Brand association				
Brand awareness	0.844			
Brand image	0.877	0.819		
Perceived quality	0.767	0.744	0.835	
Purchase intention	0.791	0.763	0.777	0.802

The structural model was assessed using a bootstrapping procedure with 10,000 re-samples (Ramayah et al., 2018) for path coefficients, t-values, p-values and confidence intervals. The results of the structural model are shown in Table 5.

Table 5: Hypothesis Testing

Hypothesis	Std. Beta	Std. Dev.	t-value	p-value	PCI LL	PCI UL	f^2
H1: Brand association -> Purchase intention	0.230	0.091	2.521	0.006	0.078	0.38	0.044
H2: Brand awareness -> Purchase intention	0.239	0.076	3.141	0.001	0.113	0.36	0.055
H3: Brand image -> Purchase intention	0.137	0.091	1.508	0.066	-0.008	0.288	0.013
H4: Perceived quality -> Purchase intention	0.277	0.101	2.745	0.003	0.112	0.445	0.078

The R^2 value of 0.620 indicates that 62% of the variation of purchase intention for dietetics and nutrition consultation services is explained by 4 predictors in the study. The path coefficient results shown in Table 5 indicate that brand association ($\beta = 0.230$, p< 0.01), brand awareness ($\beta = 0.239$, p< 0.01), and perceived quality ($\beta = 0.2773$, p< 0.01) were found to be positive, which significantly influences the purchase intention for dietetics and nutrition consultation service. Thus H1, H2 and H4 were supported.

The effect size of brand association, brand awareness and perceived quality on purchase intention were small. Hypothesis H3 was not supported, which concludes that brand image has an insignificant effect on purchase intention. The predictive relevance of the model is assessed using PLSpredict (Shmueli et al., 2019). As shown in Table 6, a majority of the items' PLS-SEM RMSE values were less than LM RMSE values, indicating the model has a moderate predictive power.

Table 6: PLS Predict

Item	PLS-SEM		LM	PLS-SEM - LM
	Q^2predict	RMSE	RMSE	RMSE
PI1	0.161	0.881	0.92	-0.039
PI2	0.202	0.841	0.88	-0.039
PI3	0.196	0.859	0.816	0.043
PI4	0.322	0.813	0.889	-0.076
PI5	0.445	0.781	0.82	-0.039
PI6	0.436	0.779	0.838	-0.059
PI7	0.461	0.746	0.779	-0.033

Discussion

Three brand equity dimensions (perceived quality, brand awareness and brand association) were found to have a positive significant impact on purchase intention for dietetics and nutrition consultation services. The results revealed similar findings to previous studies (Lee et al., 2019; Rahmi et al., 2021; Qiyu Yu, 2023; Supiyandi et al., 2022). The findings agreed with Qiyu Yu (2023) and Lee et al. (2019) where perceived quality has the most influential effect. However, brand image was found to be insignificant in purchase intention for dietetics and nutrition consultation services. The result aligned with Saputro and Setyaningrum (2023) but contradicted with studies from Pandey and Srivastana (2017) and Cuong (2022).

As perceived quality refers to consumers' subjective assessment of a brand's overall excellence, consumers often associate high-quality products with better health outcomes. In the healthcare industry, perceived quality is one of the important components of brand equity (Chahal & Baha, 2010). Health-conscious consumers are more likely to be attracted and will consider purchasing dietetics and nutrition consultation services from a brand that is perceived to offer superior quality. In terms of brand awareness, where consumers are familiar and can recall a specific brand name, the result showed brand awareness to positively affect purchase intention. In the context of health care, consumers seem to feel more comfortable choosing dietetics and nutrition consultation services that they are familiar with, which eventually influence their purchase decisions. As most studies show a positive influence of brand association on purchase intention, this study also found similar results for purchase intention on dietetics and nutrition consultation services. Products associated with positive health outcomes, safe, reliable, and trustworthy attract consumers and can positively sway their purchase decision.

The result indicated that brand image did not affect purchase intention for dietetics and nutrition consultation services. Therefore the third hypothesis was rejected. In the study conducted by Saputro and Setyaningrum (2023), they reasoned that brand image was insignificant to purchase intention due to the pandemic situation where consumers considered that it was not important as compared to other variables. In this study, where other dimensions of brand equity seem to have a stronger effect, consumers may prioritize tangible aspects (product quality, product safety, efficacy, reliability, positive health outcomes) more than intangible aspects (brand image) when making a purchase decision on health-related choices. Tangible product attributes (product quality, price) were found to have a positive effect on purchase decisions (Akpoyomare et. al, 2012; Chaerudin & Syarafudin, 2021). In addition, some demographic variables (gender, age, culture, health conditions) may lead to differences in the findings. Different consumer segments may yield different contributing factors influencing purchase intention on dietetics and nutrition consultation services.

5. Conclusion and Recommendations

This study explores the influence of four dimensions of brand equity towards purchase intention for dietetics and nutrition consultation services. As Malaysians become more health-conscious and embrace healthy lifestyles, the healthcare market has expanded tremendously. With a larger market and more competitors, it is important to differentiate one brand from another and to be preferable among competitors.

As brand equity portrays the value and strength of a brand in a market, strong brand equity can lead to greater customer retention and loyalty, higher perceived value, and easier introduction to new products. This can significantly impact a company's financial performance. Thus it is important to understand the dimensions of brand equity that influence dietetics and nutrition consultation services purchase intentions. The result revealed that perceived quality, brand awareness, and brand association significantly impact consumers' purchase intentions, while the brand image does not seem to have a significant influence. This shows that brand equity is highly influenced by how consumers perceive quality and preferability towards certain brands.

The findings provide insight and implications for the dietetics and nutrition consultation services market and practitioners in formulating their marketing strategies in Malaysia particularly. The absence of a significant relationship between brand image and purchase intention for dietetics and nutrition consultation services suggests that consumers prioritize tangible or functional product attributes (eg. quality, efficacy, safety) over intangible or emotional aspects (brand image). Healthcare marketers, therefore, should tailor their marketing strategies to emphasize the tangible benefits. The focus should be more on building trust, awareness, and positive associations that could instill confidence in consumers rather than brand image and perceptions through the three significant brand equity dimensions.

Healthcare practitioners could emphasize perceived quality by maintaining or improving product quality, safety and efficacy. This could be done by highlighting clinical trials, scientific evidence, certification, or endorsement from healthcare professionals to enhance credibility and reinforce the perception of high quality. They could boost brand awareness by doing educational content, social media campaigns, advertising, and signing partnerships with healthcare providers to disseminate information on the advantages or benefits of the brand. Healthcare marketers could also focus the marketing strategy by leveraging positive brand associations. Dietetics and nutrition consultation services must positively be associated with good health and well-being. Thus, highlighting natural ingredients, sustainability and ethical practices could enhance brand reputation. Special attention must also be given to aligning brands to positive health outcomes and prevention to boost brand association.

This study enriches the theoretical foundation and enhances our knowledge of changing consumer behavior in healthcare literature. However, the healthcare industry is unique and various dimensions of brand equity that affect purchase intentions could vary based on age, culture or health conditions. Given the limitations of this research, future studies could explore these nuances to refine marketing strategies in building product brand equity in the healthcare industry.

Abstract: This article examines the significance of human resource management (HRM) in innovation, organizational culture, and organizational effectiveness. The conceptual framework creation was supported by extracting information from literature research on related study topics, such as resource-based views and organizational effectiveness. This paper seeks to address the existing gap in the literature on organizational effectiveness by emphasizing the role of HRM in influencing business performance. Specifically, it focuses on the intermediate impact of HRM on innovation and culture. This research can help higher education institutions better understand how human resource policies can improve long-term performance by encouraging innovation and fostering an effective culture.

Keywords: *Organizational culture, innovation, effectiveness, HRM*

1. Introduction and background

In the current intricate and competitive job market, various elements influence an employee's choice to stay in their current vocation inside their organization. The factors that are most renowned for potentially influencing an employee's decision to remain with or go from a company are the economic environment, job satisfaction, managerial practices, organizational culture, and occupational commitment. However, this study primarily focuses on the strategic management of human resources to enhance employee innovation. In contemporary human resource management, it is necessary to synchronize organizational goals with the human resource strategy to guarantee coherence between personnel policies and management objectives. Consequently, the HR department should no longer be perceived as a mere extension of the company, but rather as a crucial component in guaranteeing the achievement of organizational objectives. The objectives of strategic management are to furnish the organization with a clear orientation and a sense of mission.

Organizational culture plays a critical role in bridging the gap between innovation and human resource management (HRM) in organizations. Here's how:

Culture as an Inhibitor or a Facilitator: Innovation may be encouraged or stifled by an organization's culture. Innovative ideas are more likely to be supported in a culture that values experimenting, taking risks, and open communication. On the other hand, a strict or risk-averse culture can hinder innovation and creativity. Harmony with the Innovation Approach: The organization's innovation goals and culture must coincide for innovation to flourish. This entails cultivating virtues like cooperation, adaptability, and never-ending learning. Developing HR Procedures: The organizational culture must be reflected in and supported by HRM procedures. For instance, if the culture values innovation, HR procedures should concentrate on finding, training, and keeping creative staff members.

Performance Management: Rather than focusing just on achieving short-term objectives, performance measures in an innovative culture may give precedence to creativity, teamwork, and the capacity to effect change. Empowerment and Autonomy: Employees' capacity for innovation can be improved in a workplace culture that grants them both empowerment and autonomy. HR can help with this by creating positions that promote creativity and by offering resources for skill improvement. Collaboration and Knowledge Sharing: Cross-functional innovation is more likely to occur in cultures that value cooperation and sharing of knowledge. HR may help with this by encouraging communities of practice and networks inside the company.

Training and Development: By offering chances for ongoing learning, HRM is essential to maintaining an innovative culture. Programs for developing creative thinking, problem-solving, and other innovative talents may fall under this category. Reward and Recognition: Employee incentives are in line with the company culture when creative conduct is

Acknowledged and rewarded, which reinforces the desired behaviors that foster innovation. Cultural Transformation: To foster innovation more effectively, a company may occasionally need to change its culture. HRM plays a critical role in managing this transition by bringing leadership together, involving staff members, and revamping procedures to fit the new culture. Employee Engagement: Increasing employee engagement through a strong, supportive culture can result in increased.

In the end, human resource management must be integrated into the overall plan to maximize staff utilization and provide organizations with better returns on investment, as indicated by ROI (Return on Investment) per unit of currency allotted to them. Organizations run the danger of not making the most use of their staff if the human resource management approach is not developed in this way. This is not a good sign for the success of the organization.

2 . Literature Review

Examining several academic research, theories, and viewpoints is part of a literature study on the subject of how organizational culture influences the relationship between innovation in organizations and human resource management (HRM). Important ideas, theoretical frameworks, and findings from empirical research will all be covered in this overview. The common attitudes, behaviors, and values that influence how people behave within an organization are referred to as its organizational culture. Schein & Schein (2019) posits that an organization's culture may be viewed as its "DNA," impacting every facet of its functioning, encompassing innovation and human resource management. Employee perceptions of their responsibilities, engagement levels, and readiness to innovate are shaped by this culture.

Organizational cultures that value transparency, adaptability, and a risk-taking attitude are said to be more innovative, according to several studies. Quinn and Cameron (2024), for example, emphasize the importance of an adaptable and flexible culture in promoting innovation, contending that these cultures inspire workers to try new things and welcome unconventional ideas. Obstacles to Innovation: Conversely, hierarchical or excessively efficiency-focused cultures might hinder innovation. According to Martins and Terblanche (2003), organizations with inflexible cultures that prioritize control and conformity tend to have lower levels of creativity and innovation. Management of Human Resources and Organizational Culture HRM as a Designer of Cultures:

HRM as a Cultural Architect: HRM is essential to establishing and preserving corporate culture. Ulrich et al (2007) suggest that HR strategies, including recruitment, training, and performance management, have a crucial role in fostering a culture of innovation. Alignment with Organizational Culture: Bowen and Ostroff's (2004) research emphasizes the significance of matching HR procedures to the culture of the company. They contend that HRM and an inventive culture work together to produce a synergistic effect that improves the organization's capacity for innovation as a whole. Mutual Reinforcement: There is a mutually reinforcing relationship between HRM, innovation, and corporate culture. Research by Damanpour and Schneider (2006) shows that HRM practices that foster innovation are incentivized by an innovation-supportive culture, resulting in a positive feedback loop.

HRM's Function in Innovation: Research such as that conducted by Sanders et al. (2018) has demonstrated the importance of particular HRM practices in creating an environment that is conducive to innovation, such as continuous learning and development. These procedures aid in fostering in workers the attitudes and abilities needed to create. Surveys and Case Studies: Through HRM, empirical research has shed light on how various organizational cultures impact innovation. For instance, Chang and Lee's 2017 study discovered that successful innovation was more common in companies with a strong culture of cooperation and knowledge sharing. In a similar vein, Chen and Huang (2009) showed that HR procedures emphasizing collaboration and employee

empowerment had a favorable effect on organizational creativity. Cross-Cultural Views: Research by Hofstede (1980) and later investigations have demonstrated that cultural variation

Cultural Inertia: Long-standing organizational cultures' resistance to change is one of the issues addressed in the literature. As mentioned by Denison, this can present serious challenges for HRM in promoting innovation (1996). The literature also discusses the question of whether organizational cultures can be successfully altered to foster innovation, with a focus on dynamic vs. static cultures. According to Kotter and Heskett (1992), deeply rooted beliefs and conventions may endure despite cultural change, making it challenging for HRM to spur innovation. Organizational culture, innovation, and HRM have a complicated and intertwined relationship, according to the literature. Innovation requires a supportive culture, and HRM practices play a critical role in creating and maintaining this culture. However, there are obstacles like cultural inertia and the requirement for culture and HRM practices to coincide.

The purpose of this study is to ascertain how employee innovation and human resources strategy are related. The process of attracting, assessing, and selecting qualified candidates for a position inside an organization is known as recruitment. Hiring is an essential managerial responsibility that guarantees the acquisition of a highly productive workforce. Finding the best candidate for a position is the essence of effective recruitment, which has a big impact on customer perception, industry reputation, workforce size, productivity, and profit. These days, hiring new staff members and their capacity for innovation have become major concerns for organizations.

Carefully examining the organization's practices—including its structures, procedures, and policies—is essential to developing a consistently inventive workforce. This happens because these practices may inadvertently make it more difficult for the business to promote innovation. For innovation to flourish, senior leaders' mere dedication to it—even when combined with an emphasis on the requisite skills and culture—is insufficient. For example, it was recorded in another case that "Many seasoned HR directors and hiring managers agree that senior staff are receiving worse treatment and bemoan the loss of their important contributions, such as organizational knowledge and the ability to mentor junior staff" (p. C1). Many companies were not designed to make innovation or change easier.

According to Elippo, training is the process of improving a worker's knowledge and abilities to carry out a certain task. On the other hand, according to Dale Yoder, training is the methodical process of providing people with the abilities and information needed to complete specific job responsibilities. According to Beach, training is a methodical procedure that people use to gain knowledge and abilities for a certain goal. To increase employee performance, training can involve learning new material, honing existing abilities, comprehending ideas, adhering to regulations, or changing attitudes and behaviors. A person's capacity to plan and carry out their goals determines their level of success in life, not just their wants. The means of getting there is more important than the final destination. In the same way, the strategy for starting something should be the main focus rather than the intended degree of success. Training is recognizing where you are right now, whether things seem good or bad, and projecting where you want to go in the future at the same instant. In addition, training describes the process of acquiring knowledge, competencies, and skills via career advancement. The process of acquiring skillful behavior is known as training. One's capacity to plan ahead and carry out their goals is what ultimately determines their success in life, not just their wants.

An employer's acknowledgment and appreciation of a worker's performance is referred to as reward and recognition. In return for their services, employees receive monetary compensation, which is referred to as this. Benefits for employees generally don't directly affect how well they work. On the other hand, inadequate benefits are linked to higher employee turnover and absenteeism as well as lower satisfaction levels. To fully use the benefits that employee benefits provide to a company, a positive feedback loop for benefit distribution must be established. AIG UK Benefits recently carried out a survey whereby it looked at how employers and employees felt about the offering and dissemination of voluntary employee benefits (VEBs). The intention was to learn more about how these perks can encourage employee engagement. The results underscored how important it is to communicate benefits packages efficiently. Benefits offered by the company to employees are known as VEBs. One hundred and fifty HR managers who actively choose and promote employee perks at their

different companies made up the research sample. Furthermore, the sample comprised five hundred individual workers who work for companies that offer both mandatory (core) and optional employee benefits.

The foundation for creating HRM procedures that are in line with strategic goals is organizational culture. Certain core skills or abilities have historically been highlighted in the body of extant strategy literature as being essential for attaining good corporate performance. Performance results are strongly influenced by organizational culture. We argue that an organization will function better when its members, regardless of hierarchical position, have common values, presumptions, and beliefs that align with its strategic goals and capabilities. According to recent research, positive organizational outcomes are correlated with high-performance work practices (5) and high-engagement work organizations (6). Outcomes like decreased termination and resignation rates and increased productivity. Results, such as higher productivity and reduced rates of quitting and firing. In general, Organizational capacities and culture encompass the concept of social capital. The overwhelming evidence suggests that social capital has a significant and beneficial impact on the performance of companies.

Three categories of HR practices have been found in the literature to help put in place an HR system that is geared toward encouraging innovation. The three main focuses are as follows: performance-based reward, which emphasizes rewarding employees for their contributions and results; team development, which entails significant development and implementation of leadership and team-based activities; and training-focused, which emphasizes skill improvement and investing in human capital. It's common knowledge that a cross-functional team is a necessary organizational structure for fostering innovation and creativity. Cross-functional teams are heavily utilized by many progressive companies (Ledford, Lawler, & Mohrman, 1995). The three sets of HR practices outlined above are often essential and play a critical role in supporting the development of cross-functional teams inside innovation-driven enterprises.

3. Conceptual Framework

A conceptual framework for assessing how organizational culture affects the connection between innovation in organizations and human resource management (HRM) can be structured to illustrate the relationships between these key components. The framework typically involves defining the key constructs, their interrelationships, and the mechanisms through which these relationships influence outcomes. Below is a conceptual framework that can be used to guide research or analysis in this area.

Conceptual Framework Components

A. Organizational Culture
Definition: Organizational culture refers to the shared values, beliefs, norms, and practices that shape the behavior of individuals within an organization.
Key Dimensions of Culture: Flexibility vs. Rigidity: The degree to which the culture supports adaptability, creativity, and openness to change.
Collaboration vs. Individualism: The extent to which teamwork, knowledge sharing, and collective problem-solving are emphasized.
Risk-Taking vs. Risk-Aversion: The organization's tolerance for uncertainty and its encouragement of experimentation and innovation.
Support for Learning and Development: The emphasis is placed on continuous learning, skill development, and employee growth.

B. Innovation
Definition: Innovation in organizations refers to the process of generating, adopting, and implementing new ideas, processes, products, or services that create value.
Types of Innovation:
Product Innovation: The introduction of new or improved products or services.
Process Innovation: The development of new or improved ways of producing goods or delivering services.
Organizational Innovation: Changes in organizational structure, management practices, or business models.

C. Human Resource Management (HRM)
Definition: HRM refers to the strategic approach to managing an organization's most valuable assets—its people. This includes recruitment, training, development, performance management, and employee relations. **Key HRM Practices:**
Recruitment and Selection: Hiring individuals whose values and skills align with the organization's innovation goals and
Training and Development: Providing continuous learning opportunities that enhance employees' ability to contribute to innovation.
Performance Management: Designing appraisal and reward systems that incentivize innovative behaviors and outcomes.
Employee Engagement and Retention: Strategies to keep employees motivated and committed to the organization, particularly those who contribute to innovation.

Interrelationships and Hypotheses
Organizational Culture as a Mediator:
Hypothesis 1: Organizational culture mediates the relationship between HRM practices and innovation outcomes. For example, HRM practices that promote flexibility, collaboration, and learning are more effective in fostering innovation when they align with a supportive organizational culture.
Hypothesis 2: A culture that emphasizes risk-taking and openness to change strengthens the impact of HRM practices on innovation by encouraging employees to experiment and embrace new ideas.

Direct Impact of HRM on Innovation:
Hypothesis 3: HRM practices directly influence innovation by developing the necessary skills, behaviors, and attitudes among employees. For instance, continuous training and performance management systems that reward innovative contributions directly boost an organization's innovation capacity.

Feedback Loop:
Hypothesis 4: Successful innovation can, in turn, reinforce and shape organizational culture and HRM practices. For example, as an organization becomes more innovative, its culture may evolve to further support creativity and risk-taking, and HRM practices may be adjusted to sustain and scale innovation efforts.
Moderating Effects of Organizational Culture:
Hypothesis 5: The relationship between HRM and innovation is moderated by the strength of the organizational culture. In strong cultures where values and norms are deeply embedded, HRM practices that align with these values are more likely to succeed in promoting innovation.

Visualization of the Conceptual Framework
The conceptual framework can be visualized as follows:
Organizational Culture
- Arrows leading to Box 2: Innovation and Box 3: HRM Practices
- Dimensions of culture influencing both innovation and HRM

Innovation
- Connected with **Box 3: HRM Practices** via a two-way arrow
- Innovation outcomes feeding back into organizational culture

HRM Practices
- Arrows connecting to both Box 1: Organizational Culture and Box 2: Innovation
- HRM practices designed to align with and support the culture, thereby enhancing innovation

This conceptual framework illustrates how organizational culture serves as a critical link between HRM practices and innovation in organizations. By understanding and managing these interrelationships, organizations can create an environment that fosters sustained innovation, supported by strategic HRM practices that align with the desired cultural attributes. Future research and practical applications can use this framework to explore specific aspects of these relationships, such as the impact of different cultural dimensions on various types of innovation, or how specific HRM practices can be tailored to different cultural contexts.

Empirical research has shed considerable light on how different types of organizational cultures influence innovation through human resource management (HRM). These studies generally focus on the characteristics of organizational culture that either facilitate or inhibit innovation and how HRM practices can support or undermine these cultural traits.

Types of Organizational Cultures and Their Impact on Innovation
Innovative Cultures: Research consistently shows that cultures characterized by flexibility, openness, and risk tolerance are more likely to foster innovation. For instance, a study by O'Reilly, Chatman, and Caldwell (1991) found companies with cultures that value adaptability and creativity tend to be more innovative. These organizations often support decentralized decision-making, which empowers employees to take initiative and experiment with new ideas.

Hierarchical Cultures: In contrast, cultures that are more hierarchical and control-oriented often struggle with innovation. A study by Zammuto and Krakower (1991) found that organizations with a strong emphasis on rules, procedures, and control tend to be less innovative. In such environments, employees may feel constrained by the rigid structure, limiting their ability to think creatively or propose novel solutions.

HRM Practices Supporting Innovation
Recruitment and Selection: Empirical studies indicate that recruiting individuals who align with the organization's innovative culture is crucial. For example, a study by Collins and Smith (2006) demonstrated that firms with a strong emphasis on collaborative culture and knowledge-sharing tend to select and retain employees who are not only technically skilled but also adept at working in team-oriented, innovation-driven environments.

Training and Development: Research by Sanders et al. (2018) shows that HRM practices focused on continuous training and development are key to maintaining an innovative culture. These practices ensure that employees acquire the necessary skills to contribute to innovation, such as creative problem-solving and interdisciplinary collaboration.

Performance Management: Empirical evidence suggests that performance management systems that reward creativity and innovation can reinforce a culture of innovation. For instance, a study by De Jong and Den Hartog (2007) found that companies that recognize and reward innovative behavior tend to see higher levels of creative output from their employees.

Knowledge Sharing and Collaborative Cultures
Role of Knowledge Sharing: Cultures that emphasize knowledge sharing and collaboration are particularly conducive to innovation. Research by Chang and Lee (2017) highlights that organizations with strong knowledge-sharing mechanisms often experience higher levels of innovation. These cultures facilitate the flow of ideas across different parts of the organization, enabling employees to build on each other's knowledge and expertise.

HRM's Role in Facilitating Collaboration: HRM practices that promote teamwork and cross-functional collaboration are crucial in such cultures. For example, Chen and Huang (2009) found that HRM practices aimed at enhancing collaboration, such as team-building activities and cross-training programs, significantly boost the organization's capacity for innovation.

Cultural Fit and Employee Engagement
Cultural Fit: The alignment between an employee's values and the organizational culture—often referred to as "cultural fit"—is critical for fostering innovation. A study by Kristof-Brown et al. (2005) found that employees who perceive a strong fit with their organization's culture are more likely to be engaged and contribute to innovation. HRM practices that assess and ensure cultural fit during recruitment and onboarding processes are therefore vital.

Employee Engagement: Engaged employees are more likely to go above and beyond in their roles, contributing to innovative processes. Research by Schaufeli et al. (2002) supports this, showing that engaged employees in

organizations with supportive cultures are more likely to participate in innovation-related activities, such as brainstorming sessions and project teams.5. Case Studies and Cross-Cultural Comparisons

Case Studies: Numerous case studies illustrate how specific organizations have successfully cultivated an innovative culture through targeted HRM practices. For example, Google is often cited in the literature as a case study of how a culture of innovation, supported by HRM practices like 20% time (where employees can spend 20% of their time on projects of their choice), can lead to significant innovative outcomes.

Cross-Cultural Comparisons: Cross-cultural studies also provide insights into how different national cultures impact the relationship between organizational culture, HRM, and innovation. For instance, Hofstede's cultural dimensions theory has been used to explore how cultural differences in power distance, uncertainty avoidance, and individualism/collectivism influence organizational innovation across different countries (Hofstede, 1980). In cultures with low power distance and high Individual organizations tend to have more innovation-friendly HRM practices, compared to those in high power distance, collectivist cultures.

Challenges and Limitations
Cultural Inertia: One of the challenges highlighted in the empirical literature is the concept of cultural inertia, where long-standing organizational cultures resist change, thereby inhibiting innovation. This is particularly evident in studies of older, established organizations that have a deeply ingrained culture focused on efficiency and control.

Balancing Innovation with Other Organizational Goals: Another challenge is balancing the need for innovation with other organizational goals, such as operational efficiency. Research by Gibson and Birkinshaw (2004) suggests that organizations must find a balance between maintaining a culture that supports innovation while also achieving operational excellence.

Empirical research provides strong evidence that organizational culture significantly influences the relationship between innovation and HRM. Cultures that are flexible, collaborative, and open to risk-taking tend to foster higher levels of innovation, particularly when supported by HRM practices that reinforce these cultural attributes. However, challenges such as cultural inertia and the need to balance innovation with other goals must be carefully managed. Future research could further explore these dynamics, particularly in the context of rapidly changing business environments and diverse cultural settings.

Managerial Implications
Pragmatically speaking, the proposed paradigm benefits higher education institutions in particular. Better organizational performance for businesses will result from fusing HRM approaches with creativity and cultural efficacy. Addressing environmental protection, developing continuously, and adapting to societal and governmental demands, will strengthen the firm's sustainability. Furthermore, the proposed paradigm provides scholars with insightful information about how HRM might enhance organizational performance through innovation and cultural efficacy. To achieve cutting-edge innovations and sustain long-term success in the ever-changing business landscape, firms must have access to human resources. The importance of innovation performance and cultural effectiveness in the relationship between human resource management is highlighted by this study.

4. Methodology

The Human Resource function is vital for any firm, regardless of management's awareness of its impact on daily activities. Human Resources plays an increasingly important function in today's organizations. It is widely known that most firms' most valuable resource is their workforce. Human Resources is the traditional functional department in charge of personnel management, and its strategic scope is expanding. Human Resource teams are now responsible for change management, succession and retention planning, continuous learning, and 360 career planning. Before implementing a strategy, Human Resources must first identify the existing obstructions to the planned improvements in their organization. Strategy implementation is a systematic process of removing internal obstacles.

Before executing a strategy, Human Resources must first identify the present roadblocks to organizational change. Strategy implementation is a rigorous process of removing internal barriers to organizational transformation. Every strategic strategy will inevitably face opposition, even if the majority agrees that change is required. Furthermore, the more drastic the shift in strategy, the more disagreement will arise. Measures and analyses.

The dependent variable was assessed using a single-item question, 'Please rate your firm's success in the area of developing new products or services over the last three years as compared to your industry's average,' on a Likert scale of 1 (poor) to 5 (very good). It's been hypothesized that It has been hypothesized that this comparative strategy is more effective in eliciting responses than explicitly asking respondents to supply exact values. A conceptual model of how the HR system influences innovation through company culture.

HR can proactively prevent many potential conflicts by anticipating and resolving some of the issues that are likely to arise. Typically, there are five primary reasons why plan implementation fails, and as a result, HR management must work to overcome around ten predictable hurdles. The primary factors and associated concerns include the organization's competitiveness, employees' ability to perform their current jobs, the cultivation and preservation of a high-quality work environment, maximizing employee job satisfaction and self-fulfillment, and conducting a SWOT analysis to identify external opportunities while taking into account the associated risks and threats. This is the rationale for conducting research: to discover the scope of the problem and viable remedies.

The methodology component of a study examining how organizational culture influences the relationship between innovation in organizations and human resource management (HRM) should include the research design, data-gathering methods, sample tactics, and analytical methodologies. This section describes an organized approach to exploring the proposed research questions or hypotheses.

Research Design
The research design defines the overall approach to the study. Given the complexity of the relationship between organizational culture, innovation, and HRM, a mixed-methods approach is recommended, combining both qualitative and quantitative research methods. This approach allows for a more comprehensive understanding of the phenomena under study.
Qualitative Component: Exploratory, this component seeks to understand the nuances of how organizational culture influences innovation through HRM practices. It may involve case studies, interviews, and focus groups.
Quantitative Component: This component aims to measure the relationships and test the hypotheses derived from the literature review. It may involve surveys and statistical analysis to determine the strength and significance of the connections between variables.

Research Questions and Hypotheses
The research will be guided by specific research questions and hypotheses, such as:
RQ1: How does organizational culture influence the effectiveness of HRM practices in fostering innovation?
RQ2: What specific dimensions of organizational culture are most strongly associated with innovation in organizations?
H1: There is a positive relationship between a culture of collaboration and the effectiveness of HRM practices in promoting innovation.
H2: HRM practices are more effective in fostering innovation when aligned with a culture that supports risk-taking and flexibility.

Data Collection Methods
a. Qualitative Data Collection
Case Studies: Select organizations known for their strong innovative cultures and successful HRM practices. These organizations will be studied in-depth to understand how culture shapes HRM and innovation.
Interviews: Conduct semi-structured interviews with key stakeholders, including HR managers, innovation leaders, and employees. Questions will explore how they perceive the influence of organizational culture on HRM and innovation.

Focus Groups: Organize focus groups with employees from different departments to gather diverse perspectives on the impact of organizational culture on their ability to innovate.

b. Quantitative Data Collection
Surveys: Develop and distribute a structured survey to a larger sample of organizations. The survey should include validated scales to measure organizational culture (e.g., the Organizational Culture Assessment Instrument), HRM practices, and innovation outcomes.
Secondary Data: Use existing data from organizational reports, employee performance records, and innovation metrics (e.g., number of patents, and new products launched) to complement survey findings.

Sampling Strategy
Qualitative Sampling: Purposeful sampling will be used to select organizations that represent different types of organizational cultures (e.g., innovative, hierarchical) and varying degrees of innovation success. The sample should include organizations from diverse industries to capture a broad range of cultural and HRM practices.
Quantitative Sampling: A stratified random sampling method will be employed to ensure that the survey sample is representative of different organizational sizes, sectors, and regions. The target population will include HR professionals, innovation managers, and employees across various levels within the organization.

Data Analysis
a. Qualitative Data Analysis
Thematic Analysis: Analyze interview transcripts, case study notes, and focus group discussions to identify key themes related to the influence of organizational culture on HRM and innovation. Coding will be used to categorize the data into themes, and patterns will be identified to draw meaningful insights.
Content Analysis: Apply content analysis to any textual data, such as organizational documents or interview transcripts, to quantify the frequency of specific cultural attributes or HRM practices mentioned about innovation.
b. Quantitative Data Analysis
Descriptive Statistics: Summarize the survey data to describe the sample characteristics and distributions of key variables such as organizational culture dimensions, HRM practices, and innovation outcomes.
Correlation Analysis: Use Pearson or Spearman correlation coefficients to explore the relationships between organizational culture variables, HRM practices, and innovation metrics.
Regression Analysis: Conduct multiple regression analyses to test the hypotheses and assess the impact of specific cultural dimensions and HRM practices on innovation outcomes. This analysis will help determine the strength and significance of the relationships. Structural Equation Modelling (SEM): If appropriate, SEM can be used to test complex relationships between latent variables (e.g., culture, HRM, innovation) and to validate the conceptual framework proposed.

Ethical Considerations
Informed Consent: Ensure that all participants understand the purpose of the research and provide informed consent before participating in interviews, focus groups, or surveys. Confidentiality: Maintain the confidentiality of all participants and organizations involved in the study. Data should be anonymized to protect privacy. Bias and Reflexivity**:** Acknowledge and Mitigate any potential biases in data collection and analysis. Reflexivity will be practiced, particularly in qualitative research, to consider how the researcher's background and perspectives might influence the study.

5. Conclusion and Limitations of the Study

Generalizability: The findings from qualitative case studies may not be generalizable to all organizations. However, they will provide deep insights into specific contexts. Response Bias: Survey respondents may exhibit social desirability bias, particularly in self-reporting organizational culture or innovation practices. Mitigating strategies, such as anonymizing responses and triangulating data sources, will be employed. Complexity of Culture: Measuring organizational culture is inherently complex, and capturing its full impact on HRM and innovation may be challenging. Multiple data collection methods and robust analysis techniques will be used to address this issue.

This methodology outlines a comprehensive approach to assessing how organizational culture affects the connection between innovation and HRM. By combining qualitative and quantitative methods, this research aims to provide a nuanced understanding of these relationships, offering valuable insights for both academic research and practical application in organizations.

Conclusion

The relationship between corporate culture, innovation, and human resource management is complex and interrelated. A culture that fosters creativity is required, and HRM procedures must be adjusted to reflect and promote this culture. When HRM properly supports an innovative culture, it fosters creativity and new ideas, resulting in long-term competitive advantage.

Abstract: In recent years, live-streaming commerce has witnessed remarkable global growth, catalyzed in part by the COVID-19 pandemic. TikTok, originally a video-sharing app, has undergone rapid expansion and now offers livestreaming capabilities. This review aims to explore how TikTok livestreaming is reshaping the marketing landscape. The objective is to uncover the advantages of TikTok livestreaming for various stakeholders, shedding light on its potential implications for marketers, customers, and content creators. A comprehensive examination of existing literature was conducted, analyzing studies, reports, and academic papers. The analysis focused on the multifaceted benefits of TikTok live streaming for marketers, customers, and content creators. It also considered practical implications for businesses utilizing this platform. TikTok livestreaming fosters real-time engagement between marketers and customers, leading to enhanced trust and more effective product demonstrations. It appeals to younger demographics, offering a valuable marketing avenue. For customers, it facilitates interactive, informative, and emotionally engaging shopping experiences. Content creators can leverage TikTok live streaming to monetize their content and deepen connections with their audience, enhancing brand exposure. In conclusion, TikTok livestreaming is reshaping e-commerce by facilitating immersive, interactive, and trust-building experiences for marketers, customers, and content creators. Marketers should focus on quality interaction, product presentation, and partnering with suitable content creators. Collaborations with influencers should consider credibility and alignment with brand values. Leveraging TikTok's livestreaming capabilities offers the potential to cultivate customer loyalty and retention, transforming conventional marketing paradigms in the process.

Keywords: *TikTok, Livestreaming Commerce, Social Commerce, Content Creators, Marketing, Generation Z.*

1. Overview of Livestreaming Commerce

In the past few years, the growth of live-streaming businesses has helped create new ways for people all over the world to share information. Wongkitrungrueng and Assarut (2020) have defined live-streaming commerce as shopping that involves live streamers by using real video and real-time chat and commonly occurs on e-commerce platforms. The worldwide spread of the coronavirus disease known as COVID-19 is thought to be a contributor to the skyrocketing trends in the use of live-streaming commerce (Jahrir and Tahir, 2020). According to Statista (2024), China consumers are the most active in live commerce, with a projected market size of 5.86 trillion in 2024 (Ganbold, 2024), with Douyin and Taobao having the biggest gross merchandise volume. According to Statista, livestreaming commerce sales in the United States are predicted to reach $50 billion in 2023, and by 2026, revenues from live shopping are expected to climb by 36% (Chevalier, 2024). The live-streaming business model is also beginning to succeed in Southeast Asia. Live streaming sales in Southeast Asia will grow more than tenfold to US$13 billion in 2022, with the most active audiences coming from Vietnam, Thailand, and Singapore (Ignatius, 2022).

The above statistics have shown that livestreaming commerce has become a rapidly growing phenomenon in today's world. As a result, many online merchants are launching livestreaming selling channels using internet platforms and social media to cater to customers' desires. Live streaming commerce has the potential to take advantage of customers' "see-now-buy-now" mentality, it has emerged as a fundamental common marketing medium in the modern marketplace (Lo et al., 2022). Consumers who participate in live-streaming commerce, as stated by Lin et al. (2022), have a chance to engage and interact with one another through the use of chat rooms and discussion boards. According to Xu et al. (2020), live-streaming commerce gives customers the possibility to view, comment on, and even buy things as the broadcast happens in real time. Established e-commerce selling platforms like Alibaba, Amazon, and Taobao have all already begun to incorporate live-streaming commerce into their operations. Starbucks and Samsung have also added live-streaming features to their websites to facilitate online sales and marketing. Social networking sites (SNS) have also joined the battle,

which has resulted in the creation of an entirely new form of e-commerce known as social commerce (Wang et al., 2022). This form of e-commerce uses social media to complete an e-commerce transaction known as livestreaming selling (Wongkitrungrueng and Assarut, 2020).

E-commerce live streaming differs from social commerce live streaming. It is noted that e-commerce live streaming usually happens on e-commerce platforms that have a live streaming function, and the initial idea these platforms have been developing is for selling products (Yan et al., 2023). Social commerce livestreaming, on the other hand, often takes place on social media platforms that were initially designed for live streams but later incorporated commercial activities (Yan et al., 2023). These platforms were designed primarily for social networking and entertainment purposes, not to sell products. Regarding product display, time efficiency, shopping experience, and sales strategy, live-streaming commerce has significant advantages over traditional e-commerce (Li et al., 2021). As a cutting-edge business strategy that facilitates direct communication and interaction between suppliers and customers, live-streaming commerce is an essential platform for vendors (Lee & Chen, 2021).

TikTok is one example of a social media platform that was initially developed for live streams but later incorporated commercial activities. Thus, this paper aims to review the usage and benefits of TikTok. The following section will discuss the uses and benefits of TikTok livestreaming.

2. Overview of TikTok

TikTok is a video-sharing application that allows users to create and share short videos on any subject they desire. The Chinese start-up company ByteDance released the application in September 2016 (D'Souza, 2023). The app was formerly known as Musical.ly before it changed its name to TikTok (Sharabati et al., 2022). As a result of the COVID-19 outbreak, TikTok's popularity has increased because more people are using their mobile devices to explore new methods of interacting with others, conducting business, and making purchases (Pongratte et al., 2023). After the epidemic, TikTok quickly became the social network with the highest growth rate (Barta et al., 2023) and the social media and video platform with the greatest number of users all over the world. TikTok climbed to become the fifth most popular social network globally in April 2024, according to a DataReportal report with 1.58 billion active users (see Figure 1).

Figure 1: The World's Most Used Social Platform
Source: DataReportal (Digital 2024 Global Overview Report)

In addition, based on Statista 2024 statistics, Indonesia emerged as the country with the largest TikTok audience as of July 2024, with about 157.6 million members utilizing this well-known social media site. The United States, with about 120.5 million users, comes in second, followed by Brazil, with 105.3 users (Ceci, 2024). It should be noted that China is left out of the statistics because Chinese consumers access TikTok through the Douyin app, which is also owned by ByteDance and has over 755.5 million daily active users

(Winter, 2024). In Malaysia, as shown in Figure 2, TikTok is the most popular social media site, with 21.9% of users loving its fascinating short-form video content, according to the Global Digital Report 2024, which was produced in partnership with Melwater and We are Social (Howe, 2024).

Figure 2: Favorite Social Media Platform in Malaysia as of January 2024
Source: DataReportal (Digital 2024: Malaysia)

According to data from Statista (2024), women made up about 45.2% of TikTok's global user base, whereas male users on the popular social video platform accounted for 54.8 percent of the total (Ceci, 2024). A statistic by DataReportal (2024) has shown that in terms of the age demography of TikTok users, it is evident that the TikTok advertising audience profile is primarily dominated by users from Generation Z, which is 36.2% (see Figure 3).

Figure 3: TikTok: Advertising Audience Profile
Source: DataReportal (Digital 2024 Global Overview Report)

Figure 4: TikTok Advertising Audience Overview
Source: Data Reportal 2024. (Digital 2024 Global Overview Report)

Furthermore, according to the DataReportal in Digital 2024 Global overview report, TikTok has overtaken all other social media in Malaysia as it has emerged as the most widely used platform in Malaysia (refer to Figure 4). The data shows there are 28.68 million Malaysians who could have the potential to get exposed to advertising in TikTok. Through this data, we can conclude that the TikTok platform is effectively capturing the substantial attention of the majority of Malaysian internet users. It also shows that TikTok has become an important social media network in Malaysia that can be pursued by marketers as part of their digital marketing strategy by tackling different demographic profiles of consumers.

3. Overview of TikTok Livestreaming

In 2021, TikTok introduced a live-streaming shopping function that enables real-time, two-way contact between buyers and sellers (Parahiyanti et al., 2024). TikTok initially focused on short video content but later expanded its capabilities to include online commerce, enabling viewers to make purchases while watching live streams (Ahmadi and Hudrasyah, 2022; Hua and Chiu, 2022; Luo et al., 2022). From the perspective of this article, which will discuss TikTok livestreaming, what exactly is the definition of TikTok livestreaming? According to Chillingworth (2024), TikTok livestreaming can be defined as a feature on the TikTok platform that enables content creators to engage directly with their audience by hosting live-streamed sessions, and through it, content creators can answer the audience's comments and questions. Additionally, Mileva (2024) defines TikTok livestreaming as a real-time product demonstration that allows TikTok users to purchase products directly within the app, eliminating the need to leave the platform.

In addition to this, TikTok live streaming provides its streamers and sellers with the ability to present their products to customers in the form of real-time video while also giving buyers access to further information (Wongkitrungrueng and Assarut, 2020). Live video streaming on TikTok allows users to interact in real time with their followers through comments, and it can also help users monetize their accounts by receiving "gifts" from their live-stream audience (Geyser, 2020). During live streaming on TikTok, prospective customers can enquire about the details of the showcased products by posing questions to the streamer or vendor in the comment section. Customers have the option to request the vendor or streamer to showcase the goods, demonstrate their texture, and provide an evaluation of their performance or outcomes. In addition, the platform offers promotional vouchers that clients can utilize when making purchases (Annisa and Chusjairi, 2023).

There are three (3) actors involved in TikTok live streaming: the seller, the streamer, and the customer (Huang and Suo, 2021). According to Sanjaya et al. (2023), the term seller refers to any individual or organization that offers goods and services that are going to be advertised; streamers are individuals who aid in the marketing

of a product and may also be the product's vendor; and customers are people who need to know about products and services during live streaming.

4. Benefits of TikTok Livestreaming

Ultimately, the success of live streaming shopping on TikTok will depend on how it helps the platform's users, which are marketers, customers, and content creators.

Marketers
It is important to note that TikTok livestreaming differs from typical e-commerce in that it allows consumers to engage with marketers in real-time contact. Marketers have the chance to participate in deeper conversations and foster a sense of social presence through face-to-face interactions with actual people, which will ultimately lead to an increase in consumer trust (Cha and Lee, 2022; Park and Yoo, 2022; Xu et al., 2020). For instance, during broadcast time, live streaming broadcasts or marketers may address individuals by their names and offer products that suit their interests, which can build symbolic value between store and consumer (Wongkitrungrueng and Assarut, 2020). Through this, it helps marketers to eliminate the gap between products, marketers, and consumers. Furthermore, the TikTok livestreaming feature enables marketers to showcase product usage and highlight the associated benefits, making it a distinctive platform for building consumer loyalty and trust.

Additionally, the live feature of TikTok is particularly advantageous due to its algorithm's emphasis on live content, which informs followers and boosts views (Schweitzer, 2023). This further enhances the capabilities of the live feature to facilitate consumer engagement for marketers. Additionally, live streaming has grown in importance as a promotional tool for marketers, giving customers the ability to make decisions about what to buy and fostering relationships between customers.

Next, live streaming on TikTok also enables businesses to connect more easily with huge audiences and acquire new customers. The report "Navigating the Future of Seamless in Asia Pacific (2024)" by KPMG contains data that indicates that 63% of Gen Z consider social commerce to be a significant aspect of their purchasing experience, while 57% consider livestreaming commerce to be similarly significant (Westerhout et al., 2024). In the United States, 72% of Generation Z (born between 1995 and 2015) and 88% of Millennials (born between 1980 and 1994) follow live streamers, and 88% learn about brands and items they are interested in and willing to buy through social media (Lu et al., 2021). According to data by Statista, during the first quarter of 2023, the United States also exhibited a significantly higher proportion of Generation Z customers who actively engaged in live-streaming purchasing events, surpassing other countries by a wide margin, with a participation rate of 46 percent (Chevalier, 2024). Given that they have grown up with technology and digital communication, Generation Z is far more tech-savvy and "digital natives" than previous generations (Adeola et al., 2020; Reinikainen et al., 2020; Fairistha et al., 2023). Consequently, the TikTok livestreaming platform has emerged as an exceptional choice for marketers seeking to attract younger audiences, particularly Generation Z, and to increase their brand's exposure to a diverse range of audiences.

Moreover, past researchers have recognized that live-streaming marketing can generate opportunities for impulsive buying decisions among customers. According to Gita et al., (2024), livestreaming selling and impulse purchase are closely related because of limitation of time during broadcast may create urgency for consumers to purchase. The phenomenon of impulse purchase behavior has been extensively researched in marketing studies over the past few decades, encompassing both offline and online contexts. This research has been driven by the advancements in digital payment, e-commerce, and social business (Abdelsalam et al., 2020). An impulse purchase refers to the act of consumers making unplanned purchases in response to external stimuli without having any prior purpose to acquire a certain product or category (Beatty and Ferrell, 1998). Previous studies have identified several factors that contribute to impulse purchase decisions in livestreaming. This includes scarcity-induced promotion (Yi et al., 2023), discounts and bundle offers (Gita et al., 2024), anchor characteristics such as attractiveness, professionalism, and interactivity (Li et al., 2024), the exterior design of the live platform (Gong et al., 2020), and the interface design of the live streaming platform (Yang et al., 2022). According to Statista data from 2022, more than half of TikTok users made impulse purchases, making TikTok users a social media user group that is most susceptible to impulse buying (Gelder, 2023).

Furthermore, TikTok livestreaming can aid small business marketers because it is a highly strong marketing tool for them (Vasilisa, 2023). According to Vulcan Post, TikTok Shop Malaysia experienced a 78% increase in the number of small and medium-sized businesses (SMEs) that signed up between January and June 2023, the company's one anniversary. This platform might be a low-cost marketing tactic for small firms that want to target specific demographics without investing in expensive production equipment. Small-scale individual sellers may find live selling more cost-effective as it only requires a camera, microphone, internet connection, and streaming platform. TikTok livestreaming also provided an opportunity for small businesses to help their brands get recognized by customers and improve their reputation. Small business marketers have the opportunity to reveal their identities in real time during live-streaming sessions. Customers may assume that a seller is less likely to engage in fraudulent behavior when they can see the vendor's face, gain an understanding of how the seller conducts business, and build brand awareness. Building brand awareness can assist small businesses in fostering consumer trust and cultivating a loyal customer base (Cox, 2022).

Customers
Next are the benefits of TikTok livestreaming for customers. Through TikTok, and live streaming, face-to-face interactions between customers and marketers will affect customers' physical, social, and emotional cues, which in turn influence their purchasing decisions (Gao et al., 2021). During livestreaming, customers may also ask marketers questions about products via chat, and marketers can instantly respond with answers and solutions tailored to the specifics of these requests. On top of that, TikTok livestreaming also has a feature that allows customers to have real-time interaction with other customers through the chat function. The process of exchanging information through interaction leads to an effective purchase decision (Sanjaya et al., 2023). Some customers might have prior experience using the products, and when they share their experiences, electronic word-of-mouth (WOM) activities will also increase.

Content Creators
TikTok livestreaming will also benefit content creators. Bloggers, writers, influencers, artists, podcasters, and streamers are all examples of content creators (Tafesse and Dayan, 2023). Influencers connect with customers and sell products online through live broadcasting. It is gaining popularity and importance in the online influencer economy (Lee and Theokary, 2021). According to Florida (2022), content creators are those who use digital tools to produce and disseminate original works of art, including but not limited to video, film, art, writing, games, and so on, to receive feedback from viewers. Creators of digital content have a wide range of interests, including fashion, travel, technology, music, food, health, and many more (Valsesia et al., 2020). They create content based on their interests, passions, and experiences and monetize it on digital platforms (Bhargava, 2022) via endorsement, digital tips, brand partnerships, advertising, and other forms of digital payment. Content creators' relationships with their followers typically deepen as a result of the content they share. This has become a significant draw for marketers and advertisers seeking to form partnerships with content creators to promote their products on digital platforms (Pahwa, 2023). According to Johnson et al. (2022), certain individuals refer to content creators as "contempreneurs" because of their entrepreneurial skills. With TikTok's recent introduction of live streaming, creators now have more options than ever before.

The goal of brands of all sizes is to increase exposure for their products, and one effective strategy is to form partnerships with influential content creators who already have sizable fan bases. For content creators, their work becomes a source of income, allowing them to pay for their salaries as well as those of their employees (Tefesse and Dayan., 2023). According to information provided by Melissa Yuen, TikTok's country manager for Malaysia, Singapore, Indonesia, and Taiwan, in an interview with Vulcan Post, top creators can earn up to RM20,000 per month, or RM60,000 on good months, by live streaming for an average of 2.8 hours per day (Tan, 2023) on TikTok LIVE. TikTok livestreaming serves as a prompt feedback channel, particularly during product launches. Creators can generate immediate sales by offering time-limited deals during a live event.

5. Practical Implications

Marketers
From a managerial perspective, marketers who use TikTok live streaming have to pay attention to the quality of interaction between content creators and customers. During the conversation, the marketers should ensure the appointed content creators have engaged in both verbal and non-verbal communication. Social interaction

between content creators and customers through verbal explanation (sharing past product experiences, asking questions, and explaining products) and non-verbal (acting and emotion expressed facially) will increase viewers' trust in products (Wang et al., 2022). In addition, to gain the trust of customers, marketers should ensure the content creators of TikTok livestreaming can show their competence, ability, and integrity before customer interaction.

Moreover, watching live videos usually takes more time than browsing still pictures of products, so content creators need to keep customers engaged and reduce their boredom through the inclusion of enjoyable and entertaining activities relating to products (e.g., product demonstration shows with a sense of adventure and fantasizing) or incentives (e.g., games, flash sales). These activities have the potential to evoke positive emotions, thereby fostering affective trust in both the products and the marketers. Furthermore, companies should focus on content creator marketing expertise and strive to enhance their skills. In addition to training broadcasters, marketers should focus on identifying and selecting suitable types of broadcasters and giving them products that are appropriate for advertising based on their areas of expertise and marketing style. Such actions can help boost consumer perceptions of broadcaster expertise and service quality, which will lead to increased consumer purchase intentions.

The marketers also should monitor the way a content creator shows their goods during a livestream session. It should assist the buyer in visualizing and understanding how the product will be used in an environment similar to the actual store. As a result, marketers will recommend that content creators use enhanced video by using high-quality technology to give customers a clearer picture of the goods they are considering purchasing. Through TikTok live streaming, customers can feel more connected to the content creators and feel more like they belong on the marketer's page, thanks to rich experiences and interactions that foster a sense of friendship. It is also critical for marketers to monitor whether content creators comply with this requirement. For example, marketers can ask content creators to record and assess client comments to make it much easier for them to recognize customers and recall their preferences. Marketers can also ask content creators to request comments and votes on forthcoming products or rewards during a live-streaming broadcast. These actions generate symbolic value that has a direct effect on consumer engagement.

Finally, given the complexity of live information presentation, consumers primarily rely on visual cues to navigate the platform interface (Gong et al., 2020). Therefore, it is suggested that marketers should also pay attention to the interface design of the live streaming room. Elements of interface design in a live streaming room include product display methods, interface colors, and interactive panels (Yang et al., 2022). Research indicates that the brighter the color of the live-streaming interface, the easier it is for consumers to generate emotional arousal, such as excitement which leads to impulse purchase decisions (Yang et al., 2022). Therefore, marketers should devise inventive and captivating content layouts to capitalize on consumers' impulse purchase decisions during live streaming. Given the characteristics of the young generation that dominates the TikTok platform, marketers should pursue creating a more "fresh" live streaming room.

Content Creators

First, to effectively capture consumers' attention and boost customer purchase intention or impulse purchase, content creators need to focus on showing their attractiveness, similarity, professionalism, and interactivity to consumers in the process of live broadcasting. To cultivate favorable impressions from consumers, content creators can create a unique live-streaming style based on their strengths in areas such as appearance, personality, and background. Additionally, analyzing the common characteristics of the viewers in the live-streaming room enables the content creators to display more targeted similarities with consumers and to increase the consumers' trust and favor, which will then promote buying. For instance, if the target viewers are young women, the content creators can visually appear more fashionable, friendly, and interesting. Content creators must continue to enhance their understanding of the product's characteristics (i.e., selling points, and usage methods) and increase their professionalism in recommending the product. Professionalism also creates trust in the content creator and a stronger willingness of customers to make impulse purchases (Yang et al., 2022). In addition, they can also expand their interactions with the viewers by using product demonstrations, setting up flash sales, and distributing coupons. When answering the consumers' questions, content creators can share personal or industry views, experiences, and stories to enhance the appeal within the live-streaming scenario and drive the purchase of products.

Furthermore, content creators on TikTok live streaming must closely monitor the interactions between consumers during live streaming chat sessions to promptly understand and satisfy their needs, as well as guide products. Moreover, content creators should fully showcase their knowledge and skills related to the product, providing additional information and evidence to support consumers' purchase decisions, thereby encouraging them to purchase more products. Finally, content creators must establish a positive emotional bond with their consumers. Emotional trust plays a vital role in cultivating long-term customer relationships and fostering loyalty (Zhou and Tong, 2022), which contributes to enhancing brand reputation and lays the foundation for long-term live-streaming e-commerce business success.

Last but not least, as we notice, TikTok livestreaming provides an opportunity for marketers to promote their products by seeking the assistance of content creators such as celebrities and online influencers. When celebrities post a message, it will inspire followers to buy products since customers are prone to mimicking celebrities' actions (Djafarova and Bowes, 2021). The creators of content must convince marketers to use this potential. Some consumers are more likely to believe celebrities and influencers when it comes to hearing what they have to say about a business, and content creators can use this to their advantage by influencing the purchasing decisions of their followers. The influencer, for instance, will be able to demonstrate the product in real time and respond to customer inquiries instantly. Marketers, on the other hand, will be able to improve sales, increase awareness, and reach larger target audiences by leveraging information provided by influencers or celebrities.

It has been suggested that brands looking for content creators, such as influencers, to endorse their products should not only consider the candidates' external appeal but also their intrinsic nature as well as the fit between their expertise and the product (Park and Lin, 2020). This should be taken into account when evaluating the credibility of influencers and the marketing campaigns they generate. Collaboration with those involved in scandals, in particular, should be avoided because it may negatively affect consumer opinions of brands (Campbell and Farrell, 2020). Furthermore, many endorsements by the same celebrity can reduce the effectiveness of celebrity endorsements, particularly when consumers view celebrities as being involved in too many product endorsements at one time (Yan et al., 2023). As a result, while seeking collaborations, brands should take these factors into account.

Finally, brands sometimes partner with influencers based on popularity rather than demographic alignment, which leads to suboptimal campaign results (Linh, 2023). Therefore, marketers should carefully select influencers who have a proven track record of engaging with the target age group. For instance, if an influencer has a strong track record of engaging Generation Z, marketers should consider collaborating with them as they possess the expertise to create authentic and relatable content strategies for this demographic.

Conclusion
This article review discusses the nature of live streaming on TikTok, and as a result, some new insights have been presented. From the perspectives of customers, marketers, and content creators, respectively, the benefits of TikTok live streaming have been analyzed. When we consider the benefits that come with selling their products and services, we can see that marketers may leverage the TikTok livestreaming commerce platform into their business operations. Finally, live streaming on TikTok is not only meant for marketing products and services, but it is also a new approach for business organizations to form relationships with customers, which will further create customer loyalty and retention. The emergence of new technologies in the modern age has impacted the way businesses connect with their customers. This proved particularly noticeable in electronic communication. The level of rivalry among companies has also risen because of these companies' hunt for novel and innovative ways to broaden their consumer bases. The advent of TikTok live streaming has opened a fresh channel for content makers. The advantages of TikTok live streaming can be utilized by content creators not just for financial gain but also for the dissemination of informative content that can provide societal benefits.

In addition, the marketing strategies of modern companies have been significantly influenced by the growing prevalence of social media, and the competition between online marketers and physical stores has been increased by the rise of livestreaming commerce on social media. Consequently, online marketers face significant obstacles in attracting new consumers in a competitive market. Nevertheless, marketers can resolve the challenges by concentrating on Generation Z, a group that is extremely engaging in social media, as

indicated in the article. It is essential for marketers to not only advertise their products but also to emphasize the value and overall experience of Generation Z, as it is essential to comprehend their behaviors and desires. Lastly, it is anticipated that TikTok livestreaming will present yet another chance to enhance society and the nation in the future.

Abstract: Employee engagement has been one of the deepest issues for organizations. Organizations are currently struggling to survive due to the tough current economic environment, whereas the only tool for the organization to achieve a competitive advantage is by engaging employees to foster a competitive edge in the marketplace. Previous studies discovered that employee engagement in Malaysia is still steadily improving but falling behind its neighboring countries, including Indonesia and the Philippines, with the result rising only by four points to 63%. In addition, it was revealed that our country still ranks among the lowest in the region. This study focuses on employee engagement among call centers at selected telcos in Malaysia. There are many theoretical approaches to examining the quality of work life and employee engagement. Hence, this study adopted the Spillover Theory and Self-Determination Theory to explain the relationship between independent variables and employee engagement.

Keywords: *Employee Engagement, Quality of Work Life, Call Center*

1. Introduction and Background

Employee engagement is the positive attitudes, interests, and attachment of employees toward the organization, its mission, vision, goals, and values (Mat et al., 2019). Nasreen et al. (2019) mentioned that employee engagement is a required benefit and can be a key managerial objective. The concept of employee engagement may be vital because it has many effects and includes many factors. It influences things like job fulfillment, commitment to the company, stress, task performance, and pressure (Saks, 2019). A lot of earlier research has also proved that employee engagement affects job performance. Besides, many scholars revealed that employee engagement impacts other variables for instance creativity (Ismail et al., 2019; Eldor & Harpaz, 2016).

According to Gallup (2022), State of the Workplace research showed that 60% of workers experience feeling disconnected at work, while 19% are actively detached. In Sub-Saharan Africa, 21% of employees are actively engaged at the workplace, 46% are considering quitting occupations, and 23% experience everyday unhappiness at work. Employees who are highly engaged mostly prefer to take joy in their work, maintain close relationships with their coworkers, and may be less likely to consider quitting (Bahri et al., 2020). According to Gallup (2017b), employees will show good engagement if management focuses on the basic human need for psychological engagement.

Employee engagement is directly connected to their quality of work life. Quality of work life may be preferred as working conditions, job contentment, chance for continuous growth, work-life balance, workplace stress management, organizational culture, communication, and social relationships. Quality of work life has gotten attention in recent years due to its ability to foster employee engagement and enable the attraction and retention of personnel (Ranna & Sharma, 2019; Suifan et al., 2016). Harini et al. (2019) observed a positive and statistically existing correlation between the quality of work life and employee engagement. Specifically, the researchers discovered that employees who practiced a more balanced working life presented a higher degree of engagement (Harini et al., 2019).

According to Sahni (2019), compared to other industries, telecommunications is a more rapidly growing and

dynamic sector, however, the increase puts weight on each employee because their working hours are also longer than before. The transformation of technology and services that is taking place in the telecom industry challenges every employee to move more quickly, effectively, and efficiently when carrying out tasks. To adjust the quality of work life among employees, the industry needs to play an important role by constantly being concerned and taking proactive steps, which will help each employee focus more and be able to adapt to change (Sahni, 2019).

Kotera et al., (2021) determined that the tendency to not engage when working can prevent them from achieving their goals, which in turn reduces opportunities to be productive because they do not achieve the desired results. Additionally, employee engagement rates continue to decline while working around the world, based on the results of employee engagement surveys, despite numerous journals and articles mentioning a high increase in employee engagement (Saks, 2017). An increase in workplace accidents and obstacles to organizational progress, coupled with a decline in employee morale, financial impact, and productivity, can significantly impact the organization through employee disengagement (Robotham et al., 2020).

From a practitioner's viewpoint, there is a significant gap in terms of the percentage of employee engagement scores across countries and the global average score. According to a report by Aon Hewitt (2017), for the years 2015 and 2017, there are still a few countries, including Malaysia, where employee engagement is minimal than the global average of 65 percent. Disengaging employees costs United States companies up to $5.5 billion annually (Vega, 2020). As cited by Natrajan et al. (2019), after six months, their engagement drops by 38% and can only reach 20% of their initial level even though employees are normally highly engaged at the start of their careers. Since studies among call center employees mainly focused on turnover rate or turnover intention, this study is looking into another aspect of employee development, which is employee engagement. Recent studies show that call centers are now a valuable resource in improving the customer experience. However, most employees from call centers receive high stress in the workplace environment and experience high rates of quitting (Baek & Lee, 2018).

It was anticipated that call centers in Malaysia would produce more than $15.5 million in profits for the organizations. Moreover, the high attrition rate among call center employees impeded the growth of profits as organizations were forced to pay additional operational expenses to retrain and replace new employees (Narehan et al., 2020). Based on the discussion mentioned above, this paper tries to find the answers, is there a relationship between quality of work life and employee engagement? And which factors of quality of work life predict employee engagement?

2. Literature Review

Call Center

A call center is known as a facility that handles many telephone calls, usually for customer service and technical support. The center serves as the main channel for companies to interact with their customers, solve problems, provide information, and ensure customer satisfaction. Call centers are often regarded as a fundamental factor in driving several commercial processes in the contemporary business environment. As a result, call centers play a crucial role in the global economy (Horng & Lin, 2020). They are seen as essential resources utilized by firms to maintain communication with customers and address issues referring to products and services (Nazli, 2020).

The industry's rapid expansion can be recognized as technological advancements, globalization, and shifts in customer expectations and habits (Han et al., 2020; Connell & Hannif, 2009; Hannif et al., 2008; Rameshbabu et al.,2013) by an expected 20% annually to account for about 3% of the workforce in the United States and the United Kingdom (Nag & Helal, 2017). In view of Nkonde and Phiri (2020), call centers prepare enhanced customer service through competence while expanding their market share through competence. Moreover, the 24/7 economy has created the functions and characteristics of call centers, which in turn shaped the 24/7 economy.

Further, the preferences of customers to transact business virtually using their technical devices are examples of shifts in consumer requirements and habits. Consequently, businesses have been pushed to change their

operating strategies to enable customers to conduct business wherever they are and whenever they choose, thus raising the 24/7 economy (Riekhoff, Krutova, & Nätti, 2019). The impact of differences in the consumer and business environment has caused many companies to reduce or downsize their physical locations. With this move, face-to-face interactions with customers become less frequent, making call centers the main channel for customers to communicate with the company (Nag and Helal, 2017). Therefore, customers utilize call centers primarily to settle issues they cannot fix (Nkonde et al, 2020).

Employee Engagement
Employee engagement is a critical topic in cooperation management theory and practice. On the other hand, definitions, ideas, antecedents, and consequences differ significantly (Sun & Bunchapattanadasakda, 2019). In the words of Uddin et al. (2019), employee engagement is meaningful for the survival and success of businesses. Employee engagement is described as an emotional interaction characterized by a positive attitude toward the organization's values (Sun & Bunchapattanasakda, 2019). Similarly, employee engagement is seen as critical in Human Resource Development (HRD) as a critical concept for many organizations (Lee & Eissesstat, 2018). This substance is also broadly discussed in a variety of fields, particularly industrial development, psychology, and organizational management (Wood et al., 2020). Besides, employee engagement is a multidimensional motivating notion that reveals a person's physical energy, cognition emotions, and excellent performance (Kuok & Taormina, 2017). As a result, focusing on employee engagement is needed nowadays because it can increase an organization's sustainability quality, as evidenced by favorable outcomes in prior research (Bakker & Albrecht, 2018). Intrinsically motivated employees always want to grow and develop because they are always connected to their position. Employee engagement rises because of the intrinsic link since they desire to be more active in their role (Adil & Hamid, 2019; Amabile & Pratt, 2016). Understanding the difference between motivation and engagement, as well as the relationship between the two, can help companies devise methods to maintain employee engagement levels. When companies understand how motivation drives employees and how engagement improves performance, they can develop more effective strategies to keep employees interested and committed to their jobs.

Martin (2020) conducted research that explored employee engagement in various library positions in the United States. Participants consisted of staff in a variety of positions, including user services, acquisitions, cataloging, information literacy, library technology, and support systems. There was a total of 1,100 relevant questionnaires used for testing, including 139 responses from men and 939 from women. The UWES-17 is used to determine the overall level of employee work engagement. As claimed by Martin (2022), a one-way ANOVA analysis shows that there is a difference in engagement according to gender, where women (M=4.32) statistically show more engagement or connection than men (M=3.87).

Quality of Work Life
Recently, researchers have identified QWL as employees' sense of comfort and well-being in the workplace (Hermawati, 2019; Monzani et al, 2016; Nayak & Sahoo, 2015). Afterward, industrial psychologists and management specialists generally agree that QWL is primarily concerned with promoting employee well-being. Kwahar and Iyortsuun (2018) also noted that the term QWL can vary depending on the nature of the industry and the working environment of the organization. Exactly, they described QWL in the context of the hospitality industry as a means of humanizing the work environment by improving physical work settings, remuneration and benefits, social relationships, job characteristics, management systems, and employee relations.

In the tourism field, the quality of work life is getting more and more attention. Previous research has demonstrated that various factors, including organizational attachment, leadership style, and corporate social responsibility practices, influence the quality of work life and life satisfaction of tourism workers (Ampofo et al., 2021; Kara et al., 2013; Kim et al., 2021). The well-being of tour facilitators merits special consideration. Anxiety can be caused by inherent characteristics of tour guidance, such as unstable income and future uncertainty (Chen & Chang, 2020).

Generally, numerous publications have revealed and evaluated the quality of work life (QWL) as a multidimensional model of influencing factors, as it is widely used in terms of managerial, worker behavioral, and individual performance variables (Aruldoss et al., 2021). In general, quality work life is achieved by humanizing work, whereas basic requirements demand more, which has persuaded employees to expand their

work quality (Malik et al., 2020). Quality work life has been explored as a job enrichment path and a motivating tool for significant variables of career achievement, job satisfaction and career balance regarding employee requirements (Davoodi et al., 2020).

This is consistent with empirical studies on the role of the quality of work life in relation to the concept of employee loyalty to the organization, which motivates employees and improves the best performance in the organization to increase their involvement (Park et al., 2019). Along with the request for additional research on quality work life to identify the significant aspect of employment, this study checks the closest aspect, namely the work engagement scope (Sahni, 2019).

Many studies confirm that the quality of work-life influences employees in terms of identification with the organization, job satisfaction, teamwork, effort at work, job achievement, intention to quit, resignation rate, and alienation from the organization (Aruldoss et al., 2021). Consequently, this paper acknowledges that embracing the idea of employee engagement is critical to organizational accomplishment, and organizations need to develop better strategies to foster highly engaged employees (Setyaningrum & Pawar, 2020).

Silarova et al., (2022) demonstrated that the quality of work life among nursing staff was studied a decade ago to determine whether employees were fulfilling their individual needs through experience while achieving organizational goals. Work-life balance is closely related to the emotional, physical, and mental health of employees and in turn affects organizational outcomes, work quality, and attrition rates. The main characteristics of work life include work-related factors, organizational characteristics, balance between personal and professional spheres, and professional personality (Silarova et al., 2022; Hsu, 2016).

A low quality of work life can also result in increased medication use, sleep difficulties, migraines, frustrated outbursts, depression, anxiety, nightmares, poor appetite, and job or career changes (Cha & Lee, 2022). According to studies, poor work-life balance affects social aspects and, subsequently, the quality of medical care (Souza Calliari et al., 2021). Empathy, fatigue, and traumatic stress are often linked with job satisfaction, which affects the quality of life at work. Job stress and satisfaction can also impact on a person's quality of life at work (Inocian et al., 2021).

The link between Quality of Work Life and Employee Engagement
A call center in the telecommunications industry is facing challenges in considering work and personal life, dealing with unclear work roles, and affecting individual well-being. Studies have revealed that call centers encounter significant pressure or stress due to rushed task completion and limited time constraints. Call centers also experienced work for extended periods, encountering interruptions during task completion and often lacking sufficient rest periods. High work pressure can lead to stress and emotional health issues (Curzy et al., 2020; Felstead and Henseke, 2017)

Hermawati and Mas (2017) found that the quality of work life has a positive relationship with employee engagement, and these two variables play a crucial role in influencing the relationship between global leadership and employee performance. In addition, the results of the study by Smeltzer et al. (2017) showed the influence of employee engagement on quality of life in the United States. Overall, quality of work life and employee engagement are closely related, and both characteristics influence employee performance outcomes.

Furthermore, extensive research over the years has shown the importance of quality of work life (QWL) in expecting employee engagement. Toscanodel Cairo et al. (2020), presenting insights from South America, found that organizational initiatives to improve the quality of work life had a positive effect on the level of employee engagement in a higher education institution in Colombia. Quality of work life (QWOL) is an important factor influencing employee engagement, in addition to job satisfaction, workplace interactions, freedom of choice, and continuing education (Geldenhuy et al., 2015). Therefore, it is expected that employees who receive sufficient advantages from their employer are more committed to their work. In addition, when employees have been treated equitably, with dignity, and with respect, these employees are connected at work. The character of working life raises employee engagement. From the existing literature mentioned, this is a new field to investigate, particularly from the perspective of call center employees.
H1: There is a relationship between Quality of Work Life and Employee Engagement

3. Theoretical Framework: Underpinning Theory

Self-determination theory related to employee engagement
Gagné et al. (2017) mentioned that self-determination theory encompasses a broad concept of motivation, personal objectives, and well-being in relation to engagement and motivation at work. This theory becomes the theoretical basis for studies that observe the relationship between the quality of work life and employee engagement. In self-determination theory, individuals thrive in work environments that meet their basic psychological needs. This concept is important because it shows that employees are more engaged and motivated when needs such as autonomy, competence, and social connection are met in their workplace (Olafsen et al, 2015; Ryan & Deci, 2017). In accordance with self-determination theory, a person's primary psychological requirements are autonomy, competence, and relatedness (Ryan & Deci, 2017). Self-determination theory applies to numerous fields, including business, sports, education, religion, healthcare, and interpersonal relationships (Güntert, 2015). The individual is a central reference in Self-Determination Theory (SDT), and variables such as management style and work context can either support or hinder motivation and well-being. SDT provides an evidence-based approach to motivation and involvement, so it is able to challenge conventional wisdom about motivation in the workplace and fit societal transformation by stressing individual strengths. This approach emphasizes that intrinsic motivation, such as the desire to grow and connect with others, is more effective in the long term than extrinsic motivation based solely on reward.

According to self-determination theory, all people have an essential desire to develop, grow, improve their environment, and live life with passion. People who are energetic, dynamic, passionate, curious, and creative, who take the initiative and are excited about life and its chances, function optimally. Moreover, people at the other end of the spectrum are uninterested, bored, lonely, and disengaged effects of their energy and enthusiasm for life have disappeared. Self-determination theory presents that these people have unfulfilled needs for competence, autonomy, and connectedness (Deci & Ryan, 2000).

Deci and Ryan sought to understand the results of studies in intrinsic motivation and internalization when they realized the three needs of competence, autonomy, and relatedness through inductive empirical methods. SDT illustrates the needs as necessary nutrients for healthy human functioning, which, if unmet, can negatively impact personal well-being. Therefore, SDT emerged to elucidate the three crucial elements necessary for intrinsic motivation, psychological development, and overall well-being (Deci & Ryan, 2000).

Spillover Theory Related to Quality of Work Life.
Spillover refers to the phenomenon where employees' activities, attitudes, and behaviors at work carry over into their personal lives. Sirgy et al. (2001) used spillover theory as a conceptual framework to develop a quality of work life (QWOL) measurement tool. Spillover theory suggests that employees' experiences are not only confined to the workplace but also spill over into their personal or family lives, existing in an unbounded environment. In theory, this spillover can be positive or negative (Khateeb, 2021). Positive spillover refers to the belief that positive experiences at work lead to feelings of satisfaction and achievement in one's personal or family life, and vice versa. Negative spillover occurs when a negative experience in one domain causes a negative experience in another domain, which reflects the reverse relationship between the domains. Positive spillover describes the idea that positive experiences in one aspect of life can lead to positive experiences in other aspects of life (Vijayakumar & Janakiram, 2017).

Life satisfaction can be influenced when the presence or absence of happiness in one important area of life has the potential to have a vertical or horizontal impact on other areas of life. An example of a spillover could be after experiencing a similar reaction from a superior at work, an employee becoming suddenly angry and acting hostile towards a family member. According to spillover scholars, there is a relationship or a strong correlation between the domains of work and home life, as well as between home life and work (Mauno et al., 2017).

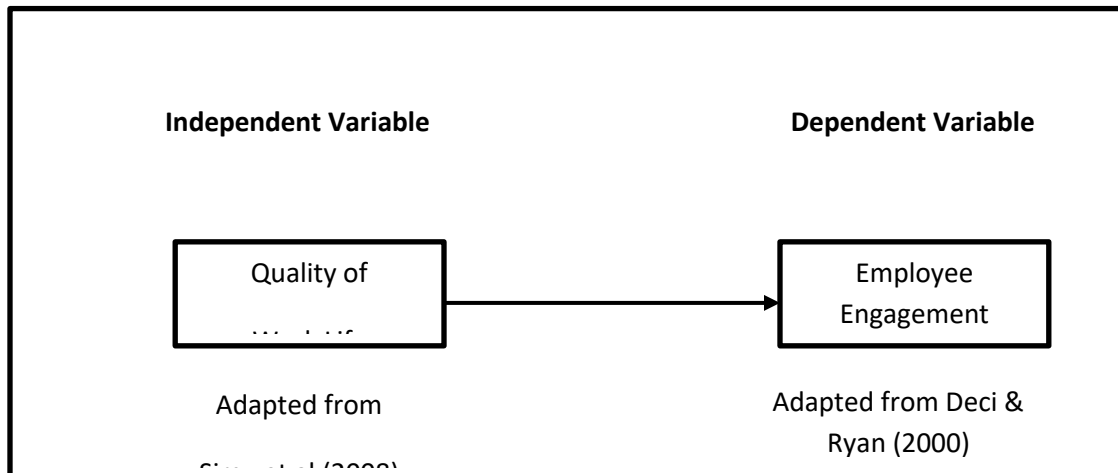
Patel (2018) asserts that the spillover theory holds the distinction of being the most frequently utilized and cited among the several theories about work-life balance. Patel found the work and family structures as two distinct approaches that compete within the framework of spillover theory. This theory suggests that there is potential for a positive or negative association between these two systems. The nature of the relationships is

affected by moderator effects, including factors such as place, time, flexibility and energy (Patel, 2018).

To discover the spillover idea, scholars have conducted studies to examine the influence of different variables on the connection between work and home behaviors. In their study, Barber et al., (2017) employed a quantitative research approach to explore the potential mediating influences of sleep and exercise on family treatment following cases of supervisor-lowering treatment, which encompasses various negative behaviors such as employee disapproval, critical feedback, anger, and work conditions that prevent the achievement of goals. The study conducted by researchers showed a significant correlation linking supervisor undermining and home undermining.

Furthermore, it was observed that this correlation played a mediating role in subjective sleep quality. These findings suggested comparable outcomes regarding the exercise's mediation impact. The authors proposed that the adverse effects of spillovers might be effectively mitigated through the implementation of suitable interventions, such as maintaining a regular sleep schedule and engaging in a well-balanced exercise routine (Barber et al., 2017).

From the literature reviewed, the conceptual framework for The Relationship between Quality of Work Life and Employee Engagement among telecommunication Call Center Employees in Malaysia is shown in Figure 1.

Figure 1: The Relationship between Quality of Work Life and Employee Engagement


4. Conclusion

This study shows the significance of quality of work life and employee engagement. The conceptual framework reveals the direct relationship between quality of work life and employee engagement. This study wants to measure the effectiveness of quality of work life that will enhance the level of engagement among call centers in the telecommunication industry. Indeed, this conceptual paper suggested that the survey results will address issues involving between quality of work life and employee engagement in the telecommunication call centers industry. Hence, some suggestions for future research are to study other variables involved in testing the model for current issues linked to quality of work life and employee engagement.

Abstract: This conceptual paper explores the impact of leadership styles, work-life balance, and the physical environment on psychological well-being using the Job Demands-Resources (JD-R) model as the theoretical framework. In the contemporary workplace, evolving job demands, rising expectations for mental health support, and persistent stressors like job insecurity have increased the need for organizations to prioritize employee well-being. Leadership is identified as a critical mediating variable that enhances or mitigates the effectiveness of job resources, such as work-life balance and physical environment, in promoting psychological well-being. Transformational and servant leadership styles are emphasized for their role in fostering supportive work environments that buffer the negative effects of high job demands. Additionally, the paper underscores how well-designed workspaces and balanced work-life integration can significantly enhance employee well-being, contributing to higher engagement and performance. The JD-R model provides a robust lens through which the interactions between job demands, resources, and leadership can be examined. This framework offers organizations practical strategies to safeguard employee psychological well-being by fostering leadership that advocates for flexible work arrangements and supportive physical environments. Future research should empirically validate the proposed relationships to further refine the role of leadership in promoting employee well-being.

Keywords: *Psychological Well-Being; Job Demands-Resources Model (JD-R); Leadership Styles; Work-Life Balance; Physical Environment*

1. Introduction and Background

The current situation of employee psychological well-being is a mix of evolving work models, rising expectations for mental health support, and the ongoing impact of work-related stress and burnout (Salanova et al., 2021). While many organizations are making strides in addressing these issues through mental health programs, flexible work policies, and empathetic leadership, challenges such as job insecurity, poor workplace culture, and leadership failures continue to hinder employee well-being (Prasad et al., 2020). Addressing these concerns holistically and proactively is critical for maintaining a healthy and productive workforce in today's rapidly changing work environment (Tanjung et al., 2021; Rahi, 2023). The well-being of employees is increasingly recognized as a critical factor influencing organizational productivity, engagement, and long-term success. Psychological well-being encompasses various dimensions of an employee's experience, including emotional, mental, and social health, which are essential for fostering a motivated and satisfied workforce. Research indicates that psychological well-being is not merely a byproduct of job satisfaction but a foundational element that enhances employee engagement and performance across various sectors (Ausat, 2024; Kundi et al., 2020; Hanif et al., 2021).

Several factors contribute to the psychological well-being of employees, including job demands, work-life balance, and the design of physical workspaces. Occupational stress has been shown to negatively impact work-life balance and psychological well-being, particularly in high-demand industries such as e-commerce (Prasad, 2022). The blurring of boundaries between work and personal life, exacerbated by remote working conditions, has further intensified these challenges, leading to increased stress and diminished well-being (Prasad et al., 2020). Effective management of these stressors is crucial, as prolonged exposure to negative work conditions can result in withdrawal from social interactions and reduced productivity (Tsalasah et al., 2019; Presantoro, 2024).

Moreover, leadership styles play a significant role in shaping employee psychological well-being. Transformational leadership, for instance, has been linked to improved employee well-being by fostering a positive organizational climate and encouraging employee engagement (Ausat, 2024; Lindert et al., 2022). Ethical leadership and supportive workplace practices are also associated with enhanced psychological well-being, as they promote a culture of trust and open communication (Yousaf et al., 2019; Salanova et al., 2021). The presence of supportive leadership can mitigate the adverse effects of workplace stressors, thereby enhancing employee resilience and overall well-being (Ding & Yu, 2021; Rahi, 2023).

The design of physical workspaces has also been identified as a critical factor influencing employee well-being. Work environments that promote flexibility and support work-life balance contribute positively to psychological well-being (Stankevičienė et al., 2021; Alsheweir, 2023). Organizations that implement flexible working arrangements can reduce work-nonwork conflict, leading to improved employee satisfaction and commitment (Rahim et al., 2020). Furthermore, fostering a culture of organizational support and citizenship behavior can enhance job satisfaction and, consequently, employee well-being (Adnan et al., 2021).

This conceptual paper explores the influence of leadership styles, work-life balance, and the physical environment on psychological well-being, using the Job Demands-Resources (JD-R) model as the guiding theoretical framework. The JD-R model offers a comprehensive lens for examining how job demands negatively impact employee well-being and how job resources can buffer these demands. By integrating leadership, work-life balance, and the physical environment as key resources within this model, this paper aims to present a holistic approach to promoting psychological well-being in the workplace.

2. Literature Review

Theoretical Framework: Job Demands-Resources Model
The Job Demands-Resources (JDR) model is a significant theoretical paradigm in occupational health psychology that clarifies the relationship between job demands, job resources, and their impact on employee well-being and performance. Originally formulated by Demerouti et al. (2001), the model asserts that job demands are elements of employment necessitating continuous physical or mental exertion, linked to specific physiological and psychological repercussions, including stress and burnout. In contrast, job resources refer to the physical, social, or organizational elements that facilitate the attainment of work objectives, alleviate workplace pressures, and promote human growth and development (Schaufeli & Taris, 2013; Orgambídez-Ramos et al., 2014; Tooren & Jong, 2014).

The JDR model functions through two fundamental processes: the health impairment process and the motivational process. The health impairment process posits that elevated job demands may result in strain and health complications, whereas the motivational process asserts that job resources may boost motivation and engagement, ultimately fostering improved performance and job satisfaction (Schaufeli & Taris, 2013; Crawford et al., 2010). This dual-process approach facilitates an in-depth understanding of how various workplace characteristics might affect employee outcomes, including engagement, burnout, and overall well-being (Orgambídez-Ramos et al., 2014; Boyd et al., 2010; Consiglio et al., 2013).

Numerous studies have repeatedly validated the JDR model in diverse occupational settings, illustrating its relevance in forecasting employee engagement and burnout (Korunka et al., 2009; Boyd et al., 2010; Consiglio et al., 2013). Research indicates that job resources might alleviate the adverse impacts of job demands on employee health, serving as a protective factor against burnout (Crawford et al., 2010; Korunka et al., 2009; Consiglio et al., 2013). The model has been augmented to incorporate personal resources, defined as human traits that can improve an employee's capacity to manage job demands, hence deepening the comprehension of workplace dynamics (Buonomo et al., 2021; Hassard, 2024; Tooren & Jong,2014).

Additionally, the JDR model has been employed to investigate the influence of organizational characteristics, including culture and management practices, on employee well-being. A supportive organizational culture can augment job resources, thereby fostering employee engagement and mitigating stress (López-Martín & Topa, 2019; Buonomo et al., 2021). This facet of the paradigm emphasizes the significance of organizational context in influencing employee experiences and outcomes (López-Martín & Topa, 2019; Hassard, 2024). This research

examines leadership, work-life balance, and the physical environment as essential employment resources that enhance psychological well-being by mitigating the impact of working demands.

Leadership Styles and Psychological Well-Being
Leadership is essential in promoting psychological well-being among employees, primarily by creating psychological safety in the workplace. Psychological safety denotes an environment in which individuals feel secure to articulate their thoughts, undertake risks, and exchange ideas without apprehension of adverse repercussions. This notion has been thoroughly examined about diverse leadership styles, such as authentic, inclusive, and servant leadership.

True leadership significantly enhances the promotion of psychological safety. Studies demonstrate that leaders displaying authentic actions foster an atmosphere of trust and safety among their subordinates, therefore improving employee engagement and well-being (Maximo et al., 2019; Frazier et al., 2016). Maximo et al. discovered that authentic leadership actions enhance psychological safety, which is crucial for cultivating a supportive work environment (Maximo et al., 2019). The meta-analytic analysis by Frazier et al. underscores the significance of leadership in fostering an environment that promotes psychological safety, indicating that comprehending the intricacies of leadership's influence is essential for improving employee well-being (Frazier et al., 2016).

Inclusive leadership significantly contributes to the cultivation of psychological safety. Research indicates that inclusive leaders foster workplaces in which employees feel appreciated and respected, promoting open communication and risk-taking (Ye et al., 2018; Wang & Shi, 2020). Ye et al. established that inclusive leadership correlates favorably with psychological safety, hence promoting employee learning from mistakes and improving overall well-being (Ye et al., 2018). Wang and Shi emphasized that inclusive leadership cultivates a supportive environment that promotes pro-social behaviors essential for psychological safety (Wang & Shi, 2020). Selander et al. observed that engaged leadership styles, such as servant leadership, markedly improve employees' psychological safety and well-being (Selander et al., 2023).

The connection between leadership and psychological safety is corroborated by data associating both variables with other beneficial outcomes, including less turnover intention and heightened job satisfaction. Ahmed et al. have shown that inclusive leadership substantially alleviates psychological discomfort in crises, hence enhancing employees' psychological well-being (Ahmed et al., 2020; Ahmed et al., 2020). The research conducted by Sobaih et al. identified psychological safety as a mediating factor between transformational leadership and turnover intention, indicating that leaders who cultivate a secure workplace can significantly mitigate adverse effects for employees (Sobaih et al., 2022).

Work-Life Balance and Psychological Well-Being
Work-life balance (WLB) has become increasingly recognized as a vital determinant of psychological well-being among employees in diverse sectors. A substantial amount of research demonstrates that attaining a healthy equilibrium between professional and personal life markedly improves psychological well-being, job satisfaction, and overall life contentment. This synthesis analyzes the correlation between work-life balance and psychological well-being, referencing several studies that elucidate the mechanisms and effects linked to this correlation.

Work-life balance directly influences psychological well-being. Prasad's research on occupational stress in the E-Commerce sector revealed that elevated levels of occupational stress adversely affected employees' work-life balance and psychological well-being, particularly regarding autonomy and life purpose (Prasad, 2022). Yayla and İlgin indicated that work-life harmony significantly predicts psychological well-being among nurses during the COVID-19 pandemic, highlighting that individuals with superior work-life balance generally derive greater enjoyment from their work and report higher life satisfaction (Yayla & İlgin, 2021). Studies show that work-life balance enhances a sense of worth and general pleasure, which are essential elements of psychological well-being (Singh, 2016).

Furthermore, numerous research has emphasized the mediation function of good emotions in the correlation between work-life balance and job performance. Faisal et al. contend that an improved work-life balance

cultivates psychological capital and good emotions, thus augmenting job performance (Faisal et al., 2022). This concept corresponds with the observations of Yang et al., who indicated that insufficient workplace assistance may result in familial complications, hence deteriorating work-life balance and undermining psychosocial well-being (Yang et al., 2018). The relationship between work-life balance and psychological well-being is not solely a straight link; it is also shaped by emotional and social dynamics within the workplace.

The influence of work-life balance on psychological well-being is apparent in several cultural situations. Nwanzu and Babalola's research underscores the necessity for investigations in developing nations to comprehend the impact of work-life balance on psychological well-being across varied cultural contexts (Nwanzu & Babalola, 2023). This is especially pertinent as the dynamics of work-life balance can differ markedly due to cultural expectations and corporate practices. The research by Zheng et al. indicates that an imbalance between work and family life presents a more significant risk for mental health problems than work-related stress alone, highlighting the necessity for organizational initiatives to foster work-life balance (Zheng et al., 2015).

Physical Environment and Psychological Well-Being
A recent study has significantly focused on the correlation between the physical environment and psychological well-being. Urban green areas are recognized as vital components that enhance mental health outcomes. Research indicates that access to urban green parks may reduce feelings of social isolation and diminish mental health problems by facilitating social engagement and physical activity year-round (Jabbar et al., 2021; Larson et al., 2016). Larson et al. performed an extensive study in multiple cities in the southern United States, emphasizing the significance of the quality, quantity, and accessibility of urban green spaces in improving physical, psychological, and social well-being (Jabbar et al., 2021; Larson et al., 2016).

Furthermore, interaction with natural areas has been associated with enhanced emotional well-being. Marselle et al. (2013) discovered that group walks in natural areas provide superior psychological benefits relative to urban settings, indicating that nature's restorative properties significantly contribute to mental health enhancement (Marselle et al., 2013). Keniger et al. further corroborated this, observing that exercise in natural environments can enhance psychological outcomes; however, they recognized the necessity for additional controlled studies to differentiate the effects of the environment from those of physical activity itself (Keniger et al., 2013).

The design and attributes of urban green spaces are significant, as demonstrated by Braçe et al., who highlighted the necessity of planning these areas to accommodate varied user requirements, thereby optimizing their psychological advantages (Braçe et al., 2021). Furthermore, studies demonstrate that the biodiversity of green spaces can amplify their restorative effects, indicating that not all green environments have comparable benefits for psychological healing (Wood et al., 2018).

The consequences of these findings relate to urban development and public health programs. The Natural Environment Initiative, established by Harvard University, seeks to investigate the impact of natural settings on human health and well-being, highlighting the essential interdisciplinary teamwork required for effective urban design (Lee, 2017). Moreover, research indicates that children with enhanced access to green spaces exhibit a reduced likelihood of developing psychiatric illnesses in adulthood, underscoring the enduring mental health advantages of early exposure to nature (Engemann et al., 2019; Alcock et al., 2014).

3. Research Methodology

This paper is conceptual and depends on a synthesis of previous material to establish a conceptual framework. The methodology encompasses the synthesis of findings from research on leadership, work-life balance, physical environment, and psychological well-being, all contextualized within the JD-R model. The suggested paradigm discusses the interaction of these variables in affecting employee well-being, establishing a basis for further empirical investigation.

Framework Development

This conceptual framework is grounded in the Job Demands-Resources (JD-R) model, which provides a robust theoretical foundation for understanding the interplay between job demands, job resources, and their impact on employee well-being. The JD-R model suggests that job demands (e.g., workload, time pressure) deplete energy and negatively affect employee well-being, while job resources (e.g., work-life balance, leadership support, physical environment) enhance well-being and buffer the negative effect of job demands. In this study:

- Work-life balance and Physical Environment are identified as key independent variables that function as job resources. These resources directly impact Psychological Well-Being by mitigating the stress caused by job demands.
- Leadership acts as a mediator that influences the strength and direction of the relationships between these resources (Work-Life Balance and Physical Environment) and Psychological Well-Being. Effective leadership can enhance the positive effects of job resources on well-being and further buffer the adverse effects of job demands.

The JD-R model posits that employees face two types of pressures at work: job demands (which negatively impact well-being) and job resources (which help alleviate job demands and promote well-being). In this framework:

- Job Demands: High job demands (e.g., workload, emotional demands) are the main stressors that negatively affect psychological well-being.
- Job Resources: Work-life balance and Physical Environment serve as job resources that buffer the negative effects of job demands.
- Leadership mediates the relationships between these job resources and psychological well-being, ensuring that supportive leadership can strengthen the positive effects of job resources and help further reduce the negative impact of job demands.

Therefore, this study proposed that:

- Leadership styles (transformational and servant) that provide job resources, such as emotional support and flexibility, will mediate the relationship between work-life balance and psychological well-being, enhancing well-being by buffering the negative effects of high job demands.
- Leadership styles (transformational and servant) will mediate the relationship between the physical environment and psychological well-being, ensuring that a well-designed physical workspace strengthens the positive impact on employee well-being, especially in high job demand contexts.
- Work-life balance will have a direct positive relationship with psychological well-being, as employees experience reduced work-related stress through policies that encourage balance between personal and professional life.
- A well-designed physical environment will have a direct positive relationship with psychological well-being by improving comfort and reducing workplace stressors, independent of the level of job demands.

This study's conceptual framework emphasizes the interrelated dynamics of work-life balance, physical environment, and leadership in shaping psychological well-being within the JD-R model setting. Leadership serves as a crucial intermediary, shaping the influence of job resources on psychological well-being by mitigating the adverse impacts of job demands. This integrative paradigm offers a thorough comprehension of how organizations can improve employee well-being via supportive leadership, work-life balance policies, and an optimally planned physical environment.

Conceptual Framework
Figure 1: Proposed Conceptual Framework
The conceptual framework discusses the interconnections between Work-Life Balance, Physical Environment, Leadership, and Psychological Well-Being. In this model, Work-Life Balance and Physical Environment function as the principal independent variables (IVs), directly influencing Psychological Well-Being, the dependent variable (DV). Leadership serves as an intermediary in these interactions, influencing the degree to which Work-Life Balance and Physical Environment affect Psychological Well-Being. The impact of these independent variables on psychological well-being may be either boosted or reduced, based on the leadership style and its effectiveness.

These are the key elements of the conceptual framework:
Work-Life Balance (IV): Defined as the extent to which employees can balance their work responsibilities with their personal lives, work-life balance serves as a resource that reduces stress and improves psychological well-being.
Physical Environment (IV): Refers to the physical workspace, including ergonomics, noise levels, lighting, and overall comfort. A well-designed physical environment promotes comfort and reduces mental and physical strain, which in turn enhances psychological well-being.
Leadership (Mediating): Leadership is positioned as a mediating variable that influences how Work-Life Balance and Physical Environment affect Psychological Well-Being. Leadership styles such as transformational and servant leadership play a critical role by providing emotional and practical support, advocating for work-life balance policies, and promoting a positive physical environment. This mediating role strengthens the effects of these job resources on well-being and reduces the negative impact of job demands.
Psychological Well-Being (DV): The outcome of the model is psychological well-being, which refers to employees' mental health, emotional balance, and overall sense of satisfaction in the workplace.

This framework aligns with modern organizational studies, suggesting that leadership is not an isolated factor but one that enhances or mitigates the effectiveness of workplace conditions like work-life balance and physical environment in promoting psychological well-being.

4. Discussion

Implications of the Proposed Model
The proposed conceptual framework provides significant insights for organizations seeking to improve employee well-being by targeting essential workplace resources. Comprehending the interrelated functions of Work-Life Balance, Physical Environment, and Leadership offers organizations a comprehensive strategy for enhancing Psychological Well-Being.

Leadership significantly mediates the impact of Work-Life Balance and Physical Environment on employee well-being. Leadership development programs must be structured to equip leaders with essential skills to cultivate supportive and empathetic workplace environments, advocate for flexible work-life balance policies that address diverse employee needs and promote the maintenance of optimal physical workspaces that enhance comfort, productivity, and mental health.

By prioritizing leadership development in these areas, organizations can enhance the impact of work-life balance policies and thoughtfully planned work environments on employee well-being. This comprehensive strategy not only improves psychological well-being but also elevates employee happiness, retention, and overall performance.

Relevance of the JD-R Framework
The Job Demands-Resources (JD-R) model offers an outstanding theoretical basis for this concept, elucidating the interaction between job resources (such as work-life balance, physical environment, and leadership) and job demands regarding employee well-being. The JD-R paradigm asserts that although job demands may adversely impact well-being, the availability of job resources can mitigate these impacts, hence enhancing well-being and engagement.

This paper enhances the JD-R framework by highlighting the significance of Leadership as a mediating variable. Leadership serves as a job resource and simultaneously improves the effectiveness of other resources, including work-life balance and the physical environment, in alleviating the adverse impacts of elevated workplace demands. Integrating leadership into the JD-R model enhances the framework's capacity to elucidate how organizations may navigate the intricate interplay between demands and resources to cultivate a psychologically healthy work environment.

This conceptual framework posits that, when bolstered by strong leadership, work-life balance regulations and physical surroundings can significantly mitigate the negative impacts of workplace demands. Therefore, organizations must prioritize the establishment of work cultures in which leadership actively endorses these job resources, so safeguarding employee psychological well-being, even under high-pressure circumstances.

5. Managerial Implications and Recommendations

Managerial Implications
Leaders significantly influence the workplace atmosphere and enhance employee welfare. Their influence transcends task management, cultivating a culture in which people feel supported, respected, and motivated. Transformational and servant leadership styles are especially helpful in fostering a corporate culture focused on well-being. Leaders may improve the efficacy of work-life balance policies by offering emotional and practical support, thereby ensuring that the physical environment promotes health and comfort. This strategy enhances employee engagement while alleviating the adverse impacts of job expectations, enabling employees to sustain elevated levels of psychological well-being even under challenging circumstances.

Work-life balance is a crucial element in employee well-being. Organizations that adopt flexible work arrangements, including remote work choices and adjustable hours, equip employees with the means to efficiently balance professional and personal responsibilities. This thus diminishes stress, enhances job satisfaction, and fosters overall psychological well-being. Moreover, providing mental health and well-being programs can alleviate the pressure exerted by elevated job demands on employees, fostering a more supportive and balanced workplace atmosphere.

The physical environment significantly impacts employee well-being. An ergonomically designed workstation with appropriate furniture, adequate lighting, and noise management boosts productivity and promotes improved mental and physical well-being. An effectively planned physical environment indicates that the organization values employee comfort and well-being. For remote employees, supplying resources to enhance home office configurations is crucial, as it directly influences their comfort, productivity, and general well-being.

Recommendations
Organizations should engage in leadership development programs that train leaders to prioritize employee well-being to cultivate leadership that enhances well-being. Transformational and servant leadership styles ought to be promoted, as they foster a helpful and empowering workplace atmosphere. Furthermore, leaders must be authorized to promote work-life balance programs and endorse attempts to establish a physical work environment conducive to both psychological and physical well-being.

To achieve work-life balance, organizations must establish flexible work practices that allow people to effectively manage their personal and professional obligations. Providing remote work alternatives, flexible scheduling, and wellness support initiatives, including mental health resources and stress management courses, will alleviate stress and enhance overall job satisfaction. These activities will foster a more supportive environment that enhances long-term psychological well-being.

Organizations should design workspaces that emphasize ergonomics, adequate lighting, and noise management to improve comfort and productivity. Equipping employees with thoughtfully planned, supportive physical work environments will alleviate workplace stress and enhance their well-being. Organizations might provide stipends or resources to remote employees to enhance their home office arrangements, so guaranteeing a favorable environment for productivity and well-being.

Conclusion

This conceptual paper has proposed a framework that integrates leadership, work-life balance, and the physical environment within the JD-R model to explain their collective impact on psychological well-being. While the propositions outlined in this paper are grounded in existing research, future empirical studies are needed to validate the framework and test the relationships between these variables. By taking a holistic approach that addresses these three factors, organizations can foster environments that promote psychological well-being, leading to higher employee engagement, productivity, and satisfaction.

Abstract: The trend towards buying organic food is declining among young adults, which raises concerns about factors influencing their purchasing behavior. This study investigates factors affecting young adults' buying behavior of organic food products, including environmental concerns, knowledge, and health consciousness. Survey data was collected from 100 young adults in Selangor, Malaysia. Multiple regression analysis was conducted to analyze the data. The results showed that knowledge about organic food was the strongest predictor of young adults' organic food purchasing behavior. In addition, concern for the environment had a significant positive influence on young adults' organic food purchasing behavior, while health consciousness showed no significant influence. These findings offer practical implications for manufacturers: to provide clear product details that can enhance consumers' knowledge and highlight environmental advantages in marketing strategies to encourage consumption. This study contributes to the literature by highlighting the value of environmental awareness and knowledge of organic food and shedding light on the minor influence of health awareness-a topic that has received less attention in other studies.

Keywords: *Organic Food, Green, Buying Behavior, Environmental Concern, Health Consciousness, Knowledge.*

1. Introduction

Organic food, i.e. agricultural products that are grown, treated and processed using natural resources and without conventional pesticides, is gaining importance worldwide. These products are free of antibiotics and contain higher levels of vitamins and proteins so fewer additional food supplements are required (Paul & Rana, 2012; Armin, Chin, & Neda, 2013). The demand for organic food in Asia has seen a remarkable growth of 20% per year (Somasundram et al., 2016; Radman, 2005), reflecting a societal shift towards healthier and more sustainable consumption patterns. Key societal drivers of this trend include increasing environmental awareness, rising health consciousness and changing lifestyles where individuals prioritize wellness and sustainability in their food choices (Marozzo et al., 2023). Consumers in Asia are paying higher prices for organic products, despite their higher costs, as they are increasingly concerned about long-term health and environmental sustainability.

In Malaysia, the consumption of organic food is increasing, driven by changing consumer behavior toward healthier food (Abdullah et al., 2022; Siti Hasnah et al., 2015; Armin et al., 2013). Malaysia's growing middle class, higher disposable income and increased environmental awareness have contributed to this change. However, according to Chen (2009), the consumption of organic food among young adults is still underdeveloped. This attitude is relatively due to the lack of awareness of organic products and insufficient environmental awareness in this population group. Furthermore, Yi et al. (2024) point out that young adults' limited knowledge of the benefits of organic food, combined with misconceptions about what constitutes an organic product, is a significant barrier for them in purchasing organic products. This is particularly important in Malaysia, where cultural factors such as traditional food preferences and the convenience of non-organic options can also influence purchasing behavior.

Young adults are an important demographic in the organic food market as their preferences can signal future trends in food consumption. As this group increasingly influences market dynamics, it is important to understand their purchasing behavior. Young adults are also more likely to be influenced by digital marketing and social media, which can reinforce or inhibit their interest in organic food depending on the available information. Therefore, investigating the factors influencing their buying decisions is key to identifying potential strategies to promote organic consumption among this group.

Despite the growing interest in organic food consumption, few studies specifically address the factors that influence the purchasing behavior of young adults in Malaysia. This study tries to fill this gap by examining how knowledge of organic food, concern for the environment, and health awareness influence the purchasing decisions of young adults, thus contributing to the understanding of this under-researched segment of the organic food market.

2. Literature Review

Environmental Concerns
Environmental concerns are linked to an individual's self-perceived responsibility for the environment. Organic food can help reduce natural pollution, protect the health of water and soil, and reduce the use of chemicals in agriculture. Alternatively, organic food products are also known as green products. Paul and Rana (2012) asserted that preserving natural resources for future generations is vital to ensure they obtain a chance to experience and use the natural resources for their use. It will also prevent diseases that might harm future generations since the more technology is enhancing and growing day to day, the more problems and diseases might increase and make the situation worse. Moreover, normal farming is not better than natural farming (Armin et al., 2013). Avoiding chemicals in food results in a higher cultivation rate, which can be achieved. Previous research has found that young adults with a high level of environmental awareness tend to buy organic food (Bagher et al., 2018; Curl, Fenske, & Elgethun, 2003). Prakash et al. (2023) emphasized that young adults' intention to purchase organic food is positively influenced by their environmental concerns. According to previous research (Yi et al., 2024; Prakash et al., 2023; Shamsudin et al., 2018; Ayub et al., 2018), young consumers' preferences for organic products are greatly influenced by their awareness of environmental issues, as they are more likely to choose environmentally friendly options when making purchases.

Asia's growing environmental consciousness, especially in reaction to pollution and industrial expansion, has made consumers more conscious of how their decisions affect the environment (Prakash et al., 2023). This shift towards sustainability is particularly evident among young adults, who are increasingly concerned about reducing their carbon footprint. The growing demand for organic products reflects the larger Asian environmental movement, which includes government programs to support sustainable agriculture. These trends are in line with changing lifestyles, where consumers are trying to balance their environmental responsibility with their consumption habits and support organic products due to their eco-friendly characteristics (Yi et al., 2024). Consistent with the literature, this study thus posits that:
H1: Environmental concern has a significant effect on young adults' buying behavior of organic food products.

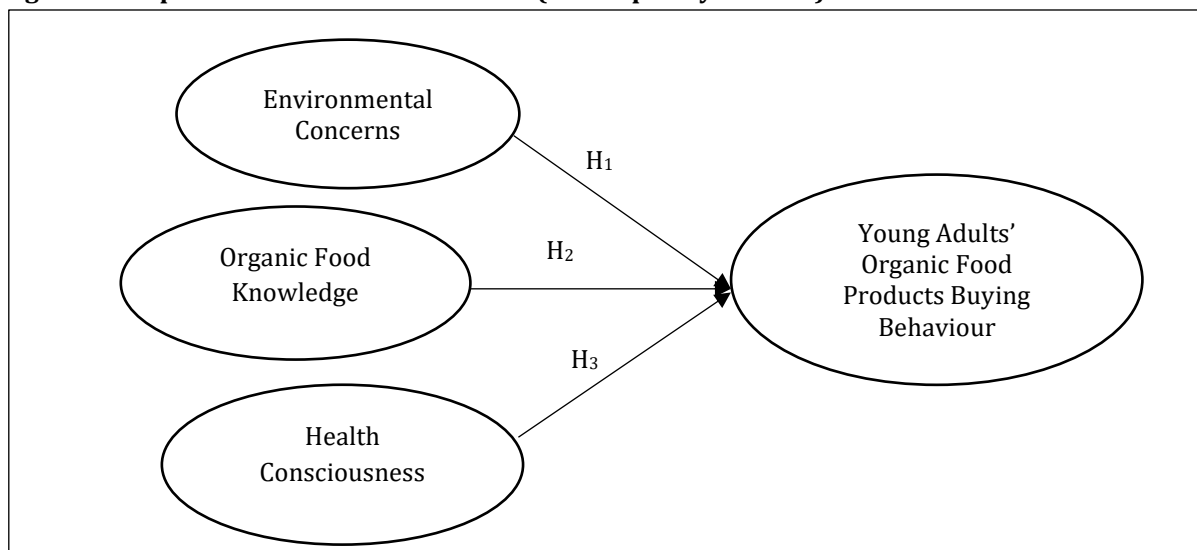
Organic Food Knowledge
Organic food knowledge is associated with a person's factual knowledge of organic food and awareness as a prerequisite for developing organic food purchasing behavior. People with knowledge about organic food recognize the importance of their actions for the environment. Consumers with a low level of knowledge about organic food and a low level of education are less likely to purchase organic food because they are not aware of the benefits (Quah & Tan, 2010). Educated consumers, especially college degree holders, have the highest number of users compared with those consumers who are not educated. This suggests that greater knowledge and awareness of organic food leads to a more positive attitude and higher purchase intention. As mentioned by Paul and Rana (2012), consumers with higher education tend to have a more positive attitude. They know the health benefits of organic food and how it can change a person's lifestyle by consuming it daily and preventing diseases. Thus, the connection between organic food knowledge and education level and buying behavior toward natural food cannot be left out. In conclusion, the research that is currently available indicates

that increasing consumer awareness and understanding through education may result in more favorable attitudes and increased focus on buying organic food (Yi et al., 2024).

Similarly, growing awareness and education about organic products in Asia has had a significant impact on consumer purchasing decisions. Consumers, particularly young adults, are becoming more conscious of the sustainability and health advantages of eating organic food as more information about the advantages of organic farming and its role in environmental preservation is shared, especially through social media and government initiatives. This growing trend is in line with a broader lifestyle shift, where a health-conscious and environmentally friendly lifestyle is increasingly at the forefront. Asian consumers are becoming more discerning in their food choices and are looking for transparency in production methods and ingredients, fueling the growing demand for organic products. The hypothesis is proposed. Hence, this study put forward that:
H2: Organic food knowledge has a significant effect on young adults' buying behavior of organic food products.

Health Consciousness
Health consciousness can determine consumers who are concerned about their health and they will find ways to improve their quality of life and end their poor fitness (Parashar et al., 2019; Michaelidou, Nina & Louise, 2008). Organic food helps prevent cancer. Lockie et al. (2002) also found that consumers perceive organic products as a healthier alternative to conventional foods because they contain more nutrients that enhance personal well-being. Organic foods are also perceived as safer, better tasting and more enjoyable than conventional products (Rahman et al., 2021; Nadricka et al., 2020; Mohd Rizaimy et al., 2010; Magnusson, 2003). Moreover, the strongest motivator for people to purchase organic food is health consciousness (Huang et al., 2022; Parashar et al., 2019; Song, 2017; Nasir & Karakaya, 2014; Derk, Gerda, & Inge, 2012). They showed that health consciousness is the most important motivator influencing consumer behavior when buying organic food. Michaelidou and Hassan (2008) show that health consciousness is known to be a motivator for some consumers. Based on the positive relationship between consumers' purchasing behavior towards organic foods that are important for health, the following hypothesis is put forward.

In Asia, rising healthcare costs and concerns about lifestyle diseases have driven consumers, particularly young adults, to seek healthier alternatives to conventional foods (Huang et al., 2022). This fits into a broader trend towards preventative health care and holistic well-being, where eating organic food is thought to be safer and better. The findings of this study, however, indicate that young individuals' purchasing decisions for organic food are not substantially influenced by health awareness, despite the growing understanding of the advantages. This disparity could result from things like cost, accessibility, or mistrust of organic food claims. Consequently, the following hypothesis is proposed:
H3: Health consciousness has a significant effect on young adults' buying behavior of organic food products.

Figure 1: Proposed Theoretical Framework (Developed by authors)


3. Methodology

Sampling and Population
This study used a quantitative research design to assess young adults' environmental concerns, organic food knowledge, and health consciousness when choosing organic food. A structured self-administered questionnaire was distributed to a sample of 100 young adults aged 18 to 25 years in Selangor, Malaysia. This sample size is considered reasonable for statistical analysis, which is also confirmed by Hair et al. (2010). The structured questionnaire ensured consistency in data collection providing a reliable basis for the quantitative analysis of the variables studied.

The purposive sampling method was chosen to select participants who have an eco-friendly lifestyle and have experience purchasing green products. This purposive approach ensures that the sample accurately represents the population of interest, namely young adults who engage in environmentally conscious behavior. The study intends to offer significant insights into the elements that impact their choice to purchase organic food by concentrating on individuals having pertinent experience. This sampling technique improves the study's relevance and accuracy in determining how young adults' purchase decisions are influenced by their knowledge of organic foods, environmental awareness, and health consciousness.

Questionnaire development
There were two primary sections of the questionnaire. The demographic details of the respondents, such as age, gender, income, and educational attainment, were the main focus of Section A. These details are crucial for assessing the study's findings. Section B contained questions specifically designed to measure respondents' environmental concerns, organic food knowledge, health consciousness, and buying behavior, ensuring that all relevant aspects of the study objectives were considered.

A 5-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree), was used to rate the questionnaire items in Section B to precisely quantify the responses received. Because it most accurately captures the intensity of the respondents' attitudes and beliefs, this scale was selected. To make sure the things were trustworthy and pertinent to the study's setting, they were modified from Chakrabarti's (2010) well-known work. The structured format and validated items contribute to the robustness of the questionnaire and enable accurate and meaningful analysis of the factors influencing young adults' organic food choices. The detailed design and rigorous customization process underline the questionnaire's ability to provide high-quality data for this research.

4. Data Analysis

The completed questionnaires were carefully examined for accuracy and completeness after being collected. After that, the data was coded and added to statistical tools for a thorough examination. The demographic information of the respondents was compiled using descriptive statistics, which provide an accurate picture of the composition of the sample. The demographic profile of the respondents is shown in Table 1. Of the total number of respondents, 82% were female and 18% were male. The majority of respondents were under the age of 22.

Table 1: Demographic Characteristics of Respondents

Variable	Frequency	Percentage	Minimum	Maximum	Mean	Standard Deviation
Gender						
Male	18	18.0				
Female	82	82.0				
Age (years old)			18	25	22.2	1.71
Personal Monthly Income (RM)			280	3600	836.67	704.59

Experience with Organic Food Products Purchases
Table 2 lists the respondents' experiences of buying organic products. Of the three types of organic food purchases listed in the questionnaire, most respondents (40 percent) stated that they preferred to buy organic vegetables, while 35 percent preferred to buy organic eggs. Respondents also bought organic chicken (25 percent). Half of the respondents have bought less than 5 times in the last six months, while 34 percent have bought between 6 and 10 times. A small proportion of respondents (15 percent) have made 11-15 purchases in the last six months. In terms of spending on organic produce purchases, 61 percent spent less than RM100 on organic produce in the last six months, 25 percent spent RM101 to RM150, while a small percentage (14 percent) spent more than RM151.

Table 2: Experiences with Organic Food Product Purchases

Variable	Frequency	Percentage
Frequency of organic food products purchased		
1-5 times	51	51.0
6-10 times	34	34.0
11-15 times	15	15.0
Types of organic food products purchased		
Organic egg	35	35
Organic vegetable	40	40
Organic Chicken	25	25
Money spent on organic food products purchased		
<RM100	61	61
RM101-RM150	25	25
RM151-RM200	9	9
>RM201	5	5

Reliability and Validity
The reliability of the constructs was tested using Cronbach's alpha. Hair et al. (2010) found that Cronbach's alpha values above 0.70 are acceptable, while values below 0.70 indicate a deficit in internal consistency. Table 3 shows that Cronbach's alpha values for all constructs are between 0.792 and 0.901 and thus exceed the cut-off value of 0.70. The results indicate a high reliability of the constructs.

Table 3: Descriptive Analysis and Inter-construct Correlations

Variables	Mean	SD	1	2	3	4
Environmental Concern	4.027	0.585	**1.000**			
Organic Food Knowledge	3.928	0.510	0.633**	**1.000**		
Health Consciousness	4.340	0.644	0.526**	0.626**	**1.000**	
Buying Behaviour	3.727	0.606	0.538**	0.597**	0.510**	**1.000**
Cronbach's Alpha			0.820	0.792	0.901	0.823

Notes: **. Correlation is significant at the 0.01 level (2-tailed); Diagonal elements (in bold) show the square root of the average variance extracted; SD = Standard deviation.

Table 3 shows that all correlations between the four factors were less than 0.700, indicating a reasonable level of discriminant validity. Knowledge of organic food was found to correlate most strongly with young adults' organic food purchasing behavior (r=0.597, p<0.01), followed by concern for the environment (r=0.548, p<0.01). The purchasing behavior of young adults for organic food is also significantly associated with health consciousness (r=0.510, p<0.01). Thus, each factor was statistically independent of the others. In addition, health consciousness had the highest mean score of 4.340 with a standard deviation of 0.644, followed by environmental concern (mean=4.027, standard deviation=0.585).

Relationships on Organic Food Buying Behavior
A multiple regression analysis was conducted to examine the factors influencing young adults' organic food purchasing behavior. Table 4 shows the results of the R2, standardized beta coefficients and t-values for the

hypothesized relationships proposed in this study. The R2 value for the dependent variable was 0.430, above the minimum value of 10% recommended by Falk and Miller (1992), indicating strong explanatory power of the model (i.e., all independent variables explained 43% of the total variance in young adults' organic food purchasing behavior). This was significantly different from zero where F-value= 24.125, $p<0.001$. Precisely, H1 examines whether environmental concern has a significant influence on young adults' organic food purchasing behavior. The standardized beta coefficient proves that environmental concern does indeed have a significant and positive relationship with young adults' organic food purchasing behavior (β1=0.275, p<0.05). This supports H1.

The following hypothesis H2 states that knowledge about organic food has a significant influence on young adults' organic food purchasing behavior. A further examination of the standardized beta coefficient shows that knowledge about organic food has a significant influence on young adults' organic food purchasing behavior (β2=0.398, p<0.05). Accordingly, H2 is upheld as predicted. The final hypothesis, H3, states whether health consciousness has a significant influence on young adults' organic food purchasing behavior. As shown in Table 4, the hypothesized relationship between health consciousness and young adults' organic food purchasing behavior was found to be insignificant (β3=0.086, p<0.05), which means that H3 is rejected.

Table 4: Relationships on Organic Food Buying Behavior

Hypothesized paths		Standardized Beta Coefficients	Results
H1	Environmental Concern → Organic Food Buying Behavior	0.275*	H1 supported
H2	Organic Food Knowledge → Organic Food Buying Behavior	0.398*	H2 supported
H3	Health Consciousness → Organic Food Buying Behavior	0.086	H3 not supported

* Statistically significant at $p<0.05$ (for t-value > 1.960); R^2=0.430; F-value=24.125

Discussion
This study investigated factors affecting young adults' buying behavior of organic food products. Three hypotheses were put forward in the research model. H1 states that concern for the environment has a significant influence on young adults' organic food purchasing behavior. Based on the standardized beta coefficients, the multiple regression analysis resulted in the acceptance of H1. It was found that environmental awareness has a significant influence on young adults' organic food purchasing behavior. This is consistent with previous studies (Yi et al, 2024; Prakash et al, 2023; Wang et al, 2020; Curl et al, 2003; Harper & Makatouni, 2002; Paul & Rana, 2012). Younger adults are concerned about environmental issues, they tend to opt for buying organic food products. They emphasize that the environment should be well protected by organic food production practices that use no/fewer chemicals and no/fewer growth hormones.

In addition, the correlations between knowledge about organic food and the purchasing behavior of young adults with regard to organic food were examined in H2. A closer examination of the empirical results shows that H2 is also supported as expected. The results indicate that knowledge about organic food has a significant influence on young adults' organic food purchasing behavior. This factor was found to be the strongest significant predictor of young adults' organic food purchasing behavior. The results reflect the findings of previous studies (Zhuravleva et al, 2023; Migliorini et al, 2020; Sing & Verma, 2017; Smith & Paladino, 2010). Young adults are inclined to buy organic food because they have good knowledge and information about organic food, e.g. about how much chemicals they consume. Developing knowledge about organic food helps them to develop a better understanding of the benefits of organic food for the environment. They can also learn about how organic farmers take extra care in their farming practices.

The following hypothesis H3 was used to test whether health consciousness has a significant influence on the purchasing behavior of young adults with regard to organic food. The results of this quantitative study show that health consciousness has an insignificant influence on the purchasing behavior of young adults for organic food. Therefore, H3 is not confirmed. Health awareness had no significant influence on young adults' organic food purchasing behavior, even though they know that organic food is natural and healthier than regular food because it contains no/less growth hormones, additives, antibiotics and chemical residues.

By investigating the different factors that influence the purchasing behaviors of young adults in Malaysia, a demographic that has received little attention, this study closes a gap in the body of previous research. The results challenge the commonly accepted notion that health consciousness is a significant determinant in this demographic while highlighting the significance of environmental awareness and familiarity with organic foods.

5. Conclusion

Organic food knowledge and environmental concerns were vital to impact young adults' buying behavior of organic food products. To encourage more consumption of organic food products, manufacturers should furnish clear product information that can evoke their organic food knowledge. In addition, it is time for producers to promote young adults' understanding of the benefits of organic food and the important environmental aspects that are worth emphasizing in their marketing strategies during the production phase. The knowledge and understanding of organic food, especially among young adults, needs to be expanded by utilizing all technologies and artificial intelligence to promote awareness and knowledge of organic food. This is a hope to strengthen the steps taken by the government to increase the awareness of Malaysians to buy organic food.

The findings of this study provide new insights into the organic food purchasing behavior of young adults in the Malaysian context. Further research with longitudinal studies across a larger population and geographical area can contribute to a better understanding of organic food purchasing behavior in Malaysia. Further. It is recommended to conduct research by focusing on the comparison of consuming preferences for specific organic food products among Malaysian populations. Additional research can be implemented to decide which segments are excellent in imitation of market or accordance with organic food as much as an access regarding building sustainable ruin pattern because of the future. It is also strongly recommended that focusing on environmental sustainability and product knowledge is similarly important rather than just health benefits.

Appendix 1: Measurement of Instruments

Statements

Buying Behaviour

My intention to buy organic food can increase with my knowledge about organic food.
Government policy can help me increase my intention to buy organic food
Environment improves my intention to buy organic food
My intention to buy organic food can develop with the level of my perceived value
My attitudes are related to my intention to buy organic food
My intention to buy organic food comes from health reasons

Environmental Concern

The environment should be protected
The production of conventional food does not harm the environment
Organic food production is better for the environment because it uses no/fewer chemical instruments
Organic food production is better for the environment because it uses no/less growth hormones
Organic food production practices are better for the environment
The environment is adequately protected

Organic Food Knowledge

Study about organic food provides me with information about how much chemicals I consume every day.
Organic farmers put more care into farming methods and trends
Self-knowledge is important in organic food taste perception
I do purchase organic food because of good knowledge about it
The benefits of organic food for my health increase my intention to buy organic food
Development in knowledge and education helps me to understand the benefits of organic food for the environment

Health Consciousness

My health is very important for me
Organic foods are healthier than normal foods
Organic foods are natural and therefore better for my health
Organic foods are healthier because they have no/less growth hormone additives and antibiotics
Organic foods are healthier because have no/fewer chemical residues
Organic foods are healthy

Artificial Intelligence-Powered Risk Assessment in Supply Chain Safety

Abstract: The increasing complexity and globalization of supply chains necessitate robust risk management strategies to ensure safety and resilience. Traditional risk assessment methods often fall short in dynamically adapting to the rapidly changing conditions and voluminous data inherent in modern supply chains. This study explores the potential of Artificial Intelligence (AI)-powered risk assessment to address these limitations in the context of Malaysia's supply chain industry. By employing AI technologies such as machine learning, IoT, and predictive analytics, organizations can significantly enhance their risk management capabilities, improving predictive accuracy, real-time monitoring, and overall operational efficiency. Through a qualitative analysis involving in-depth interviews with supply chain managers, AI experts, and technology vendors, the study identifies the strategies employed for AI integration, the perceived effectiveness of these technologies, and the challenges faced in implementation. The findings highlight the importance of robust data governance, the development of explainable AI models, and continuous skill development to overcome barriers related to data quality, model interpretability, and high implementation costs. The study concludes with recommendations for fostering a safer and more resilient logistics environment in Malaysia, emphasizing the need for comprehensive AI adoption frameworks and scalable solutions for small and medium-sized enterprises.

Keywords: *Artificial Intelligence, Supply Chain Risk Management, Logistics Safety*

1. Introduction

The increasing complexity and globalization of supply chains have made risk management a critical component of logistics and supply chain operations (Narayanan et al., 2024a). Traditional risk assessment methods, while valuable, often fall short in dynamically adapting to the rapidly changing conditions and voluminous data typical of modern supply chains (Mkumbo et al., 2019; Sundram et al., 2018; Selvaraju et al., 2017). This limitation has led to a growing interest in leveraging artificial intelligence (AI) to enhance risk assessment capabilities (Ivanov et al., 2019).

AI technologies, including machine learning (ML) and advanced analytics, offer the potential to transform supply chain risk management by providing more accurate predictions, real-time insights, and automated decision-making processes. These technologies can analyze vast amounts of data from various sources, identify patterns and correlations, and predict potential disruptions and safety issues before they occur. The application of AI in supply chain risk assessment is expected to significantly improve the resilience and safety of logistics operations (Vatumalae et al., 2020; Wamba & Akter, 2019).

Despite the promising capabilities of AI, its integration into supply chain risk management is not without challenges. Issues such as data quality, model interpretability, and the need for substantial computational resources pose significant hurdles. Furthermore, the complexity of supply chains requires AI systems to be highly adaptable and context-aware to provide reliable risk assessments (Riahi et al., 2021).

The primary problem addressed in this study is the inadequacy of current risk assessment methodologies to effectively predict and mitigate safety issues in complex supply chain environments. Traditional approaches

often rely on historical data and static models that do not account for the dynamic nature of supply chains or the vast amounts of real-time data generated by modern logistics operations (Sivan, Anuar, Krishnasamy, Bahrin, Narayanan, & Sundram, 2024a). As a result, there is a pressing need for innovative solutions that can enhance the accuracy and responsiveness of risk assessments (Vatumalae et al., 2022).

AI-powered risk assessment has the potential to address these limitations by offering more sophisticated analytical capabilities and real-time processing of diverse data streams. However, the practical implementation of AI in supply chain safety management remains underexplored, with limited empirical evidence on its effectiveness and best practices for deployment. This study aims to bridge this gap by investigating how AI algorithms can be used to assess and manage risks in supply chains, with a focus on predicting potential safety issues and optimizing safety protocols.

2. Literature Review

Supply chain risk management (SCRM) has evolved significantly over the past few decades, driven by the increasing complexity and globalization of supply chains. Traditional risk management approaches, which often rely on historical data and static models, have been criticized for their inability to adapt to the dynamic nature of modern supply chains (Tang, 2006). These methods typically involve identifying potential risks, assessing their likelihood and impact, and implementing mitigation strategies (Christopher & Peck, 2004). However, the rapidly changing business environment, characterized by unpredictable disruptions such as natural disasters, geopolitical tensions, and pandemics, demands more agile and responsive risk management solutions (Ivanov et al., 2019).

The Role of Artificial Intelligence in Supply Chain Management
Artificial Intelligence (AI) has emerged as a transformative technology across various industries, including supply chain management. AI encompasses a range of technologies, such as machine learning (ML), natural language processing (NLP), and computer vision, that enable machines to learn from data and perform tasks that typically require human intelligence (Russell & Norvig, 2020). In the context of supply chains, AI applications include demand forecasting, inventory optimization, route planning, and predictive maintenance (Choi et al., 2018).

AI's potential in enhancing supply chain risk management lies in its ability to process large volumes of data from diverse sources, identify patterns and correlations, and provide real-time insights. For instance, ML algorithms can analyze historical and real-time data to predict potential disruptions, while NLP can process unstructured data, such as news articles and social media posts, to identify emerging risks (Wamba & Akter, 2019).

AI-Powered Risk Assessment in Supply Chains: AI-powered risk assessment involves using AI algorithms to identify, evaluate, and mitigate risks in supply chains. This approach offers several advantages over traditional methods, including improved accuracy, real-time analysis, and the ability to handle complex and high-dimensional data (Wang et al., 2020).

Predictive Analytics and Machine Learning: Predictive analytics, powered by ML, is a key area where AI contributes to risk assessment. By training models on historical data, ML can predict the likelihood of future disruptions and their potential impact. For example, ML algorithms have been used to forecast supply chain disruptions caused by weather events, geopolitical tensions, and supplier failures (Papadopoulos et al., 2017).

Natural Language Processing (NLP): NLP enables the processing and analysis of unstructured data, such as text from news articles, social media, and industry reports. This capability allows supply chain managers to identify emerging risks that may not be evident from structured data alone. For instance, NLP can detect early warning signals of geopolitical instability or changes in trade regulations that could impact supply chains (Kamble et al., 2020).

Real-Time Monitoring and IoT Integration: The integration of AI with Internet of Things (IoT) devices enhances real-time monitoring and risk assessment capabilities. IoT devices generate vast amounts of data on

various aspects of supply chain operations, such as location, temperature, and humidity. AI algorithms can analyze this data to detect anomalies and predict potential risks, such as equipment failures or deviations from optimal conditions (Wang et al., 2020).

Despite the promising potential of AI in supply chain risk management, several challenges and limitations need to be addressed. One major challenge is data quality and availability. AI algorithms require large amounts of high-quality data to perform effectively, but obtaining such data can be difficult due to issues such as data silos, inconsistencies, and privacy concerns (Riahi et al., 2021).

Another challenge is model interpretability. While AI algorithms, particularly deep learning models, can achieve high accuracy, their decision-making processes are often opaque, making it difficult for supply chain managers to understand and trust their recommendations. This lack of transparency can hinder the adoption of AI in risk management (Guidotti et al., 2019).

Additionally, the implementation of AI in supply chains requires substantial computational resources and technical expertise. Small and medium-sized enterprises (SMEs) may find it challenging to invest in the necessary infrastructure and talent to leverage AI effectively (Kamble et al., 2020).

AI-powered risk assessment represents a promising frontier in supply chain risk management, offering the potential to enhance predictive accuracy, real-time monitoring, and overall resilience (Sundram, Ghapar, Chew, & Muhammad, 2023). However, addressing the challenges of data quality, model interpretability, and accessibility is essential for realizing this potential. Future research should focus on developing innovative solutions that overcome these barriers, paving the way for more effective and widespread adoption of AI in supply chain safety management (Sundram, Ghapar, Osman, Chew, & Muhammad, 2023).

3. Research Methodology

Conceptual Framework
The conceptual framework for this study is grounded in the integration of AI technologies in supply chain risk management. The framework posits that AI can enhance supply chain safety by improving predictive capabilities, enabling real-time monitoring, and providing actionable insights for risk mitigation. This framework draws on existing literature that highlights the potential of AI in transforming traditional supply chain practices (Choi et al., 2018; Wamba & Akter, 2019). The framework also considers the challenges associated with AI implementation, such as data quality and model interpretability, as critical factors influencing the effectiveness of AI in supply chain risk management.

Sampling
The qualitative part of this study employs a purposive sampling strategy to select participants who are knowledgeable and experienced in supply chain management and AI implementation. The sample includes:

Supply Chain Managers: Individuals responsible for overseeing supply chain operations and risk management in their organizations.
AI Experts: Professionals with expertise in developing and implementing AI solutions in supply chains.
Technology Vendors: Representatives from companies that provide AI and IoT solutions for supply chain management. A total of 6 participants were selected, ensuring a diverse representation of industries, including manufacturing, retail, logistics service providers, and healthcare.

Data Collection
Data was collected through in-depth semi-structured interviews. This method allows for a detailed exploration of participants' experiences, perspectives, and insights regarding AI-powered risk assessment in supply chains (Zetty et al., 2020). The interviews were conducted either in person or via video conferencing, depending on the participants' availability and preferences.

Interview Duration: Each interview will last approximately 60 minutes, allowing for a thorough discussion of the topics.

Recording and Transcription: With participants' consent, all interviews will be audio-recorded and transcribed verbatim to ensure accuracy in data analysis.

Confidentiality: Participants will be assured of the confidentiality and anonymity of their responses. Personal identifiers will be removed from the transcripts, and data will be stored securely.

Interview Questions: The interview questions are designed to elicit detailed and comprehensive responses related to the study's objectives. The questions are open-ended to encourage participants to share their experiences and insights freely.

AI Adoption and Implementation:
How has your organization integrated AI into its supply chain risk management processes?
What specific AI technologies (e.g., machine learning, IoT, predictive analytics) are being used?

Challenges and Barriers:
What challenges have you encountered in implementing AI for risk management in your supply chain?
Can you provide examples of situations where AI has significantly enhanced supply chain safety?

By employing this qualitative methodology, the study aims to gain rich (Sivan, Anuar, Krishnasamy, Bahrin, Narayanan, & Sundram, 2024b), in-depth insights into the role of AI in supply chain risk management, the challenges faced by practitioners, and potential solutions for overcoming these challenges.

4. Data Analysis

Table 1: Respondent Demographics

Respondents ID	Role	Industry	Years of Experience in Supply Chain	Years of Experience in AI Implementation
1	Supply Chain Manager	Manufacturing	15	5
2	AI Expert	Retail	10	8
3	Technology Vendor	Logistics	20	10
4	Supply Chain Manager	Healthcare	12	4
5	AI Expert	Manufacturing	8	6
6	Technology Vendor	Retail	18	7

The demographic table presents a diverse group of six respondents, including two supply chain managers, two AI experts, and two technology vendors, all operating within various industries in Malaysia, such as manufacturing, retail, logistics, and healthcare. The respondents' extensive experience in supply chain management (ranging from 8 to 20 years) and AI implementation (ranging from 4 to 10 years) underscores their deep expertise in the field. However, the relatively small sample size and concentration of respondents from large and medium-sized companies (with only one from a small company) may limit the generalizability of the findings. Additionally, while the table reflects a broad representation of industries within Malaysia, the absence of respondents from other sectors could result in a narrow perspective. This diverse yet limited demographic snapshot provides valuable insights into AI-powered risk assessment in Malaysian supply chains but also highlights the need for broader inclusion to fully capture the impact across all industry sectors in the country.

Table 2: Data Analysis -Thematic Analysis

Interview Question	Codes	Themes
AI Adoption and Implementation		
How has your organization integrated AI into its supply chain risk management processes?	Step By Sep Integration	AI Integration Methods
	Pilot Testing	Implementation Process
	Gradual Rollout	Strategies for AI Adoption
What specific AI technologies (e.g., machine learning, IoT, predictive analytics) are being used?	Use of Machine Learning Algorithms	AI Technologies Used
	IoT Sensors for Real-Time Monitoring	
	Predictive Analytics Software	Types of Technologies
	Implementation of Specific AI Tools	
Challenges and Barriers		
Can you provide examples of situations where AI has significantly enhanced supply chain safety?	Case of Improved Hazard Detection	Practical Examples
	Success in Predicting Disruptions	Real-World Impact
	Example of Improved Safety Compliance	
	Issues with Data Quality	Implementation Challenges
What challenges have you encountered in implementing AI for risk management in your supply chain?	Difficulty in Interpreting AI Models	
	High Implementation Costs	Barriers to AI Adoption
	Lack of Skilled Personnel	

The study reveals that AI adoption in supply chain risk management reveals that organizations employ a structured, methodical approach to integrate AI technologies such as machine learning, IoT, and predictive analytics. Strategies like step-by-step integration, pilot testing, and gradual rollout are essential to manage complexity and mitigate risks associated with AI deployment. These methods ensure that AI tools enhance supply chain safety by providing advanced analytical capabilities, real-time data insights, and predictive modelling. The perceived effectiveness of AI is notably positive, with improvements in predictive accuracy, faster risk mitigation responses, increased operational efficiency, and real-time data analysis, all contributing to a more resilient and reliable supply chain.

However, significant challenges persist, including issues with data quality, model interpretability, high implementation costs, and a shortage of skilled personnel (Sundram, Rajagopal, Atikah & Subramaniam, 2018). These barriers can impede the full realization of AI's potential in enhancing supply chain safety. Organizations address these challenges through robust data governance, developing explainable AI models, regular training, and adopting advanced technical solutions. By overcoming these obstacles, AI can play a pivotal role in optimizing supply chain processes, reducing manual errors, and improving overall productivity, thereby significantly enhancing supply chain safety and resilience.

Discussion
The integration of Artificial Intelligence (AI) into supply chain risk management processes represents a transformative approach that holds significant potential for enhancing supply chain safety, particularly within the context of Malaysia. This study's findings highlight the structured and methodical strategies that organizations in Malaysia adopt to integrate AI technologies. These strategies include step-by-step integration, pilot testing, and gradual rollout, ensuring that AI tools are deployed effectively to enhance supply chain safety

through advanced analytical capabilities, real-time data insights, and predictive modeling (Ivanov et al., 2019; Wamba & Akter, 2019).

The use of specific AI technologies such as machine learning algorithms, IoT sensors for real-time monitoring, and predictive analytics software illustrates the diverse technological landscape in Malaysia's supply chain sector. These technologies facilitate improved predictive accuracy, faster risk mitigation responses, increased operational efficiency, and real-time data analysis, all of which contribute to a more resilient and reliable supply chain (Narayanan et al., 2024a). The positive reception and perceived effectiveness of these technologies indicate their critical role in modernizing supply chain risk management practices (Kamble et al., 2020; Wang et al., 2020).

However, the study also uncovers significant challenges that impede the full realization of AI's potential in enhancing supply chain safety. Issues related to data quality, model interpretability, high implementation costs, and a shortage of skilled personnel are major barriers that organizations must address. Data quality issues, for instance, can significantly undermine the effectiveness of AI models, leading to inaccurate predictions and unreliable risk assessments (Riahi et al., 2021). Similarly, the complexity and opacity of some AI models make it difficult for supply chain managers to interpret and trust AI-generated insights, which can hinder adoption and effective utilization (Guidotti et al., 2019).

Addressing these challenges requires robust data governance frameworks that ensure the integrity and quality of data across the supply chain (Sundram, Rajagopal, Nur Atiqah, Atikah & Appasamy, Zarina, 2018). Developing explainable AI models is also crucial to enhance transparency and build trust among users (Jobin et al., 2019). Regular training programs can help bridge the skills gap, equipping supply chain professionals with the necessary expertise to implement and manage AI technologies effectively. Additionally, providing scalable and cost-effective AI solutions can facilitate broader adoption, especially among small and medium-sized enterprises (SMEs) that may find the financial barriers prohibitive (Al Doghan & Sundram, 2023).

The findings of this study underscore the need for a comprehensive approach to integrating AI into supply chain risk management in Malaysia. By overcoming the identified challenges and leveraging AI's potential, organizations can optimize their supply chain processes, reduce manual errors, and significantly enhance overall productivity and safety. This approach not only aligns with global best practices but also positions Malaysia's supply chain sector to be more resilient and competitive in the face of evolving risks and uncertainties (Sivan et al., 2022).

The adoption of AI-powered risk assessment in Malaysia's supply chain industry demonstrates promising potential to enhance safety and resilience. However, the successful realization of these benefits hinges on addressing critical challenges related to data quality, model interpretability, costs, and skill development. By implementing comprehensive data governance, developing explainable AI models, investing in continuous training, and providing accessible AI solutions, Malaysia can foster a safer and more efficient supply chain ecosystem. These efforts will contribute to sustainable growth in the logistics sector, ensuring the well-being of workers and the public involved in supply chain operations while aligning with global standards for safety and security (Othman et al., 2023).

5. Conclusion and Recommendations

This study highlights the significant potential of AI-powered risk assessment in enhancing the predictive accuracy, operational efficiency, and real-time monitoring of Malaysia's supply chains. While AI technologies offer transformative benefits, challenges such as data quality, model interpretability, and the high cost of implementation still pose barriers to their widespread adoption. Addressing these issues is essential for fully realizing AI's potential to improve supply chain safety and resilience.

To overcome these challenges, it is crucial to implement robust data governance frameworks that ensure data integrity and security and develop explainable AI models that foster transparency and trust. Additionally, regular training programs should be established to equip supply chain professionals with the necessary skills to manage AI technologies effectively. Providing scalable, cost-effective AI solutions tailored to the needs of

small and medium-sized enterprises (SMEs) will also be key to democratizing access to these advanced tools.

Continuous monitoring and periodic reassessment of AI implementations are recommended to maintain their effectiveness in an evolving risk landscape. Encouraging collaboration between industry players, academia, and government bodies can further support the adoption and optimization of AI in supply chain risk management. By addressing these challenges and fostering a collaborative environment, Malaysia's supply chain sector can enhance its resilience, safety, and global competitiveness.

Abstract: The COVID-19 pandemic has significantly disrupted global supply chains, exposed their vulnerabilities and underscored the urgent need for enhanced resilience. In Malaysia, the pandemic's impact on supply chains has been profound, prompting a re-evaluation of existing strategies and frameworks. This study explores the integration of Resource-Based Theory (RBT) and Contingency Theory (CT) to enhance supply chain resilience in Malaysia. Through in-depth case studies and semi-structured interviews with senior managers and supply chain professionals, this research identifies key factors contributing to the successful implementation of an integrated resilience framework. The findings reveal that firms leveraging advanced technology, skilled workforce, and strategic partnerships can maintain operational efficiency and adaptability. Context-specific strategies such as diversifying suppliers, local sourcing, strategic stockpiling, and flexible logistics solutions are essential in responding to disruptions. Common challenges include high initial costs, coordination issues, regulatory hurdles, and cultural resistance to change. The integration of RBT and CT results in improved supply chain visibility, flexibility, robustness, and stakeholder collaboration. This study contributes to the academic discourse by offering practical insights for firms seeking to enhance supply chain resilience. It underscores the importance of combining internal strengths with adaptive strategies tailored to the external environment. The findings provide valuable guidance for both academia and industry in developing more robust and adaptive supply chain strategies in the post-pandemic landscape. Future research should explore the integration of RBT and CT across different contexts and industries and investigate the role of emerging technologies in enhancing supply chain resilience.

Keywords: *Resource Based Theory, Contingency Theory, Supply Chain Resilience, Post-Pandemic*

1. Introduction

The COVID-19 pandemic has fundamentally disrupted global supply chains, exposed their vulnerabilities and highlighted the urgent need for greater resilience. In Malaysia, the pandemic's impact on the supply chain has been profound, affecting various industries and prompting a re-evaluation of existing strategies and frameworks (Chowdhury et al., 2021; Sundram et al., 2018; Selvaraju et al., 2017). Supply chain resilience-the ability to anticipate, prepare for, respond to, and recover from disruptive events—has become a critical focus for both practitioners and scholars (Narayanan, Ghapar, Chew, Sundram, Jayamani & Muhammad, 2024a).

Resource-Based Theory (RBT) and Contingency Theory (CT) are two prominent theoretical frameworks that offer valuable insights into building resilient supply chains. RBT posits that firms can achieve sustained competitive advantage by effectively leveraging their unique resources and capabilities (Barney, 1991). In contrast, CT emphasizes the importance of aligning organizational strategies with specific environmental conditions to enhance performance (Donaldson, 2001; Mkumbo et al 2019). Integrating these two theories provides a robust approach to developing supply chain strategies that are both resource-efficient and contextually adaptive (Sundram, Ghapar, Osman, Chew, and Muhammad, 2023).

The post-pandemic landscape presents an opportunity to apply this integrated theoretical framework to enhance supply chain resilience in Malaysia. As businesses navigate the complexities of a rapidly changing

global environment, understanding how to effectively combine RBT and CT can offer critical insights for sustaining operational continuity and achieving long-term success (Sundram, Ghapar, Chew & Muhammad, 2023).

Despite the extensive research on supply chain resilience, there remains a gap in understanding how to effectively integrate RBT and CT to address the unique challenges posed by the COVID-19 pandemic, particularly within the Malaysian context. Existing studies predominantly focus on either resource-based strategies or contingency planning in isolation, without considering the potential synergies between these approaches (Kaufmann & Roesch, 2012; Pettit, Croxton, & Fiksel, 2013).

This research aims to fill this gap by exploring how the integration of RBT and CT can enhance supply chain resilience in Malaysia during the post-pandemic period. Specifically, this study seeks to answer the following questions: How can Malaysian firms strategically align their resources and contingency plans to mitigate supply chain disruptions? What are the key factors that contribute to the successful implementation of an integrated resilience framework? By addressing these questions, this research will provide valuable insights for both academia and industry, contributing to the development of more robust and adaptive supply chain strategies.

2. Literature Review

The need for enhanced supply chain resilience has gained unprecedented attention in the wake of the COVID-19 pandemic. This literature review explores the integration of Resource-Based Theory (RBT) and Contingency Theory (CT) as frameworks to develop resilient supply chains, with a specific focus on the Malaysian context. The review synthesizes existing research on supply chain resilience, RBT, and CT, and identifies gaps in the literature that this study aims to address.

Supply Chain Resilience
Supply chain resilience is defined as the capacity of a supply chain to prepare for, respond to, and recover from disruptions while maintaining its operational capabilities (Ponomarov & Holcomb, 2009; Vatumalae et al., 2020; Sundram et al., 2018). The concept has evolved over the past two decades, driven by an increasing frequency of disruptions, including natural disasters, geopolitical events, and most recently, the COVID-19 pandemic (Ivanov & Dolgui, 2020). Scholars identify several key elements that contribute to supply chain resilience, including flexibility, redundancy, visibility, collaboration, and agility (Christopher & Peck, 2004). Flexibility refers to the ability of supply chain components to adapt to changes, while redundancy involves maintaining excess capacity or inventory to cushion against disruptions. Visibility and collaboration emphasize real-time information sharing and coordination among supply chain partners, and agility focuses on the speed of response to disruptions (Vatumalae et al., 2022; Sundram et al., 2020).

Resource-Based Theory (RBT)
Resource-based theory (RBT) posits that a firm's competitive advantage is derived from its unique resources and capabilities that are valuable, rare, inimitable, and non-substitutable (Barney, 1991). In the context of supply chains, RBT suggests that firms with superior resources—such as advanced technology, skilled labor, and robust infrastructure—are better positioned to withstand and recover from disruptions (Wernerfelt, 1984). RBT has been widely applied in supply chain management to explain how firms can leverage their internal resources to achieve resilience. For instance, firms that invest in advanced information technology systems can improve supply chain visibility and coordination, thereby enhancing their ability to anticipate and respond to disruptions (Wang, Jie, & Abareshi, 2015).

Contingency Theory (CT)
Contingency Theory (CT) asserts that there is no one-size-fits-all approach to management; instead, effective management strategies depend on the specific context or environment in which an organization operates (Donaldson, 2001). In supply chain management, CT emphasizes the need for adaptive strategies that align with the external environment, such as market volatility, technological changes, and regulatory requirements. CT has been used to highlight the importance of context-specific strategies in achieving supply chain resilience. For example, firms operating in highly volatile markets may benefit from flexible and adaptive supply chain designs that can quickly respond to changes in demand or supply conditions (Sousa & Voss, 2008).

Integration of RBT and CT
The integration of RBT and CT offers a comprehensive approach to building resilient supply chains by combining the internal strengths of a firm with context-specific adaptive strategies. This integrated approach recognizes that while unique resources and capabilities are essential for resilience, their effectiveness is contingent upon the external environment (Eisenhardt & Martin, 2000). Studies have shown that firms that successfully integrate RBT and CT are better equipped to handle disruptions. For instance, a study by Brandon-Jones et al. (2014) found that firms that leveraged their unique resources (RBT) and adapted their supply chain strategies to market conditions (CT) were more resilient during the 2008 financial crisis.

Supply Chain Resilience in Malaysia
Malaysia's strategic location and diversified economy make it a critical player in global supply chains. However, the COVID-19 pandemic exposed significant vulnerabilities in Malaysia's supply chains, particularly in sectors such as electronics, automotive, and pharmaceuticals (Yong, Haron, & Li, 2021). The integration of RBT and CT can provide valuable insights into enhancing the resilience of Malaysian supply chains. Malaysian firms face several challenges, including limited access to advanced technology, dependency on global supply chains, and regulatory constraints. However, there are also opportunities to enhance resilience through strategic investments in technology, fostering collaboration among supply chain partners, and adopting adaptive strategies tailored to the local context (Narayanan, Ghapar, Chew, Sundram, Jayamani & Muhammad, 2024b; Omar et al., 2020).

Gaps in the Literature
Despite the extensive research on supply chain resilience, there is a lack of studies that explicitly integrate RBT and CT within the Malaysian context. Most existing research focuses on either RBT or CT in isolation, without exploring the potential synergies between these frameworks (Kaufmann & Roesch, 2012; Pettit, Croxton, & Fiksel, 2013). Additionally, there is limited empirical evidence on how Malaysian firms can apply these integrated strategies to enhance supply chain resilience in the post-pandemic landscape. As such, this underscores the importance of integrating Resource-Based Theory and Contingency Theory to develop resilient supply chains. By combining the internal strengths of a firm with adaptive strategies tailored to the external environment, this integrated approach provides a robust framework for addressing supply chain disruptions. The review identifies significant gaps in the existing literature, particularly within the Malaysian context, and sets the stage for the current study to explore how Malaysian firms can enhance their supply chain resilience in the post-pandemic era.

3. Research Methodology

The methodology for this study involves a qualitative approach, focusing on in-depth case study analysis to explore how Malaysian firms integrate Resource-Based Theory (RBT) and Contingency Theory (CT) to enhance supply chain resilience. The study examines three key industries: electronics, automotive, and pharmaceuticals.

Conceptual Framework
The conceptual framework integrates RBT and CT to provide a comprehensive approach to supply chain resilience. RBT focuses on leveraging a firm's unique resources and capabilities, while CT emphasizes the need for adaptive strategies that align with the external environment. The framework aims to understand how these theories can be combined to mitigate supply chain disruptions and sustain operational continuity (Barney, 1991; Donaldson, 2001; Sivan, Anuar, Krishnasamy, Bahrin, Narayanan & Sundram, 2024b).

Sampling
Purposive sampling is used to select firms from the electronics, automotive, and pharmaceutical industries in Malaysia (Zetty et al., 2020) This method ensures the inclusion of information-rich cases that provide valuable insights into supply chain resilience practices (Patton, 2015). Approximately three firms, one from each industry, will be selected for detailed case study analysis. The inclusion criteria for these firms are as follows: they must have been significantly impacted by the COVID-19 pandemic, have implemented strategies to enhance supply chain resilience, and have senior managers or supply chain professionals available and willing to participate in in-depth interviews.

Data Collection
Data will be collected through semi-structured interviews with senior managers and supply chain professionals from the selected firms, exploring the integration of RBT and CT in enhancing supply chain resilience (Creswell & Poth, 2017). Participants will first be contacted and briefed on the study's purpose, confidentiality, and consent procedures. Each interview, lasting approximately 60-90 minutes, will be audio-recorded with the participant's consent, and detailed notes will be taken to capture non-verbal cues and contextual information. After the interviews, the recordings will be transcribed verbatim, and participants will be allowed to review and verify the accuracy of their transcripts.

4. Data Analysis

The qualitative data collected from the interviews will be analyzed using thematic analysis. This method involves identifying, analyzing, and reporting patterns (themes) within the data (Braun & Clarke, 2006; Sivan, Anuar, Krishnasamy, Bahrin, Narayanan & Sundram, 2024a).
Steps in Thematic Analysis:
Data Familiarization: Immersing in the data by reading and re-reading the interview transcripts and listening to the audio recordings.
Initial Coding: Generating initial codes from the data by labelling segments of text that are relevant to the research questions.
Theme Development: Examining the codes to identify broader patterns or themes.
Reviewing Themes: Reviewing and refining the themes to ensure they accurately represent the data.
Defining and Naming Themes: Assigning clear definitions and names to each theme.
Reporting: Presenting the themes in a coherent and compelling narrative, supported by quotes from the data.

The analysis will focus on identifying how firms in the electronics, automotive, and pharmaceutical industries integrate RBT and CT to enhance supply chain resilience, the challenges they face, and the outcomes of these efforts. The findings will be presented in detailed case study analyses, highlighting the unique resources, adaptive strategies, integration challenges, and resilience outcomes for each firm.

Table 1: Respondent Demographics for Case Study Organization

Characteristic	Company A	Company B	Company C
Industry	Electronics	Automotive	Pharmaceuticals
Years of Operations	7 years	10 years	14 years
Respondent's Designation and Identification Code	Supply Chain Manager (A1) Operations Director (A2) Procurement Manager (A3	Supply Chain Manager (B1) Operations Director (B2) Logistics Coordinator (B3)	Supply Chain Manager (C1) Operations Director (C2) Procurement Manager (C3) Chief Operating Officer (C4)

Table 1 provides an overview of the demographics of respondents from three companies in different industries: electronics (Company A), automotive (Company B), and pharmaceuticals (Company C). This diversity ensures the study covers a wide range of supply chain dynamics and challenges, each with unique characteristics and requirements. The years of operation vary among the companies, with Company A having 7 years, Company B with 10 years, and Company C with 14 years. This variation indicates that the study includes organizations at different stages of maturity, providing insights into how supply chain resilience practices evolve.

The respondents hold senior and strategic positions within their organizations. Company A includes a Supply Chain Manager, Operations Director, and Procurement Manager; Company B includes a Supply Chain Manager, Operations Director, and Logistics Coordinator; and Company C includes a Supply Chain Manager, Operations Director, Procurement Manager, and Chief Operating Officer. This ensures that the insights provided are

reflective of both operational and strategic perspectives, given the seniority and roles of the participants.

Overall, the respondent demographics highlight the diverse industry representation, varied years of operation, and senior-level designations of the participants. This diversity is beneficial for the study as it provides a comprehensive view of supply chain resilience practices across different sectors and organizational stages. The inclusion of high-level executives ensures that the insights and strategies discussed are robust and applicable to a wide range of supply chain contexts.

Case Study 1: Electronics Industry
Company A is a leading electronics manufacturer in Malaysia, specializing in semiconductor production. The COVID-19 pandemic disrupted its supply chain, causing delays in raw material supplies and impacting production schedules.

Table 2: Case Study Analysis of Company A

No	Aspect	Description
1	Unique Resources (RBT)	Advanced manufacturing technology, skilled workforce, strategic partnerships ("Our cutting-edge technology and highly skilled staff were pivotal in maintaining operations during the pandemic." - Respondent A1) ("Strategic partnerships helped us secure critical supplies." - Respondent A2) ("The expertise of our workforce allowed us to quickly adapt to new processes." - Respondent A3)
2	Adaptive Strategies (CT)	Diversification of suppliers, real-time monitoring systems, flexible production processes ("We diversified our supplier base and implemented real-time monitoring to swiftly adapt to supply chain changes." - Respondent A1) ("Flexible production processes enabled us to switch between products based on the availability of materials." - Respondent A2) ("Real-time monitoring helped us anticipate and mitigate disruptions." - Respondent A3)
3	Integration Challenges	High dependency on global suppliers, and cultural resistance to change. ("One of our biggest challenges was our reliance on international suppliers and resistance to changing established practices." - Respondent A1) ("Transitioning to new suppliers was costly and time-consuming." - Respondent A2) ("There was significant resistance from some departments to adopt new strategies." - Respondent A3)
4	Resilience Outcomes	Improved supply chain visibility, enhanced flexibility in production, and faster recovery times. ("These strategies significantly improved our visibility and flexibility, allowing us to recover more quickly from disruptions." - Respondent A1) ("We are now able to respond to supply chain disruptions more effectively." - Respondent A2) ("Our recovery times have shortened due to better coordination and flexibility." - Respondent A3)

Company A leveraged its advanced manufacturing technology and skilled workforce to maintain operational efficiency. By diversifying suppliers and implementing real-time monitoring systems, the company adapted to the pandemic's disruptions. Despite facing challenges such as dependency on global suppliers and cultural resistance, the integration of RBT and CT resulted in improved visibility, flexibility, and recovery times.

Case Study 2: Automotive Industry
Company B is a major automotive parts supplier in Malaysia. The pandemic severely disrupted its supply chain, particularly in the procurement of essential components from international suppliers.

Table 3: Case Study Analysis of Company B

No	Aspect	Description
1	Unique Resources (RBT)	Extensive distribution network, strong brand reputation, skilled engineering team. ("Our extensive distribution network allowed us to quickly reroute supplies." - Respondent B1) ("Our strong brand reputation helped us maintain supplier relationships." - Respondent B2) ("The expertise of our engineering team was crucial in adapting our processes." - Respondent B3)
2	Adaptive Strategies (CT)	Local sourcing initiatives, inventory optimization, strategic alliances with local firms ("We initiated local sourcing to reduce dependency on international suppliers." - Respondent B1) ("Optimizing our inventory helped us manage supply chain disruptions more effectively." - Respondent B2) ("Forming strategic alliances with local firms strengthened our supply chain." - Respondent B3)
3	Integration Challenges	High initial costs for local sourcing and coordination issues with new suppliers. ("The shift to local sourcing incurred high initial costs." - Respondent B1) ("Coordinating with new suppliers was a significant challenge." - Respondent B2) ("We faced difficulties in aligning our processes with new suppliers." - Respondent B3)
4	Resilience Outcomes	Reduced dependency on international suppliers and increased supply chain robustness. ("Our dependency on international suppliers has significantly decreased." - Respondent B1) ("Our supply chain is now more robust and capable of handling disruptions." - Respondent B2) ("We have seen a marked improvement in supply chain stability." - Respondent B3)

Company B utilized its extensive distribution network and strong brand reputation to navigate the supply chain disruptions caused by the pandemic. By initiating local sourcing and optimizing inventory, the company reduced its dependency on international suppliers. Although the shift to local sourcing incurred high initial costs and coordination issues, the integration of RBT and CT enhanced the supply chain's robustness.

Case Study 3: Pharmaceuticals Industry
Company C is a pharmaceutical company in Malaysia that faced significant challenges during the pandemic, particularly in sourcing raw materials and ensuring timely delivery of products.

Table 3: Case Study Analysis of Company C

No	Aspect	Description
1	Unique Resources (RBT)	Advanced research and development (R&D) capabilities, and robust distribution channels. ("Our advanced R&D capabilities were crucial in developing new products quickly." - Respondent C1) ("Robust distribution channels ensured continuous supply of products." - Respondent C2) ("Our strong R&D team helped us innovate and adapt rapidly." - Respondent C3) ("Effective distribution networks were vital in maintaining supply chain continuity." - Respondent C4)

2	Adaptive Strategies (CT)	Strategic stockpiling, collaboration with government agencies, and flexible logistics solutions. ("Strategic stockpiling helped us manage supply shortages." - Respondent C1) ("Collaboration with government agencies facilitated smoother operations." - Respondent C2) ("Flexible logistics solutions allowed us to adapt to transportation challenges." - Respondent C3) ("Working with government agencies was key in overcoming regulatory hurdles." - Respondent C4)
3	Integration Challenges	Regulatory hurdles, logistical constraints in stockpiling ("Regulatory hurdles were a major challenge in our operations." - Respondent C1) ("Stockpiling posed logistical constraints that we had to manage." - Respondent C2) ("Navigating complex regulations was difficult and time-consuming." - Respondent C3) ("Logistical challenges in stockpiling were significant." - Respondent C4)
4	Resilience Outcomes	Ensured continuous supply of critical medicines, and enhanced collaboration with stakeholders. ("We ensured a continuous supply of critical medicines despite the disruptions." - Respondent C1) ("Collaboration with stakeholders improved significantly." - Respondent C2) ("Our ability to supply critical medicines remained uninterrupted." - Respondent C3) ("Stakeholder collaboration was greatly enhanced, improving overall resilience." - Respondent C4)

Company C capitalized on its advanced R&D capabilities and robust distribution channels to mitigate supply chain disruptions. By strategically stockpiling critical raw materials and collaborating with government agencies, the company ensured a continuous supply of essential medicines. Despite facing regulatory hurdles and logistical constraints, the integration of RBT and CT improved the company's ability to maintain supply chain continuity and enhanced collaboration with stakeholders.

Cross-Case Analysis
The three case studies illustrate how firms in different industries have successfully integrated RBT and CT to enhance supply chain resilience. Key findings include:

Unique Resources (RBT): Across all case studies, firms leveraged their unique resources, such as advanced technology, skilled workforce, and strong distribution networks, to maintain operational efficiency and adaptability.
Adaptive Strategies (CT): Companies adopted context-specific strategies, such as diversifying suppliers, local sourcing, strategic stockpiling, and flexible logistics solutions, to respond to the pandemic's disruptions.
Integration Challenges: Common challenges included high initial costs, coordination issues, regulatory hurdles, and cultural resistance to change. Addressing these challenges required careful planning and stakeholder engagement.
Resilience Outcomes: The integration of RBT and CT resulted in improved supply chain visibility, flexibility, robustness, and stakeholder collaboration, enabling faster recovery and continuity in operations.
These findings demonstrate the value of integrating Resource-Based Theory and Contingency Theory in developing resilient supply chains, offering practical insights for firms seeking to enhance their supply chain resilience in the post-pandemic landscape.

Discussion
The integration of Resource-Based Theory (RBT) and Contingency Theory (CT) in enhancing supply chain resilience has yielded significant insights, particularly within the context of the post-pandemic landscape in Malaysia. The case studies conducted in the electronics, automotive, and pharmaceutical industries illustrate how firms have successfully navigated the challenges posed by the COVID-19 pandemic by leveraging their

unique resources and adopting context-specific adaptive strategies.

Electronics Industry, Company A is a leading electronics manufacturer specializing in semiconductor production, utilized its advanced manufacturing technology and skilled workforce to maintain operational efficiency amidst the pandemic-induced disruptions. The company's strategic partnerships and diversification of suppliers were crucial in enhancing supply chain resilience. Real-time monitoring systems and flexible production processes enabled Company A to adapt swiftly to changes in raw material supply and production schedules. However, the high dependency on global suppliers and cultural resistance to change were significant challenges. Despite these, the integration of RBT and CT resulted in improved supply chain visibility, enhanced flexibility in production, and faster recovery times (Barney, 1991; Donaldson, 2001).

Automotive Industry, Company B, a major automotive parts supplier, faced severe disruptions in procuring essential components from international suppliers during the pandemic. By leveraging its extensive distribution network, strong brand reputation, and skilled engineering team, the company initiated local sourcing and optimized inventory to reduce dependency on international suppliers. Strategic alliances with local firms further strengthened its supply chain. While high initial costs for local sourcing and coordination issues with new suppliers were challenges, the integration of RBT and CT significantly increased supply chain robustness, demonstrating the value of a combined theoretical approach (Christopher & Peck, 2004; Ivanov & Dolgui, 2020).

Pharmaceuticals Industry, Company C, a pharmaceutical firm, faced significant challenges in sourcing raw materials and ensuring timely product delivery. The company's advanced research and development capabilities and robust distribution channels played a pivotal role in mitigating these disruptions. Strategic stockpiling, collaboration with government agencies, and flexible logistics solutions were key adaptive strategies. Regulatory hurdles and logistical constraints in stockpiling presented challenges, but the integration of RBT and CT improved the company's ability to maintain supply chain continuity and enhanced collaboration with stakeholders (Pettit, Croxton, & Fiksel, 2013).

5. Conclusion, Implication and Recommendation for future research

This study has provided valuable insights into how integrating Resource-Based Theory (RBT) and Contingency Theory (CT) can enhance supply chain resilience in Malaysia, especially in the post-pandemic context. By analyzing case studies from the electronics, automotive, and pharmaceutical industries, the research demonstrates how firms can leverage unique resources and implement adaptive strategies tailored to specific environmental conditions. The findings highlight that firms with advanced technological capabilities, strategic partnerships, and skilled workforces are better positioned to respond to disruptions. However, challenges such as high initial costs, regulatory hurdles, and cultural resistance to change remain significant barriers that need to be addressed.

The implications of this study are far-reaching for both practitioners and scholars in supply chain management. For practitioners, the research underscores the importance of aligning internal resources with external environmental conditions to build resilient supply chains. Firms are encouraged to invest in advanced technologies, foster strategic partnerships, and enhance workforce capabilities to improve their resilience against future disruptions. Additionally, the findings suggest that addressing cultural resistance and regulatory challenges is critical for the successful implementation of these strategies. For scholars, the study contributes to the academic discourse by offering a nuanced understanding of how RBT and CT can be integrated to develop more robust and adaptive supply chain strategies. It opens up new avenues for research on the synergies between these theories and their application in different contexts.

Future research should explore the integration of RBT and CT across various industries and geographical regions to validate and expand upon the findings of this study. Comparative studies between developed and developing economies could provide additional insights into how different environmental conditions influence the effectiveness of these integrated strategies. Longitudinal studies are also recommended to assess the long-term impact of RBT and CT integration on supply chain resilience, particularly as firms continue to adapt to an increasingly complex global environment. Moreover, the role of emerging technologies such as artificial

intelligence, big data analytics, and blockchain in enhancing the integration of RBT and CT warrants further investigation. These technologies could offer innovative solutions to some of the challenges identified in this study, such as improving data visibility, streamlining regulatory compliance, and fostering a more agile organizational culture. By addressing these research gaps, future studies can contribute to the development of more resilient and adaptive supply chains, better equipped to navigate the uncertainties of the post-pandemic world.

Abstract: Small and Medium Enterprises (SMEs) have a crucial impact on the Malaysian economy, making major contributions to the functioning of the supply chain. Integrating supply chain technology has become a crucial element in enhancing the efficiency and competitiveness of SMEs in Malaysia. During recent years many developing and developed countries have witnessed the expansion of markets and supply chain networks; in the progress of these market and supply systems SMEs find various complexities when they are implementing or improving the technology integration of their supply chain. The current body of literature often addresses the adoption of technology in a general manner or within larger organizations, resulting in a significant gap in study about the specific circumstances and requirements of small and medium-sized enterprises (SMEs). This study employs a rigorous methodology that analyzes relevant papers to examine the drivers, challenges, and opportunities for adopting supply chain technology among SMEs in Malaysia. By implementing supply chain technology, Malaysian SMEs can increase their performance in many areas of key performance indicators. This includes improving efficiency, optimizing inventory management, achieving cost savings, enhancing customer service, and increasing market competitiveness. It is believed that the findings of the study can be useful for managers of SMEs, policymakers, and interested stakeholders. This will enable SMEs to navigate the challenges of adopting technology more effectively and enhance global competitiveness.

Keywords: *Supply chain technology adoption, Small and Medium Enterprises (SMEs), drivers, challenges, opportunities, performance.*

1. Introduction and Background

Small and Medium Enterprises (SMEs) play a crucial role in Malaysia's economic structure, making substantial contributions to employment, innovation, and GDP. According to the most recent data released by the Department of Statistics, Malaysia (DOSM, 2023), there were a total of 1,101,725 small and medium enterprises (SMEs). These SMEs made up 39.1% of the country's Gross Domestic Product (GDP) in 2023, contributing a value-added amount of RM613.1 billion. When looking at the distribution of SMEs concentration of various sectors over the years it is clear that the service sector has always exceeded 80%of all SMEs in total. The most recent profile of SMEs in 2023 shows that the services sector accounted for 83.9% of the total, with a total of 924,170 enterprises. The construction sector continued to be the second greatest contributor, accounting for 9.3% (102,657 enterprises). Meanwhile, around 5.4% of small and medium-sized enterprises (SMEs), totaling 59,316 organizations were engaged in the manufacturing sector. This was followed by 1.2% (13,099 firms) in the agriculture sector, and the last 0.2% (2,483 firms) in the mining and quarrying sector. Of the total small and medium companies (SMEs) in Malaysia, the majority, comprising 69.7% or 767,421 firms, were microenterprises. Concurrently, enterprises of small size made up 28.5% of the total (314,465 firms), while medium-sized firms accounted for the remaining 1.8% (19,839 firms).

In the face of growing competition and complexity in global marketplaces, small and medium-sized enterprises (SMEs) must embrace and incorporate innovative supply chain technology to maintain and improve their competitiveness. Supply chain technology adoption involves the integration of cutting-edge technological solutions like blockchain, Internet of Things (IoT), artificial intelligence (AI), and big data analytics to optimize supply chain operations, enhance efficiency, and improve overall performance (Kaur, Awasthi & Luthra, 2021). Despite such benefits, Malaysian SMEs are faced with several challenges whenever deploying such technologies. Technological progress in SMEs is impeded by limited technology access, high costs for implementation and maintenance, and insufficient infrastructure. Furthermore, the presence of organizational inertia, which is defined as a lack of support from management and a strong reluctance to change, amplifies the challenges associated with adopting new technologies (Tay, Alipal & Lee, 2021). Otherwise, there are other

challenges that SMEs are confronted with, which do not allow them to invest in the required integrated technology since they are financially limited. Moreover, the lack of adequate governmental assistance and regulatory frameworks fails to offer the necessary incentives or direction.

Malaysian SMEs also face some challenges in implementing supply chain technology since not many understand the value and opportunities that accrue with the use of supply chain technology. SMEs frequently fail to fully capitalize on the potential benefits of supply chain innovations, such as cost reduction, lead time improvement, and increased customer service, because of a lack of knowledge in this area (Ismail, Saman & Ghani, 2021). In addition, many facilities and infrastructures are lacking, which poses challenges to the organization's functioning and acts as barriers to the optimal application of these technologies (Alkatheeri and Ahmad (2024). Since these are sinister hurdles, basic research needs to be conducted that maps the drivers, challenges, and opportunities of implementing supply chain technology into SMEs. This study seeks to address this deficiency by conducting a comprehensive analysis of the factors that impact the adoption of technology among SMEs in Malaysia. It will investigate the challenges they encounter as well as the opportunities that can be capitalized on.

It is equally important to comprehend the forces that may motivate or demotivate SMEs about technology adoption to identify actionable strategies to encourage the firms to acquire technology that could help with their development. These drivers encompass factors such as perceived complexity, usefulness, compatibility, financial resources, and top management support, among others. However, by identifying the issues, it becomes possible to create focused solutions that directly tackle specific obstacles. Furthermore, acknowledging the potential advantages offered by supply chain technology can assist SMEs and policymakers in developing policies that optimize the benefits of technological adoption. This paper provides significant information to policymakers and SMEs on ways in which such strategies can be developed or improved for enhancing technology adoption in the supply chain.

2. Drivers that influence SMEs' adoption of supply chain technology in Malaysia

The Malaysian government has been engaged in the active promotion of digitalization by launching various policies including the Industry4WRD policy which is aimed at enhancing the rate of implementation of Industry 4.0. Concerning that, more industries are initiating the adoption and implementation of technologies including the Internet of Things, artificial intelligence, and big data analysis (MITI, 2018). These policies include financial incentives, training, and support that would encourage SMEs to incorporate complex technologies into their supply chains. Additionally, the escalating competition in both domestic and international markets necessitates that small and medium-sized enterprises (SMEs) enhance and innovate their supply chain processes. SMEs can respond quickly to market demands and maintain a competitive edge by leveraging advanced technologies such as blockchain, IoT, and AI, which provide significant advantages in terms of efficiency, transparency, and agility (Tay, et al., 20201). In addition, Fabeil, Pazim, and Langgat (2020) have emphasized the necessity of resilient and adaptable supply chains that can sustain disruptions in light of the COVID-19 pandemic, which has further accelerated the digital transformation agenda.

The adoption of supply chain technology in Malaysia is influenced by a variety of drivers including both internal and external drivers, such as perceived usefulness, perceived compatibility, perceived complexity, top management support, financial resources, the size of the organization, and many others. It is essential to comprehend these drivers to develop effective strategies that encourage the adoption of technology among SMEs. Particularly in their supply chain operations, SMEs frequently encounter distinctive obstacles to competitiveness. The efficacy, efficiency, and responsiveness of supply chains can be improved through the implementation of advanced technologies. Policymakers, business leaders, and researchers must comprehend the drivers that influence the adoption of these technologies. The following are the drivers of technology adoption, as determined by the previous studies:

Driver 1: Perceived complexity
Rogers (2003) defines complexity as the level at which an invention is perceived as challenging to understand and implement. Consequently, although the majority of individuals within a social system may comprehend certain changes in the organization, certain changes are more challenging and require a longer time to adjust

to. Similarly, Alam, Ali, and Jani (2011) asserted that prior studies consistently demonstrate a negative correlation between the perceived complexity of a new technology and its adoption rate. The intricacy of supply chain technology can have a substantial impact on its adoption by small and medium-sized enterprises (SMEs). SMEs may exhibit reluctance to accept technology when they regard it as too intricate or challenging to comprehend and implement. To solve this difficulty, it is crucial to streamline the technology and offer comprehensive training and assistance (Nguyen & Ngo, 2021).

Driver 2: Perceived usefulness
SMEs evaluate the perceived usefulness of supply chain technology concerning its potential advantages and benefits. Included in this category are factors such as enhanced competitiveness, improved decision-making, cost reductions, and increased efficiency (Mohamad Faisal & Idris, 2020).

Driver 3: Perceived compatibility
One critical aspect is how well supply chain technology integrates with preexisting infrastructure, procedures, and company ethos. According to Mohamad Faisal and Idris (2020) and Lin, Alam, Ho, Al-Shaikh, and Sultan (2020), SMEs are more likely to adopt a new technology if this technology will fit into their current activity and work in parallel with it. In addition, they also mentioned that the adoption of technology is more likely to happen in SMEs if the technology can be integrated as an addition to current workflow and processes.

Driver 4: Top management support
Supply chain technology can only be adopted if top management gives its support and commitment to the change. Senior management plays a key role in influencing the level of acceptance and investment made by SMEs in technology where they are willing to accept technological change if the senior management in the organization recognizes the importance of the process and encourages it (Mohamad Faisal and Idris (2020), & Lin, Alam, Ho, Al-Shaikh, and Sultan (2020). In a similar vein, another researcher has stated that parity received from upper-level management has a positive impact on technological adoption (Alsetoohy, Ayoun, Arous, Megahed, & Nabil, 2019). Furthermore, Lin et al., (2020) asserted that the endorsement of innovative technologies by senior management exerts a significant influence on their acceptance. In small and medium-sized enterprises (SMEs), the individuals in charge, whether they be managers or owners, hold the highest level of authority and are involved in all aspects of decision-making inside the organization.

Driver 5: Financial resources
Significantly, the existence of adequate financial resources and investment capacities can affect the implementation of supply chain technology. SMEs may find it difficult to acquire and implement technologies as they may not be able to afford to invest heavily. Hence, government initiatives and subsidies can assist in reducing this obstacle (Mishra, 2013). Furthermore, Azman et al. (2020) asserted that the primary obstacle encountered by SMEs, namely micro-entrepreneurs, is the scarcity of funds or restricted availability of financial resources.

Driver 6: Technical knowledge and expertise
SMEs' technical knowledge and skill in supply chain technology can have a substantial impact on adoption. A lack of technical skills and understanding can impede the adoption process. Training programs and capacity-building activities can assist SMEs in developing the skills required to effectively embrace and use supply chain technology (Bansal, Kumar, Kumari, & Kuzmin, 2023)

Driver 7: Organizational size
The adoption of supply chain technology by an SME might be influenced by its size. Medium-sized enterprises with greater financial and operational capacities may be better equipped to allocate resources towards the implementation of technological advancements, in contrast to smaller enterprises. Nevertheless, smaller SMEs can still reap advantages from government support and programs that are expressly aimed at their size category (Lin, Alam, Ho, Al-Shaikh, & Sultan, 2020).

Driver 8: Customer and regulatory pressure
According to Fernando, (2015), external variables such as customer needs and regulatory restrictions, might impact SMEs' use of supply chain technology. If clients expect or want technology-enabled supply chain

procedures, SMEs may be more driven to implement the technology to meet those expectations. Similarly, regulatory pressure or incentives can encourage small and medium-sized enterprises to adopt new technology.

These drivers influence how Malaysian SMEs use supply chain technology. By addressing all of these drivers and offering assistance with training, funding, and technology simplification, SMEs can overcome the challenges and successfully integrate supply chain technology into their operations.

3. Key challenges faced by SMEs in Supply Chain Technology Adoption

Supply chain technology is critical for improving a business's efficiency, reducing costs and increasing customer satisfaction, enhancing efficiency, improving cooperation among stakeholders, and also outcompeting competitors. While there are apparent benefits, the literature also reveals many challenges faced by SMEs restricting the use of supply chain technology. These challenges include:

Restricted technology accessibility
Challenges that may point SMEs to difficulties in getting and implementing supply chain technologies include high costs, constraints in infrastructure, and poor technical know-how. It rests on the governmental and industrial associations to solve this problem by funding, training, and offering infrastructural facilities to enhance technology access for SMEs (Mohamad Faisal & Idris, 2020).

The expense of technology and infrastructure
According to Mohamad Faisal and Idris, (2020), supply chain technology can be somewhat expensive, covering hardware and software needs as well as deployment and training costs. Small and Medium enterprises are mostly affected by inadequate resources, particularly the SMEs operating with low capital, the cost associated with procurement, installation, and training of technology may be substantial (Bhardwaj, Garg, & Gajral, 2021). Although there has been an inclination towards the adoption of supply chain technologies by SMEs there are several impediments that hinder the widespread adoption of the technologies. The main issue with high implementation costs remains a problem, especially for organizations with limited budgets. Many small and medium-sized businesses (SMEs) are discouraged from implementing creative technologies by their great cost of acquisition and implementation.

Insufficient organizational support
Effective application of supply chain technologies depends on the support of top-level executives. Still, small and medium-sized businesses (SMEs) can lack the support of top-level executives, which would cause possible losses or even stop the implementation process. The major concern surrounding the utilization of Industry 4.0 of the manufacturing climate is its applicability to the SMEs. One of the challenges that are evident in 4.0 technologies is an absence of passion and positive attitude from their customers as well as the business associates. Moreover, the collective performance of the group is much influenced by the anxiety of failing regarding Industry 4.0 technology (Kumar & Ayedee, 2021).

Insufficient government support
Governments can facilitate the use of supply chain technology by small and medium-sized firms (SMEs). This includes the provision of financial assistance, education, and advice. However, many countries lack sufficient government support for small and medium-sized enterprises (SMEs) in this specific area (Mishra, 2013). In Malaysia, the government has set ambitious targets for SMEs' contribution to the country's GDP and exports (Salim, Marlapa, Ismail, Rahman, Hussin, Susilastuti, & Murti, 2022). However, achieving these targets will require a concerted effort to improve SMEs' access to financing, increase productivity, and encourage technology adoption. The adoption of digital technology can help SMEs improve their competitiveness and enhance their ability to compete in the global market.

Lack of knowledge and awareness
SMEs could suffer from ignorance of the benefits and possibilities of supply chain technologies. It is also likely to be specific to small and medium enterprises and their necessity to be focused on in terms of knowledge about the benefits of the mentioned technologies application. Effective ways to reach this are seminars, workshops, and knowledge-sharing platforms (Fernando, 2015). Moreover, Kumar and Ayedee (2019) pointed out the

main challenges to the application of technology as the lack of specialized knowledge and the related costs of change.

Financial constraints

When it comes to investing in supply chain innovations, small and medium-sized businesses (SMEs) might face budgetary limits. To combat this, the government can devise programs that provide small and medium-sized enterprises (SMEs) with low-interest loans, subsidies, or incentives to embrace and execute supply chain innovations (Fernando, 2015). Other researchers Martini, Setiawan, Tanding, Khresna, & Asrihapsari. (2023) mentioned that in the ever-changing business environment, all businesses, including SMEs, must embrace technology to confront challenges and ensure survival. However, it is acknowledged that SMEs may encounter difficulties in adopting digital technology, primarily due to financial constraints and a lack of innovation capability.

Insufficient facilities and infrastructure

When it comes to supply chain adoption and innovations, small and medium-sized businesses (SMEs) might lack the necessary facilities and infrastructure. By establishing shared technology centers or providing access to pooled resources, government agencies, industry groupings, and SMEs can collaborate to improve infrastructure (Fernando, 2015). Another major hurdle is integration issues. It can be difficult and time-consuming to integrate new technology with existing systems and procedures in a way that works well for everyone involved. Managing integrations can be particularly difficult for small and medium-sized businesses (SMEs) because of their limited resources and lack of technical expertise. According to Alkatheeri and Ahmad (2024), this may lead to disruptions and inefficiencies in operations.

Limited managerial capabilities

Small and medium-sized businesses (SMEs) might lack the managerial skills and knowledge required to effectively apply supply chain technologies. Using capacity-building initiatives, training, and mentoring campaigns, small and medium-sized businesses (SMEs) will be better equipped with the necessary abilities to properly employ supply chain technologies and have managerial capacities raised (Mohamad Faisal & Idris, 2020).

Shortage of technical skills and experience

Another downside is that SMEs do not possess the technical competence and experience that is required in selecting and integrating supply chain technologies. Misunderstandings about how to effectively use the technology and problems with its implementation may ensue (Mohamad Faisal & Idris, 2020). Specialized skilled people are necessary for the management and deployment of such complicated equipment; although the companies may not possess such human resources (Bag, Gupta, Kumar, & Sivarajah, 2021). A major hurdle is the lack of adequately trained personnel. Adopting and effectively managing supply chain technologies can be challenging for SMEs due to a lack of specific knowledge and abilities. SMEs face difficulties in making effective use of new technology capabilities because of the presence of this skills gap (Ismail et al., 2021). In addition, Ta and Lin (2023) highlight various challenges faced by SMEs in adopting digital transformation. These challenges encompass a shortage of technical and managerial skills, restricted access to finance, limited financial and human resources for development, technology, and markets, as well as the need for effective business structures.

Resistance to change

Both staff and management may be resistant to change when it comes to implementing new technologies. According to Romero & Mammadov, (2024), this reluctance might be caused by things like aversion to change, worries about possible dangers, or concerns about upsetting existing habits. Besides, if people are comfortable with what they used to see or experience, they are likely to resist change (Lee et al., 2022). Technology adoption in the supply chain presents some challenges to SMEs even though there are resources and specialists available. Problems like this might arise when different departments fail to communicate and work together effectively, when employees are resistant to change, or when there are unclear goals and objectives (Mohamad Faisal & Idris, 2020). In addition to that, new practice implementation may face serious challenges because both the management and employees may not want a change. As a result of these risks and other forms of uncertainty that surround the use of new technology, many SMEs are normally not willing to deviate from their set routines

and systems (Qutaishat, Abushakra, Anaya, & Al-Omari, (2023).

The benefits of supply chain technology can only be completely realized by SMEs if they overcome all of these challenges. According to a study conducted by Mohamad Faisal and Idris (2020), SMEs can overcome these challenges by taking the following steps: using the right technology, getting enough help, communicating clearly with staff, setting clear goals, and working together with other departments. Consequently, SMEs can reap the benefits of supply chain technology, such as improved efficiency, visibility, and decision-making capacities, by overcoming these challenges.

4. Opportunities for Supply Chain Technology Adoption for SMEs

Supply chain technology therefore comes in handy for SMEs, especially if they are keen on growing to be efficient, competitive, and keen on meeting consumers' needs in the market. Currently, the existing market system has slowly formed a large and highly coordinated market system so that SMEs gradually develop new technological advancements to sustain their growth rate and achieve a higher level of efficiency. This paper seeks to analyze the implication of supply chain technology to determine whether it holds any possibility that may work to the advantage of SMEs. Among those opportunities, some of them include the following:

Enhanced Efficiency
There is a great chance to increase operational efficiency by adopting supply chain technology. Rapid process automation (RPA) and other advanced manufacturing technology and automation tools streamline routine tasks, reduce human error, and boost output (Bhardwaj, Garg & Gajpal, 2021). Two areas within an organization that can benefit from Robotic Process Automation (RPA) include order processing and inventory management. That way, the workers can then attend to the more important tasks within the company. The use of IoT devices enables real-time monitoring of the supply chain thus achieving less downtime and more visibility (Pereira & Romero, 2017).

Enhanced Decision-Making
By use of supply chain technology, especially artificial intelligence (AI) and machine learning (ML), SMEs are given sophisticated analytical capabilities that enable enhanced decision-making. By applying AI and ML, data can be scanned for large volumes to come up with forecasted outcomes. This in turn assists the SMEs to aggressively manage risks, forecast the market, and reduce supply chain complexity (Min, 2021). Predictive analytics, for example, may more precisely forecast demand, which lets SMEs adjust their inventory to avoid stockouts or overstock events. In the presence of market changes, this data-driven strategy for decision-making increases the general resilience and responsiveness of SMEs.

Cost Reduction
Costs can be significantly reduced for SMEs by using innovations in the supply chain. By improving inventory management, decreasing transportation charges, and reducing waste, big data analytics and blockchain technology help to reduce costs (Dubey, Gunasekaran & Childe, 2020). By using big data analytics, SMEs may find out some specifics of the supply chain, trends, or patterns, thus enhancing their allocations snuffing out financial misuse of resources, or even lessening operational costs. Due to this, blockchain technology offers a way of securing and reviewing the transactional process hence minimising fraud as well as errors. Given the potentially devastating financial consequences of such events for SMEs, this is very welcome news (Saberi, Kouhizadeh, Sarkis, & Shen, 2018). Furthermore, cloud computing solutions provide SMEs with an adaptable and economical IT infrastructure, according to Lacity and Reynolds (2014), since they do away with the need for large upfront expenditures in software and hardware.

Increased Agility and Responsiveness
Using supply chain technology helps SMEs to meet customer needs and rapidly change with the state of the economy. SMEs are capable of responding promptly to disruptions within the supply chain and scarce resources and adapting to existing market conditions through the application of IoTs as well as AI, which offer real and correct information and data (Ivanov & Dolgui, 2020). IoT sensors can spot supply chain anomalies and start quick fixes, therefore preventing likely disruptions. Analytics driven by artificial intelligence can identify evolving market trends, which lets SMEs modify their goods and approach to fit changing customer

preferences. Small and medium-sized businesses (SMEs) benefit from more flexibility in maintaining their competitive advantage in markets undergoing fast development.

Improved Cooperation
Technology and digital platforms have made it easier for all parties involved in the supply chain—including customers, partners, and suppliers to work together more effectively. Improved collaboration and coordination are outcomes of using cloud-based solutions, which allow for the efficient transfer and sharing of information (Bag et al., 2021). Through effective collaboration in integrated business environments, suppliers and SMEs stand to benefit from better production planning and shorter lead time implementation. For businesses to thrive, better collaboration is essential since it strengthens supplier connections and supply chain networks. Hence, SMEs may build stronger supply chains with the help of digital technology. This will allow them to better handle disruptions and seize new opportunities as they come.

Impact of Technology Adoption on SMEs' Performance
Adoption of supply chain technology helps one to assess the performance of SMEs in Malaysia by looking at key performance indicators including cost reduction, lead time improvement, inventory management, customer service enhancement, and general competitiveness per Mishra (2016). SMEs in Malaysia can reduce wastage, act more efficiently, and thus save money when using supply chain technology. Moreover, supply chain technology can improve lead times by simplifying procedures, therefore lowering delays, and encouraging departmental communication and cooperation. Furthermore, technology helps small and medium-sized businesses (SMEs) in Malaysia in inventory management by improving demand forecasting, lowering stockouts, and offering real-time inventory level visibility. This means that through supply chain technology, lead-time, tracking delivery, and order fulfillment are reduced to improve customer experience (Mishra, 2013). Furthermore, by increasing productivity, lowering expenses, and raising customer service, these technologies help SMEs to be more generally competitive (Mishra, 2016; Fernando, 2015). Through the use of supply chain technology, SMEs in Malaysia can enhance their performance based on several key performance indicators, which include efficiency, cost reduction, and competitiveness in the market.

5. Recommendation and Future Trends

The awareness of Malaysian SMEs regarding the benefits of embracing digitalization in enhancing efficiency and competitiveness will significantly enhance the implementation of supply chain technology by Malaysian SMEs in the coming years. To encourage SMEs in supply chain technology adoption, further research is needed to explore and understand the specific barriers and challenges that hinder their uptake of digital technology as follows:

Analyze government policy
Identify the policy of the Malaysian government, rules, regulations, and support in promoting technology adoption among SMEs. Assess the effectiveness of existing initiatives and identify potential areas for improvement to better facilitate technology adoption and integration into SME operations.

Incorporating cutting-edge technologies
Cutting-edge technology such as 5G, robotics, and machine learning is one of the major upcoming trends in Malaysian supply chain technology adoption. Rapid and dependable connectivity is essential for real-time data exchange and decision-making; 5G technology is expected to revolutionize supply chains in this regard (Khaw, Alhamzah, Hadi, Victor, Yuvara, & Nadia, 2022). Robotics and also automation have the potential to boost the operational efficiency of the company. This is because they can replace humans as workers, make procedures more precise, and speed up industrial operations. Additionally, machine learning and artificial intelligence can provide insights and predictive analytics that help SMEs improve their supply chain operations and proactively respond to market demands (Wong, Leong, Hew, Tan, & Ooi, 2020).

Explore the successful technology adoption cases
The SMEs can observe and organize case studies of SMEs that have successfully adopted and integrated digital technology into their business processes. This can be done through identifying the strategies and also the best practices learned from these successful cases that can be replicated or adopted by other SMEs.

Analyze the role of industry associations
The company can identify the role of industry associations and networks in promoting technology adoption among SMEs. In Malaysia for example, SME Corporations and the Federation of Malaysian Manufacturers (FMM) can facilitate knowledge sharing, collaboration, and technology adoption support among their members, especially SMEs.

Explore collaboration with stakeholders
On the other hand, Lee et al. (2022) suggest that researchers investigate collaboration models that enhance coordination and cooperation among supply chain stakeholders through the utilization of digital platforms and technologies. Malaysian SMEs' future use of supply chain technology will be defined by the utilization of complex technologies, sustainability imperatives, resilience measures, and collaborative endeavors. By focussing on these areas through study and practical implementation, Malaysian SMEs can fully utilize supply chain adoption. This will lead to enhanced growth and competitiveness in the increasingly digitalized global marketplace.

Sustainability
It is almost becoming a trend that sustainability is slowly becoming a focal point for companies, especially in aspects like supply chain management and this is perhaps due to technological development. To reduce their environmental impact without sacrificing their economic viability, future research should focus on reviewing how SMEs can incorporate sustainable supply chain management practices in their business. Studies have shown that sustainable supply chain practices have multiple benefits, including lower costs in the long run, better brand recognition, and more efficient and effective business operations (Lin et al., 2020).

Conclusion
Finally, this study suggests how Malaysian SMEs can do better within this digitalized and globally competitive environment based on the literature review that underlines the significance of supply chain technology adoption in the Malaysian business community alongside its drivers, challenges, and opportunities. The positive impact of technology adoption on supply chain performance highlights the need for continuing efforts to encourage SMEs to become digital firms. Other than that, the role of incentives from the government, the top management support, skill and knowledge of employees, facilities and infrastructure, and the cost of technology, contribute to Malaysian SMEs' dynamic and ever-changing process of adopting supply chain technology. As a result, SMEs can evaluate the obstacles that lie ahead, seek solutions to those, and most importantly, disseminate the appropriate messages to the employees that will enhance the effective implementation of the technology. Malaysian governments and managers need to provide support structures for this sector by easing measures to help SMEs grow and become a major boost to the Malaysian economy. In addition, policymakers, corporations, and academia can create successful policies and investments to fully capitalize on supply chain innovations by addressing these barriers and aiding SMEs on their digital journey. Understanding the use of advanced technologies such as automation, artificial intelligence, the Internet of Things, blockchain, and cloud computing has the potential to dramatically improve the performance of Malaysian SMEs. Ultimately, understanding and overcoming the barriers to technology adoption enables SMEs to achieve long-term development, increased efficiency, and higher customer satisfaction, equipping them for success in an increasingly digitalized global market.

Abstract: The overnight interbank rate is an essential factor for central banks to impact economic activity and preserve financial stability. It refers to the rate at which banks lend and borrow short-term funds from one another, often overnight. The overnight interbank rate plays a crucial role in the transmission mechanism of monetary policy since changes in the rate can affect the cost of borrowing and the availability of credit, which in turn impacts consumption, investment, and economic activity. According to Bank Negara Malaysia (2021), overnight transactions in the interbank market run in parallel to the existing Kuala Lumpur Interbank Offered Rate (KLIBOR). This study intends to explore time series data from 1991 to 2021 to identify the relationship between dependent and independent variables based on the ordinary least square method (OLS). Meanwhile, the study investigates whether macroeconomic variables influence the overnight interbank rate in Malaysia. Therefore, this study uses the determinant of economic indicators of unemployment (UR), domestic private credit (DGR), gross domestic product (GDP), foreign exchange (FER), and inflation (I). The data comes primarily from the World Bank and the Federal Reserve Bank (FRED). Based on results demonstrate that unemployment and inflation have the most significant impacts on monetary policy. The reason why unemployment has an impact on economic growth is that high unemployment frequently indicates resource underuse, pointing to the need for stimulative monetary policy (such as decreasing interest rates) to promote investment and expenditure and promote economic growth. To slow down the economy and cut expenditure, central banks typically raise interest rates in response to rising inflation. On the other hand, declining inflation may lead to rate reductions to boost the economy. This is a significant element of inflation in monetary policy.

Keywords: *Overnight interbank rate, Unemployment, Domestic private credit, Gross domestic credit, Foreign exchange, Inflation*

1. Introduction and Background

Financial globalization is described as the overall trend toward more international economic integration, as evidenced by a rise in cross-border monetary transactions (Prasad et al., 2005). According to Bhanumurthy and Kumawat (2020), financial globalization become a hot topic that has been discussed globally in the last three decades. Unprecedented financial globalization has taken place during the 1980s, as evidenced by the dramatic growth in capital flows experienced by both developed and developing nations. The most current phase of financial globalization has been characterized by an increase in the cash flow, most significantly, between industrial and developing countries.

We have known for a long time that the financial system is critical to the implementation of monetary policy because monetary policy aimed at macroeconomic variables is essentially a financial operation. Thus, the financial sector, via the monetary transmission mechanism, connects central bank policies and the actual economy. Because monetary policy is primarily implemented through the financial system, any change that alters its structure or circumstances may disrupt the transmission mechanisms. As a result, the effectiveness of monetary policy is vitally dependent on a set of characteristics impacted by the expansion of the financial sector (Ma & Lin, 2016). In this context, research into the relationship between financial globalization and monetary policy success has substantial theoretical and policy implications for many economies, particularly those with rapid financial growth.

The study is based on the influence of financial globalization on the monetary policy in Malaysia. Thus, a global financial cycle that reflects domestic monetary and financial conditions has sparked our curiosity to study the link between monetary policy and financial globalization in these nations. The objective of this study is to

discover whether each country's monetary policy responds to the influence of financial globalization which consists of different variables. There are six variables used in this study. The variables are Unemployment, Domestic private credit, Gross domestic credit, Foreign exchange, Inflation and Monetary policy. The focus of these variables in this study may help individuals, groups and governments to understand how these variables may affect the changes of a country's monetary policy. The issue arose when there was instability of the overnight interbank rate which impacted to public, business, and financial sectors.

The objective of this study is to discover whether each country's monetary policy responds to the influence of financial globalization which consists of different variables. The focus of these variables in this study may help individuals, groups and governments to understand how these variables may affect the changes in a country's monetary policy.

2. Literature Review

Unemployment and monetary policy
Unemployment is when citizens are seeking and asking for jobs but are sometimes unable to secure jobs. They are actively seeking availability based on their knowledge and skills. Hence, graduates should look at this issue as an opportunity for them to uplift their skills and knowledge, in line with future industrial needs. As the future is more towards the gig economy, more focus should be given to the professional workers residing in that area (Abd Rahman, Ismail, Ridzuan, Abd Samad, 2020). The employment rate is the absolute most important indicator of economic growth. Indicators of the labor market, such as the unemployment rate, have generally been known as useful metrics by which to assess the economy as a whole (Lee & Kim, 2023).

Based on the Keynesian theory of economics, they are looking for the advocate deficit spending on labor intensive to ensure that unemployment can be stimulated and wages more attractive even during downturns (Jahan, S., Mahmud, A. S., & Papageorgiou, C., 2014). Consider that Keynesian economics also says that both market economies and capitalist economic systems are prone to boom and bust cycles (Stockhammer, 2022). Low aggregate demand and high unemployment rates characterize the economy's collapse period. If the economy can re-enter its growth phase, the unemployment rate will eventually revert to normal. The Keynesian theory of unemployment serves as the foundation for explaining cyclical unemployment since it describes the impact of regular shifts in the business and economic cycle on the labor market. This is due to the theory's explanation for why cyclical unemployment occurs. People who follow the Keynesian theory of economics think that demand from consumers is the most important factor in an economy.

According to the literature by (Christoffel and Linzert, 2005, Trigari, 2006), unemployment has a substantial impact on how monetary policy is transmitted. According to the researcher's approach, a direct link between wages and inflation is established by the right-to-govern pay negotiations. Thus, they can demonstrate that the dynamics of inflation following a shock to monetary policy depend greatly on the degree of real wage rigidity. This is because under these circumstances, however, the effect of unemployment on total consumption is rather small. Next, none of the cited research specifically used cointegration techniques, which are formally intended to reveal structural breaks in the relationship between the two variables. As a result, we discovered that there is a lack of agreement in the literature, particularly in research that pertains to the situation in Malaysia. The investigation included very little agreement on any of its topics. Researchers in Malaysia conducted studies between 1980 and 2010 to determine whether or not shifts in the country's monetary policy affected the country's high unemployment rate (Georgiadis & Mehl, 2016). According to Chicheke (2009), there is a co-integration between these two variables, which is in line with what Benazic and Rami (2016) found in Croatia. The Phillips curve is not true because of these results. This study also shows that changes in the inflation rate have a bigger effect on monetary policy than changes in the unemployment rate. So, changes in the inflation rate are more significant to the monetary authority than changes in the unemployment rate. In conclusion, a lower unemployment rate could also indicate strong economic growth and robust demand for goods and services, which could support a case for a tightening of monetary policy. Thus, there is a relationship between unemployment and monetary policy according to Keynesian theory.

Domestic private credit and monetary policy
Through careful management of the supply and demand for domestic credit, monetary policy has the ability to

influence both the growth of credit and overall spending, which in turn can affect inflation, employment, and other crucial economic indicators.

An identical study was conducted in Malaysia. However, these investigations solely utilized combined data from the works of Kassim and Turkhan (2008), Kassim and Shabri (2010), and Goh and Yong (2007). To fully capture the type of reaction from this banking institution against the policy change, this scenario summoned complexity (Hosono, 2006). As a result, research using data from microbanks is still in its early stages. The banking institution was not divided into Islamic banking and regular banking, therefore the conclusion made broad sense. Bernoth and Pick (2011), conducted research and the results show a positive domestic credit trend, which shows that domestic credit can be used to gauge the health of the banking industry, but a faster GDP growth rate reduces the risk of default. More crucially, the authors emphasized that, in contrast to a model with solely observed variables, the inclusion of unobserved common characteristics in the model is essential in predicting the instability of the banking and insurance sectors.

Gross domestic product and monetary policy
A strong and sustained increase in gross domestic product (GDP hereafter) can lead to increased demand for goods and services, putting upward pressure on prices. If this results in higher inflation, a central bank may tighten monetary policy by raising interest rates to curb inflation and maintain price stability. On the other hand, if GDP growth is sluggish, a central bank may loosen monetary policy by lowering interest rates to stimulate borrowing and spending, and thus support economic growth. The state of the economy as reflected by GDP can also impact market expectations for future interest rates. If GDP growth is strong, market participants may expect interest rates to rise in the future, which can influence the behavior of consumers and businesses. Therefore, the relationship between GDP and monetary policy is not one-sided, as GDP can also impact monetary policy by influencing the central bank's decisions regarding interest rates and the money supply. The interplay between GDP and monetary policy helps to maintain economic stability and support sustainable economic growth.

In the context of actual business cycles, there has been a lot of talk about the connection that exists between Gross Domestic Product and monetary factors. Recent studies, such as the one conducted by Ellison and Sargent (2015), have demonstrated that nominal factors, such as inflation and money supply, are unable to provide an adequate explanation for actual production. However, this is not always the case because it depends on the type of economy. To formulate the most effective monetary policy, it is essential to determine the phase of the business cycle (whether it be a period of economic contraction or expansion) during which the monetary variables exert their influence on production. In conclusion, based on classical growth theory, there is a relationship between gross domestic product and economic growth.

Both monetary policy and exchange rate values are interrelated. The supply and demand of a nation's currency are both impacted by the monetary policy of that nation, which in turn has an impact on the currency exchange rate. The increase in demand for a currency might lead to an increase in that currency's value in comparison to other currencies if the central bank decides to hike interest rates. In the opposite direction, if the central bank reduces interest rates, it may cause demand for the currency to decrease, which in turn may cause the value of the currency to decrease. In the opposite direction, fluctuations in exchange rates can also affect the monetary policy of a country by influencing inflation and economic growth.
Foreign exchange and monetary policy.

Based on the findings, researchers also analyze the effects of US monetary policy transmission across different types of loans and their distribution. Lower policy rates shift bank allocation toward riskier borrowers, as shown by several empirical research (Jiménez et al., 2014, for Spain; Ioannidou et al., 2015, for Bolivia). They hypothesize that banks will move toward less risky loans as a result of their research into the effects of an increase in foreign monetary policy on lending. The data on loan disbursements is broken down into many categories, including currencies, maturities, security, and industries, so we can look into whether or not banks shift their lending toward safer bets. In addition, they assess the results of foreign monetary policy.

Foreign Exchange and monetary policy
Foreign exchange (FX) refers to the exchange of one currency for another or the conversion of one currency

into another currency. A decentralized market where currencies are purchased, sold, and traded is the foreign exchange market. The value of currencies fluctuates based on a variety of factors, including interest rates, economic growth, and political stability. Foreign exchange is used by businesses, investors, and governments to pay for goods and services, invest in foreign countries, and manage currency risk.

To understand why the impact of monetary policy on the exchange rate may have changed, it is helpful to consider a general explanation of the relationship between the exchange rate and interest rates (Ferrari et. al., 2021). The Interest Rate Parity (IRP) theory suggests that changes in interest rates may affect the value of a currency. Additionally, if a location has a higher interest rate than another, it is expected that investor would flock there in quest of larger returns on their investments, increasing the value of that region's currency.

Due to changes in the current and anticipated future differences between domestic and foreign interest rates, changes in expectations for the currency risk premium, and changes in opinions about the long-term level of the exchange rate, there are three main causes for currency rate changes in response to monetary policy events. The monetary policy transmission channel through the exchange rate has survived this period of considerable changes in financial markets and monetary policy implementation by using a properly designed event analysis to account for the multiple elements in monetary policy news.

Inflation and monetary policy
Kumawat and Bhanumurthy (2018) indicate that the monetary policy in India has been sensitive to the rate of inflation, the output gap, and the volatility of the exchange rate. In addition, the results of several studies that were conducted in the past indicate that monetary policy reacts more to the issue of inflation than it does to the issue of unemployment (Chicheke, 2009). Next, Zhang & Clovis (2010) claim that the dynamic equations for inflation in China provide signs of structural instability over time. These indications are based on the fact that the equations change over time. It has been established that the considerable change in the inflation persistence parameter is due to a response of inflation expectations to a series of adjustments in China's monetary policy framework that took place in the middle of the 1990s. These reforms took place during this period. Given that the structural change in the inflation process is primarily attributable to improvements in monetary policy and the associated improvements in inflation expectations, it is also possible for high inflation to strike back at China in the absence of a determined effort by the monetary authorities to continue managing inflation expectations. This is the case even though China has made progress in improving its monetary policy.

The relevant theory that indicates inflation related to monetary policy was Irving Fisher's theory. American economist Irving Fisher established the Irving Fisher theory (1867-1947). Fisher's theory on inflation, interest rates, and money supply underpins it. Fisher's theory also addresses inflation-interest rate relationships. Fisher felt money supply fluctuations might affect interest rates, economic activity, and inflation. He predicted inflation and higher interest rates if the money supply grew faster than the economy. Economists continually study and debate Fisher's theory, which shaped monetary economics. His research on money, pricing, and economic activity has offered a foundation for monetary policy decisions. In Irving Fisher's theory, monetary policy and inflation are linked. Fisher believes money supply changes can significantly affect the economy and inflation. Fisher predicted inflation and higher interest rates if the money supply grew faster than the economy. If the money supply declines, interest rates and inflation fall. Fisher advocated monetary policy to curb inflation. According to Irving Fishing's theory, there is a connection between monetary policy and inflation, which leads us to the following conclusion.

3. Research Methodology

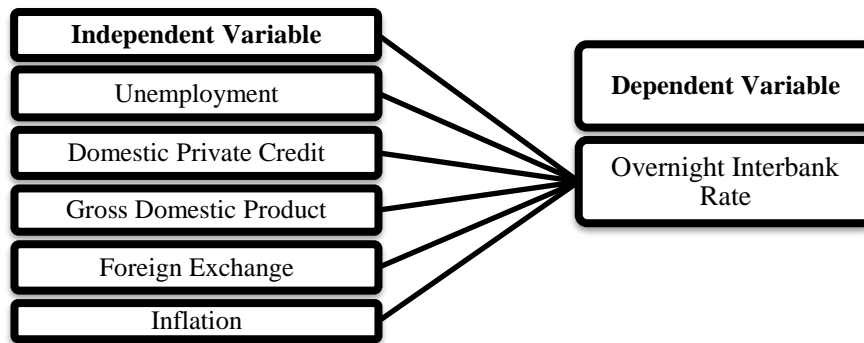
Model Specification
To test the relationship between the variables of unemployment (UR), domestic private credit (DGR), gross domestic product (GDP), foreign exchange (FER), and inflation (I). Model specification for determining the connection between a dependent variable (y) and an independent variable (x). To describe the link between one dependent variable and two or more independent variables, the Multiple Regression Analysis Model is used. There are just a few models that can be employed with the multiple linear regression model. As a result, the Ordinary Least Squares (OLS) approach is being used in this research investigation. The OLS technique is a statistical analysis method that evaluates the link between variables by minimizing the sum of squared

differences between observed and corresponding values. In this research, the OLS method is used to analyze the data between monetary policy and its determinants which are unemployment, domestic private credit, gross domestic product, foreign exchange and inflation. The regression model is given below:

$$\gamma = \beta_0 + \beta_1 LNUR_t + \beta_2 LNDGR_t + \beta_3 LNGDP_t + \beta_4 LNFER_t + \beta_5 LNCPI_t + \varepsilon_t$$

Data Collection and Measures
This study uses annual data in the context of Malaysia, covering the period from 1991 to 2021. We began the data in 1991 due to the changes in monetary policy. This is a preliminary investigation that aims to identify the sources of the issue and provide the most accurate explanation that can be provided. To put this another way, the objective of exploratory research is not to produce conclusive answers to questions that have already been posed; rather, its focus is on merely investigating the research questions. The purpose of doing a study of this kind is often to investigate a subject that has not yet been precisely identified. The purpose of exploratory research is not to provide evidence that an issue exists; rather, it is to provide us with a deeper knowledge of the nature of the problem. This study is done to determine the nature of the problem, and its purpose is not to supply evidence that the problem exists. Quantitative research can be used to argue about how variables in a study interact with one another. According to (Ivankova, 2023), the significance of the teaching and learning process can be studied and understood through qualitative research, which focuses on investigating people's experiences with and views of social phenomena.

According to the figure 1 above shows two variables that be used in this research which are dependent variables and independent variables. The figure above indicates and explains how macroeconomic components influenced the monetary policy effectiveness in Malaysia. Based on the figure, monetary policy effectiveness is the dependent variable, and the independent variables are unemployment, domestic private credit, gross domestic product, foreign exchange, and inflation. The result of implication on the monetary policy in Malaysia comes out from the independent variables. In other words, the independent variables are the elements that will affect the monetary policy. The sources of the data are in Table 1.

Figure 1: Theoretical Framework for Monetary Policy


In this study, there are Furthermore, Multiple regression also being used to determine the connection between a dependent variable (y) and an independent variable (x). To describe the link between one dependent variable and two or more independent variables, As a result, the Ordinary Least Squares (OLS) approach is being used in this research investigation. The OLS technique is a statistical analysis method that evaluates the link between variables by minimizing the sum of squared differences between observed and corresponding values. In this research, the OLS method is used to analyze the data between monetary policy and its determinants which are unemployment, domestic private credit, gross domestic product, foreign exchange and inflation. R-squared is a statistical measure that represents the proportion of the variance in the dependent variable that is predictable from the independent variables. The t-test is used to evaluate the degree of significance to reject the null hypothesis by comparing it to the P-value. Another way to say this is that the T-test is used to decide whether or not the null hypothesis should be accepted. Another statistical is the F-Test. It is used to compare the variances of two populations. It is used to determine whether the variances of two groups are equal, and thus whether the two groups have similar dispersion.

In the diagnostic test, this study used four tests that involved time-series data which are the Variance Inflation Factor (VIF) procedure, Serial Correlation Test Normality Test on Residuals and Multiple Regression Model. Variance Inflation Factor (VIF) is a statistical measure that indicates the degree of multicollinearity (correlation between independent variables) in a multiple regression analysis. When there are strong correlations between two or more independent variables, multicollinearity occurs. It is stated to exist among the independent variables in a regression if the independent variables are connected to or reliant on one another. Next is the serial correlation test where any error terms of a time series are correlated in the manner described above, we can perform a Durbin Watson (DW hereafter) Test. The common rule is that when the DW statistic is lower than Durbin (dL) or the DW statistic is higher than 4-du, it suggests that serial correlation exists (Studenmund, 2017). Moreover, a normality test is to establish the likelihood that a given sample represents a normal distribution in the larger population. For quantitative variables to be tested using parametric methods like correlation, regression, the t-test, and analysis of variance (ANOVA), the data must follow a normal distribution. When represented on a graph like a histogram, a Box Plot, or a Frequency Polygon, time series data should take the shape of a bell-shaped curve, representing a normal probability distribution. If the data set is not normally distributed, it indicates that the 'model is not good in the representation of the data generation process (Lütkepohl, 2005).

Table 1: Definition and sources of variables

Variables	Description	Data source	Expected Relationship
Monetary Policy	Overnight Interbank Rate (OIR)	World Bank, FRED	-/+
Unemployment	Unemployment Rate (UR)	International Monetary Fund, World Bank, FRED	-/+
Domestic Private Credit	Domestic Growth Rate (DGR)	World Development Indicator	-/+
Gross Domestic Product	Gross Domestic Product (GDP)	World Bank, FRED	-/+
Foreign Exchange	Foreign Exchange Rate (FER)	World Bank, FRED	-/+
Inflation	Consumer Price Indexes (CPIs)	World Bank, FRED	-/+

The hypothesis will be considered and tested in this analysis:
Hypothesis 1
H01: Unemployment has no relationship with monetary policy.
HA1: Unemployment has a relationship with monetary policy.
Hypothesis 2
H02: Domestic private credit has no relationship with monetary policy.
HA2: Domestic private credit has a relationship with monetary policy.
Hypothesis 3
H03: Gross domestic product has no relationship with monetary policy.
HA3: Gross domestic product has a relationship with monetary policy.
Hypothesis 4
H04: Foreign exchange has no relationship with monetary policy.
HA4: Foreign exchange has a relationship with monetary policy.
Hypothesis 5
H05: Inflation has no relationship with monetary policy.
HA5: Inflation has a relationship with monetary policy.

4. Results

Regression result
Estimates are used to carry out the empirical investigation based on model specification. This allows us to examine the effects of the explanatory variables at different points in the relationship based on the impact of economic indicators on monetary policy. The empirical results discussion between the independent variables and dependent variables are shown in Table 2. The OLS estimates are shown below:

Table 2: Regression Result

DV – Overnight Interbank Rate (OIR)	$\gamma = \beta_0 + \beta_1 LNUR_t + \beta_2 LNDGR_t + \beta_3 LNGDP_t + \beta_4 LNFER_t + \beta_5 LNCPI_t + \varepsilon_t$
	Regression Method: Ordinary Least Square (OLS)
LNUR	-0.744** (-2.188)
LNDGR	0.315 (1.289)
LNGDP	0.019 (0.273)
LNFER	-0.205 (-0.621)
LNCPI	-1.356***(-5.703)
cons	7.814*** (5.873)
R-squared	0.832
F – statistic	24.815
Durbin Watson	1.025

t statistics in parentheses, p<0.10* p<0.05**, p<0.01***

Table 2 provides the regression result for the variables used in the OLS analysis. The result shows two economic indicators have a negative relationship with monetary policy determined by overnight interbank rate. It shows that if the Unemployment Rate (UR) increases by 1%, the Overnight Interbank Rate (OIR) will decrease by 0.744%. Another negative coefficient was if the Foreign Exchange Rate (FER) increases by 1%, the Overnight Interbank Rate (OIR) will decrease by 0.205%.

Based on the result, the adjusted r-squared is 79.88%. It depicts that 79.88% of the variations in the dependent variable can be explained by two of the independent variables which are the unemployment rate and consumer price index in the model. The remaining 20.12% is due to the omission of the other important independent variables.

Moreover, on the t-test, we have enough evidence to reject the first and fifth null hypotheses because the p-value is at significance levels of 0.05 and 0.01 respectively. Therefore, we conclude that unemployment (UR), and inflation (CPI) are influencing the movement of monetary policy in Malaysia.

Lastly, Based on F-test, we have enough evidence to reject the null hypothesis because the p-value is at 0.01 (1%). Therefore, we can conclude that there is a significant relationship between at least one of the macroeconomic variables which are unemployment (UR) and inflation (CPI) with monetary policy in Malaysia.

Diagnostic Test

VIF Procedure

Table 3: VIF Test

Variable	VIF
LNUR	1.602
LNDGR	1.397
LNGDP	1.281
LNFER	2.582
LNCPI	2.603

Sources: Author's calculation

Based on table 3 shows the test of Variance Inflation Factors (VIF) results to identify the multicollinearity. The results show all five variables scored in VIF are below 5. We found out that the Unemployment Rate (LNUR), Domestic Growth Rate (LNDGR), Gross Domestic Product (LNGDP), Foreign Exchange Rate (LNFER), and Consumer Price Index (LNCPI) were scored below 5 (Centered VIF) at the first order. Hence, we can accept all the independent variables.

Durbin Watson
Next, based on Table 2, the test proceed to the second diagnostic which is the Serial Correlation Test which is

the Durbin Watson Statistic the 1st order serial correlation test. Since DW Statistic 1st order does not fall within the range of 1.5-2.5 whereby 1.025, hence it requires us to rerun a serial correlation test at 2nd order using the Breusch Godfrey test for corrections.

Since a Durbin-Watson stat score at 2nd order (Breusch-Godfrey) falls within the range of 1.5-2.5 whereby 1.847729, hence we have enough evidence to reject the H0 of having a severe correlation among the error terms. Therefore, we may proceed with the 3rd Diagnostic Check which is Normality Test.

5. Conclusion

A total of five independent variables been found which include unemployment, domestic private credit, gross domestic product, foreign exchange and inflation have been utilized and a total of 31 annual data have been collected for Malaysia spanning from year 1991 to year 2021 from a reliable secondary source to achieve and solve the research objectives and questions. This model has been constructed in a significant way in which the independent variables utilized in explaining the dependent variable which monetary policy are derived to be at a 99% confidence interval. Furthermore, the result also emphasizes that 95.41% of the variation in monetary policy can be explained by all independent variables, therefore proving the variables that have been chosen are suitable. Overall, unemployment and inflation are the most significant to the impact of monetary policy. According to the literature by (Christoffel and Linzert, 2005, and Trigari, 2006), unemployment has a substantial impact on how monetary policy is transmitted. Kumawat and Bhanumurthy (2018) indicate that the monetary policy in India has been sensitive to the rate of inflation, the output gap, and the volatility of the exchange rate. As a result of the multiple regression, it is found that unemployment and foreign exchange have a negative relationship with monetary policy whereby the increase of unemployment and foreign exchange may decrease the monetary policy of the country. While for domestic private credit, gross domestic product and foreign exchange have both positive and negative relationships with monetary policy depending on various countries. This study will be significant to policymakers and may potentially be used as a basis for the formulation of legislation and policies about the industry. The findings of the study can be used by central banks as policymakers to design rules that promote stability and safeguard the interests of investors using the information gained from the study. This would apply specifically to enterprises in the industry. Moreover, existing and potential investor make better investment selections depending on their long-term or short-term investment objectives and for future research.

Understanding Customer Satisfaction: A Study of Convenience Stores

Nur Ain Hanisah Jaafri, Aida Azlina Mansor*
Faculty of Business & Management, Universiti Teknologi MARA, Kampus Puncak Alam, Selangor, Malaysia
2022697426@student.uitm.edu.my, *aidaazlina@uitm.edu.my
Corresponding Author: Aida Azlina Mansor

Abstract: This study explores the impact of customer satisfaction on purchasing behavior within convenience stores, focusing on four key determinants: service quality, perceived value, product quality, and trust, perceived value, and trust. The growing population and increasing consumer demand have prompted companies to enhance productivity and service standards across their convenience store branches. To maintain competitiveness and attract a diverse customer base—comprising existing, new, and potential customers—businesses need to review and refine their operational strategies continuously. The study's methodology involved a structured approach to gathering quantitative data from a specific sample of convenience store customers in Bentong City. By using surveys and questionnaires, the research aimed to capture relevant information directly from the consumers, providing insights into their experiences and satisfaction with the convenience stores. The non-probability convenience sampling method facilitated the collection of data from readily available participants, ensuring a practical and timely data collection process. Using a data set collected from 220 respondents who utilized products and services at a convenience store, this research aims to empirically investigate the relationships between service quality, perceived value, product quality, and trust, perceived value, trust, and overall customer satisfaction. The findings indicate that while all four factors contribute to customer satisfaction, service quality, perceived value, and trust exert a significantly stronger influence compared to product quality. These insights underscore the importance of prioritizing service enhancement, value creation, and trust-building initiatives in the strategic management of convenience stores, thereby ensuring sustained customer satisfaction and loyalty.

Keywords: *Customer Satisfaction, Convenience Stores, Product Quality, Service Quality, Perceived Value & Trust*

1. Introduction and Background

In recent years, substantial growth has been observed in the convenience store industry in Malaysia, driven by consumer lifestyles that increasingly prioritize convenience and flexibility in shopping. This shift towards modernity has led to a notable increase in the number of convenience stores across the country. In Malaysia, the industry's expansion has been fueled by key players such as FamilyMart, 7-Eleven, MyNews, 99 Speed Mart and CU, which have significantly contributed to this growth. Recent scholarly literature emphasizes that the rapid proliferation of convenience stores, such as FamilyMart, 7-Eleven, MyNews, 99 Speed Mart and CU, over the past decade has been driven by their innovative product offerings and enhanced accessibility (The Edge, 2024). Convenience stores are defined as small retail outlets offering a limited variety of groceries and other products, typically operating for over 18 hours a day to meet the needs of time-conscious consumers (Mendonça, et al., 2017). Traditional retail is being reshaped by the rise of e-commerce and the expansion of modern grocery retail, with convenience stores adapting through the adoption of digital advancements and the introduction of food service options (Euromonitor International, 2024).

Between 2016 and 2022, the number of convenience stores in Malaysia was projected to grow at a compound annual growth rate (CAGR) of 6%, driven by companies scaling their operations and enhancing efficiency to better compete in the market (Ee, Abdullah & Japper, 2024). According to the National Association of Convenience Stores (NACS, 2021), convenience stores offer consumers a strategic location to quickly purchase a diverse range of products and services. Convenience stores are easily accessible, allowing customers to swiftly identify, select, and purchase their desired products (Seiders, Berry and Gresham, 2000).

This study focuses on the leading convenience store chains in Malaysia, namely FamilyMart, 7-Eleven, MyNews, 99 Speed Mart and CU. These stores are strategically located near residential areas and busy hubs, underscoring the importance of location in attracting customers. Retail analysis indicates that, for convenience stores, the right location—characterized by appropriate distance from other stores and proximity to public transportation—is more critical than the sheer number of outlets in a chain (The Edge Malaysia, 2019). This

highlights the crucial role of location in driving customer traffic and enhancing business success.

Several factors, including service quality, perceived value, product quality, and trust, perceived value, product quality, and trust, have been identified as key influences on customer satisfaction in convenience stores. The influence of service quality on customer purchase intentions in convenience stores reveals the importance of this factor in the retail environment Rong and Zainal (2021). Given the limited research in this area, especially in Bentong City, this study aims to explore the determinants of customer satisfaction in purchasing from convenience stores in this region.

For a convenience store to succeed, the factors that influence customer satisfaction in the retail industry must first be understood. As store performance improves, so does customer satisfaction, leading to a positive corporate image. Meeting customer expectations requires a thorough understanding of their needs, which can be achieved through consistent and accurate communication (Ene and Ozkaya, 2014). By doing so, convenience stores can attract and retain a diverse customer base, including new, regular, and potential customers. Recent studies indicate that service quality, including tangibility, empathy, assurance, reliability, and responsiveness, significantly influences customer satisfaction (Ansari, 2019). By focusing on these elements, convenience stores can enhance their appeal and foster customer loyalty.

2. Literature Review

Customer satisfaction
Customer satisfaction measurement provides timely, unbiased insights into customer preferences and expectations, serving as a crucial performance indicator for businesses (Mihelis, Grigoroudis, Siskos, Politis, & Malandrakis, 2001). Similarly, satisfaction is an emotional state, where post-purchase emotions can range from anger, dissatisfaction, and irritation to neutrality, enthusiasm, and pleasure (Wirtz & Lovelock, 2021). Customer satisfaction can be understood, drawing from various definitions, as the emotional evaluation or sentiment experienced by customers when their needs and expectations are met through the use of a company's products or services. The product is more likely to be recommended to others by satisfied customers, aligning with the company's goals (Crosby, Evans, and Cowles, 1990). Effective measurement of customer satisfaction often involves using surveys, engagement metrics, and social media monitoring to gather feedback and understand customer sentiments (Baker, 2023).

Organizations adopting a customer-oriented perspective are better positioned to deliver quality, enhance customer satisfaction, and effectively achieve organizational objectives (Kim & Cha, 2002). Satisfaction is a comprehensive response, influencing the gap between prior expectations and the perceived outcome after consuming or retiring a service product, where the perceived performance of the chosen service meets consumer expectations Oliver (2010). Recent literature supports these views, emphasizing that a customer-oriented approach significantly enhances customer satisfaction and loyalty (Lee, & Park, 2023). By prioritizing these aspects, organizations can better meet customer expectations and foster a positive corporate image (Yan & Fan, 2022).

Customer satisfaction is a crucial metric for businesses, providing valuable insights into customer preferences and expectations. The gap between customer expectations and perceived product or service performance influences the emotional response. Therefore, loyal advocates, driving business growth, are more likely to emerge from satisfied customers. Thus, to achieve high levels of customer satisfaction and overall business success, an organization must maintain a customer-centric focus.

Product Quality
The quality of a product or service is determined by its inherent qualities and attributes. According to Russell and Taylor (2006), product quality is defined as "fitness for use" or "conformance to requirements". The International Organization for Standardization (ISO) defines product quality as 'the ability to satisfy the market and the customers' (Lakhal and Pasin, 2008). Quality is constituted by eight dimensions: perceived quality, functionality, compliance, features, serviceability, durability, and aesthetics (Garvin, 1984). Additionally, a positive relationship between product quality and customer satisfaction was found by Tran and Le (2020). It was established by the study that customer satisfaction serves as a mediator between product quality and

consumer behavior (Tsiotsou, 2006). The factors influencing satisfaction, such as quality and performance, have been extensively highlighted in the literature. Kotler (1989) defines product quality as the ability of a product to fulfill its intended function, which is particularly critical in product-based industries. The research investigated the interrelationships among three key elements of quality-customer satisfaction, price, and behavioral intention—within the context of quick-service restaurants, specifically examining the impact of service, food, and the physical environment (Ryu & Han, 2010).

A systematic review highlights that perceived value and service quality are crucial in influencing customer satisfaction and intention to continue the relationships (Adeyemo, & Oyewunmi, 2024). Additionally, firm performance is significantly impacted by customer satisfaction, with high satisfaction levels leading to loyalty being increased, and positive word-of-mouth generated (Euromonitor International, 2024). The integration of digital services and enhanced customer experiences has also been identified as vital for meeting modern consumer expectations and fostering satisfaction (Smith & Lee, 2021). By focusing on these elements, businesses can better align their offerings with customer needs and drive long-term success.

A product's inherent characteristics and its ability to meet customer needs are encompassed by the multifaceted concept of product quality. Research has identified various dimensions of quality, including functionality, features, and durability. Importantly, product quality is closely linked to customer satisfaction, influencing subsequent consumer behavior. Product quality is essential in all industries, but its impact is especially pronounced in product-based sectors. Furthermore, factors such as price and the overall customer experience also interact with product quality to shape customer perceptions and behaviors.

Service Quality
Service quality is crucial for maintaining a company's reputation, satisfying valued customers, and capitalizing on market opportunities (Mahato & Goet, 2020). It is imperative that all employees within an organization commit to delivering the highest standard of customer service (Surahman et al., 2020). Service quality consists of five key dimensions: reliability, which is the ability to consistently and accurately deliver promised services; tangibles, referring to physical facilities, equipment, and the appearance of personnel; assurance, which includes competence, courtesy, credibility, and security, reflecting employees' ability to inspire trust and confidence; responsiveness, defined as the willingness to assist customers and provide prompt service; and empathy, which involves the organization's care and individualized attention to customers, including accessibility, communication, and understanding their needs (Zeithaml, Berry, & Parasuraman, 1996).

Service quality is a critical component of these models and has been demonstrated to positively influence customer satisfaction (Cronin et al., 2000; Oliver, 1997). Previous research suggests that customers' positive behavioral intentions are a result of their satisfaction with the company, which is directly linked to the provision of high-quality service. Satisfaction plays a crucial role in mediating the impact of service quality on behavioral intentions (Dabholkar et al., 2000). Recent literature continues to support these findings, emphasizing that service quality—encompassing dimensions such as reliability, assurance, tangibles, empathy, and responsiveness—remains a pivotal factor in driving customer satisfaction (Johnson & Smith, 2021). Businesses that focus on these components can better connect their services with the demands of their customers and generate long-term happiness and loyalty.

Numerous researchers have explored the concept of service quality from the perspective of the customer over the past several decades (Zeithaml, 2009; Ramsaran-Fowdar, 2007). Customers possess diverse values, evaluation criteria, and situational contexts, so it is essential to approach the concept of service quality with a broad perspective (Chang, 2008). Customer satisfaction is critically determined by service quality; high-quality services have been shown to significantly enhance customer satisfaction, whereas low-quality services have the opposite effect. It is consistently demonstrated by the literature that service quality is one of the most influential factors affecting customer satisfaction (Cronin et al., 2000; Oliver, 1997). Various studies have well-documented the relationship between customer satisfaction and service quality (Zeithaml et al., 2003; Cronin & Taylor, 1992; Fernandes et al., 2017; Zaibaf et al., 2013; Zeithaml et al., 1996; Zhang & Prybutok, 2005).

Customer satisfaction and overall business success are critically influenced by service quality, which encompasses various dimensions, including reliability, tangibles, assurance, responsiveness, and empathy.

While a strong positive relationship between service quality and customer satisfaction has been established by numerous studies, the broader implications of service quality for businesses, including its impact on reputation, customer loyalty, and market opportunities, are the focus of this summary.

Perceived value

In contemporary business sectors, delivering optimal value to customers is a significant management challenge. Service value is defined by the user's overall assessment of a service's utility, based on the perceived benefits relative to the costs incurred (Zeithaml, 1998). It has been consistently demonstrated by research that perceived value positively influences customer satisfaction (Gallarza & Saura, 2006). Perceived value represents a paradigm shift, offering a more comprehensive approach than focusing solely on quality or service satisfaction, and it has broader implications beyond immediate behavioral relevance (Martinez-Ruiz et al., 2010).

Customer satisfaction and perceived value are key determinants of subsequent customer actions in the restaurant industry (Tam, 2004). Another finding from Kim & Tang, (2020), customer behavior exerts a more substantial influence on perceived value within the restaurant industry compared to participation behavior, providing valuable insights for the development of effective marketing strategies. The fulfillment of input requirements necessary for satisfaction is intrinsically linked to value, establishing a strong positive correlation between perceived value and customer satisfaction (Rust & Oliver, 1994). Similarly, that increase in perceived value corresponds to higher levels of customer satisfaction (Cuong & Khoi, 2019). According to Kumar & Reinartz (2016), marketing efforts must be strategically oriented toward creating perceived value for customers and optimizing customer lifetime value to cultivate loyalty, satisfaction, and ultimately, profitability.

Customer satisfaction and subsequent behaviors are critically influenced by perceived value, which is derived from the assessment of benefits received relative to costs incurred by the customer. Research consistently demonstrates a strong positive relationship between perceived value and customer satisfaction. Although customer behavior also impacts perceived value, focusing on creating perceived value is essential for driving customer loyalty and long-term profitability.

Trust

Trust is defined as the ability to foster comfort, accumulate positive experiences, and sustain continuous communication, all of which contribute to building strong future relationships (Lestariningsih, Hadiyati, and Astuti, 2018). It is emphasized by Reichheld and Schefter (2000) that to gain customer loyalty, their trust must first be gained. The importance of customer trust in business cannot be overstated, as it is fundamental to cultivating customer loyalty. Trust not only underpins loyalty but also plays a crucial role in reducing perceived risk (Hansen et al., 2018). A business must continually evolve to maintain the trust customers have placed in its products and services; without this trust, customer loyalty is at risk of being lost.

The critical role of trust in customer relationships has been underscored by recent literature. A meta-analysis cited in Zhang, & Roberts (2024), reveals that integrity-based antecedents are more effective in driving trust compared to reliability-based ones. Positive behavioral intentions, including repurchase intentions and word-of-mouth recommendations, are predicted by trust and satisfaction, as noted by Kumar & Patel (2023). Businesses that successfully establish and preserve trust are better positioned to encourage long-term consumer loyalty and lower perceived risks associated with their products and services.

In the study of consumer and interpersonal relationships, trust is a factor that commands significant attention Barnes (2003). Trust is most significantly influenced by the perceived quality of service (Lupiyoadi, 2006). It has been demonstrated by another study that both trust and loyalty among consumers are profoundly impacted by customer satisfaction (Cuong & Khoi, 2019). Trust significantly enhances attitudinal outcomes such as loyalty and customer satisfaction (Liang, 2022). In the context of service quality, perceived quality remains a critical determinant of trust. Increased customer loyalty and positive word-of-mouth are results of high service quality, as shown by studies (Leninkumar, 2017). Strong customer relationships and long-term business success are ensured by the crucial interaction between trust and satisfaction (Yong, 2021).

Trust is a critical component of customer relationships and a precursor to loyalty, influenced by factors such as service quality and customer satisfaction. Building and maintaining trust requires ongoing effort and a focus

on meeting customer expectations.

3. Research Methodology

The study employs a correlational analysis to examine the relationships between service quality, perceived value, product quality, and trust, perceived value, trust, and customer satisfaction. A quantitative research method was employed by the study, involving the collection and analysis of numerical data to understand patterns, relationships, or trends within a population. Primary data was gathered directly from the source, ensuring the information was specific to the research objectives. The study collected data through surveys and questionnaires. The study surveyed 220 customers from three major convenience store chains in Bentong City: 7-Eleven, KK Super Mart, and 99 Speed Mart. With a total population of 52,489 in Bentong City, the sample size of 220 respondents was selected to provide a representative cross-section of the population. The study used non-probability convenience sampling, selecting respondents based on their availability and willingness to participate rather than through random selection. This method is often used for its practicality and ease of access to participants. The study collected data through online questionnaires distributed to customers of convenience stores in Bentong City. This approach allowed for efficient data collection, effectively reaching a broad audience in a timely and convenient manner.

The Statistical Package for the Social Sciences (SPSS) Version 25, recognized for its comprehensive capabilities in tabulating academic research, particularly in quantitative studies, is utilized in the analysis (Rowley, 2014). The study employs multiple regression analysis to test the hypotheses, evaluating how well a set of variables predicts a specific outcome, identifying the most significant predictor, and assessing whether a particular predictor variable maintains its predictive power when accounting for the effects of other variables.

4. Results

The demographic table provides a comprehensive overview of the respondents' characteristics, including gender, age, occupation and education level. This table details the distribution of respondents across various demographic categories, offering insights into the composition of the sample population.

Table 1: Demographic profile

VARIABLE	FREQUENCY	PERCENTAGE
Males	70	31.8
Females	150	68.2
18-23 years old	48	21.8
24-29 years old	115	52.3
30-34 years old	13	5.9
35-39 years old	9	4.1
40-44 years old	10	4.5
45-49 years old	7	3.2
50-54 years old	7	3.2
55 years & above	11	5.0
Single	150	68.2
Married	70	31.8
7-Eleven	67	30.5
KK Super Mart	7	3.2
99 Speed Mart	126	57.3
Other	20	9.1

Table 1 presents a demographic profile of the study population, categorized by gender, age, marital status, and preferred convenience store. Gender Distribution, the data reveals a predominantly female population, with females accounting for 68.2% of the sample compared to 31.8% males. For age distribution, the majority of respondents fall within the 24-29 age group, constituting 52.3% of the sample. This demographic is followed

by the 18-23 age group at 21.8%. The data indicates a relatively young population, which could be relevant for targeting products or services accordingly. Marital Status, the table shows a higher proportion of single individuals (68.2%) compared to married individuals (31.8%). This information can be useful for tailoring marketing campaigns or product offerings to specific lifestyle segments. As for convenience store preference, 99 Speed Mart emerges as the most preferred convenience store, with 57.3% of respondents indicating it as their choice. 7-Eleven follows closely with 30.5%, while other options like KK Super Mart and "Other" hold relatively smaller market shares. This analysis provides insights into consumer preferences in the convenience store sector. Overall, the data presents a demographic profile skewed towards young, single females. The preference for 99 Speed Mart is a notable finding. Further analysis, potentially incorporating geographic or socioeconomic factors, could provide additional valuable insights.

Table 2: Analysis of the Correlation Matrix

	Product Quality	Service quality	Perceived value	Trust
Customer satisfaction	0.676**	0.750**	0.806**	0.829**

*** . Correlation is significant at the 0.01 level (2-tailed).*
*. Correlation is significant at the 0.05 level (2-tailed).

Product Quality and Customer Satisfaction (r = 0.676)**: A strong positive relationship is indicated by the correlation of 0.676 between Product Quality and Customer Satisfaction, suggesting that as product quality improves, customer satisfaction tends to increase significantly. The high correlation indicates that customers value the quality of the products they purchase, and their satisfaction is closely tied to their perception of this quality. Companies that prioritize product quality are likely to see a direct impact on customer satisfaction, making this a key area for businesses to focus on.

*Service Quality and Customer Satisfaction (r = 0.750)**:* Service Quality has an even stronger correlation with Customer Satisfaction, at 0.750. This shows that the quality of service provided is a crucial determinant of how satisfied customers are. Customer satisfaction with their overall experience is more likely when high-quality service is received, even if other factors such as product quality are not as strong. This highlights the importance of investing in customer service training, support infrastructure, and service delivery processes to ensure that customers have positive interactions with the company.

*Perceived Value and Customer Satisfaction (r = 0.806)**:* The highest correlation with Customer Satisfaction is shown by Perceived Value, at 0.806, suggesting that the perception of value received from a product or service is the most influential factor in determining customer satisfaction. Perceived value encompasses the balance between what the customer receives (in terms of quality, benefits, and satisfaction) and what they give up (in terms of price, effort, and time). A high perceived value indicates that customers feel they are getting a good deal, which strongly correlates with their overall satisfaction. Higher levels of customer satisfaction are likely to be seen by companies that can enhance perceived value, whether through competitive pricing, superior quality, or added benefits.

*Trust and Customer Satisfaction (r = 0.829)**:* The strongest correlation with Customer Satisfaction, at 0.829, is shown by trust, indicating that trust is a critical factor in ensuring customer satisfaction. Trust involves the customer's confidence in the company's products, services, and overall brand. High levels of trust mean that customers believe the company will deliver on its promises, which leads to higher satisfaction. Building and maintaining trust requires consistency, transparency, and reliability. Companies that focus on creating trustworthy relationships with their customers are likely to see the highest levels of satisfaction.

The analysis of the correlations shows that Customer Satisfaction is most strongly influenced by Trust, followed by Perceived Value, Service Quality, and Product Quality. Trust and Perceived Value stand out as the most critical factors, suggesting that customers place a high premium on their confidence in the company and the perceived benefits they receive. Service Quality and Product Quality are also important, but they play a slightly less significant role compared to Trust and Perceived Value.

To enhance customer satisfaction, building and maintaining trust with customers should be prioritized by companies. Companies can achieve this through consistent and transparent communication, delivering on

promises, and providing reliable products and services. Additionally, companies should focus on enhancing perceived value by offering high-quality products and services at competitive prices or by providing additional benefits that customers perceive as valuable. Investing in service quality is also essential, as positive service experiences are closely tied to customer satisfaction. Higher levels of customer satisfaction and long-term customer loyalty can be fostered by focusing on these areas.

Discussion

Trust was identified as the primary determinant of customer satisfaction among the four variables examined, based on the quantitative analysis of this study. A significant positive relationship between customer satisfaction and trust was established by Leninkumar (2017), positing customer satisfaction as a precursor to trust, which aligns with this finding. A positive correlation with customer satisfaction was demonstrated by service quality and perceived value, collectively contributing significantly to overall customer satisfaction levels.

The critical role of customer satisfaction in business success is underscored by previous research. Increased purchasing behavior (Davras & Caber, 2019; Gerdt et al., 2019), repeat business (Razak & Shamsudin, 2019), and loyalty rooted in trust (Hasim, Shamsudin, Ali, & Shabi, 2018) are exhibited by satisfied customers. Moreover, they demonstrate a willingness to pay a premium (Mohd Farid Shamsudin, Ali, Wahid, & Saidun, 2019), ultimately driving sales and profitability (Razak & Shamsudin, 2019). These findings collectively emphasize the paramount importance of customer satisfaction in the business context. Several factors influencing customer satisfaction in convenience stores were identified by this study, but product quality did not exhibit a significant relationship with customer satisfaction, suggesting it is a potential area for improvement.

According to the study, customer satisfaction in convenience stores is primarily driven by trust. While service quality and perceived value also positively influence satisfaction, product quality, surprisingly, does not. Satisfied customers are more likely to make repeat purchases, remain loyal, and spend more, underscoring the significance of customer satisfaction for business success. The study suggests that enhancing product quality could be a potential opportunity to further increase customer satisfaction in convenience stores.

Future Research

To expand upon the current findings, future research could incorporate additional variables to provide novel insights. A broader exploration of diverse variables would enhance our comprehension of consumer behavior's impact on convenience store satisfaction. This approach would offer a more comprehensive perspective on how various factors interact within the broader business landscape in Malaysia. Given the limitations of a single location, Bentong, future studies should consider a larger geographical scope, such as the state or national level, to increase sample size and improve research quality. Expanding the study to include additional convenience store brands, as suggested by Tran & Le (2020), would further enhance reliability. To optimize survey response rates and data quality, researchers could refine question wording to better capture respondent attention and understanding. Leveraging the advantages of online research, as highlighted by Wright (2005), including cost-effectiveness, time efficiency, and wide reach, can be advantageous.

Future research should explore why product quality did not significantly impact customer satisfaction and investigate how trust mediates the relationship between service quality, perceived value, and satisfaction. Conducting longitudinal studies will help examine changes in customer satisfaction over time. Additionally, expanding research to various retail environments beyond convenience stores can provide comparative insights. Analyzing customer satisfaction across different demographic groups will enable the development of targeted strategies while examining the influence of online interactions on trust, satisfaction, and loyalty is essential. Lastly, considering external factors, such as economic conditions or cultural influences, will enhance understanding of their effects on trust and customer satisfaction

5. Managerial Implications and Recommendations

The correlation analysis underscores the intricate relationship between perceived value, service quality, trust, and customer satisfaction. These factors collectively influence customer loyalty and overall business

performance. To optimize customer satisfaction, organizations must prioritize delivering exceptional service experiences, building strong customer relationships based on trust, and consistently exceeding customer expectations. A customer-centric approach is essential. By investing in employee training, leveraging technology for efficiency, and actively seeking customer feedback, businesses can enhance service delivery and foster customer loyalty. It's crucial to recognize the interconnectedness of these factors. Improvements in one area can positively impact others, creating a virtuous cycle of customer satisfaction and business growth.

Conclusion

The analysis highlights the crucial role of service quality, perceived value, trust, and customer satisfaction in driving business success. These factors are intricately linked, and improvements in one area can positively impact others. Organizations that prioritize customer experience, foster trust, and continuously measure performance are more likely to achieve sustained growth and customer loyalty. A competitive advantage in today's customer-centric marketplace can be created by adopting a holistic approach that considers the interconnectedness of these elements.

Abstract: This study adapted some of the dimensions in the ES-QUAL model that contribute to e-satisfaction, with additional factors of e-trust and perceived value about repurchase intention among young adults in an online shopping setting. The research methodology involved a sample size of 103 full-time students of Bachelor of Business Administration (BBA) Retail Management (Hons.) in UiTM Puncak Alam aged between 18 to 26 years old, utilizing a structured adapted questionnaire to capture demographic profiles and components of e-satisfaction, e-trust and perceived value about repurchase intention. The descriptive statistics show a substantial increase, with the highest mean obtained by e-satisfaction, followed by perceived value and e-trust. In addition, the finding implies that there is a high degree of repurchase intention among these students.

Keywords: *Online shopping, e-commerce, e-satisfaction, e-trust, perceived value, repurchase intention*

1. Introduction and Background

Online shopping, also known as e-commerce, is the practice of making purchases of goods and services using the internet. While online buying was already common before the pandemic struck, it has unavoidably taken the lead and grown to be the most favored method of payment for the great majority of individuals (Maheshwari, 2023). The biggest benefit of this kind of shopping is that it can be finished in a matter of minutes by just clicking a tab, from the comfort and convenience of your own house or anyplace else. Customers can shop from the comfort of their homes by browsing online catalogues, comparing prices, reading reviews, and making purchases using a computer, smartphone, or other internet-enabled device in place of going to physical stores.

Even so, there are still certain issues with online buying in our nation, even though people adore it. According to a survey conducted by Parcel Perform and meta-search engine iPrice Group, 43% of Malaysian customers are dissatisfied with their e-commerce delivery experience (Bernama, 2019). Malaysia has the longest transit time in the region, taking 5.8 days for deliveries, while the average for the region is 3.3 days, according to the poll. Unsatisfactory shipment and delivery might lead to unhappy customers. This could deter clients from making additional online purchases. The findings of earlier research by Trivedi & Yadav (2020) and Kazancoglu & Demir (2021) indicate that contentment has a major influence on repurchase intention.

Furthermore, paid-for fake review businesses have penetrated major websites including Google, Facebook, and Trustpilot (The Star, 2022). People who are swayed by bogus reviews will purchase the things they are interested in, which will leave them disappointed because their expectations were not met. Previous research by Trivedi & Yadav (2020) and Purnamasari & Suryandari (2023) indicates that trust positively influences repurchase intention. Customers are more inclined to repurchase a good or service in the future when they have faith in it.

Repurchase intention, which refers to whether a consumer intends to make additional purchases from the same online retailer, is significant when it comes to online purchasing (Javed & Wu, 2020). Consumers are more likely to want to return to a website that is user-friendly and has a positive atmosphere. Trust is also important; consumers are more likely to stay with an online store if it seems secure and communicates honestly. According to earlier research, two important components of website loyalty are satisfaction and trust (Mahadin, Akroush, & Bata, 2020). Additionally, finding product ratings and information quickly improves a consumer's online buying experience and encourages him or her to return for more.

Repurchase intentions are a person's assessment of whether to repurchase a specific service from the same business. It is the likelihood that customers will consistently buy goods and services from the same online merchant, according to research definitions (Quan, Chi, Nhung, Ngan & Phong, 2020). Customer repurchase intention is significantly influenced by satisfaction and attitude, according to several studies (Bearden & Teel, 1983; Oliver, 1981; Roest & Pieters, 1997). It is an important marketing metric that evaluates the probability that customers will remain loyal to a specific brand. Numerous product and service research corroborate the direct positive association between customer satisfaction and repurchase intention (Anderson & Sullivan, 1993).

According to the Hand Phone Users Survey 2021 published by the Malaysian Communications and Multimedia Commission, 35.3% of Malaysian handphone users were youth aged 15-24 years old, making them quite a lucrative market to tap into despite that not much is known about this group's consumer behavior. To further understand these young adults' consumer behavior while shopping online, this study adapted some of the dimensions in the ES-QUAL model that contribute to e-satisfaction with additional factors of interest namely e-trust and perceived value about repurchase intention among the young adults. As a result, the correlations between customer satisfaction, perceived value, and trust and their intention to make another purchase will be made clear by this study.

2. Literature Review

The relationship between e-satisfaction positively influences the intention to repurchase via an e-commerce platform.
E-satisfaction is the amount of satisfaction a client feels when dealing with an online platform, website, or electronic service. It includes aspects such as website usability, product information, navigation ease, customer service, and overall user experience. When a customer is happy with their past purchase they can repurchase the product. According to Ali, Ali, ur Rehman, Yilmaz, Safwan & Afzal (2010), the cost of obtaining a new client is seven times that of sustaining an existing one. Research by Kazancoglu & Demir (2021); Trivedi & Yadav (2020); and Cunningham & De Meyer-Heydenrych (2021) all resulted in saying that customer satisfaction influences repurchase intention. Purani, Kumar & Sahadev (2019) also agreed that acquiring customers for online stores is more difficult than traditional outlets. Research by Tata, Prashar & Parsad (2021) found that there is a positive influence between satisfaction and repurchase intention. When purchasing items online, there is a probability of not receiving items as ordered and it is important for sellers to ensure customers are satisfied with their purchase because it will cost more to attract new customers compared with having a loyal customer. Besides that, a good web design can also influence customer satisfaction, however according to research by Haq & Awan (2020), it cannot lead to repurchase intention. According to Thakur (2019), the finding shows the effect of satisfaction on continuance intention is stronger among customers with higher levels of engagement. Bello, Jusoh & Md Nor (2021) stated that customer satisfaction positively influences consumer repurchase intention.

Al Amin, Arefin, Sultana, Islam, Jahan & Akhtar (2020) and Liu, Guo & Huang (2023) investigated consumers that use mobile food ordering apps (MFOA) and found that customer satisfaction with MFOAs is positively related to continuance intention. Khan, Zubair & Malik (2019); Demirbaş, Gültekin Salman & Uray (2022); Purnamasari & Suryandari (2023) and Riorini & Samia (2024) studies indicate that e-customer satisfaction and e-customer loyalty is significantly influencing repurchase intention. The relationship between e-satisfaction and repurchase intention is vital for online business success. Providing a pleasant and gratifying online experience may lead to greater consumer loyalty, repeat purchases, and positive word-of-mouth, all of which contribute to an e-commerce platform's long-term success. As a result, in ten collective journals findings from various studies indicate that only two out of ten journals that show e-satisfaction and repurchase intentions are not significant because web design satisfaction cannot influence customer repurchase intention. As a result, the subsequent hypothesis is posited:
H1: *E-satisfaction positively influences the intention to repurchase via an e-commerce platform*

The relationship between e-trust positively influences the intention to repurchase via an e-commerce platform

A consumer who possesses a high level of trust in a specific e-retailer may choose to endorse and suggest said e-retailer to other potential customers. Therefore, it is possible to observe a positive correlation between trust, commitment, and word of mouth. Prior studies have proven that there exists a noteworthy correlation between trust and consumers' behavioral intention. This finding emphasizes the significance of fostering original and repurchase intention, as well as promoting word-of-mouth referrals. Trust can be established when the various aspects of security, privacy, ease of use, and other elements associated with making a transaction have been adequately addressed (Trivedi & Yadav, 2020). According to Della Prisanti (2017), there is a prevailing expectation among online consumers for online sellers to demonstrate responsiveness and commitment to consumer interests, uphold transactional integrity, fulfill promised goods and/or services, and offer reliable electronic services. These factors collectively contribute to the establishment of a comfortable transactional environment for online consumers.

According to Pradnyaswari & Aksari (2020), e-commerce platforms and online sellers must furnish comprehensive, lucid, and precise information to instill a sense of priority toward delivering high-quality online services. This approach is crucial in cultivating client trust and enhancing the credibility of the website. The purchasers of e-commerce platforms heavily depend on the information provided by the sellers through the website. To secure the trust and buy intentions of website users, e-commerce entities must deliver superior quality and service. This necessitates the provision of exceptional customer experiences, hence fostering a positive perception of the brand and encouraging repeat purchases. The study was conducted by Pardede, Lapian & Pandowo (2018) to identify the relationship between e-trust in-service performance and its impact on buyers' repurchase intention in the context of e-commerce. The findings indicate that a high level of e-trust in service performance positively influences customers' satisfaction and subsequently increases their desire to repurchase from the e-commerce platform. The significance of the effect of e-trust mediation on the link between e-service quality and e-repurchase intention has been established in a previous study conducted by Santoso & Aprianingsih (2017); Budi, Isyanto & Romli (2024) and Afridhianika, Harisudin & Handayani (2024). Hence the hypothesis proposed:

H2: E-trust positively influences the intention to repurchase via an e-commerce platform

The relationship between perceived value positively influences the intention to repurchase via an e-commerce platform.

Perceived value, defined as the perceived benefits relative to the cost of a product or service, plays a significant role in influencing consumers' repurchase intentions. Numerous studies have established a positive relationship between perceived value and repurchase intention in various industries and contexts (Dodds, Monroe & Grewal (1991); Sweeney & Soutar (2001). Customers tend to form repurchase intentions when they perceive higher value in their purchase experiences. Dodds et. al. (1991) found that consumers who perceive a higher value in products or services are more likely to express intentions to repurchase. This aligns with the notion that when the perceived benefits derived from a product or service outweigh the perceived costs, customers are more inclined to engage in repeat purchases. Moreover, Sweeney & Soutar (2001) emphasized the significance of perceived value in building customer loyalty and fostering repurchase intentions. They highlighted that a positive perception of value not only influences initial purchases but also contributes to sustained patronage and repeat buying behavior. These findings underscore the important role of perceived value as a determinant factor influencing consumers' repurchase intentions across diverse industries. Similar findings were documented in the work of Oktaviani (2024) and Zeqiri, Ramadani & Aloulou (2023). Businesses that prioritize delivering perceived value to customers are more likely to witness increased loyalty and higher repurchase intentions among their customer base. From the above review, this hypothesis is formulated:

H3: Perceived value positively influences the intention to repurchase via an e-commerce platform

Conceptual Framework: Figure 1 shows the conceptual framework proposed for this study based on the reviewed literature.

Figure 1: Conceptual Framework

E-Satisfaction
Web Design
Information Quality
Delivery Service

E-Trust
Security
Customer Service Quality

Perceived Value
Perceived Fair Price
Perceived Risk

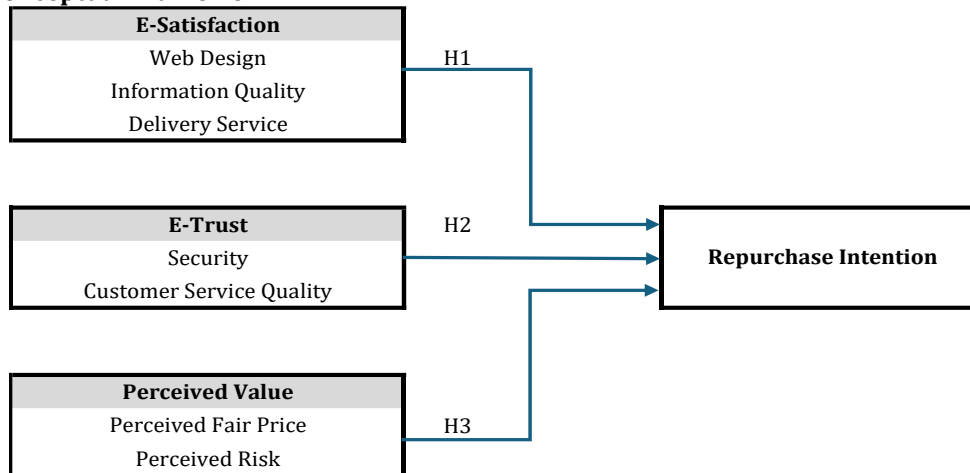
Repurchase Intention


3. Research Methodology

Measures
The research utilized an online self-administered survey to gather the data. Google Form was used to deliver a research survey questionnaire and collect data online, where respondents rate their agreement or disagreement with some types of statements regarding the relationship between e-commerce and consumer behavior (Taherdoost, 2019). The research instrument was designed to capture demographic profiles and explore various components of shopping behavior, namely e-satisfaction, e-trust, perceived value, and repurchase intention using a Likert scale. Miao, Jalees, Zaman, Khan, Hanif & Javed (2022) identified that the components of the relationship consist of e-satisfaction (web design, information quality, delivery service), e-trust (security, customer service quality), and perceived value (perceived fair price, perceived risk). E-commerce shopping behavior can be determined by customers' experiences with service, quality of product, security, information availability, shipping, pricing, and time while shopping online (Vasić, Kilibarda & Kaurin, 2019). Five-point Likert scales, with one denoting "strongly disagree" and five denoting "strongly agree," were used to rate the items.

Data Collection
Convenience sampling was used in this research to gather data from Bachelor of Business Administration (BBA) Retail Management (Hons.) full-time students at UiTM Puncak Alam from semester one to semester six, with a total of 146 population. Based on Krejcie & Morgan (1970), the closest population to us is N=140 hence the sample size of 103 students. To make data collecting easier, an existing questionnaire from the work of Miao et. al. (2021) was adopted. The questionnaire, chosen for its relevance to the research objectives, was disseminated to participants via Google Forms, which provided a simple and accessible platform for response submission. The form was distributed by using WhatsApp. Before distribution, all required consents were obtained, participants were told about the goal of the research, and informed consent was sought where needed. While the sample size might limit the scope of generalization, it allowed for a comprehensive analysis of the targeted population's perceptions and behaviors regarding e-commerce and online shopping.

Data Analysis
The computer software Statistical Package for the Social Sciences (SPSS) version 26 was used to do several empirical analyses. The conducted analysis included correlation analysis, reliability test, normality test and descriptive analysis.

4. Results

Demographic Profile of Respondents: Table 1 shows the demographic of the participants. The data reveals that the female respondents constituted the majority, accounting for 51.5 percent of the total 103 respondents. Out of the entire sample size of 103 participants, the majority (71.8%) were 21 to 23 years old. The survey

participants were only selected from a particular degree program of Bachelor of Business Administration (BBA) Retail Management (Hons.) based in UiTM Puncak Alam. Finally, 35.9 percent of respondents were in Semester 5, followed by Semester 3 (28.2%), Semester 1 (20.4%), Semester 2 (6.8%), Semester 6 (4.9%) and Semester 4 (3.9%). As for the preferred e-commerce platform, 74.8 percent of the respondents chose Shopee, followed by Lazada (8.7%), SHEIN (6.8%), Zalora (3.9%), and other e-commerce platforms (5.8%).

Table 1: Demographic

		Frequency	Per cent
Gender	Female	53	51.5
	Male	50	48.5
Age	18 – 20 years	21	20.4
	21 – 23 years	74	71.8
	24 – 26 years	8	7.8
Degree Program	Retail Management	103	100.0
Semester	1	21	20.4
	2	7	6.8
	3	29	28.2
	4	4	3.9
	5	37	35.9
	6	5	4.9
Preferred E-Commerce Platform	Shopee	77	74.8
	Lazada	9	8.7
	SHEIN	7	6.8
	Zalora	4	3.9
	Others	6	5.8
	Total	103	100.0

Analysis of Reliability: The study employed Cronbach's Alpha as a reliability coefficient to precisely assess the consistency of the utilized scales. Table 2 demonstrates that Cronbach's alpha values for variables in the research are at an acceptable level exceeding 0.70. Consequently, all of the items are suitable for measuring the variables of interest.

Table 2: Reliability Analysis

Construct	Cronbach's Alpha	Internal Consistency
E-satisfaction	0.939	Excellent
E-trust	0.924	Excellent
Perceived value	0.906	Excellent
Repurchase intention	0.909	Excellent

Normality Test: Table 3 indicates whether normality is assumed based on skewness and kurtosis values. Since all variables have skewness and kurtosis values within the recommended ranges, normality is assumed for each variable. Kline (2005) suggests that skewness values within the range of +/- 3 and kurtosis values within the range of +/- 10 are generally acceptable for assuming normality. In this table, all skewness and kurtosis values fall within these suggested ranges. Therefore, based on Kline's criteria, it can be concluded that the distributions of e-satisfaction, e-trust, perceived value, and repurchase intention are reasonably close to normal.

Table 3: Findings of the Normality Test

Construct	Skewness	Kurtosis	Normality Assumed
E-satisfaction	-0.536	-0.573	Yes
E-trust	-0.259	-0.209	Yes
Perceived value	-0.182	-0.989	Yes
Repurchase intention	-0.36	-1.027	Yes

Descriptive Analysis of the Variable: Table 4 shows the means for variables measured by a 5-point Likert scale. E-satisfaction recorded the highest mean of 4.2727, followed by perceived value with a mean of 4.1650 while the lowest mean of 3.9137 is for e-trust. Additionally, repurchase intention resulted in a mean of 4.2880.

Table 4: Descriptive Analysis

Item ID	Construct	Mean	Level
ES	E-satisfaction	4.2727	High
ET	E-trust	3.9137	High
PV	Perceived value	4.1650	High
RI	Repurchase intention	4.2880	High

Correlation Analysis: Table 5 is a representation of the correlation matrix, which is made up of Pearson correlations. These correlations reflect the inter-correlation that exists between the variables that were investigated. It is clear from the table that there is a significant correlation between each of the factors that were investigated in this study. According to these findings, the constructs have a discriminant validity, which means that although they are connected, they do not overlap with one another. In this study, repurchase intention is most strongly correlated with perceived value ($r = 0.524$, $p < 0.01$), followed by e-satisfaction ($r = 0.519$, $p < 0.01$) and e-trust ($r = 0.485$, $p < 0.01$).

Table 5: Pearson Correlation

Relationship	Pearson Correlation	Strength	Direction
E-satisfaction with repurchase intention	0.519**	Moderate	Positive
E-trust with repurchase intention	0.485**	Moderate	Positive
Perceived value with repurchase intention	0.524**	Moderate	Positive

**. Correlation is significant at the 0.01 level (2-tailed).
*. Correlation is significant at the 0.05 level (2-tailed).

Discussion
The analysis from this study implies that the intention of retail management students to repurchase via e-commerce platforms is influenced by e-satisfaction, e-trust and perceived value factors. Additionally, the findings were also parallel with the previous studies related to the variables. The findings also showed that the respondents were experiencing a high level of repurchase intention.

Prior studies have shown that consumers' intentions to make additional purchases when they buy online are significant because they help online businesses. Repurchase intentions and customer loyalty are closely related in certain research (Jiang & Rosenbloom, 2005). Khan et. al. (2019); Demirbaş et. al. (2022); Purnamasari & Suryandari (2023); and Riorini & Samia (2024) studies indicate that e-customer satisfaction and e-customer loyalty are significantly influencing repurchase intention. Moreover, a study conducted by Reichheld, Markey Jr & Hopton (2000) revealed that it takes an average customer four purchases at an online store for the business to make a profit from them. Furthermore, consumers find online shopping enjoyable enough to motivate them to return to an online retailer (Ahn, Ryu & Han, 2007; Koufaris, 2002). Since keeping current clients is typically more cost-effective than obtaining new ones, internet shoppers who make recurring purchases save money on marketing.

When an online store surpasses its expectations, customers are more likely to anticipate future purchases from that merchant, which promotes satisfaction and repurchase intention (Kotler & Armstrong, 2010). The term "e-repurchase intention" in Javed & Wu (2020) refers to this intention, which is impacted by information quality, which includes correctness, relevance, and completeness from the perspective of the consumer (Patrada & Andajani, 2020). Research, such as Mahadin et. al. (2020), emphasized that e-satisfaction and e-trust are critical factors influencing repurchase intention that eventually leads to e-loyalty. Additionally, in the context of online retailers, perceived value—which is shaped by delivering more than promised—contributes to consumer happiness and is a major factor in repurchase intention.

Influential studies such as Zeithaml (1988) laid the groundwork by defining perceived value and its relation to consumer behavior, while others like Dodds et. al. (1991) further extended these concepts to focus on the role of price and quality perceptions in which consumers who perceive a higher value in products or services are more likely to express intentions to repurchase. A similar finding was also documented in the work of Salem & Alanadoly (2022).

5. Managerial Implications and Recommendations

The digital landscape's rapid evolution has profoundly impacted consumer behavior, emphasizing the importance of understanding key factors like e-satisfaction, e-trust, perceived value, and repurchase intention in e-commerce. E-commerce managers must prioritize user-friendly interfaces and reliable post-purchase services to enhance e-satisfaction. However, while personalization enhances user satisfaction, it raises privacy concerns, creating a challenging balance for businesses (Pappas, Kourouthanassis, Giannakos & Lekakos, 2017). Online businesses may enhance their security protocols, invest in user-centric website design, improve customer support systems and balance personalization with privacy.

On the other hand, e-trust is vital for reducing consumer risk perception and fostering repeat business (Gefen, 2000). Essential elements include data security, privacy policies, and transparent communication. This study underscores the critical role of e-trust in the digital landscape. The implications of e-trust are far-reaching, influencing user engagement, satisfaction, and loyalty. Key recommendations for future research include adopting comprehensive methodologies, exploring underrepresented factors such as user experience and transparency, and considering context-specific elements. By addressing these areas, scholars and practitioners can develop more effective strategies to foster e-trust, ultimately enhancing the digital ecosystem's reliability and efficiency.

Perceived value plays a critical role in shaping consumer behavior and business outcomes in online shopping. The reviewed literature revealed that perceived value, encompassing quality, price, and consumer benefits, is a predictor of purchase decisions (Zeithaml, 1988). Therefore, managers can enhance perceived value through value-added services and personalized experiences. In addition, this review also highlights the need for ongoing research to address existing gaps, particularly in the areas of diverse consumer preferences and rapidly evolving technologies. Practical recommendations include optimizing website usability, fostering positive shopping experiences, leveraging social influence, offering competitive pricing, and streamlining transaction processes to enhance perceived value.

Overall, a critical evaluation of the literature reveals several recurring themes and methodologies in the study of e-satisfaction, e-trust and perceived value of repurchase intention in a digital setting. Many studies adopt a quantitative approach, utilizing surveys and regression analysis to elucidate the relationship between e-satisfaction, e-trust, and perceived value dimensions and consumer behavior, particularly repurchase intention. While these methods provide valuable insights, they often lack depth in understanding the underlying psychological mechanisms. Additionally, there is a tendency for studies to focus on specific demographics, leaving gaps in our understanding of diverse consumer groups. Furthermore, the rapid technological changes in e-commerce necessitate continuous updates to theoretical models and empirical evidence.

Conclusion
Tested variables of e-satisfaction, e-trust and perceived value were found to significantly influence repurchase

intention across various contexts. However, future research should address existing gaps, particularly in the areas of technological impact and emerging markets, to provide a more comprehensive understanding of this critical consumer behavior factor.

E-satisfaction is a multifaceted construct influenced by various technical and psychological factors. By addressing the themes and responding to debates, businesses can refine their e-commerce strategies to foster customer loyalty and enhance satisfaction. Further research should focus on emerging technologies and their impact on consumer satisfaction, particularly considering evolving consumer expectations and technological advancements. The concept of e-trust has garnered significant scholarly attention in recent years, particularly as digital interactions become increasingly integral to everyday life. E-trust encompasses various factors such as security (robust security measures are fundamental in establishing e-trust), privacy (ensuring user privacy significantly enhances trust in digital platforms), user experience (well-designed user interfaces and seamless interaction boost trust), and transparency (transparent policies and practices foster greater user trust).

The relationship between perceived value and repurchase intention in e-commerce is a complex and multifaceted phenomenon that has garnered significant attention in the literature. A study by Ramayah, Rahman & Ling (2018) provides insights into the influence of psychological factors on online purchase intention, particularly among the younger generation in Malaysia. Additionally, the work of Ahmed, Hussain, Jafar, Latif, Sultan & Jian Zhou (2017) emphasizes the significant positive effect of e-service quality on perceived value and purchase intention in online shopping. The study underscores the importance of e-service quality in enhancing perceived value, ultimately leading to higher purchase intention among e-shoppers. These findings contribute to a deeper understanding of the intricate interplay between perceived value and repurchase intention in the e-commerce context. Hence, understanding the multifaceted nature of perceived value which encompasses functional, emotional, social, monetary, and convenience dimensions is essential for e-commerce businesses seeking to enhance customer satisfaction and loyalty.

In a nutshell, delving into contemporary research within the e-commerce domain would further enrich our understanding, offering more nuanced and up-to-date insights into the prevailing consensus on this intricate relationship.

Abstract: This paper explores the potential of computer-assisted qualitative data analysis software (CAQDAS), specifically Nvivo 14, in facilitating the qualitative evaluation of multiple case studies. The focus is on halal purchasing strategies within micro and small enterprises (MSEs) in the food industry, a critical issue from a Shariah perspective that ensures halal integrity from source to consumer. The issue highlights that MSE leaders in Malaysia's food industry failed to optimize halal purchasing in their management practices, which undermines their ability to increase probability. The objective is to explore the strategies for optimizing halal purchasing performance of MSEs in Malaysia's food industry, on how these businesses navigate the requirements of halal compliance in their operational practices. Through an exploratory study, 10 MSEs were examined to investigate their halal purchasing structures, involving interviews with key stakeholders such as brand owners, company directors, halal executives, and CEOs. In-depth, semi-structured interviews provided insights into company structures, challenges, and halal purchasing strategies. Thematic analysis was employed, using an inductive pattern coding approach where codes emerged organically from the data and were categorized into themes and sub-themes. Findings revealed a variety of business types, with six individually owned companies and four family-run businesses, highlighting differences in employee numbers, business longevity, and owner demographics. The study also suggests a trend of generational succession in family-owned businesses. This research demonstrates the utility of CAQDAS in managing and analyzing complex qualitative data in case study research.

Keywords: *Qualitative, CAQDAS, Inductive approach, Thematical Analysis*

1. Introduction and Background

In Malaysia's food industry, particularly among micro and small enterprises (MSEs), halal purchasing practices are becoming increasingly crucial due to the nation's Muslim-majority population and its position as a global hub for halal certification (Md Husin & Haron, 2020). When choosing suppliers, MSEs prioritize those with JAKIM-recognized halal certification, ensuring that raw materials and ingredients comply with strict halal standards. Many MSEs favor local suppliers over imported ones, as local suppliers are more likely to be JAKIM-certified and familiar with the country's halal regulations. For imported ingredients, MSEs ensure that they are certified by bodies recognized by JAKIM (Paik et al., 2009) Additionally, an increasing number of MSEs are seeking official halal certification themselves. This requires not only purchasing halal-certified inputs but also implementing halal standards throughout their operations, from food handling to storage. However, smaller businesses, particularly micro-enterprises, often face challenges related to the cost and perceived complexity of obtaining halal certification, which can hinder their ability to fully comply with halal purchasing requirements.

MSEs are becoming more aware of the importance of traceability in halal ingredients, ensuring they maintain proper documentation of the halal status of all purchased products so that their final products can be certified and trusted by consumers. To improve transparency and simplify audits by halal certification bodies, some MSEs are adopting digital tools to manage halal documentation (Tieman & Ghazali, 2013). These enterprises also collaborate closely with JAKIM for guidance on halal purchasing practices, benefiting from training and workshops organized by JAKIM and other industry organizations to stay updated on evolving halal standards. The higher cost of sourcing halal-certified raw materials, compared to non-certified alternatives, can be a challenge, especially for smaller enterprises with limited financial resources. Moreover, some MSEs may have limited knowledge about the complexities of halal standards, particularly in ensuring that every step of the supply chain adheres to halal principles. Despite these challenges, MSEs in Malaysia's food industry are becoming increasingly conscious of the significance of halal purchasing practices. This awareness is driven by

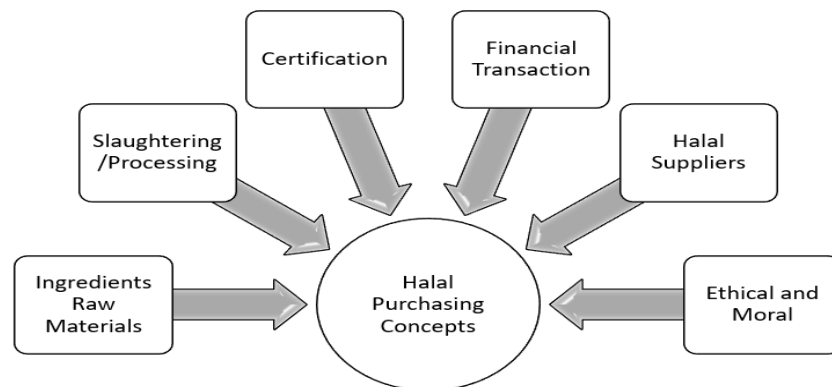
consumer demand, regulatory requirements, and opportunities in international markets. While obstacles like costs and certification complexities remain, support from the government and halal bodies is crucial in helping businesses transition towards full halal purchasing compliance.

The integrity of halal purchasing practices is of paramount importance to Muslim consumers, as it ensures adherence to Shariah law from the point of production to the final consumer purchase. In an increasingly globalized food industry, maintaining halal integrity presents a complex challenge, particularly for Micro and Small Enterprises (MSEs) that may lack the resources and infrastructures of larger corporations. Halal purchasing is a critical function in meeting the demand of the halal food industry to maintain the halal integrity of halal products. The initial understanding fails to comprehend why most MSE entrepreneurs were traditionally running their businesses and had the perception that they did not need to obtain halal certification (Tieman & Ghazali, 2013). This study seeks to explore the strategies for optimizing halal purchasing performance of MSEs in Malaysia's food industry, on how these businesses navigate the requirements of halal compliance in their operational practices.

2. Literature Review

Halal purchasing is an innovative fusion of two distinct academic fields: halal principles and purchasing management. This chapter offers a comprehensive exploration of both areas, laying the foundation for a proposed conceptual framework that integrates these disciplines to enhance understanding of halal requirements for Micro and Small Enterprises (MSEs). It begins by delving into essential aspects of purchasing, including foundational concepts, theoretical models, and strategic approaches. Following this, it discusses the nuances of purchasing strategies within the context of halal compliance, covering key topics such as halal certification, regulatory frameworks, market dynamics, and the various challenges and barriers faced by businesses.

The stage concludes by examining emerging trends and potential opportunities in the field. Additionally, it presents a conceptual framework aimed at optimizing halal purchasing processes for MSEs, emphasizing the importance of aligning purchasing strategies with Islamic principles. In the supply chain process, purchasing management plays a crucial role, particularly in fostering robust buyer-supplier partnerships. The organization in purchasing function is wide and involves all activities of the purchasing process, services or work supplied and the administration actions as Figure 1 halal purchasing concepts below.

Figure 1: Halal Purchasing Concepts


The complexity of sourcing products in today's global market is increasingly influenced by the need to meet halal requirements. As the concept of halal expands into various aspects of purchasing, there is a need for more effective integration of halal principles into purchasing strategies. This includes the development of halal policies, procurement strategies, and purchasing processes, as suggested by Tieman (2020c). According to Porter (1985), within a firm's halal value chain, purchasing serves as a vital supporting activity, contributing significantly to the overall halal compliance of the business (Mulders, 2020). To ensure compliance with halal purchasing standards, all products and services must adhere strictly to halal certification requirements. This

involves a comprehensive process that includes the application, enforcement, and continuous monitoring of halal standards, which is essential for maintaining a sustainable supplier base.

Suppliers must be rigorously vetted to ensure they comply with halal standards, often through contract agreements and regular audits. Additionally, companies must stay abreast of market developments related to halal purchasing by actively monitoring supply risks and obtaining intelligence on the halal market landscape. The development of a halal purchasing process extends beyond the traditional scope of the purchasing department or buyer-supplier relationship. Halal purchasing involves acquiring goods and services that conform to Islamic principles and laws, which are not limited to food items but also encompass various other facets of business and daily life. For instance, when purchasing ingredients, it is crucial to ensure that all components are permissible under Islamic dietary laws. This means avoiding prohibited items such as pork and its derivatives, alcohol, and meats not slaughtered according to Islamic guidelines. Furthermore, the processing and manufacturing stages must comply with Islamic regulations, which may include assessing production facilities for adherence to hygiene standards and ethical practices.

Many products carry halal certification from recognized authorities, such as the Department of Islamic Development Malaysia (JAKIM), providing consumers and businesses with a guarantee that the products meet stringent halal standards. Halal purchasing also encompasses ethical and moral considerations, extending beyond dietary laws to include fair trade practices, ethical treatment of workers, and environmental sustainability. In financial transactions, halal purchasing ensures compliance with Islamic finance principles. This includes avoiding interest-based transactions (riba) and adhering to principles such as risk-sharing and asset backing. These financial guidelines are fundamental to maintaining the integrity of halal purchasing, as they align with the ethical and moral tenets of Islamic law. Thus, the concept of halal purchasing is comprehensive, covering not only the procurement of goods and services but also ensuring that all aspects of the transaction and supply chain are by Islamic values.

3. Research Methodology

The study will employ a qualitative case study approach, utilizing in-depth, semi-structured interviews with key stakeholders, including brand owners, company directors, halal executives, and CEOs. The use of CAQDAS, specifically NVivo 14, will facilitate the coding and analysis of qualitative data. An inductive pattern coding approach will be adopted, allowing codes to emerge organically from the data, which will then be categorized into themes and sub-themes. This exploratory study adopts a multiple case study approach, focusing on 10 MSEs within the food industry. These businesses were selected to represent a range of ownership structures, including individual ownership and family businesses, to provide a comprehensive understanding of the different approaches to halal purchasing. Data was collected through in-depth, semi-structured interviews with key stakeholders in each business, including brand owners, company directors, halal executives, and CEOs. These interviews were designed to elicit detailed information about each company's structure, their approach to halal purchasing, and the challenges they encounter in ensuring compliance. The sample will include six individual-owned businesses and four family-owned enterprises, with varying years of operation and employee counts. This demographic diversity will provide a comprehensive understanding of halal purchasing strategies and the succession trends in family businesses. Employing a qualitative focus group interview was deemed most suitable for exploring a phenomenon within its natural real-life context (Burchett, 2014). This method was significant in demonstrating how and why employing qualitative inquiry was beneficial for unpacking complex phenomena (Abdul Kadir et al., 2018).

The qualitative research method allowed the researcher to probe deeper into understanding the problem rather than examining the external structures of the subject matter (Golden, 2017). Given the multifaceted nature of qualitative research, especially in the context of multiple case studies, this paper also aims to demonstrate the potential of Computer-Assisted Qualitative Data Analysis Software (CAQDAS), specifically Nvivo 14, in facilitating and enhancing the qualitative evaluation process. The software's ability to manage, analyze, and visualize large amounts of qualitative data makes it a valuable tool for researchers dealing with complex datasets. Halal purchasing is essential for Muslim consumers, as it guarantees compliance with Islamic law. MSEs play a vital role in the food sector, yet their halal purchasing strategies remain underexplored. This research seeks to fill this gap by examining the current practices of 10 MSEs, focusing on their organizational

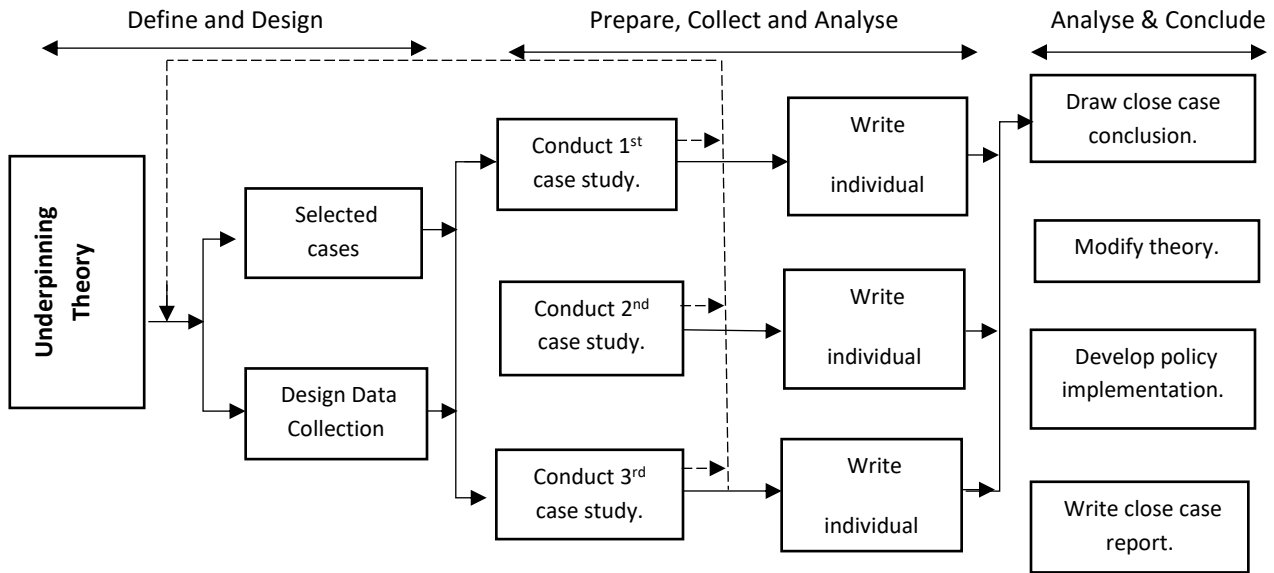
structures and challenges in maintaining halal integrity. The researcher conducted qualitative research throughout Malaysia to identify micro, and small, enterprises (MSEs) food industry. The first location for the research was in Bagan Serai, Perak, followed by Melaka and Sungai Petani, Kedah in January 2023. The methods included data recording, telephone calls, and emails. The research resumed from November to December 2023, and this time data collection was carried out physically by visiting the entrepreneurs' premises. The focus areas were the East Coast regions of Kelantan and Terengganu. In total, 10 (ten) companies participated in answering the research questions through in-depth interviews. Halal certification is a crucial component for businesses targeting Muslim consumers, as it reflects a commitment to ethical and religious standards. MSEs in the food industry are particularly vulnerable to challenges related to halal certification due to their limited resources. Understanding their halal purchasing strategies is essential for identifying areas where support and guidance are needed to ensure compliance.

A data analysis process that involves delving through a data set and identifying patterns. Systematically coding, deriving themes, and creating a narrative. The researcher employed a thematic approach to qualitative data analysis, following the methodology advocated by (Mattimoe et al., 2021). The thematic analysis involves systematically identifying, examining, and interpreting patterns and themes present within the dataset. These themes encapsulate significant elements of the data pertinent to the research question, revealing discernible patterns or meanings inherent within the dataset. The qualitative analysis adhered to the structured six-phase thematic data analysis process outlined by Braun & Clarke (2006), as follows:

Figure 2: Thematic Analysis

Familiar with the data	Generate initial codes	Searching for themes	Reviewing the themes	Define and naming themes	Report and Narrative
Transcribe, read-through the transcribe, active obscene meanings & pattens appears.	Codes that represent the meanings of data	Decide what the code. Apply appropriate codes.	Bring together all the excerpts with a particular code.	Group the code and themes. It should be nuanced complex and say something meaningful and important.	Each theme has enough data to support them and is distinct.

Research Design
Qualitative research is an approach used to explore and understand the meanings people attribute to their experiences, the processes involved in their social interactions, and the contextual factors influencing these experiences. Unlike quantitative research, which seeks to quantify variables and relationships, qualitative research aims for a deeper understanding of the phenomena studied. A well-structured research design is essential to ensure that the study produces credible and meaningful results. For this study, the researcher will design an outline of the definition and design for underpinning theory. The provided Figure 2 involves a structured process for conducting multiple case studies, data collection, analysis, and finally conclusion.

Figure 3: Research Design


The provided framework in Figure 2 outlines a structured process for conducting multiple case studies, data collection, analysis, and conclusion. The initial phase begins with defining and designing the research, where the underpinning theory is developed to establish a solid theoretical foundation. This involves outlining the theory that will guide the study, ensuring that the research questions and objectives are grounded in this framework. The design of data collection plans the process for gathering data. This includes determining the methodology, selecting tools for data collection (e.g., interviews, observations), and establishing protocols to ensure consistent data collection across all cases. The next steps involve preparing, collecting, and analyzing data based on the selected cases.

These cases should be relevant to the research objectives and chosen according to criteria that align with the underpinning theory. In conducting the first case study, data is to have been collected according to the designed methodology, gathering detailed information specific to the first selected case. After collecting the data, an individual case report will be written, analyzing the findings and preparing a detailed report on the first case. The process will then repeat for the second case study, following the same data collection procedures. The researcher to analyze the data from the second case and prepare an individual case report. For the third case study, data collection continued in the same manner. Finally, the researcher wrote an individual case report, analyzing and documenting the findings for the third case.

Data Analysis
The qualitative data was analyzed using Nvivo 14, a CAQDAS tool known for its robust capabilities in handling complex qualitative data. An inductive pattern coding approach was employed, allowing codes to emerge organically from the data. Each code was labelled according to the research questions, and a thematic analysis was conducted to identify, examine, and interpret patterns and themes within the dataset. Thematic analysis will be employed to systematically identify, examine, and interpret patterns within the dataset. Each code in NVivo 14 will be linked to the research questions, facilitating a structured analysis process. By categorizing codes into themes, the study uncovered insights into the halal purchasing structures and strategies employed by MSEs. A multiple case study enables the researcher to explore differences within and between cases. The goal is to replicate findings across cases. Because comparisons will be drawn, the cases must be chosen carefully so that the researcher can predict similar results across cases, or predict contrasting results based on a theory (Yin, 2018). The unit of analysis, in a case study can be in the form of a person, enterprise, institution, program, responsibility or population (Merriam, 2015).

This study has approached 10 (ten) multiple case studies of micro, small, and medium enterprises (MSEs) to respond to the halal purchasing structure, with the unit of analysis mostly being the brand owner, director of the company, halal executives, and CEO. In this study, the target population employed nonprobability sampling

or purposive sampling. Purposive sampling was a non-probability sample based on the assumption that the researcher wanted to discover, understand, and gain insight into the characteristics of a population and selected a sample from which most could be learned. (Crossman, 2020). Patton, 2007 Discovered that the logic and power of purposeful sampling lay in selecting information-rich cases for study in depth (Patton, 2007). The data collection steps include the boundaries for the study, collecting information through unstructured or semi-structured observations and interviews, documents and visual materials and visual materials and establishing the protocol for recording information (Creswell & Creswell, 2018). By identifying purposefully selected sites or individuals in the study, the researcher aimed to best understand the problem and the research questions. The research took place, and the interviews were set at the MSEs factory or participant locations for the convenience and comfort of the participants.

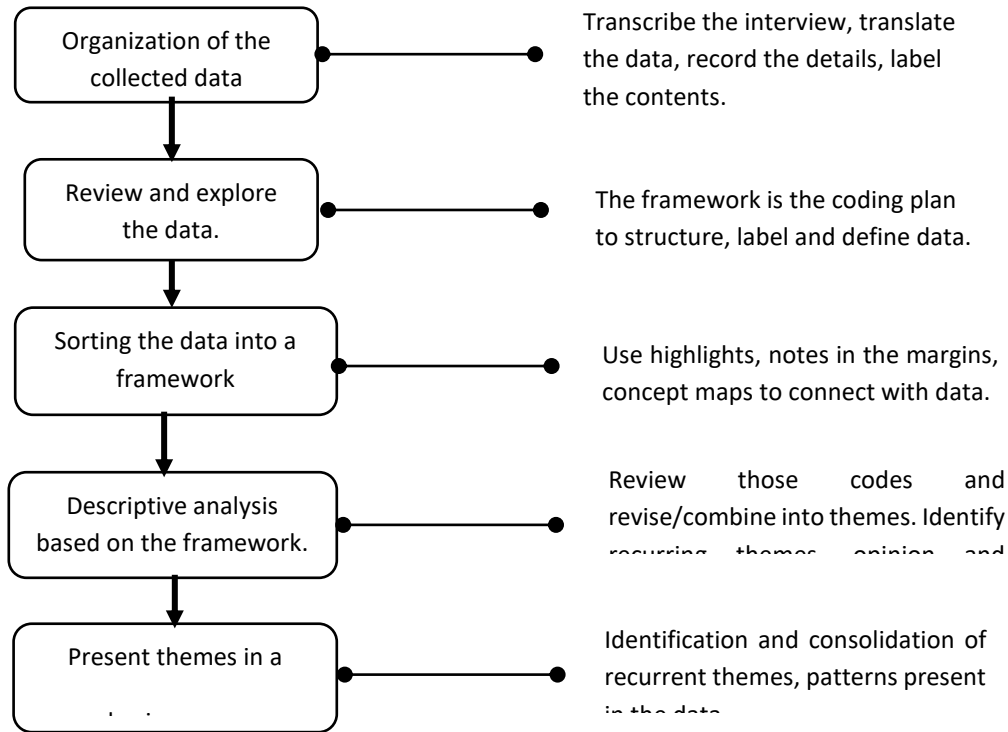
The participants included in the research varied from the brand owner, director, CEO of the company, and the halal executive. Most of the interviews were conducted individually because the owners preferred to explain their perspectives and ideas to answer the research questions. The events where participants were observed or interviewed were also included in the meetings. To conclude the process, the evolving nature of events undertaken by the participants within the setting was considered during the interviews.

4. Analysis and Findings

A. Analysis of Qualitative Research Data
The data analysis for qualitative data in multiple case studies followed a rigorous and systematic process aimed at thoroughly examining and interpreting the information gathered from various sources. As Merriam (2015) explains, data analysis is fundamentally about making sense of the data. In this research, the analysis involved several key steps: constructing categories, sorting data into these categories, naming the categories, and refining the categories to develop a more theoretical understanding of the data over time (Merriam, 2015). The researcher conducted ten multiple case studies, utilizing in-depth semi-structured interviews with entrepreneurs. These interviews were designed to gain a deep understanding of the organizational structures of their companies and to gradually uncover the challenges they face and the strategies they employ in the halal purchasing process, particularly in the context of Micro and Small Enterprises (MSEs).

The use of multiple case studies allowed for a comprehensive exploration of the different experiences and perspectives of the entrepreneurs, providing rich, detailed data for analysis. Before the formal data analysis could begin, a substantial amount of preparatory work was necessary to ensure the accuracy and reliability of the interview data. This preparatory phase involved the meticulous transcription of all interview recordings. Each transcription was carefully reviewed and cross-checked against the original recordings to identify and correct any inaccuracies or errors. This step was crucial for maintaining the integrity of the data and ensuring that the subsequent analysis would be based on precise and accurate information. In addition to transcriptions, the researcher also took detailed field notes immediately after each interview. These notes captured initial impressions, contextual details, and any non-verbal cues or observations that were not fully conveyed in the audio recordings. The field notes played a significant role in the data analysis process by providing additional context and helping to triangulate the data obtained from the interviews. Moreover, the field notes aided the researcher in maintaining reflexivity throughout the analysis.

Reflexivity involves the researcher's awareness of their influence on the research process and their ability to critically reflect on their own biases and assumptions. By regularly revisiting the field notes and reflecting on their positionality, the researcher was able to approach the data analysis with a more critical and nuanced perspective. During the analysis, data were sorted into meaningful categories that emerged from the data itself, rather than being imposed by the researcher. This inductive approach allowed the categories to evolve and become more abstract and theoretical as the analysis progressed, moving from specific observations to broader generalizations and theories. This iterative process of refining categories helped the researcher to develop a deeper understanding of the phenomena under study, ultimately leading to a more robust and comprehensive conceptual framework. Overall, the data analysis process for these multiple case studies was comprehensive, involving careful preparation, rigorous transcription and validation of data, and reflexive engagement with the material. This approach ensured that the findings were grounded in the data and provided a detailed understanding of the halal purchasing strategies and challenges faced by MSEs.

Figure 4: Qualitative Data Analysis Process


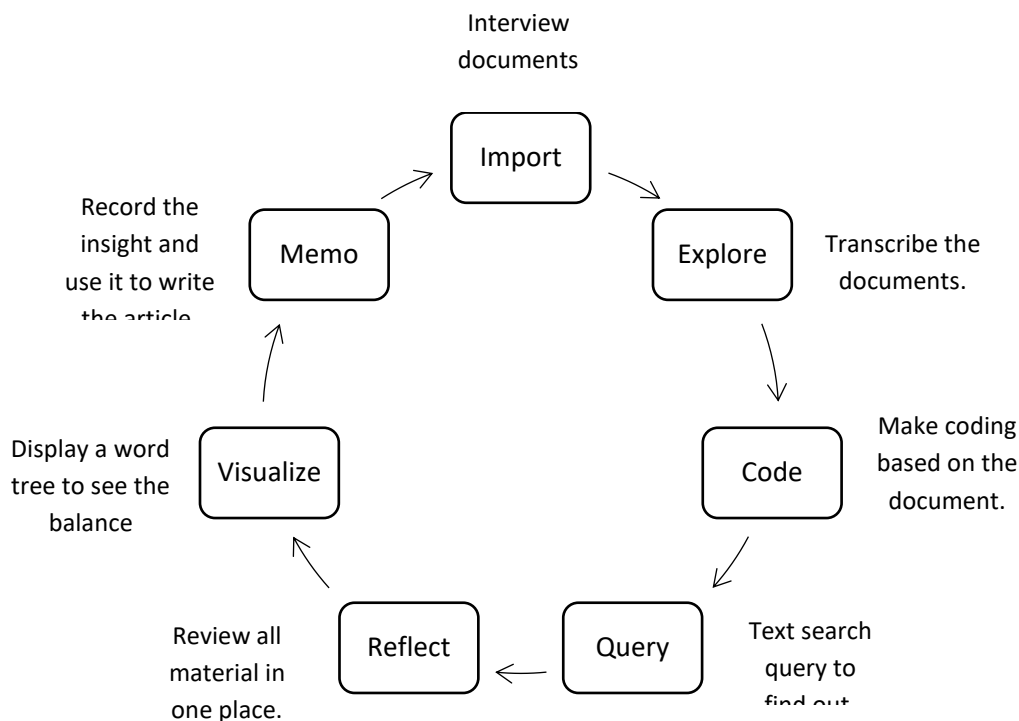
Every research had a different approach to data analysis, and there was no single or best way to analyze and interpret data (Taylor-Powell & Renner, 2003) It was also unique in the sense that the data analysis occurred as soon as the data was collected (Merriam, 2015). According to Taylor-Powell & Renner (2003), the focus of analysis could be done either by question or topic, period, or event, or by case, individual, or group. The researcher conducted 10 multiple case studies, and the theoretical saturated data was reached when no new information about the subject emerged from repeated cases. The researcher analyzed each set of data before proceeding to interview the next participant. Data saturation was critical here to determine when adding new participants stopped yielding new or novel insights (Fusch & Ness, 2015).

B. Qualitative Data Analysis using CAQDAS

According to Mason (2002), qualitative research is not just about analyzing words; it is fundamentally about understanding a practice that is socially constructed (Mattimoe et al., 2021). This approach requires researchers to embrace subjectivity to interpret data effectively. Unlike quantitative research, which often focuses on numerical data, qualitative research involves a deeper engagement with the data to uncover meanings and insights that are contextually grounded. This approach is inherently labour-intensive due to the large volume of data collected and the substantial effort needed to develop themes and patterns from the data. Given the extensive work involved in manual qualitative analysis, researchers have increasingly turned to Computer Assisted Qualitative Data Analysis Software (CAQDAS) as an alternative. CAQDAS tools, such as NVivo, provide powerful capabilities for importing, organizing, and analyzing diverse data sources, including audio recordings, video files, emails, images, spreadsheets, online surveys, social media content, and web content (Baxter & Jack, 2015). In this paper, the researcher utilized NVivo 14 to facilitate the qualitative data analysis process. The use of NVivo 14 allowed the researcher to efficiently manage the data collected during the study. During the interviews, most respondents provided comprehensive answers to the questions posed. They shared their perspectives on various issues, such as the structure of their business initiation, challenges in sourcing suppliers for goods, and strategies their companies employ to optimize the use of materials from suppliers.

However, because the interviews were conducted with open-ended questions, the responses were often unstructured and varied greatly. Respondents did not always answer linearly, making it challenging to categorize their responses according to the specific questions. This complexity highlighted the benefits of using an inductive approach to coding, where patterns and themes naturally emerge from the data, akin to painting on a blank canvas. In an inductive coding process, researchers do not begin with preconceived categories; instead, they allow the data to guide the creation of codes and themes. This approach can be particularly time-consuming if done manually, as it requires careful reading and re-reading of the data to identify meaningful patterns and insights. By using NVivo 14, the researcher was able to streamline this process significantly. The software was used to import audio recordings from the interviews, which were then transcribed into text format. NVivo 14 facilitated detailed transcription by allowing the researcher to organize each interview according to the respondent. Once transcriptions were completed, the researcher classified and coded each piece of data, aligning each code with the relevant research question. The software's ability to label and categorize data efficiently helped in systematically developing themes and sub-themes from the coded material.

NVivo 14 provided a structured and systematic approach to coding, creating a clear audit trail that is essential for qualitative data analysis. This audit trail helps in maintaining transparency and rigor in the research process by documenting every step taken during data analysis (Fusch & Ness, 2015).Furthermore, NVivo's organizational capabilities allow researchers to manage large volumes of qualitative data effectively, facilitating a multi-layered analysis that can reveal deeper insights. The use of NVivo also enabled the researcher to develop valuable skills in qualitative data management and analysis. These skills are highly beneficial for future research projects, as they allow for a more nuanced and sophisticated analysis of complex qualitative data sets. Overall, NVivo 14 proved to be an invaluable tool in managing the complexity associated with qualitative data analysis, offering a systematic approach that enhances both the efficiency and depth of the research process.

Figure 5: Qualitative Data Analysis using CAQDAS NVivo 14


CAQDAS (Computer-Assisted Qualitative Data Analysis Software)
CAQDAS (Computer-Assisted Qualitative Data Analysis Software) offers significant advantages over manual coding methods, particularly in terms of efficiency and accuracy, especially when dealing with large and complex datasets. Regarding efficiency, key aspects of CAQDAS include speed and organization. The software

allows for quick coding through features such as drag-and-drop functionality and efficient data retrieval. This stands in stark contrast to manual coding, which can be time-consuming and cumbersome, particularly as data volume increases. Manual methods often involve physically sorting through documents, which can lead to disorganization and inefficiency. Data management is another crucial advantage of CAQDAS. These tools are specifically designed to handle large datasets, enabling researchers to easily organize, categorize, and retrieve coded segments. In contrast, manual coding can become unmanageable, risking data coherence and increasing clerical workload. Collaboration is also a significant benefit of CAQDAS. Many of these tools support remote collaboration, allowing multiple researchers to work simultaneously on the same project.

This is a considerable improvement over manual methods, which typically require physical presence and can create logistical challenges in sharing and organizing data. In terms of accuracy, CAQDAS offers substantial benefits as well. Enhanced coding capabilities allow for the application of multiple codes to a single text excerpt and the creation of subcodes. This flexibility enhances the granularity of analysis, a level of detail that is more challenging to achieve manually. CAQDAS also provides robust search and query functions, enabling researchers to quickly find and analyze patterns across multiple documents. This feature improves the accuracy of thematic analysis by helping researchers identify relationships and co-occurrences within the data that might be overlooked with manual coding. Finally, the systematic approach of CAQDAS enhances the audibility and rigor of qualitative research, making it easier to track coding decisions and maintain consistency. This contrasts with manual methods, where tracking changes and ensuring consistency can be labor-intensive and prone to human error. While manual coding may offer a tactile connection to the data and can be sufficient for smaller datasets, CAQDAS significantly enhances both the efficiency and accuracy of qualitative data analysis.

The ability to manage large volumes of data, collaborate effectively, and utilize advanced coding and search capabilities makes CAQDAS an invaluable tool for qualitative researchers. However, researchers should also be aware of the potential learning curve and costs associated with these software tools. In this part of the research, the qualitative data focuses on data reduction. Using NVivo 14, significant information that addresses the research question is extracted from the data provided by the informants. The process begins with coding, where labels are assigned to the important information identified in the data. After developing a large number of codes, these need to be categorized to develop themes or sort the data accordingly. In qualitative analysis, two common approaches are thematic analysis and content analysis. The thematic analysis involves generating themes based on the data. For this research, the findings are divided into thematic descriptions, themes, sub-themes, codes, and initial verbatim quotes.

Preliminary Findings
The initial analysis revealed several key themes related to halal purchasing strategies and challenges. The businesses studied displayed a variety of approaches, reflecting differences in company size, ownership structure, and years of operation. Notably, a distinction was observed between the strategies of founder-owned companies and family businesses, with the latter showing signs of a succession trend aimed at maintaining the business's heritage. The thematic analysis also highlighted common challenges, including the complexity of ensuring halal compliance across all stages of the supply chain, the financial burden of certification, and the need for more accessible guidance and support from regulatory bodies. This exploratory study aims to provide valuable insights into the halal purchasing strategies of MSEs, highlighting the challenges faced and the organizational structures in place. The findings will contribute to the understanding of halal integrity in the food industry and may inform future practices and policies for MSEs. The researcher has approached respondents from several background business types in the food industry. Based on the 10 companies approached by the researcher, six of them are owned by founders, while the remaining four were founded as family businesses. The business age of the companies owned by founders' ranges from one year to 20 years, whereas for family businesses, the duration is much longer, spanning from 25 to 47 years. The number of employees in companies owned by founders' ranges from 2 to 7 workers, while for family businesses, it varies from 6 to 15 workers. There is a notable age difference among the business owners: founders' ages range from 28 to 50 years old, while family business owners or legacy enterprises are typically between 34 and 40 years old. This indicates that family business owners are succeeding their elders to continue the business heritage.

Table 1: Theme Development

Themes Category	Themes	Codes
The Strategies in Optimising Halal Purchasing of MSEs	Market Dynamic	Price strategies
		Market segmentation
		Distribution strategy
		Market strategy - vendor placement
		Market strategy - personal engagement
	Customer Diversity	Customer satisfaction
		Customer loyalty
		Customer convenience
	Operational efficiency	Bulk purchase strategy
		Storage consideration
		Impact of external factors on pricing
		Automation for cost efficiency
	Business Strategy and Development	Marketing strategy
		Long term focus on automation
		supplier relationship and dependability
		Expansion and export goals
		Ethical business practices
		Flexible payment and collaboration
		global branding and marketing reach
		Cultural identity

Table 1 outlines a comprehensive set of strategies used by micro and small enterprises (MSEs) to optimize halal purchasing, categorized into four key themes: market dynamic, customer diversity, operational efficiency, and business strategy and development. In the market dynamic category, strategies include price adjustments, market segmentation, distribution strategies, and vendor placement, with a focus on personal engagement to build trust and ensure halal compliance. Customer diversity highlights efforts to maintain customer satisfaction, loyalty, and convenience by offering accessible, high-quality halal products. Operational efficiency emphasizes bulk purchasing, proper storage, pricing adjustments based on external factors, and automation for cost reduction, all while preserving halal integrity. In the business strategy and development category, strategies focus on long-term goals such as marketing, supplier relationships, expansion, and export goals, underpinned by ethical business practices. Businesses also promote flexible payment options, global branding, and cultural identity to foster trust and meet the specific needs of Muslim consumers. These strategies collectively enhance the halal purchasing processes of MSEs while ensuring compliance with Islamic ethical standards and market demands.

5. Conclusion

This study makes a significant contribution to the existing body of knowledge by providing a detailed examination of halal purchasing strategies employed by Micro and Small Enterprises (MSEs) in the food industry. This area has been relatively underexplored in academic literature, and this research addresses this gap by highlighting the unique challenges and approaches that MSEs face in adhering to halal standards. Through its focus on halal purchasing, the study provides insights into how these enterprises navigate the complexities of halal compliance, which is essential for accessing and competing in markets where halal certification is a critical requirement. Moreover, the study illustrates the effectiveness of Computer Assisted Qualitative Data Analysis Software (CAQDAS), specifically NVivo, in managing and analyzing data from multiple case studies. Qualitative research often involves the collection of large, complex datasets, which can be difficult to manage and analyze manually. By employing CAQDAS, the study demonstrates how such tools can streamline the process, allowing for more efficient data organization, coding, and thematic analysis. This not only enhances the accuracy and reliability of the findings but also allows researchers to delve deeper into the data to uncover nuanced insights. The findings from this study have important practical implications for

policymakers and industry stakeholders. For policymakers, the study highlights the need to provide more targeted support and resources to assist MSEs in the halal food sector.

This could include offering training programs, developing clearer guidelines for halal certification processes, and providing financial or logistical support to help MSEs meet halal standards. For industry stakeholders, understanding the strategies and challenges faced by MSEs can lead to better collaboration and support systems, ensuring that smaller enterprises are not disadvantaged in markets where halal certification is increasingly important. Additionally, the study emphasizes the value of using advanced qualitative data analysis tools to enhance the rigor and depth of qualitative research. Traditional qualitative analysis can be time-consuming and prone to human error, especially when dealing with extensive datasets. By leveraging software like NVivo, researchers can ensure a more systematic and comprehensive analysis process. This not only improves the quality and validity of the research findings but also allows for more complex and layered interpretations of the data. The study, therefore, advocates for the broader adoption of CAQDAS in qualitative research to improve analytical precision and contribute to the field's methodological advancement.

Abstract: This study analyses the impact of the pandemic on the financial performance of airlines, with a specific focus on financial ratios. The travel limitations imposed as a result of the pandemic, coupled with a significant decline in passenger demand, resulted in significant financial losses. This study investigates how passenger demand moderates the relationship between financial ratios and the performance of the aviation industry. This study gathered data from 20 premier Asian airline companies, as acknowledged by Skytrax. The data was collected from 2016 to 2022, with the timeframe from 2016 to 2019 designated as the 'pre-Covid19' period, and the timeframe from 2020 to 2022 designated as the 'during Covid19' period. The study uses static panel data analysis to accomplish its objective by integrating cross-sectional and time series analysis. Based on this analysis, it was determined that the company's financial condition had a substantial impact on its performance and operating worth before the COVID-19 outbreak. This influence was observed across all variables, except TATO (Total Assets Turnover). However, the company's financial condition does not affect its performance during the COVID-19 outbreak. This is due to the implementation of government initiatives and bailouts offered some respite, while also underscoring pre-existing structural weaknesses within the business. The results emphasize the crucial requirement for airlines to implement adaptable financial strategies and strong risk management techniques to successfully navigate future disruptions. Hence, the aviation sector should embrace a comprehensive strategy centered on minimizing expenses, expanding income sources, and implementing digitalization.

Keywords: *Aviation Industry, financial performance, passenger demand, ratios, COVID-19*

1. Introduction and Background

In 2008, a global financial crisis occurred, leading to a widespread economic recession in most countries. It required several years for companies to recuperate and restore their stability. However, the most intense outbreak occurred in December 2019 when the Coronavirus Disease (COVID-19) was identified in Wuhan, China. By the end of January 2020, COVID-19 was formally designated as a global public health emergency. On March 11, 2020, it was officially designated as a pandemic (Cucinotta & Vanelli, 2020). Although the long-term effects of COVID-19 are still undetermined, the crisis had a significant and widespread influence on a global scale in 2020 and 2021. This resulted in another global financial crisis that profoundly harmed individuals and businesses in both the public and private sectors.

The epidemic caused significant financial devastation throughout the whole aircraft value chain, particularly impacting the aviation industry. Bouwer et al. (2022) found that in 2020, all subsectors, except for goods forwarders and cargo airplanes, suffered significant financial losses as a result of a decline in demand for air cargo. Even industries and airports, which are typically considered dependable providers of economic value, were not spared from the economic repercussions of the pandemic. The COVID-19 epidemic has caused substantial financial losses for the airline industry, despite initial expectations of smooth performance. In 2020, the aviation industry had a significant decline in revenues by 55% or US$314 billion (IATA, 2020). This financial setback will have a lasting impact on the aviation business, as it continues to grapple with ongoing health concerns (Bouwer et al., 2022). Air Asia Group Berhad, a prominent long-haul low-cost airline, has been categorized by Bursa Malaysia Securities as a 'Practice Note 17' (PN17) firm, signaling a deteriorating financial condition (Alrawi, 2020). Air Asia, a key player in the private aviation market, has been categorized as PN17 as a result of financial difficulties stemming from the repercussions of COVID-19. This airline is so vast that it cannot be overlooked. These adjustments have significantly altered the core characteristics and viewpoints of the industry, reshaped the sector, and posed significant challenges to the airline industry.

To minimize the spread of COVID-19, governments around the world enforced lockdown measures that included restrictions on movement, isolation from social interactions, obligatory quarantines, shutdown of airports, and prohibitions on travel (Thiagararan, 2021). These policies have a significant impact on the aviation industry in Asia. The COVID-19 epidemic and the measures used to mitigate its spread have substantially reduced the need for passenger air travel, hence jeopardizing the financial viability of numerous businesses in the air transport sector and the broader aviation industry (OECD, 2020). The sharp decline in the demand for passenger travel (Bouwer et al., 2022) has resulted from a mix of government-enforced lockdowns and anxiety about getting and spreading the illness. As a consequence, air travel firms have experienced financial instability. Unanticipated fluctuations in transportation demand have also occurred owing to sudden choices made by passengers, which have had a substantial impact on their travel patterns due to perceived risks associated with travel. The restrictions imposed on the spread and impact of COVID-19 have had a significant impact on people's lives and the whole economy.

A decline in passenger demand could lead to the undervaluation and overinvestment in assets that an aircraft company is unable to sell to cover its expenses (Husna et al., 2022). The existence of a detrimental passenger demand has led to a forthcoming period marked by unpredictability. The ubiquitous ambiguity exerts a major impact on the whole aviation business, due to its interconnection with sectors such as tourism and trade. Moreover, the aviation sector is still vulnerable to a potential return of a pandemic, since governments may enforce further restrictions on air travel or mobility in response to outbreaks or a potential second wave of infections. Consequently, there has been a significant decrease in both passenger demand and the financial performance of airline firms, including the devaluation of their assets (Husna et al, 2022). If there is no growth in passenger demand and revenue, the aviation industry will encounter difficulties in financing assets and fulfilling obligations (Li, 2024). The emergence of the Covid-19 outbreak worsened the previously identified problem. The global aviation sector has incurred significant financial losses as a direct consequence of the epidemic, leading to lowered ratings, liquidations, and bankruptcies. Although there is a continued threat of a pandemic recurrence, the airline industry is essential and too crucial to fail, considering its substantial contribution to the economic advancement of the country.

Hence, this research especially concentrates on two key topics of emphasis. The study seeks to empirically investigate the factors that impact the financial performance of 20 airline firms that were recognized as the leading airlines in Asia by Skytrax, both before and during the COVID-19 pandemic. The evaluation of the factors is conducted by utilizing the financial ratios of the aviation industry, including liquidity, efficiency, and leverage. This study also aims to assess the moderating impact of passenger demand on the relationship between financial ratios (liquidity, efficiency, and leverage) and the performance of the aviation industry in Asia.

2. Literature Review

Aviation Industry Financial Performance: The purpose of financial performance analysis is to evaluate the performance of a company to make well-informed decisions and effectively monitor and manage its financial situation (Daryanto et al., 2020). According to Suhadak et al. (2018), financial performance is a metric that gauges a company's ability to achieve its objectives with effectiveness and efficiency. Optimizing a company's financial performance is essential to attract potential investors. According to Hayes (2022), profit and sales are often used measures to evaluate a company's financial performance. The notion of profitability has been thoroughly examined in financial literature concerning financial performance. The financial viability of a firm has a substantial influence on its capacity to sustain competitiveness. Yildirim (2018) found that profitability is a method that organizations use to improve the value of their shareholders. Alahyari (2014) argues that firms continually prioritize profitability because of its crucial importance to their entire performance. The financial condition of a firm is impacted by its profitability and its capacity to generate cash using its existing resources. Companies that exhibit high profitability ratios are considered financially prosperous, whilst those with low profitability ratios are deemed financially unsuccessful. The claim is supported by Maverick (2022) research, which argues that the profit margin ratio is the primary statistic used to assess both profitability and performance. The profitability ratios were used as dependent variables to illustrate the elements that influence profitability. The NPM (Net Profit Margin) and ROA (Return on Assets) ratios are the dependent variables in this study. Due to the significant correlation between the CR ratio and both ROA and ROE, the decision was

made to omit ROA. This study employs the NPM technique to assess the variability of profit at both the operational and income levels. Financial performance can be evaluated using different metrics, including liquidity, leverage, and solvency (Fatihudin et al., 2018). Stobierski (2020) identifies several key financial performance indicators that should be tracked, including the current ratio, quick ratio, debt-to-equity ratio, inventory turnover, total asset turnover, return on equity, return on asset, operating cash flow, and seasonality.

Underpinning Theory: Hawley's Risk Theory of Profit and Lancaster's New Theory of Demand. Hawley's Risk Theory of Profit asserts that profit signifies the social expense linked to undertaking the inherent risks of operating a firm. Hawley's theory of profit posits that a businessperson anticipates receiving remuneration for undertaking risk that is beyond the actuarial value sometimes referred to as the premium on measurable risk. Every entrepreneur strives to earn greater profits than the remuneration paid by the management in exchange for bearing the risks of the business. Hawley's 1893 research suggests that it is advisable to keep earnings beyond the threshold of actuarial risk. This is because undertaking risk can result in a multitude of problems and inefficiencies among entrepreneurs. Profit is the remuneration obtained in exchange for undertaking risks and obligations as an entrepreneur. Hawley (1893) identified several hazards in business, such as product obsolescence, price reductions, the emergence of superior alternatives, major disasters, and scarcity of essential production inputs. Hawley argues that only those persons who take on the duty of dealing with dangers will be able to obtain rewards, particularly in the form of financial gain.

Liquidity: Liquidity refers to a company's ability to convert its assets into cash to fulfill its financial responsibilities and make payments. The current ratio and the quick ratio are often used metrics for evaluating accounting liquidity (Vieira, 2010). Insufficient liquidity levels might result in higher financial expenses and the inability to fulfill one's obligations. Considering that liquidity risk plays a substantial role in triggering financial crises, it is imperative to include it while evaluating financial performance. According to Alahyari et al. (2014), a robust liquidity position is indicative of the financial stability of a company. The current ratio is a quantitative indicator that assesses the financial robustness or vulnerability of a corporation (Manaf et al., 2020). Bankruptcy may arise for a business if it is unable to meet its immediate financial obligations using readily accessible liquid assets. Due to aviation's considerable capital demands and hefty debt levels, airline companies are highly suitable for research using this financial metric. Dirman (2020) asserts that liquidity has various effects on financial crises. This scenario may arise as a result of a company's liquidity level, which is independent of its ability to withstand a financial crisis. Therefore, the existence of liquidity can improve financial performance, as supported by the study conducted by Cheong and Huy (2021), which demonstrates that an augmentation in liquidity leads to higher profitability. High liquidity ratios suggest that the company will promptly fulfill its debt obligations, whereas low levels imply the opposite. High current ratios offer potential investors significant benefits. The increase in current assets will result in a rise in investor interest in investing. Yosya and Baraja (2019) found that the current ratio has a small positive effect on changes in earnings. Riyadi (2017) found a direct relationship between the extent of profit change and the current ratio.

However, Alifiah (2014) and Platt et al. (2008) predict that there is a negative relationship between liquidity measures (current ratio, quick ratio, working capital ratio) and financial success. According to their analysis, these procedures only assist companies in fulfilling their financial obligations. Nunes et al. (2009) conducted a study on the profitability of the service industry in Portugal and found that liquidity does not have a major influence on profitability. Asimakopoulos et al. (2009) found that inadequate management of existing assets, particularly difficulties in selling inventories or generating income from past sales, had a detrimental impact on a firm's profitability. This occurs when the company amasses an excessive amount of inventory or outstanding payments. Thus, the hypothesis is:
H1: Liquidity has a significant impact on the aviation industry's financial performance before COVID-19.

Efficiency: The corporation should leverage its assets to produce profit. Inadequate management of assets by a firm will result in increased expenditures and decreased revenue, ultimately having a detrimental effect on performance (Alahyari et al., 2014). Activity ratios are a useful tool for evaluating the effectiveness of a company's management of its assets. The financial performance of a corporation is commonly evaluated by analyzing the working capital ratio and total asset turnover. The importance of TATO in this study is in its capacity to assess the effectiveness with which an airline company manages its assets, considering the significant financial resources needed in this sector. A study conducted by Fadhlur and Haron (2017) showed

that a reduction in asset utilization results in a corresponding decrease in the cost of capital. Hence, the rise in profitability suggests that the total asset turnover significantly impacts the profitability and performance of organizations. Erawati and Chandra (2016) conducted a study and found that TATO has a substantial beneficial influence on return on assets (ROA). The TATO metric quantifies the effectiveness of converting the value of assets into sales. The study conducted by Nicoleta et al. (2019) shows that when evaluating financial performance using return on assets (ROA), the efficiency ratio is more strongly affected by total asset turnover.

Seilsepoor and Ahmadi (2017) discovered that the financial crises of a corporation are notably affected by the return on assets, return on equity, current ratio, leverage ratio, and total asset turnover ratio. Both investigations have verified that the overall asset turnover significantly impacts financial performance and profitability. Rahmah et al. (2016) provide additional evidence that the efficiency ratio, namely the total asset turnover, has a positive and significant influence on the success of the automobile sector. This industry, similar to the aviation sector, requires a significant amount of capital investment. However, several studies have presented data supporting the negative relationship between Total Assets Turnover (TATO) and business performance. Alifiah (2014) conducted a study that found a negative association between profitability ratios, notably the net profit margin (NPM) and return on assets (ROA), as markers of financial success in several product industries, including the aviation sector. Gu and Gao's 2000 research indicates that an assertive company strategy can lead to high efficiency. This strategy entails prioritizing rapid sales expansion while disregarding the significance of cost management. Nevertheless, this strategy also exposes the organization to additional vulnerabilities, which might ultimately result in a decline in the company's overall performance. Thus, the hypothesis is:
H2: Efficiency has a significant impact on the aviation industry's financial performance before COVID-19.

Leverage: Leverage is an investment technique that involves using borrowed cash, financial instruments, or borrowed resources to increase the potential return of an investment (Hayes, 2022). It is a tool that can be used to evaluate financial performance. The commonly employed metrics for evaluating a company's financial leverage and performance are the Total Debt to Total Assets ratio (DR) and the Debt-to-Equity Ratio (DER). In the airline industry, airline businesses require substantial capital investment and heavily depend on debt arrangements because of the substantial value of their physical assets. Due to the enormous worth of physical assets in the aviation sector and the widespread use of heavy long-term debt for acquiring assets and advancing technology, it is typical to maintain a high level of financial leverage (Fernando, 2020). The research carried out by Sembiring and Damanik (2020) demonstrates that both elevated and diminished debt-to-equity ratios have a substantial impact on a company's ability to attain a return on assets (ROA). Minimizing the costs associated with loans and other forms of debt below the cost of capital can increase their profitability. Therefore, it can be deduced that keeping a low debt-to-equity ratio has a significant and advantageous impact on the return on assets (ROA). The claim is supported by Kuswadi (2005) research, which demonstrates that a higher debt-to-equity ratio (DER) is linked to greater total debt and consequently results in higher profits. As a result, this has a significant impact on the increase in income and the overall profitability of the organization.

However, previous studies have shown that both leverage and profitability are negatively affected. As stated by Asimakopoulos et al. (2009), higher levels of leverage have a detrimental effect on profitability. This is because when a corporation has more debt, it is required to dedicate a greater portion of its resources towards repaying that debt. As a result, the firm has less cash available for investment. Sunaryo (2022) asserted in his research that when the return on assets is less than the cost of debt, leverage will diminish the rate of return on capital. Hence, the corporation must prioritize reducing its dependence on debt to attain profitability. Nevertheless, financial leverage has a paradoxical effect on firm profitability during periods of economic decline. The reason for this is that an economic crisis can result in liquidity issues, so impeding the firm's ability to fulfill its interest obligations. The citation "Ismail et al., 2019" refers to a publication by Ismail and colleagues in the year 2019. Thus, the hypothesis:
H3: Leverage has a significant impact on the aviation industry's financial performance before COVID-19.

Firm Size: The success of airlines is largely influenced by the size of the firm, with larger airlines often seeing advantages from economies of scale, resulting in lower costs per unit and more market influence. Major airlines can utilize their scale to get more favorable agreements for fuel, maintenance, and airport charges. Additionally, they tend to possess more broad networks, which can lead to increased revenue prospects and improved

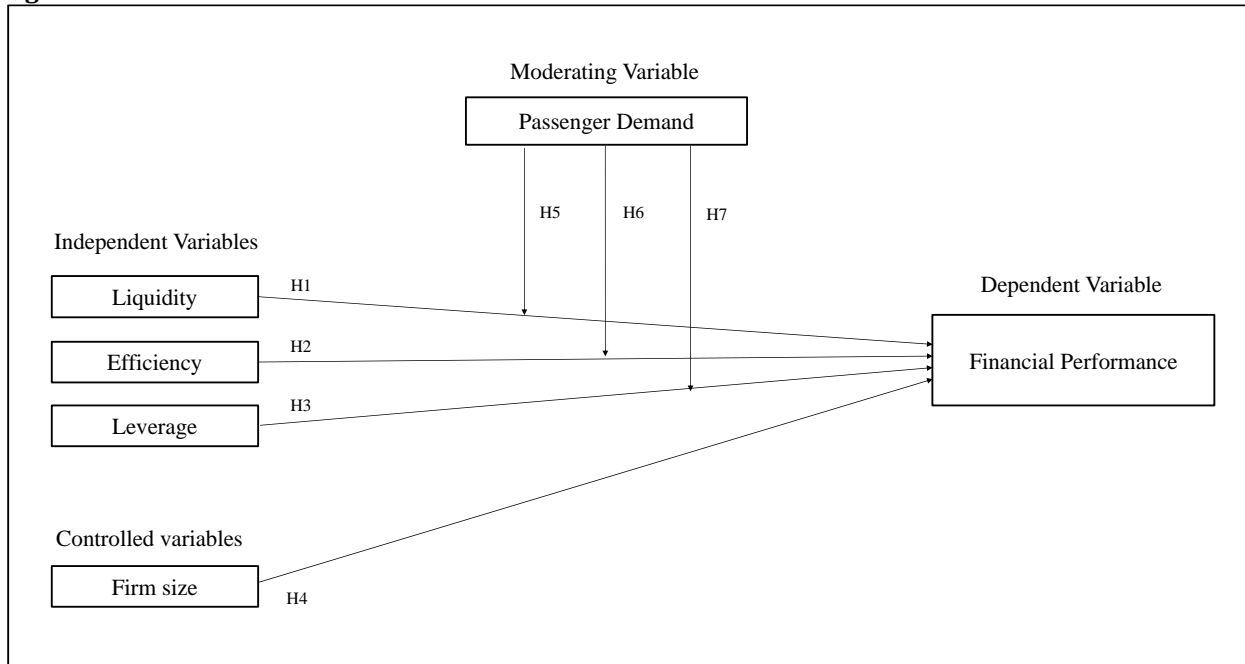
operational effectiveness (Graham, 2014). In contrast, smaller airlines may encounter difficulties due to increased operational expenses and limited ability to negotiate, which could impact their financial stability and competitive standing (Barrett, 2004). The larger scale of a company frequently leads to greater performance indicators, such as increased profitability and enhanced service offerings (Button, 2008).

The COVID-19 pandemic had a considerable impact on airline operations, with larger carriers generally performing better than smaller ones because of their higher financial resilience and capacity to handle unexpected events. Big airlines were better equipped to use their economies of scale to lessen the financial burden of fewer passengers. They benefited from having different sources of income, bigger fleets, and more extensive networks that made it easier to transport cargo and receive government assistance (IATA, 2020). Smaller airlines, on the other hand, faced more severe challenges. They had to deal with higher costs compared to larger airlines and had restricted access to both capital and government assistance. These factors worsened their financial problems and resulted in increased rates of insolvency and withdrawal from the market (Gössling et al., 2020). Thus, the hypothesis:
H4: Firm size has a significant impact on the aviation industry's financial performance before COVID-19.

Passenger Demand as Moderator: Liquidity measures, such as the current ratio, quick ratio, and cash ratio, are crucial in evaluating an airline's capacity to fulfill its immediate financial obligations by utilizing its most readily convertible assets. These ratios emphasize the airline's financial stability and operational flexibility, which are essential for effectively handling changes in passenger demand and economic downturns (Brigham & Ehrhardt, 2016). A robust cash position enables airlines to meet their fixed expenses, overcome financial difficulties, and make strategic investments in technology and services, hence fostering long-term operational efficiency and competitive edge (Pike & Neale, 2009). The total asset turnover of airlines can be considerably influenced by passenger demand, which quantifies the efficiency with which an airline utilizes its assets to create income. As the demand from passengers rises, airlines frequently observe an increase in income, resulting in enhanced utilization of assets and a larger ratio of total assets turnover. In contrast, when there is less demand, the airline's income declines, which can lead to a decrease in the efficiency of asset utilization and a lower turnover ratio. Airlines must prioritize efficient asset management since it directly correlates with improved sales generation from assets. High asset turnover signifies greater performance, whereas low turnover shows underutilization of resources (Higgins, 2012). This situation emphasizes the significance of synchronizing operational plans with demand patterns to maximize asset efficiency and financial success.

The leverage ratio of an airline is greatly influenced by passenger demand, as it quantifies the extent to which debt is utilized to fund the company's assets. Increased passenger demand usually results in higher revenues, which can help an airline pay down its debt and perhaps lower its leverage ratio by reducing the percentage of debt to equity. On the other hand, when there is less demand for flights, the airline's financial health might be negatively affected since it may have less income. This can result in higher leverage ratios, as the company may need to rely more on borrowing money to continue operating or to increase its capacity (Brealey, Myers, & Allen, 2017). Strong passenger demand can help an airline manage its debt more effectively and reduce financial risk. Conversely, inadequate demand might worsen the issues connected to debt leverage. Thus, the hypothesis:
H5: Passenger Demand moderates the relationship between liquidity and the aviation industry's financial performance before COVID-19.
H6: Passenger Demand moderates the relationship between the efficiency and the aviation industry's financial performance before COVID-19.
H7: Passenger Demand moderates the relationship between leverage and the aviation industry's financial performance before COVID-19.

In Figure 1, the researcher concentrated on the Current Ratio (CR), Total Asset Turnover (TATO), Debt Equity ratio (DTE), and firm size which stand for internal factors that influence the 20 Best airline companies' financial performance.

Figure 1: Research Framework


3. Research Methodology

The study does a quantitative analysis by utilizing secondary data extracted from the financial accounts of specific airline firms. The selection of these companies was based on their ranks in the Asia region as per the Skytrax ranking list and award. This study aims to assess and contrast the financial performance of 20 airline companies that were honored with the esteemed Skytrax Best Airlines in Asia award in both 2019 and 2021, particularly in the context of the COVID-19 pandemic. Therefore, we analyze a thorough dataset that covers a period of seven years (2016 to 2022). The years 2016 to 2019 are designated as the 'pre-COVID-19' period, while the years 2019 to 2022 are designated as the 'during COVID-19' period. The inaugural year for each airline company is subject to variation and unreliability due to the limited availability of data. Therefore, the year 2016 is utilized as a reference point to give a limited depiction of businesses functioning in a beneficial economic setting, wherein their sales and financial achievements were steadily increasing before the epidemic (OECD, 2020). Furthermore, this study has opted to omit certain years before 2016 to uphold consistent data collecting and analyze the development of the identical sample across time. The study concluded in 2022 due to the unavailability of comprehensive data for the current year, 2023, to the researcher. Furthermore, (Salim, 2022) has officially declared that 2022 will mark the shift to the endemic phase of COVID-19. The metric used to assess moderating variables before and during the COVID-19 pandemic in this study is the passenger volume transported by airline companies throughout the specified timeframe. The study will consider firm size as a controlled variable. This study employs panel data as its secondary data source. The secondary data is acquired from an external source known as the Thomson Reuters Eikon Database. The study will employ the STATA 17.0 program to analyze all the requirements. This study utilizes the following regression models to elucidate the factors influencing profitability. The definitions and measurements of each variable utilized in this study are presented in Table 1:

Table 1: Definition and sources of variables

Variables	Description	Data source
DV: Aviation Performance (NPM)	Net Profit Margin (NPM) based on the aviation industry (Net Profit / Sales)	Thomson Reuters
Liquidity: (CR)	Current Ratio (CR) (Current assets/Current liabilities	Thomson Reuters

Efficiency (TATO)	Total Asset Turnover (TATO) (Sales/Total Asset)	Thomson Reuters
Leverage (DTE) (LRATIO)	Debt-Equity Ratio (DTE) (Total Debt/Total Equity)	Thomson Reuters
Firm Size (FS)	Log of Total Assets	Thomson Reuters
Passenger Demand (PD)	Passenger load factor (Numbers of passengers/ total seats)	Thomson Reuters

Model Specifications: Based on the explanation above, the estimation models of this study are as follows:

Model 1: $NPM = \alpha + \beta CR + \beta TATO + \beta DTE + \beta SIZE + \varepsilon t$

Model 2: $NPM = \alpha + \beta CR + \beta TATO + \beta DTE + \beta SIZE + \beta CR*PD + \beta TATO*PD + \beta DTE* PD + \varepsilon t$.

The baseline model, referred to as Model 1, analyzed the direct influence of financial performance on aviation industry performance. On the other hand, the interaction model, known as Model 2, investigated the moderating impact of passenger demand on aviation industry performance. The panel data regression approach was employed to analyze these models. Panel data offers the advantage of allowing control over unobserved time-invariant heterogeneity, which increases the degree of freedom and improves the efficacy of the estimators (Baltagi, 2008). The investigation incorporated marginal effect analysis to examine the impact of competition levels on financial stability.

4. Results

Descriptive Statistics: This section presents the results of the Descriptive Analysis, Static Panel Data, and Multicollinearity Procedure. Tables 2a and 2b display the descriptive statistics that reveal significant changes in key financial metrics before and during the COVID-19 pandemic. Net Profit Margin (NPM) experienced a sharp decline, with the mean dropping from 0.0208 before the pandemic to -0.0686 during COVID-19, reflecting a substantial reduction in profitability. This was accompanied by increased variability, as indicated by the rise in the standard deviation during the pandemic. The Current Ratio (CR), a measure of liquidity, decreased slightly from a mean of 0.8018 to 0.6684, suggesting a minor reduction in firms' ability to meet short-term liabilities. However, the relatively small change in CR implies that liquidity remained more stable compared to other financial measures. Total Asset Turnover (TATO), which measures the efficiency of firms in using assets to generate revenue, saw a marked reduction from 0.6525 to 0.3012 during the pandemic, reflecting a significant decrease in operational efficiency. The Debt-to-Equity Ratio (DTE) was only reported before the pandemic, with a mean of 4.7969, indicating that firms were more leveraged pre-crisis. The absence of DTE data during the pandemic may suggest shifts in firms' financial structures.

Additionally, firm size declined from a mean of 1.3693 before the pandemic to 1.1679, indicating a contraction in firm operations, likely driven by downsizing or reduced activity in response to economic conditions. The differences between the maximum and minimum values further highlight increased variability, particularly in NPM, where the range expanded from -0.0754 to 0.1234 before the pandemic to -0.6084 to 0.5566, showing greater extremes in firm performance. For TATO, the range narrowed, signaling that firms were less efficient overall, with fewer outliers in performance during the pandemic.

The skewness and kurtosis metrics provide additional insights into the distribution of the data. For NPM, skewness increased from 0.1388 before the pandemic to 0.6906, indicating a shift toward more firms experiencing negative profitability, while a few outliers managed to perform well. In terms of kurtosis, NPM showed a more uniform distribution during the pandemic, with fewer extreme outliers compared to before. In contrast, TATO exhibited higher kurtosis during the pandemic, suggesting more extreme values and a concentration of firms with lower operational efficiency. Overall, the increased range, skewness, and kurtosis during the pandemic suggest heightened variability in firm performance, with more firms experiencing difficulties, while a few outliers performed exceptionally well. These findings demonstrate that while profitability, efficiency, and firm size were significantly impacted, liquidity remained relatively stable during the COVID-19 crisis.

Mann-Whitney Rank U Test: Based on Table 3, the Mann-Whitney Rank U test differentiates between two independent groups. Net Profit Margin (NPM) experienced a marked decline, with the mean dropping from 0.0208 before the pandemic to -0.0686, indicating a substantial reduction in profitability. This decline was statistically significant, as supported by the Mann-Whitney U test value of 0.0000. Similarly, Total Asset Turnover (TATO) decreased from a mean of 0.6525 to 0.3012, reflecting a significant drop in operational efficiency during the pandemic value of 0.0000. In contrast, the Current Ratio (CR), which fell slightly from 0.8018 to 0.6684, showed no statistically significant difference value of 0.1137, suggesting that liquidity remained relatively stable. Furthermore, firm size contracted significantly, with the mean decreasing from 1.3693 to 1.1679 p-value of 0.0001, illustrating the broader impact of the pandemic on business operations. Overall, these findings demonstrate that while profitability, efficiency, and firm size were adversely affected by the pandemic, liquidity showed relative resilience.

Variance Inflation Factors: The Variance Inflation Factors (VIF) values are presented in Table 4. None of the independent factors exceed a score of 10. This indicates that there is no multicollinearity among the independent variables.

Table 4: Variance Inflation Factor of the Independent Variables

Variables	Pre-Covid19 (Without Moderator)	Pre-Covid19 (With Moderator)	During Covid19 (Without Moderator)	During Covid19 (With Moderator)
CR	1.69	2.08	1.07	1.31

Discussion
Based on the findings presented in Table 5, it can be observed that variables such as CR (current ratio), DTE (Debt to Equity ratio), and firm size have a significant influence on the net profit margin (NPM) of Asia's aviation industry. Before the COVID-19 pandemic, the analysis indicated that the Current Ratio (CR) had a noteworthy influence on the net profit margin (NPM) with p-values of 0.071. This finding suggests that the degree of liquidity had a significant impact on financial performance, with a statistical significance level of 10%. Therefore, it provides support for hypothesis H1a. These companies are utilizing their existing assets to balance off their immediate debts, resulting in a favorable effect on their financial performance. Furthermore, this suggests that aviation companies can depend on their existing assets to repay their short-term debt sustainably. Furthermore, the correlation between CR and NPM is influenced by Passenger Demand. It demonstrates that there is support for H5a. The findings are consistent with the studies conducted by Rahma (2020) and Bachwera et al. (2014), which suggest that the current ratio formula affects financial performance and may lead to financial distress if an aviation company's management fails to effectively use current assets to repay short-term debt. The results of this study validate the assertions made by Sari and Putri (2016) that liquidity has a good impact on the performance of aviation companies.

However, the Total Asset Turnover (TATO) did not have a significant impact on the net profit margin. The p-values of 0.102 and 0.132 indicate that efficiency, as measured by asset turnover, did not have a significant influence on financial performance before COVID-19, regardless of the presence or absence of a moderator. This means that the hypotheses H2a and H5a are not supported. Nevertheless, the Debt-Equity ratio (DTE) had a substantial influence on NPM, as indicated by the p-values of 0.034. This underscores the significant impact on financial performance and implies that leverage had a crucial role before the pandemic. This finding suggests that the use of leverage has a significant impact on financial performance, with a level of significance of 5%. Furthermore, this supports hypothesis H3a. The findings indicate that before the COVID-19 epidemic, aviation companies demonstrated proficiency in handling their debt and equity, highlighting the substantial impact of the Debt-to-Equity (DTE) ratio on the operational success of 20 aviation companies in Asia. The results of this study are consistent with prior studies conducted by Naufal (2020) and Syawil et al. (2020), which demonstrated a direct correlation between leverage and a decrease in financial performance and financial

difficulties. In addition, the research conducted by Almajali et al. (2012) and Abbas et al. (2013) supports the connection between leverage and financial performance. In contrast, Lindawati (2020) presents opposing findings, suggesting that leverage has a negligible effect on financial challenges and proposes a negative relationship between the Debt-to-Equity ratio and company success.

Furthermore, the correlation between DTE and NPM is influenced by Passenger Demand. It demonstrates that there is support for H7a. Before the COVID-19 outbreak, the size of the firm had a substantial influence on its financial success. The p-values of 0.005 indicate that larger firms had a higher level of financial performance compared to smaller firms. This finding suggests that the size of a firm has a significant impact on its financial success, with a 5% level of significance. Therefore, it supports hypothesis H4a.

Analysis conducted during the COVID-19 epidemic revealed that the Current Ratio (CR), Total Asset Turnover (TATO), Debt-Equity Ratio (DTE), and firm size have little impact on the net profit margin (NPM). The coefficients had p-values of 0.149 and 0.283, both of which were greater than the 5% significance threshold. These findings suggest that the financial performance during the pandemic was not significantly influenced by liquidity, efficiency, leverage, and business size. Therefore, the outcome indicates that there is no support for H1b, H2b, H3b, and H4b. In addition, Passenger Demand did not affect or influence the connections between liquidity, efficiency, or leverage and financial performance. This suggests that variations in passenger demand have little effect on the influence of these financial considerations on performance. Thus, there is no support for H5b, H6b, and H7b. Amidst the COVID-19 pandemic, airlines saw significant cash challenges because of a sharp decline in passenger demand, coupled with the burden of substantial fixed expenditures and debt commitments. Although the airline industry experienced a decrease in operational costs as a result of fewer flights, its intricate cash flow system, which involved receiving ticket sales revenue in advance but having continuing expenses such as aircraft leases and maintenance, led to a shortage of available funds. The incapacity to promptly modify these predetermined expenses in reaction to the significant decline in demand worsened financial pressure, prompting some airlines to pursue government bailouts or resort to bankruptcy despite attempts to reduce expenses and adapt to the swiftly evolving circumstances. This indicates that, despite the worldwide economic downturn, the financial performance of the aviation industry in Asia remains unimpacted by fluctuations in passenger volumes or ticket revenue.

5. Conclusion and Recommendations

This research makes significant theoretical advances to the understanding of the financial performance of aviation enterprises in the Asia area. These contributions are made in various important ways. The study confirms earlier research by verifying that the pandemic and broader economic crises have negative effects on the risk profiles and profitability of airline operations. Furthermore, it offers a comprehensive and detailed comprehension of the factors that impact the financial performance of the aviation sector, considering both regular and pandemic circumstances. This gives useful knowledge and perspectives for both academic researchers and professionals in the industry. Moreover, this study provides valuable insights that may be used to shape government policies and regulatory frameworks. This, in turn, helps to improve economic competitiveness and meet market sensitivities. The findings provide a valuable point of reference for comprehending the effects of the epidemic on the financial industry and offer valuable insights into how investors have reacted throughout this time.

It can be concluded that during the COVID-19 pandemic, the link between liquidity and debt for airlines was not affected by passenger demand. This is because the travel industry saw an unprecedented collapse, which had a disproportionate impact on revenue, fixed costs, and debt obligations. In contrast to typical situations when varying passenger demand impacts cash flow and financial stability, the pandemic resulted in significant liquidity pressure and difficulties in managing debt that were not alleviated by changes in passenger demand (Gössling et al., 2020). Airlines encountered persistent high fixed expenses and significant debt, and the unprecedented nature of the crisis rendered traditional financial measures ineffective, so nullifying the customary mitigating impact of passenger demand (IATA, 2020).

The aviation industry plays a vital role in supporting the hotel and tourism industries, trade, and the overall economy. Nevertheless, the present condition of the airline business continues to pose difficulties for investors,

governments, management, suppliers, employees, and aviation firms alike. The COVID-19 epidemic has caused a substantial decrease in consumer confidence in the aircraft industry, which has been worsened by increased concerns about health. This study found that the financial performance of airline firms is influenced by various accounting criteria, including liquidity (current ratio), leverage (debt-to-equity ratio), and firm size. Considering that numerous airlines in Asia operate in emerging economies, managers and strategists should prioritize the preservation of crucial financial ratios to bolster competitiveness on both domestic and international scales. Furthermore, it is recommended that aviation operations resume while strictly following safety measures to protect public health. Furthermore, this report proposes that regulators and governments should act to alleviate the detrimental impacts of the pandemic on the transport and travel sectors. Efficient decision-making is essential for effectively handling economic disruptions induced by such events. Before instituting strict regulations, governments and international health organizations must thoroughly assess all commercial factors. For example, a suggestion to decrease the number of available seats to an average of 62% in comparison to the levels before the pandemic could be impractical (Gole et al., 2021). Although prioritizing passenger health is crucial, excessively stringent procedures may result in airlines becoming unprofitable or being forced to raise ticket prices substantially, which could lead to customer unhappiness and reduced patronage.

Additionally, this study applies Hawley's Risk Theory of Profit and Lancaster's New Theory of Demand to explain the financial outcomes of the aviation industry during the pandemic. Hawley's theory highlights that businesses are compensated for undertaking risks, which was evident as the pandemic magnified risks such as declining passenger demand and mounting debt obligations. Lancaster's theory underscores how reduced demand further exacerbates operational inefficiencies, as reflected in the decline in Net Profit Margin (NPM) from 0.0208 pre-pandemic to -0.0686 during, and the decrease in Total Asset Turnover (TATO) from 0.6525 to 0.3012. Despite these challenges, liquidity remained relatively stable, with the Current Ratio (CR) slightly decreasing from 0.8018 to 0.6684. The study thus emphasizes the need for airlines to adopt resilient financial strategies and robust risk management practices to navigate future disruptions effectively.

Corresponding Author: Mohd Faizol Rizal Mohd Rasid

Abstract: The rising frequency and severity of natural disasters have intensified the need for comprehensive motor insurance, particularly focusing on special perils coverage. This coverage plays a vital role in safeguarding vehicle owners against financial losses resulting from environmental hazards such as floods, landslides, and other catastrophic events. This study investigates the factors that influence vehicle owners' intentions to extend special perils coverage within their motor insurance policies in Klang Valley, Malaysia. A quantitative and descriptive research approach was adopted, employing convenience sampling techniques, with data analyzed using descriptive statistics through the Statistical Package for Social Sciences (SPSS) to extract valuable insights. A structured survey involving 100 vehicle owners examines the impact of knowledge, promotional efforts, and perceived benefits on their decisions to opt for extended special perils coverage. The findings highlight that these three factors - knowledge, promotion, and benefits - significantly influence the decision-making process. The study's insights are valuable for insurance companies, policymakers, and educational institutions in crafting strategies to encourage the wider adoption of special perils coverage. By increasing awareness, enhancing promotional efforts, and communicating the benefits of such coverage, stakeholders can better meet the needs of vehicle owners and boost the uptake of comprehensive motor insurance. This study underscores the importance of a multifaceted approach in promoting insurance products that offer essential protection against escalating environmental risks.

Keywords: *Motor Insurance, Special Perils, Intention, Knowledge, Promotion, Benefits.*

1. Introduction and Background

Motor insurance is a crucial component of the Malaysian insurance industry, largely due to its mandatory status under the Road Transport Act 1987. This legislation requires all vehicles on Malaysian public roads to have insurance coverage, making it essential for vehicle owners. Specifically, Section 90 of the Act mandates that driving without Third Party Bodily Injury and Death (TPBID) coverage is a criminal offense (Road Transport Act, 1987). In Malaysia, the common types of motor insurance policies include:

Act Cover: The minimal legal coverage, offering protection against third-party bodily injury or death (excluding passengers). This policy is rarely provided by insurers.
Third-Party Cover: Covers third-party bodily injury, death, and property damage caused by the insured vehicle.
Third-Party, Fire and Theft Cover: Includes coverage for loss or damage to the insured vehicle due to fire or theft, along with third-party protection.
Comprehensive Cover: Provides the broadest protection, covering third-party liability and loss or damage to the insured vehicle from fire, theft, or accidents.

Motor insurance remains the largest segment of the general insurance market in Malaysia, accounting for 45% of the total market share, followed by fire insurance at 21% (General Insurance Association of Malaysia (GIAM), 2024). The sector has experienced steady growth, with a Compound Annual Growth Rate (CAGR) of 2.6% over the past decade. In 2023, motor premiums increased by 8.5%, driven by an 11% Year-Over-Year (YoY) rise in new vehicle sales, according to the Malaysian Automotive Association (MAA) (The Star, 2024).

Motor insurance plays a vital role in protecting vehicle owners from financial risks associated with accidents, theft, and third-party liabilities. While standard policies cover common risks, they often exclude environmental hazards that can result in substantial financial losses. To address this gap, insurers have introduced specialized add-ons like the "Special Perils" cover, which extends protection to natural and man-made disasters, including floods and other natural calamities.

In 2023, the Department of Statistics Malaysia (DOSM) reported total flood-related losses of RM755.4 million, a decrease from RM1,026.5 million in 2022, representing 0.04% of the nominal Gross Domestic Product (2022: 0.06%) (Department of Statistics Malaysia (DOSM), 2024). Public assets and infrastructure suffered the most, with losses amounting to RM380.7 million (2022: RM636.8 million), followed by living quarters at RM168.3 million (2022: RM157.4 million) and the agricultural sector at RM120.6 million (2022: RM154.5 million). Business premises and vehicle-related losses reached RM53.2 million (2022: RM50.3 million) and RM22.3 million (2022: RM18.8 million) respectively, while the manufacturing sector incurred RM10.3 million in losses (2022: RM8.7 million). These figures highlight the significant financial burden on individuals whose vehicles were damaged in the floods, particularly those without special perils coverage.

Malaysia experiences annual heavy rainfall between November and February, often resulting in severe floods. The December 2021 floods, described by the Malaysian government as a "once in a century" event, affected 11 states and caused the largest insurance payout for a flood event in a decade (Honan Asia, 2022). Despite the frequent and severe nature of these floods, a large portion of Malaysians remain underinsured against flood-related damages. A survey by Zurich Malaysia in 2021 found that 59% of vehicle owners lacked adequate flood protection, either due to unawareness or a belief that they were not at risk. Moreover, only a small percentage of Malaysians are insured against other environmental hazards, such as storms (34%) and landslides (29%) (New Straits Times, 2022).

Floods pose the most significant environmental risk in Malaysia, as demonstrated by the catastrophic 2021 floods. The insurance and takaful industry paid out RM2.2 billion in flood-related claims, while the overall economic losses were estimated at RM6.1 billion. However, only 16 percent of motor comprehensive insurance policies in flood-prone areas included flood coverage (Zurich Malaysia, 2024). These statistics underscore the critical need for better preparedness against unexpected events in Malaysia, where heavy rainfall and intense monsoon seasons are common. Special perils coverage, which also protects against landslides and falling trees, is an essential but often overlooked component of motor insurance.

A report by Faber Consulting AG (2022) highlights that the demand for flood coverage in Malaysia is largely influenced by a limited willingness to pay and a low level of awareness regarding flood risks. While large public institutions and major corporations demonstrate a strong understanding of these risks, smaller entities, such as small and medium-sized enterprises (SMEs) and individual consumers, often underestimate the threat. These smaller entities tend to rely on self-insurance or expect government support in the event of a disaster. This underestimation of risk, coupled with a lack of awareness about the potential financial impact, results in heightened price sensitivity, with many perceiving flood insurance policies as disproportionately expensive relative to the perceived risk. Moreover, this price sensitivity is exacerbated by short-term thinking, as policies are often purchased only in response to a recent disaster.

Retail clients typically obtain flood insurance as part of their mortgage agreements when financing a property. However, due to intense competition in Malaysia's mortgage market, banks frequently offer loans without the added security of flood coverage. Among homeowners who no longer depend on a mortgage, flood insurance remains uncommon and is generally only purchased for lower-level structures. Similarly, flood coverage can be added to motor insurance policies but is usually selected only when the perceived flood risk is high. Many Malaysian consumers believe they can protect their vehicles during floods, leading to low overall penetration of flood insurance. The demand for this coverage is further limited by a lack of awareness and short-term decision-making, with interest often declining shortly after a major flood event.

Therefore, this study aims to (i) assess the influence of knowledge on vehicle owners' intentions to extend special perils coverage in motor insurance, (ii) explore the impact of promotional efforts on their intentions, and (iii) determine how perceived benefits affect their willingness to extend this coverage.

2. Literature Review

Intentions to Extend Special Perils Coverage: Fishbein and Ajzen (1975) first conceptualized purchase intention as a consumer's evaluation of a product or service they plan to buy in the future. Rooted in the Theory of Planned Behavior (TPB), Ajzen and Driver (1991) proposed that an individual's intention to purchase,

including health insurance, is influenced by three fundamental factors: behavioral beliefs, normative beliefs, and control beliefs. This framework has been widely adopted and extended in various contexts. For instance, Crosno et al. (2009) expanded on this concept by defining purchase intention as the likelihood that a consumer will choose a specific brand within a product category under certain purchasing conditions. Chimedtseren and Safari (2016) further supported this view, describing purchase intention as a predictive measure closely linked to actual buying behavior. Moreover, Lin and Chen (2006) emphasized that factors such as product knowledge and consumer involvement have been consistently identified in prior research as significant determinants of purchase intention.

Flooding is a persistent and severe challenge in Malaysia, particularly during the monsoon season, causing substantial damage each year. The Department of Statistics Malaysia's Special Report on the Impact of Floods in 2021 revealed that floods resulted in RM6.1 billion in losses across multiple states between late December 2021 and early January 2022 (GIAM, 2024). Additionally, recent flash floods have caused widespread property damage and financial losses nationwide, with the intensifying monsoon season expected to exacerbate the situation further.

Despite growing awareness of flood coverage, evidenced by the increase in comprehensive motor insurance uptake from 12% to 14% in the first half of 2023, there remains a critical need to improve public understanding of flood risks and the importance of protection. This need is particularly pressing due to the escalating severity of flood risks driven by climate change and shifting topography (GIAM, 2024).

Research by Ridzuan et al. (2023) indicates that the rate of flood insurance purchases in Malaysia remains significantly lower than other types of insurance, particularly motor vehicle insurance. Public awareness about flood insurance is also insufficient. A key factor contributing to the low uptake of flood insurance is the reliance on government assistance for flood relief, which has diminished the perceived necessity of individual coverage.

Knowledge: Before making a purchase, consumers typically seek information and knowledge about the product or service they are considering (Aziz et al., 2019). Product knowledge, as defined by Brucks (1985), involves an awareness of specific product-related details. This knowledge is primarily derived from direct experience with the product and advertising, both of which significantly influence consumer decisions (Rao & Monroe, 1988).

Product knowledge encompasses a consumer's awareness, understanding, and confidence regarding a product (Lin & Chen, 2006). Burton et al. (2009) emphasize the role of product knowledge in shaping consumer behavior, as it enables more informed and rational decision-making. A well-informed consumer can better assess product value and reduce the risks associated with purchasing.

In the context of takaful, knowledge has been identified as a crucial factor in the selection of takaful products (Ahmed et al., 2015). For instance, Matsawali et al. (2012) found a significant lack of awareness about takaful among individuals in Brunei, a finding echoed in other studies where insufficient knowledge was a key reason for not purchasing insurance (Oldenboom & Abratt, 2000). Yazid et al. (2012) observed that a below-average understanding of life insurance negatively impacts consumer intentions to purchase it. Moreover, an individual's purchasing ability is not solely determined by financial resources; when combined with financial literacy, these factors shape attitudes toward life insurance, which in turn influence purchase intentions (Nomi & Sabbir, 2020).

Marimuthu Nadason, President of the Federation of Malaysian Consumers Associations (FOMCA), highlighted that many Malaysians remain unaware of the availability of special perils coverage offered by their insurance providers. This lack of awareness is largely attributed to the failure of insurance companies to adequately inform customers about these options during the purchasing process. Nadason also pointed out that Malaysians often underestimate the growing threat of natural disasters, such as floods, which are increasingly affecting the nation (The Rakyat Post, 2021).

According to the General Insurance Association of Malaysia (GIAM) (2024), while awareness of flood coverage has seen improvement - as reflected in the increase in comprehensive motor insurance uptake from 12% to

14% in the first half of 2023 - there remains a pressing need to further elevate awareness of flood risks and the importance of adequate protection. This need is especially urgent given the escalating severity of flood risks due to climate change and shifting topography. Building on the existing literature, this study proposes the following hypothesis:

H1: Knowledge significantly impacts vehicle owners' intentions to extend special perils coverage in motor insurance.

Promotion: Promotion traditionally includes a range of activities such as sales promotion, advertising, personal selling, public relations, and direct marketing (Borden, 1984). Duncan (2005) further elaborated that promotion is a fundamental aspect of the market exchange process, wherein firms communicate product messages and brand identity to current and potential stakeholders, as well as the broader public, through an integrated set of marketing communication tools.

Research has consistently shown that promotional efforts, including advertising, personal selling, sales promotions, and publicity, play a significant role in shaping consumer perceptions, behaviors, emotions, and experiences toward a product (Munusamy & Wong, 2008). Among seven key marketing activities, promotional activities were identified as the second most influential factor affecting customers' policy purchasing behavior (Dash, 2012).

A study by Abu Seman and Segar (2023) demonstrated the positive impact of search engine marketing and social media marketing on consumer purchasing decisions, suggesting that businesses should prioritize these digital marketing strategies as part of their overall marketing approach. Similarly, research by Mohd Rasid et al. (2023) found that promotional advertisements significantly influence students' food expenditure habits, shaping their choices, perceptions, and budget allocation. Guan et al. (2020) also underscored the importance of life insurance marketers understanding the critical role of customer attitudes in purchasing decisions and advocating for marketing strategies that effectively influence these attitudes.

Moreover, the Federation of Malaysian Consumers Associations (FOMCA) has criticized insurance companies for failing to inform vehicle buyers about natural disaster (flood) coverage before policy purchase. FOMCA has announced plans to formally request that Bank Negara and the government mandate insurance companies to actively promote natural disaster insurance coverage to the public (The Rakyat Post, 2021). Based on these findings, this study proposes the following hypothesis:

H2: Promotion significantly impacts vehicle owners' intentions to extend special perils coverage in motor insurance.

Benefits: Adnan (2014) established a positive and significant relationship between the perceived benefits of a product and the likelihood of its purchase, underscoring that perceived benefits are a crucial determinant of purchase intentions. Yang et al. (2020) further elaborated that perceived benefits represent consumers' beliefs about the advantages or rewards they expect from a transaction. In the context of life insurance, perceived benefits are pivotal in shaping consumers' purchasing intentions (Mamun et al., 2021). When the benefits offered by a product fall short of consumer expectations, there is a strong likelihood that consumers will discontinue using the company's services and seek alternatives that provide greater perceived value (Nursiana, et al., 2021).

In the insurance sector, perceived financial benefits are often viewed as value motivations, encompassing aspects such as financial coverage against medical expenses and critical illnesses, cashless claim benefits, and tax advantages (Kumar, 2011). Yeow et al. (2021) also emphasized the significant influence of perceived financial benefits on purchase intention in previous studies.

Moreover, the concept of a product can be measured in multiple ways, including as a physical object with distinct characteristics or as a comprehensive set of benefits designed to meet customer needs (Indumathi & Dawood, 2016). Product quality has been consistently identified as a key factor influencing the customer decision-making process (Kavitha et al., 2012). Life insurance products, for instance, cater to diverse needs such as investment, education, or retirement planning (Kumar, 2011). The quality of these insurance products remains one of the strongest predictors of customers' purchase decisions (Harnam & Madhurima, 2011).

Based on these findings, this study proposes the following hypothesis:
H3: Benefits significantly impact vehicle owners' intentions to extend special perils coverage in motor insurance.

3. Research Methodology

This study utilized a convenience sampling technique to distribute questionnaires among vehicle owners, aiming to investigate the factors influencing their intentions to extend special perils coverage within their motor insurance policies. Convenience sampling was selected for its practical benefits, including cost-effectiveness, time efficiency, and ease of implementation, making it an appropriate choice for quickly and efficiently accessing respondents (Golzar et al., 2022). This approach enabled the study to gather relevant data in an efficient manner, which is essential for the timely analysis of consumer behavior.

The research methodology involved administering a structured survey to 100 respondents living and working in the Klang Valley region, all of whom use private vehicles for their daily commute. The survey included 20 measurement items designed to evaluate respondents' intentions to expand their special perils coverage. These items also assessed their knowledge, awareness of promotional efforts, and understanding of the benefits of such coverage. The collected data were analyzed using descriptive statistical techniques to identify the key determinants influencing vehicle owners' intentions to extend special peril coverage within their motor insurance policies.

Additionally, the study aimed to explore the relationship between these factors and the likelihood of respondents opting for enhanced insurance coverage, providing valuable insights for insurers looking to tailor their offerings to better meet consumer needs. This analysis is crucial for identifying target groups that are more likely to benefit from or require special perils coverage, thereby assisting insurers in developing more tailored and effective policy offerings.

4. Results

The purpose of this study is to investigate the factors that influence vehicle owners' intentions to extend special perils coverage in motor insurance. By understanding these demographics, the study aims to offer deeper insights into how various factors, such as gender, age, occupation, monthly income, and level of education, might impact the decision to opt for additional special perils coverage in motor insurance.

Profile of Respondents: Table 1 displays a summary of the characteristics of the total sample of the respondents who participated in the study.

Table 1: Demographic Profile

VARIABLE	FREQUENCY	PERCENTAGE
GENDER		
Males	42	42.0%
Females	58	58.0%
Total	**100**	**100%**
AGE		
20-29	65	65.0%
30-39	28	28.0%
40-49	5	5.0%
50 and above	2	2.0%
Total	**100**	**100%**
OCCUPATION		
Public sector	15	15.0%
Private sector	67	67.0%
Self-employed	18	18.0%
Total	**100**	**100%**

MONTHLY INCOME

RM1,000 and below	2	2.0%
RM1,001 - RM2,000	3	3.0%
RM2,001 - RM3,000	51	51.0%
RM3,001 – RM4,000	20	20.0%
RM4,000 and above	24	24.0%
Total	**100**	**100%**

LEVEL OF EDUCATION

Sijil Pelajaran Malaysia (SPM)	3	3.0%
Diploma	38	38.0%
Degree	58	58.0%
Master / PhD	1	1.0%
Total	**100**	**100%**

Table 1 presents the demographic distribution of the 100 respondents who participated in this study. Of these respondents, 58% were female, while 42% were male. In terms of age distribution, the majority of respondents (65%) were within the 20-29 years age range, with 28% falling into the 30-39 years range. A smaller percentage, 5%, were aged between 40-49 years, and just 2% were 50 years or older.

When examining employment sectors, the data reveals that 67% of the respondents were employed in the private sector, 18% were self-employed, and 15% worked in the public sector. Educational attainment among the respondents was also varied, with 58% holding a degree, 38% having a diploma, 3% possessing Sijil Pelajaran Malaysia (SPM) qualifications, and 1% having achieved a Master's or Ph.D. degree. These demographic insights provide a comprehensive overview of the sample, highlighting key characteristics that may influence the respondents' intentions to extend special perils coverage in their motor insurance policies.

Descriptive Statistics: Descriptive analysis was used in this study to provide a clear summary of the data, focusing on the characteristics of respondents and the key factors influencing their intentions to extend special perils coverage in motor insurance. The main aim was to explore and describe trends, frequencies, and patterns in the data, rather than to identify cause-and-effect relationships or make predictions. Descriptive analysis was therefore appropriate, as it helps present the raw data in a meaningful way. This method also highlights the most important variables and insights, which can guide future research and policy decisions. The results of the descriptive statistics for the factors affecting vehicle owners' intention to extend special perils coverage are shown in Tables 2, 3, 4, and 5 below.

Table 2: Mean Score and Standard Deviation for Intentions to Extend Special Perils Coverage

Item	Mean	Std Dev
I understand the importance of special perils for my financial protection.	3.28	0.998
I am likely to purchase special perils coverage when renew my motor insurance policy.	3.84	0.973
My current comprehensive motor insurance policy is more than enough to cover my vehicle	2.83	1.217
I consider discounts or promotions when deciding to purchase special perils coverage.	3.70	0.913
I am willing to spend more to add on special perils coverage for peace of mind.	3.21	0.962

Table 2 presents the overall mean and standard deviation for the five items designed to measure intentions to extend special perils coverage within motor insurance policies, which served as the dependent variable. These items were evaluated on a five-point Likert scale, with responses ranging from 1 (strongly disagree) to 5 (strongly agree). The item with the highest mean score was, "I am likely to purchase special perils coverage when renewing my motor insurance policy" (M = 3.84, SD = 0.973). This indicates a relatively strong intention among respondents to opt for this additional coverage. The second highest mean was associated with the item, "I consider discounts or promotions when deciding to purchase special perils coverage" (M = 3.70, SD = 0.913), reflecting the influence of financial incentives on purchase decisions.

The item, "I understand the importance of special perils for my financial protection," had a mean of 3.28 (SD = 0.998), suggesting moderate awareness of the benefits of such coverage. Similarly, "I am willing to spend more to add on special perils coverage for peace of mind" scored a mean of 3.21 (SD = 0.962), indicating a cautious willingness to invest in additional protection. In contrast, the item with the lowest mean score was, "My current comprehensive motor insurance policy is more than enough to cover my vehicle" (M = 2.83, SD = 1.217), suggesting that respondents generally do not believe their existing policies fully address their insurance needs.

Table 3: Mean Score and Standard Deviation for Knowledge

Item	Mean	Std. Dev.
I believe that the extension of special perils coverage is a wise decision.	3.45	0.716
I do read about special perils coverage provided by different insurance companies to increase my level of understanding.	2.99	0.823
I believe that the intention to purchase special perils coverage is influenced by the knowledge of the vehicle owners.	3.95	0.609
I do think knowledge about the scope of coverage provided impacts my intention to extend special perils coverage.	4.06	0.583
I believe that the extension of special perils coverage to my motor insurance policy is beneficial.	4.16	0.598

Table 3 presents the mean and standard deviation for five items designed to measure the knowledge construct, an independent variable in this study. These items were rated on a five-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree). The item with the highest mean score, "I believe that the extension of special perils coverage to my motor insurance policy is beneficial" (M = 4.16, SD = 0.598), indicates a strong consensus among respondents regarding the perceived value of this coverage. The second highest mean, "I think knowledge about the scope of coverage impacts my intention to extend special perils coverage" (M = 4.06, SD = 0.583), suggests that understanding the details of coverage plays a significant role in influencing purchasing decisions.

The items "I believe that the intention to purchase special perils coverage is influenced by the knowledge of vehicle owners" and "I believe that the extension of special perils coverage is a wise decision" yielded mean scores of 3.95 (SD = 0.609) and 3.45 (SD = 0.716), respectively. These findings highlight the perceived importance of knowledge in making informed decisions about motor insurance. However, the lowest mean score was observed for the item, "I read about special perils coverage provided by different insurance companies to increase my level of understanding" (M = 2.99, SD = 0.823), indicating a relatively low level of active engagement in seeking out information.

Table 4: Mean Score and Standard Deviation for Promotion

Item	Mean	Std Dev
I know which insurance company provides coverage for special perils in motor insurance.	3.07	0.640
I satisfied with the promotion on special perils coverage by the insurance company.	3.44	0.592
The insurance company frequently promotes the special perils that they provide.	3.33	0.652
The insurance company always promotes the benefits of purchasing special peril coverage.	3.36	0.647
I am aware of the advertisements on special perils coverages in motor insurance on television, media social, and billboards.	3.35	0.575

Table 4 presents the mean and standard deviation for five items measuring the promotion construct, an independent variable in this study. These items were assessed using a five-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree). The item with the highest mean score was "I am satisfied with the promotion of special perils coverage by the insurance company" (M = 3.44, SD = 0.592), indicating a moderate level of satisfaction among respondents regarding promotional efforts. The second highest mean was associated with "The insurance company always promotes the benefits of purchasing special perils coverage" (M = 3.36, SD = 0.647), suggesting that respondents recognize consistent promotional efforts by insurers.

Other items, such as "I am aware of advertisements on special perils coverage in motor insurance on television, social media, and billboards" (M = 3.35, SD = 0.575) and "The insurance company frequently promotes the special perils they provide" (M = 3.33, SD = 0.652), also received moderate mean scores, indicating a fair level of awareness and perceived frequency of promotional activities. However, the lowest mean score was observed for the item "I know which insurance company provides coverage for special perils in motor insurance" (M = 3.07, SD = 0.640), suggesting that respondents may not be fully informed about specific insurers offering this coverage.

Table 5: Mean Score and Standard Deviation for Benefits

Item	Mean	Std. Dev.
I don't need to spend more to repair my vehicle if damaged by flood when I added on special perils coverage.	3.87	0.597
I believe that the intention to purchase the special perils coverage is influenced by the benefits provided by the insurance company.	2.89	0.549
The insurance company should provide wider protection when the insured purchases special perils coverage.	3.67	0.842
Purchasing special perils coverage allows me to save more money by transferring the financial risk of unexpected natural disasters to the insurance company.	3.89	0.718
I will not suffer huge financial loss if I have taken up additional insurance coverage, particularly on special perils.	3.70	0.611

Table 5 presents the mean and standard deviation for five items measuring the perceived benefits of special perils coverage, an independent variable in this study. These items were rated on a five-point Likert scale, ranging from 1 (strongly disagree) to 5 (strongly agree). The item with the highest mean score was "Purchasing special perils coverage allows me to save more money by transferring the financial risk of unexpected natural disasters to the insurance company" (M = 3.89, SD = 0.718). This suggests that respondents strongly value the financial protection offered by special perils coverage. The second highest mean, also at 3.89 (SD = 0.549), was for the statement, "I believe that the intention to purchase special perils coverage is influenced by the benefits provided by the insurance company," indicating that the perceived benefits play a crucial role in motivating purchase intentions.

Other items with relatively high mean scores include "I don't need to spend more to repair my vehicle if damaged by flood when I add on special perils coverage" (M = 3.87, SD = 0.597) and "I will not suffer huge financial loss if I have taken up additional insurance coverage, particularly for special perils" (M = 3.70, SD = 0.611). These responses highlight the importance of financial security as a key benefit of purchasing special perils coverage. The item with the lowest mean score was "The insurance company should provide wider protection when insured purchase special perils coverage" (M = 3.67, SD = 0.842), suggesting that while respondents recognize the value of the coverage, there is a desire for even broader protection.

5. Discussion and Recommendations

H1: Knowledge significantly impacts vehicle owners' intentions to extend special perils coverage in motor insurance.

The mean scores for the items related to knowledge, ranging from 2.99 to 4.16, along with standard deviations between 0.583 and 0.823, indicate a broad spectrum of understanding and agreement among respondents regarding special perils coverage in motor insurance. The variability in responses suggests that while a significant portion of respondents recognize the importance and benefits of this coverage, there is also a segment of the population that is less informed or less convinced about its value.

The findings reveal that knowledge plays a crucial role in shaping consumer behavior regarding the extension of special perils coverage in motor insurance policies. The high end of the mean score spectrum (4.16) suggests that a substantial number of respondents are well aware of the benefits of transferring financial risks associated with natural disasters to the insurance company. This indicates a strong awareness of the protective

role that special perils coverage can play in safeguarding their financial interests.

However, the lower mean scores, particularly around 2.99, highlight that there is still a significant portion of the population that either lacks sufficient knowledge or does not fully appreciate the value of such coverage. This gap in understanding can be attributed to several factors, including insufficient information dissemination, a lack of targeted educational initiatives by insurance companies, or a general complacency among vehicle owners who may underestimate the risks posed by natural disasters.

The variation in standard deviation values further supports this observation, indicating that while some respondents have a clear and strong understanding of the benefits, others remain uncertain or inconsistent in their views. This inconsistency suggests that promotional efforts and educational campaigns by insurance companies may not be reaching all segments of the market equally, or that they may not be sufficiently persuasive in communicating the importance of special perils coverage.

The findings of this study align with previous research on the impact of knowledge on purchase intentions. Akotey et al. (2011) demonstrated that knowledge is a key factor in driving demand for microinsurance in Ghana. Similarly, Nomi and Sabbir (2020) found that financial literacy has a significant positive effect on consumers' intentions to purchase life insurance in Bangladesh. Lajuni et al. (2020) further emphasized that both consumer knowledge and attitudes significantly influence the intention to purchase life insurance products. Collectively, these studies underscore the essential role of knowledge in shaping insurance-related purchasing behavior.

For insurance companies, these findings present a significant opportunity to enhance consumer education and targeted marketing strategies. The relatively low mean scores for satisfaction with existing comprehensive policies and the variability in knowledge suggest that many consumers may not fully realize the limitations of their current coverage and the additional protection that special perils coverage can provide.

Insurers could capitalize on this by developing more comprehensive and targeted promotional campaigns that not only highlight the financial benefits of special perils coverage but also address common misconceptions or gaps in knowledge. For example, personalized marketing that illustrates real-world scenarios where special perils coverage could save policyholders from a substantial financial loss might resonate more effectively with consumers who are currently undecided or unaware of its importance.

Moreover, insurance companies could benefit from offering incentives such as discounts or bundled packages that make the extension of special perils coverage more attractive. By aligning these promotional efforts with educational content that clarifies the risks of not having such coverage, insurers could increase both the uptake of special perils policies and overall customer satisfaction.

H2: Promotion significantly impacts vehicle owners' intentions to extend special perils coverage in motor insurance.

The mean scores for the items related to promotion, ranging from 3.07 to 3.36, with standard deviation values between 0.592 and 0.652, suggest a general but moderate level of satisfaction among respondents with the promotional efforts of insurance companies regarding special perils coverage. While these scores indicate that respondents are aware of the promotional activities, the moderate range of satisfaction also highlights that there is significant room for improvement in how these promotions are perceived and their overall effectiveness.

The findings of this study are consistent with those of Al-Rawashdeh (2016), who identified promotion and advertising as significant drivers of insurance policy demand. Similarly, Guan et al. (2020) found that elements of the marketing mix, including product, price, place, and promotion, influence customer attitudes and ultimately their purchase intentions for insurance products. In addition, Cuong (2021) revealed that promotion plays a positive role in both purchasing decisions and repurchase intentions.

The relatively modest mean scores reflect a level of consumer awareness and satisfaction that is neither

strongly positive nor negative. This suggests that while respondents are not entirely dissatisfied with the promotional efforts, they are also not fully convinced or sufficiently motivated by them. The consistency in advertising efforts is acknowledged, as indicated by the standard deviation values, but these efforts may not be as impactful as they could be.

One potential reason for this moderate level of satisfaction could be that the promotional messages currently in use may not be sufficiently compelling or may lack the clarity needed to fully convey the benefits of special perils coverage. Furthermore, the findings indicate a gap in consumer awareness regarding which specific insurance companies offer this coverage. This gap suggests that the current promotional strategies may be too generic or too focused on the benefits of the coverage itself, without adequately highlighting the providers.

For insurance companies, these findings underscore the need to refine their promotional tactics. To increase consumer satisfaction and awareness, insurers might consider focusing on clearer, more targeted messaging that not only emphasizes the advantages of special perils coverage but also specifically identifies the companies that provide it. This approach would help to differentiate insurers in a competitive market and make it easier for consumers to make informed decisions.

Additionally, insurers could benefit from adopting a more segmented promotional strategy, where messages are tailored to different consumer groups based on their specific needs and levels of awareness. For example, more detailed information about coverage options could be provided to less informed consumers, while more value-driven messaging could be targeted at those who are already somewhat aware of the coverage but need an extra incentive to purchase.

Enhancing the visibility and clarity of promotions through various channels—such as digital media, social platforms, and direct marketing—can help ensure that the message reaches a broader audience. Furthermore, interactive and educational campaigns that engage consumers and provide them with the tools to compare and choose the best coverage could significantly increase their confidence in purchasing decisions.

H3: Benefits significantly impact vehicle owners' intentions to extend special perils coverage in motor insurance.

The mean scores for the items related to the perceived benefits of special perils coverage, which range from 3.67 to 3.89, with standard deviation values between 0.549 and 0.842, highlight a strong consumer recognition of the financial advantages associated with this type of insurance. These high mean scores suggest that respondents place considerable value on the ability of special perils coverage to mitigate financial risks, particularly those arising from natural disasters that could otherwise lead to significant out-of-pocket expenses for vehicle repairs.

The data underscores that consumers recognize the intrinsic value of special perils coverage, especially in terms of financial protection. The higher end of the mean score range (3.89) indicates a strong appreciation for the role of this coverage in transferring the burden of financial risk to the insurance company. This suggests that consumers are highly motivated by the peace of mind that comes with knowing they are protected from unforeseen financial liabilities, which is a critical factor in their decision to purchase this coverage.

The relatively narrow range of standard deviation values also suggests a consensus among respondents about the perceived benefits, indicating that these positive perceptions are widespread and not limited to specific subgroups. This broad agreement reinforces the idea that financial security is a universal concern among vehicle owners, making special perils coverage an attractive option across different demographics.

However, the slightly lower mean score of 3.67, associated with the desire for broader protection, points to an area where consumer expectations are not fully met. While respondents appreciate the current benefits, this finding reveals a demand for even more comprehensive coverage. Consumers seem to believe that while special perils coverage provides valuable protection, there could be additional features or broader coverage options that would further enhance its value. The findings of this study are consistent with Dzulkipli et al. (2017), who identified attitude and perceived benefits as the primary factors influencing the intention to purchase medical

and health insurance, with the highest mean score values. Similarly, Yeow et al. (2021) revealed that perceived financial benefits significantly impact the intention to purchase health insurance.

For insurance companies, these findings present both a confirmation of the value proposition of special perils coverage and an opportunity for product innovation. The high mean scores related to financial security and risk mitigation should encourage insurers to continue emphasizing these aspects in their marketing and communication strategies. However, the identified gap in perceived coverage breadth suggests that insurers could differentiate themselves by offering expanded or customizable coverage options that address the specific needs and concerns of their customers.

For instance, insurers might consider developing new policy features that extend protection beyond the standard offerings, such as coverage for a wider range of natural disasters or additional services like emergency assistance. These enhancements could be promoted as part of a premium package, catering to consumers who are willing to pay more for greater peace of mind.

Additionally, targeted marketing campaigns that highlight these expanded options could appeal to consumers who are already inclined to purchase special perils coverage but are seeking more comprehensive protection. By addressing the unmet needs revealed by the lower mean score, insurers can not only meet but exceed customer expectations, potentially leading to higher satisfaction rates and a stronger competitive edge in the market.

Conclusion
The findings of this study underscore the urgent need for a more sophisticated and strategic approach to consumer education and marketing within the motor insurance industry. By identifying and addressing gaps in consumer knowledge and effectively communicating the tangible benefits of special perils coverage, insurers have the potential to significantly enhance consumer understanding. This, in turn, can reduce variability in risk perception and drive higher adoption rates of these crucial policies.

As climate-related risks become increasingly frequent and severe, insurance companies are presented with a unique opportunity to strengthen their market position by refining their promotional strategies. Implementing targeted, informative, and differentiated marketing efforts can not only elevate consumer satisfaction but also build stronger customer loyalty and trust. By expanding the scope of protection and tailoring coverage to meet the evolving needs of their customers, insurers can increase the perceived value of their offerings and position themselves as industry leaders in innovation and customer care.

Ultimately, the successful execution of these strategies could contribute to a more resilient and adaptive motor insurance market, one that is better equipped to tackle the challenges posed by climate change and shifting topographical risks. This proactive approach would not only benefit consumers by providing them with more comprehensive protection but also ensure long-term growth and sustainability for insurers that are willing to take the lead in this critical area.

Abstract: This study investigates the relationships between urbanization, economic growth, energy consumption, transportation, and carbon emissions in seven ASEAN countries from 2011 to 2022. As released by the World Health Organization (WHO), more than 80 percent of the world's population living in urban areas were exposed to air quality levels that were above the WHO limits. The region that is most affected comes from those nations categorized as low to middle-income countries. Hence, it is best to examine why these 7 ASEAN nations categorized from the lower to upper-middle income countries are not able to control the increase in the level of their carbon emissions. The analysis would also identify the appropriate empirical model suitable for the data. Using panel data analysis applying econometric modeling which are the Pooled Ordinary Least Square, Fixed Effects Model, and Random Effects Model, the findings support the Environmental Kuznets Curve hypothesis, revealing that urbanization and economic growth significantly increase carbon emissions. The study emphasizes the need for renewable energy adoption and sustainable urban planning to reduce carbon footprints. Key recommendations include enhancing energy efficiency and promoting cleaner transportation technologies to achieve sustainable economic growth in the ASEAN region.

Keywords: *Carbon Emissions, Urbanization, Economic Growth, Energy Consumption, Transportation, 7-ASEAN, Environmental Kuznets Curve, Panel Data Analysis*

1. Introduction and Background

As countries grow economically, carbon consumption and emissions increase, leading to significant environmental consequences. The Environmental Kuznets Curve (EKC) hypothesis suggests that emissions rise until economic growth reaches a turning point, after which they decline (Salari, 2020; Munir, 2020). Large populations and industrial activities drive this trend through increased energy and transportation demands. Technological advancements and sustainable energy sources are essential for achieving economic growth while limiting emissions, benefiting the Human Development Index (HDI) through cleaner energy consumption (Yumashev et al, 2020). Urbanization in ASEAN countries fuels economic development but also raises carbon emissions due to higher energy consumption and transportation needs. By 2020, ASEAN's urban population reached 310 million, with significant growth expected (ASEAN Secretariat, 2021). Sustainable urban planning and green technologies are crucial to mitigate these impacts (Ritchie & Roser, 2020). Economic growth, measured by GDP, correlates with increased energy use and carbon emissions. ASEAN's GDP grew by 5.5% in 2022 post-pandemic (World Bank, 2023).

The region's energy demand is projected to double by 2040, with fossil fuels still dominating (International Energy Agency, 2023). Transitioning to renewable energy is vital for reducing emissions, with the ASEAN Plan of Action for Energy Cooperation aiming for 23% renewables by 2025 (ASEAN Centre for Energy, 2022). The transportation sector significantly contributes to carbon emissions due to increased vehicle usage and inadequate public transportation infrastructure. Sustainable solutions like electric vehicles and improved public transportation are necessary to mitigate this impact (ASEAN Automotive Federation, 2023). The ASEAN region's rapid economic growth has led to increased energy consumption and carbon emissions, exacerbated by population growth. This trend poses significant environmental and health challenges and impacts the transportation sector, which is crucial for socio-economic development (Li et al., 2022). Despite global efforts to reduce carbon emissions, the complex relationship between emissions, transportation efficiency, and human welfare remains underexplored, hindering effective policy formulation. The need to balance economic growth with environmental sustainability and improve transportation infrastructure is critical for achieving sustainable development goals in the region.

2. Literature Review

Understanding the interactions between economic growth, carbon emissions, energy consumption, and human development is key to sustainable development. The Environmental Kuznets Curve (EKC) hypothesis suggests that environmental degradation initially rises with economic growth but declines after reaching a certain income level. However, the income level at which this decline occurs is debated (Dinda, 2004). Around twenty factors, including energy types, trade, investment, urbanization, technology, human capital, literacy, democracy, corruption, financial development, income inequality, tourism, and natural resources, influence CO2 emissions (Adamu et al, 2020) Adopting a multidimensional approach that considers social, economic, and environmental factors is essential for sustainable development and reducing carbon emissions. Hence, urbanization, economic growth, energy consumption, and transportation should be categorized as independent variables. While carbon emission is the dependent variable.

Urbanization and Carbon Emissions: Numerous studies have explored the correlation between urbanization and carbon emissions. Urban areas tend to have higher emissions per capita due to increased energy use and industrial activity (Kennedy et al., 2010). Rapidly urbanizing regions often face challenges with environmental regulations (Seto et al., 2012). Sustainable urban development policies, such as promoting public transportation and energy efficiency, are crucial (Wang, 2021; Alshehhi, 2021). Therefore, this leads to the first hypothesis (H1) of this study that is:
H1: There is a relationship between urbanization and carbon emissions

Energy Consumption and Carbon Emissions: Higher energy consumption, particularly from fossil fuels, is directly associated with increased CO2 emissions (Ang, 2007) Renewable energy adoption and energy efficiency improvements are necessary to mitigate emissions (Liu et al., 2020). The relationship between human development and carbon emissions varies, with higher development often leading to increased emissions (Shahbaz et al, 2012; Sinha and Shahbaz, 2019). Hence, a hypothesis is formed as H2 below:
H2: There is a relationship between energy consumption and carbon emissions.

Economic Growth and Carbon Emissions: Economic growth often leads to higher carbon emissions, although this relationship can be complex. The Environmental Kuznets Curve (EKC) hypothesis suggests that emissions rise with economic growth up to a point, then decline (Dinda, 2004). However, this varies with economic development levels. Policies promoting sustainable growth and energy efficiency are vital (Stern, 2006). Hypothesis H3 therefore recognizes the role of the reward system towards employee productivity.
H3: There is a relationship between economic growth and carbon emissions

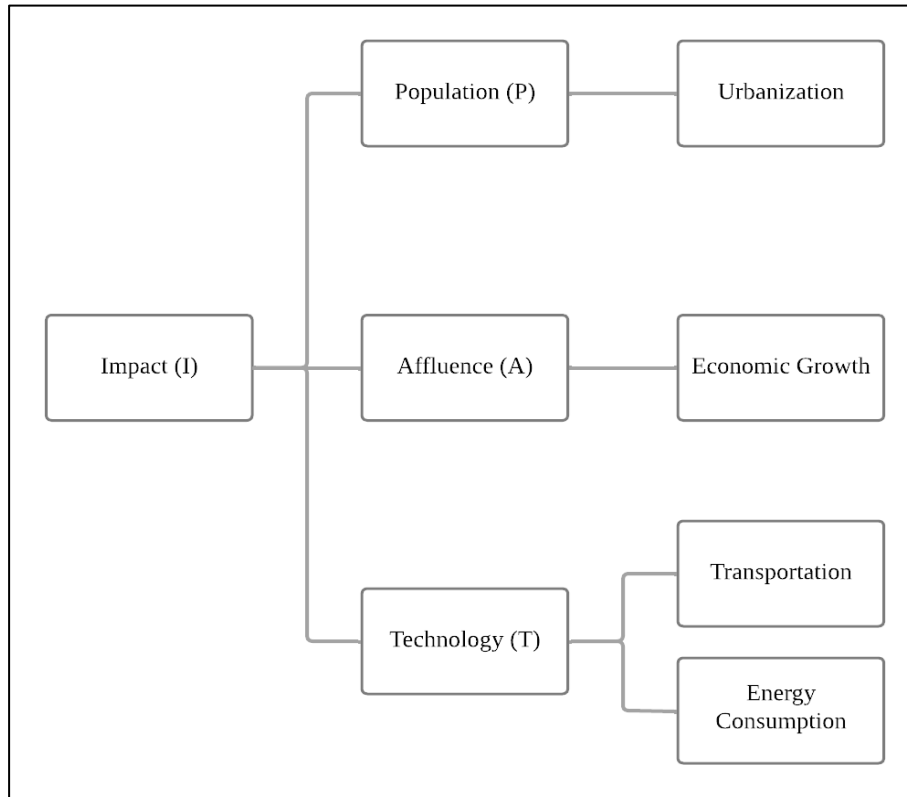
Transportation and Carbon Emissions: Transportation significantly contributes to carbon emissions. Promoting public transportation, adopting electric vehicles, and improving urban planning can reduce these emissions (Wang et al., 2023). Regulatory standards and innovative technologies are essential for achieving significant emission reductions in the transportation sector (Davis et al., 2018). Thus, the following hypothesis is formed.
H4: There is a relationship between transportation and carbon emissions

3. Research Methodology

The Environmental Kuznets Curve (EKC) hypothesis is a prominent theory that explores the relationship between economic growth and environmental degradation, including carbon emissions. According to this hypothesis, initially, as economies develop and income levels rise, environmental degradation increases. However, beyond a certain income threshold, environmental degradation starts to decline over time. In this research, a model of IPAT is being used to determine the environmental impact of the study variables. The IPAT model, also known as the I = PAT model, is a theoretical framework used to understand the environment.

Impact of human activities. It represents how human activities contribute to environmental degradation and resource depletion (Ehrlich and Holdren, 1971). The model breaks down environmental impact (I) into three components which are Population (P), Affluence (A), and Technology (T). The IPAT model provides a simple framework to understand how these three factors interact and contribute to environmental impact. It is often

used in discussions about sustainability and environmental policy to identify strategies for reducing human impact on the environment. The model highlights the need for sustainable development and the importance of addressing population growth, consumption patterns, and technological choices to achieve environmental sustainability (Ehrlich and Holdren, 1971).

Figure 1: The Research Framework


Econometric Modelling
Based on the previous literature review and theory, the dependent variable and independent variables were expected to relate to each other. The regression model into a double log-linear model can standardize the gap values between the variables since the variables have differences in the unit of measurement The equation below shows the relationship between the variable chosen:

$$LCO2_{it} = \beta_0 + \beta_1 LU_{it} + \beta_2 LGDP_{it} + \beta_3 LEG_{it} + \beta_4 LSMV_{it} + \varepsilon_{it} \qquad (1)$$

However, in the context of panel data, two types of variability are recognized between cross-sectional units and within time series units. Between variance refers to the observed inter-unit or cross-sectional variation, while internal variance measures the extent to which the total variance is attributable to variation within economic units. These variations can be detected using random-effects and fixed-effects models. Essentially, both econometric models take into account heterogeneity and individuality between nations and can have their intercept values while constraining the slope to be homogeneous. To accommodate such heterogeneity, the error term ε_{it} is decomposed into two independent components:

$$\varepsilon_{it} = \lambda_i + \mu_{it} \qquad (2)$$

λ_i is termed as an individual-specific effect meaning each nation may have a unique characteristic such as in this case a high-income and lower-income country or even a type of urbanization definition as well as an education system. For μit is a normal error term denoting the remainder disturbance. Hence, the equation if the random effect model is chosen would be:

$$LCO2_{it} = \beta_0 + \beta_1 LU_{it} + \beta_2 LGDP_{it} + \beta_3 LEG_{it} + \beta_4 LSMV_{it} + \lambda_i + \mu_{it} \qquad (3)$$

On the other hand, the fixed effect model assumes each specific effect to have intercepts that may vary across countries. Hence, the equation if the fixed effect model is chosen would be:

$$LCO2_{it} = (\beta_0 + \lambda_i) + \beta_1 LU_{it} + \beta_2 LGDP_{it} + \beta_3 LEG_{it} + \beta_4 LSMV_{it} + \mu_{it} \qquad (4)$$

To identify the coefficient of the independent variables toward the dependent variables, the hypothesis for the overall research will be as below:

H_0: The coefficient of the independent variable is equal to zero (no impact on the dependent variable).
H_1: The coefficient of the independent variable is not equal to zero (has a significant impact on the dependent variable).

Data and Variables

Table 1: Data and Variables

Variable	Key Title	Definition	Measurement	Source
CO2 emissions (CO2)	Dependent Variable	Annual total emissions of carbon dioxide (CO_2), excluding land-use change.	CO2 in tonnes	Our World Data
Urbanization (U)	Independent Variable	Urban population refers to people living in urban areas as defined by national statistical offices.	Total urban population in person	World Bank
Economics Growth (GDP)	Independent Variable	GDP per capita is gross domestic product divided by midyear population.	GDP per capita (current US$)	World Bank
Energy Consumption (EG)	Independent Variable	Annual average electricity generation per person.	Electricity generation per capita in kilowatt-hours	Our World Data
Transportation (SMV)	Independent Variable	Total sales of motor vehicles that include passenger vehicles and commercial vehicles	Total sales of motor vehicles in unit	ASEAN Automotive Federation

4. Results

The study has 84 observations throughout the year from 2011 to 2022 for 7 selected ASEAN member nations i.e. Malaysia, Indonesia, Brunei, Thailand, Philippines, Singapore, and Vietnam. The results are acceptable as per discussion since the data are collected from reliable sources. An array of appropriate econometric and statistical analyses is utilized to ensure a consistent empirical analysis is conducted.

Descriptive Statistics

Table 2 shows the descriptive statistics analyzed for both independent and dependent variables. The data spanning from 2011 to 2022, provides a comprehensive view of several key development indicators across multiple nations, focusing on CO_2 emissions (CO_{2it}), total urban population (U_{it}), GDP per capita (GDP_{it}), energy generated per capita (EC_{it}), and the total of transportation (SMV_{it}).

Table 2: Descriptive Analysis

	$CO2_{it}$	U_{it}	GDP_{it}	EG_{it}	SMV_{it}
Mean	2.16E+08	41281426	17906.63	4437.09	452540.2
Median	2.14E+08	31298700	6238.962	2505.737	337459
Maximum	7.29E+08	1.60E+08	88428.7	12994.19	1436335
Minimum	6933290	302374	1953.557	717.786	10949
Std. Dev.	1.79E+08	44823393	21990.09	3783.214	400576.6
Skewness	0.897275	1.551394	1.450337	0.749014	0.601559
Kurtosis	3.177309	4.275652	3.887038	2.094519	2.154353
Jarque-Bera	11.38146	39.39106	32.20262	10.72394	7.569135
Probability	0.003377	0	0	0.004692	0.022719
Sum	1.82E+10	3.47E+09	1.50E+06	3.73E+05	38013374
Sum Sq. Dev.	2.67E+18	1.67E+17	4.01E+10	1.19E+09	1.33E+13
Observations	84	84	84	84	84

As seen in Table 2, the dataset provides key statistical insights into CO_2 emissions, urbanization, GDP, and transportation. The mean values, such as 2.16E+08 for CO_2 emissions ($CO2_{it}$), 41,281,426 for urbanization (U_{it}), and 17,906.63 for GDP (GDP_{it}), offer a broad understanding of average levels over the period. Median values, including 2.14E+08 for $CO2_{it}$ and 6,238.962 for GDP_{it}, highlight central data points less affected by extremes. The range of data indicates significant variability, with GDP_{it} ranging from 1,953.557 to 88,428.70 and transportation (SMV_{it}) from 10,949.00 to 1,436,335. Standard deviations further reflect this variability, showing considerable dispersion around the mean. Positive skewness in GDP_{it} (1.45) and U_{it} (1.55) suggests distributions with longer right tails, while kurtosis values, such as 4.28 for urbanization, imply more frequent extreme values. The Jarque-Bera test results indicate a non-normal distribution for most variables, necessitating non-parametric methods for further analysis. With 84 observations for each variable, this descriptive statistical analysis establishes a foundation for deeper inferential studies, highlighting key trends and disparities within the dataset.

Correlation Analysis
Table 3 summarizes the results of the correlation analysis. It provides the correlation for each variable. The dataset reveals significant correlations between key variables and CO2 emissions.

Table 3: Correlation Matrix Analysis

Variable	$CO2_{it}$	U_{it}	GDP_{it}	EG_{it}	SMV_{it}
$CO2_{it}$	1				
Uit	0.887747 (0.0000)*	1			
$GDPit$	-0.585018 (0.0000)*	-0.5183 (0.0000)*	1		
$EGit$	-0.655323 (0.0000)*	-0.660176 (0.0000)*	0.827549 (0.0000)*	1	
$SMVit$	0.81097 (0.0000)*	0.670821 (0.0000)*	-0.556818 (0.0000)*	-0.590147 (0.0000)*	1

*p-value is significant at the 0.05 level (2-tailed).

There is a strong positive correlation between CO_2 emissions and urbanization (0.887747), indicating that as the urban population grows, emissions increase significantly, supported by a t-statistic of 17.46322 and a p-value of 0.0000. This aligns with studies like Sun et al. (2022), which link urbanization to higher emissions due

to increased energy use and transportation demands. Conversely, GDP per capita has a negative correlation with CO2 emissions (-0.585018), with a t-statistic of -6.531981 and p-value of 0.0000, supporting the Environmental Kuznets Curve hypothesis that economic growth initially increases emissions but later decreases them due to better energy efficiency and technology (Wang & Su, 2019).

Energy consumption per capita also shows a strong negative correlation with CO2 emissions (-0.655323), with a t-statistic of -7.856248 and p-value of 0.0000, suggesting that higher energy efficiency and cleaner energy sources reduce emissions (Sun & Huang, 2020). Additionally, motor vehicle sales have a significant positive correlation with CO2 emissions (0.810970), with a t-statistic of 12.55136 and p-value of 0.0000, linking increased vehicle usage to higher emissions (Sun et al., 2022). Overall, the analysis highlights the impact of urbanization and transportation on emissions, while GDP per capita and energy consumption per capita have more complex influences moderated by economic and technological factors.

Normality Analysis
Table 4: Summary of Normality Analysis
The standardized residuals have a mean of -2.63e-08, close to zero, indicating they are centered around the mean. The standard deviation of 62987683 indicates its variability whereas the skewness of 0.484187 suggests a slight positive skewed. The value of kurtosis which is 3.272383 is close to normal and more importantly the insignificant of the Jarque-Bera test indicates that the residuals are normally distributed. Consequently, this supports the validity and reliability of the regression model.

Panel Data Analysis
Table 5 presents the Panel Data Analysis between the Pooled OLS model, Fixed Effect Model, and Random Effect Model.

Table 5: Results of Panel Data Analysis: Pooled, Fixed and Random Effects Models

Model	Pooled	Fixed	Random
C	39923392 (0.0691)**	-164E+08 (0.0000)*	-126E+08 (0.0104)*
LU_{it}	2.514561 (0. 0000)*	6.949834 (0.0000)*	5.830096 (0.0000)*
$LGDP_{it}$	-909.1336 (-0.126)	272.3406 (-0.6525)	275.5442 (-0.6321)
LEG_{it}	3280.68 (-0.3916)	12602.4 (0.0218)*	15425.27 (0.0013)*
$LSMV_{it}$	164.5868 (0.0000)*	71.99216 (0.0040)*	62.29263 (0.0085)*
R-squared	0.876486	0.981293	0.647258

 *p-value is significant at 0.05 level

The Pooled OLS regression results show a significant positive relationship between urban population (LU_{it}) and CO_2 emissions (LCO_{2it}), with a coefficient of 2.514561, t-statistic of 10.45439, and p-value of 0.0000. GDP per capita ($LGDP_{it}$) has an insignificant negative effect on emissions (coefficient: -909.1336, p-value: 0.1260). Energy generation per capita (LEG_{it}) also shows an insignificant positive relationship with emissions (coefficient: 3280.680, p-value: 0.3916). Motor vehicle sales ($LSMV_{it}$) significantly increase emissions (coefficient: 164.5868, p-value: 0.0000). The model's R-squared is 0.876486, explaining 87.65% of emissions variability. These results emphasize the impact of urban growth and transportation on emissions, suggesting the need for targeted policies.

In the Random Effect Model, the analysis reveals that urban population (LU_{it}) significantly increases CO2 emissions ($LCO2_{it}$) with a coefficient of 5.830096, a t-statistic of 11.96177, and a p-value of 0.0000. Energy generation per capita (LEG_{it}) also shows a significant positive relationship with emissions, with a coefficient of 15425.27, and a p-value of 0.0013. Transportation ($LSMV_{it}$) contributes to higher emissions, indicated by a coefficient of 62.29263, and p-value of 0.0085. GDP per capita ($LGDP_{it}$) has a positive but statistically insignificant effect on emissions (coefficient: 275.5442, p-value: 0.6321), reflecting mixed results in the literature. The model's overall fit is robust, with an R-squared value of 0.647258 and an adjusted R-squared of 0.629398, explaining 64.73% of emissions variability. These results highlight the significant impact of urban growth and transportation on emissions, with more complex roles for GDP per capita and energy consumption.

The Fixed Effect results indicate that the urban population (LU_{it}) significantly increases carbon emissions ($LCO2_{it}$), with a coefficient of 6.949834, t-statistic of 10.95493, and p-value of 0.0000, suggesting higher emissions with urban growth (Wang et al., 2021). Energy generation per capita (LEG_{it}) also significantly impacts emissions, with a coefficient of 12602.40, t-statistic of 2.343718, and p-value of 0.0218,

highlighting the role of energy consumption (Sun et al., 2022). Transportation ($LSMV_{it}$) has a positive impact on emissions, with a coefficient of 71.99216, a t-statistic of 2.975761, and a p-value of 0.0040, indicating higher vehicle usage increases emissions (Tang et al., 2021). GDP per capita ($LGDP_{it}$) shows a positive but statistically insignificant effect on emissions, with a coefficient of 272.3406, t-statistic of 0.452104, and p-value of 0.6525, reflecting mixed findings in the literature (Wang & Su, 2019). The model is robust, with an R-squared value of 0.981293, explaining 98.13% of emissions variability, confirming the significance of urban population, energy consumption, and vehicle sales as primary drivers of carbon emissions.

In analyzing the three-panel data models-Pooled OLS, Fixed Effects, and Random Effects-the Fixed Effects model is the most suitable for representing the relationship between the variables and annual CO2 emissions. It has the highest R-squared value (0.9813), explaining 98.13% of the variance in CO2 emissions, compared to the Pooled OLS (0.8765) and Random Effects (0.6473) models. The Fixed Effects model's significant F-statistic indicates a good fit, with significant coefficients for urban population, energy per capita, and vehicle sales, showing these variables strongly influence CO_2 emissions. The Fixed Effects model accounts for unobserved heterogeneity with individual-specific intercepts, reducing omitted variable bias.

The Hausman test conducted further supports this model over the Random Effects model due to a lower probability value, indicating a correlation between regressors and the error term. Supporting literature that has similar results Ouyang et al. (2020) also demonstrated the effectiveness of the Fixed Effects model in environmental analyses. Therefore, the Fixed Effects model would be the best choice for analyzing the determinants of CO_2 emissions using the data.

Hausman Test

Table 6: Hausman Test

Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	12.156931	4	0.0162*

*p-value is significant at 0.05 level

The Hausman test for cross-section random effects in the panel data analysis produced a Chi-square statistic of

12.156931 with a p-value of 0.0162. Since the p-value is less than 0.05, the null hypothesis that the preferred model is the random effects model is rejected. This result indicates that there are significant differences between the fixed and random effects estimates, suggesting that the fixed effects model is more appropriate for your data. Hence the equation can be shown as:

$$LCO2_{it} = \text{-1.64E+08} + 6.949834 LU_{it} + 272.3406 LGDP_{it} + 12602.4 LEG_{it} + 71.99216 LSMV_{it} + \mu_{it}$$

Discussion
The analysis of the descriptive statistics, correlation matrix, panel data models, and the Hausman test offers valuable insights into the determinants of CO2 emissions across the selected ASEAN countries from 2011 to 2022. The descriptive statistics reveal substantial variability in the dataset, with skewed distributions and non-normality, necessitating careful selection of modeling approaches. The correlation matrix indicates strong relationships between CO2 emissions and key variables such as urbanization, GDP per capita, energy generation, and transportation, with urbanization and transportation showing the most significant positive correlations.

The panel data analysis demonstrates that among the three models-Pooled OLS, Fixed Effects, and Random Effects-the Fixed Effects model is the most robust and appropriate for this dataset. The Fixed Effects model captures 98.13% of the variance in CO2 emissions, making it the best fit, particularly due to its ability to account for unobserved heterogeneity across countries. The significant coefficients for urbanization, energy generation per capita, and transportation suggest that these factors are primary drivers of CO2 emissions, highlighting the need for policy interventions in these areas.

The Hausman test further confirms the superiority of the Fixed Effects model, rejecting the Random Effects model and validating the fixed effects approach in dealing with individual-specific characteristics. This finding aligns with existing literature, which often favors the Fixed Effects model in environmental studies due to its precision in capturing country-specific effects. Therefore, the results underscore the critical impact of urbanization, energy consumption, and transportation on CO2 emissions in the ASEAN region, emphasizing the importance of targeted policies to mitigate environmental impacts.

5. Conclusion and Recommendations

Based on the analyses conducted, the findings revealed that urbanization significantly increases carbon emissions due to higher energy demand and transportation needs. Economic growth initially raises emissions, but advanced economies can reduce emissions through cleaner technologies and improved energy efficiency. Energy consumption, especially from fossil fuels, is a major driver of emissions, highlighting the need for a shift to renewable energy (Thu Huong & Xuan, 2022). The transportation sector also contributes significantly to emissions, necessitating improvements in public transport and the promotion of electric vehicles (Poulova et al., 2021). The policy implications are clear of which government should promote renewable energy (RE) by incentivizing solar, wind, and hydroelectric power to reduce reliance on fossil fuels (International Energy Agency, 2023). Thus, ASEAN has taken initiatives under its Energy Policy focusing on deploying these RE potentials to promote a higher share of RE in the power generation mix.

Effective urban planning and the development of sustainable infrastructure, such as public transportation, energy-efficient buildings, and green spaces, are essential to mitigate the environmental impacts of urban growth (Chien et al., 2022). Economic incentives, including tax benefits for green technologies, subsidies for clean energy, and penalties for excessive emissions, can drive businesses and individuals toward sustainability (Destek & Aslan, 2020). ASEAN leaders in 2018 have established a collaborative platform known as ASEAN Smart Cities Network (ASCN) of which cities from the ten members work towards the common goal of smart and sustainable urban development. Considering the opportunities and challenges posed by rapid urbanization and digitalization, the primary goal of the ASCN is to improve the lives of its citizens, using technology as an enabler. It adopts an inclusive approach to smart city development that is respectful of human rights and fundamental freedoms as inscribed in the ASEAN Charter.

Future research should focus on several key areas to advance understanding of the relationship between

macroeconomic factors and carbon emissions in ASEAN countries. Longitudinal studies can capture long-term trends and dynamic relationships, providing deeper insights into how macroeconomic factors impact emissions over time (Uzar, 2020). Sectoral analysis can offer detailed insights into specific emission drivers within different sectors, enabling more effective targeted policies (Danish & Wang, 2019). Additionally, exploring the impact of technological advancements such as digitalization, automation, and innovation on reducing emissions is crucial (Nathaniel et al., 2021). Understanding the behavioral aspects of energy consumption can inform more effective policies by shedding light on the social dimensions of sustainability (Al-Mulali et al., 2020). Comparative studies between ASEAN countries and other regions can highlight successful strategies and areas for improvement (Adebayo et al., 2022). Finally, addressing potential endogeneity issues and exploring alternative methodologies will enhance the robustness of future studies. By focusing on these areas, future research can provide comprehensive insights to support effective and sustainable policy development in the ASEAN region.

Abstract: Transportation is a major challenge for energy conservation, with road transport in Malaysia being a significant contributor to greenhouse gas (GHG) emissions. In Malaysia, traditional fossil fuels such as gasoline and diesel dominate the transportation sector, which has become the second-largest source of GHG emissions, accounting for 20% in 2014. This increase in CO2 emissions, driven by rising vehicle ownership and economic growth, underscores the urgent need for effective emission reduction strategies. The rapid growth in road transportation in Malaysia is linked to socioeconomic factors, including rising incomes and urbanization, leading to higher energy consumption and pollution. Data indicates a significant increase in vehicle registrations from 1990 to 2018, with motorcars and motorcycles being the most common. This growth, fueled by subsidies and decentralization, has exacerbated the sector's environmental impact. The Green Technology Master Plan Malaysia 2017–2040 aims to address these issues by setting ambitious targets to enhance renewable energy, improve energy efficiency, and promote eco-friendly fuels. Key strategies include expanding public transportation, increasing the adoption of electric vehicles (EVs), and introducing alternative fuels like hydrogen. Malaysia has substantial potential to reduce CO2 emissions through initiatives such as expanding EV infrastructure, promoting natural gas vehicles, and improving public transit. Effective implementation of these strategies can significantly lower the transportation sector's carbon footprint, contributing to a more sustainable future.

Keywords: *Energy Consumption, Emission, Transportation, Road Transport, Carbon Dioxide (CO$_2$)*

1. Introduction

One of the most difficult areas for energy conservation is road transportation. Transportation-related consumption accounts for an increasing percentage of total gasoline consumption. In Malaysia, traditional fossil fuels such as gasoline, diesel, and electricity are still used for transportation and these activities produce millions of tonnes of greenhouse gases (GHG) every year. According to the United Nations Framework Convention on Climate Change (UNFCC), the transportation sector has consistently remained the country's second-largest source of greenhouse gas emissions, accounting for 20% of total GHG emissions in 2014. Malaysia is an oil-based economy, with almost all economic sectors, from industry to transportation to domestic operation, relying on fossil fuels in general and oil energy in particular (Azam et al., 2015)

Furthermore, CO2 emissions have risen rapidly in recent decades, and these massive CO2 emissions from the burning of fossil fuels, as well as their climatic effects, have become important issues that must be addressed. Electricity generation, transportation, industrial, and residential are the main sectors identified to contribute to the emission of CO2 in Malaysia.

Table 1 shows the global final energy consumption from 1973 to 2016. The growth of global final energy consumption has increased by 3752.8 Mtoe from 1973 to 2008. Then, for just 8 years, there is a spike increase of around 48789.5 Mtoe (2008-2016). The major contributors to growth were the transportation sectors which increased almost 14.7% from 2008 to 2016. Road transportation is the largest contributor to emissions in the transport sector which about 18% comes from it. From the trend of total road transport as shown in Figure 1, demand for road transport is unlikely to decrease in the future as it shows a positive increase from the year

1990 to 2018 and still moving upward.

Table 1: Global final energy consumption by sector

Sector	1973		2008		2016	
	Mtoe	Share (%)	Mtoe	Share (%)	Mtoe	Share (%)
Industry	1544.6	33.0	2345.1	27.8	16019	28
Transport	1081.2	23.1	2299.4	27.3	24004	42
Agriculture/Commerce/Civil	1764.6	37.7	3036.9	36.0	8464	14.7
Non-energy use	285.3	6.1	747.1	8.9	8729	15.3
TOTAL	**4675.7**	**100**	**8428.5**	**100**	**57218**	**100**

Source: Malaysia Energy Statistic Handbook 2020

Malaysia's private vehicle population has risen year after year, owing to increasing income levels and unregulated city growth. This leads to an increase in energy consumption, especially from fossil fuels, and, as a result, an increase in air pollution as a result of their combustion. Since transportation systems rely on petroleum oil, which is a limited resource in Malaysia, it is essential to prepare for energy efficiency in this sector to reduce the rapid use of petroleum oils and increase air pollution, especially CO_2. According to Dai et al., (2023), improvements in transport infrastructure are associated with increased economic growth. However, this growth often leads to higher CO_2 emissions from the transport sector due to increased vehicle usage and fossil fuel consumption. This worrying number certainly caused the government of Malaysia to commit to a deep cut in CO_2 emissions by reducing 45% in the year 2030 (Ooi & Amran, 2019). Segar et al., (2024) also predict specific emission levels for the coming years, underscoring the urgent need for effective mitigation strategies. To make it come true, reduction of CO_2 emissions from road transport is important. This can be done by improving the governance of regulators' principles and guidelines (Peiseler & Serrenho, 2022). This is because having better administration, more effective compliance and targeted enforcement of regulation can help to achieve the desired outcomes most efficiently. As a result of the aforementioned concerns about CO_2 emissions in road transportation, a study is needed to investigate effective policy options in the context of Malaysia. This paper focuses on analyzing energy use and emissions in road transportation in Malaysia, to investigate the optimal level of CO_2 emissions that can be reduced from this sector.

Figure 2: Total Road Transport

2. Road Transportation Pattern in Malaysia

Transportation networks are inextricably linked to socioeconomic shifts because of the versatility it offers. In addition, transportation infrastructures can ensure access to markets and services, thus economic opportunities are likely to emerge. Transportation networks on a global, regional, and local scale have all become critical components of economic activity. As a result, trade and distribution are becoming increasingly

important. However, while transportation has a positive effect on socioeconomic structures, it also has drawbacks such as traffic congestion, accidents, mobility gaps, and environmental impact.

The ever-increasing demand for transportation and the expansion of the road network in Malaysia signify the rapid growth of road-based motorization. According to the Department of Statistics (2012), Malaysian road transport is predominantly composed of motorcars, motorcycles, taxis, buses, and goods vehicles. Table 2 shows the percentage of registered road transport vehicles in Malaysia for various years. With 47% and 46%, respectively, motorcars and motorcycles are the most popular modes of transportation correspondingly. The table also shows spectacular rises in motor vehicle registration rates and it is obvious that Malaysia's rapidly expanding car market is a direct result of stellar economic success and the significant economic contribution they make to the country's overall growth.

Table 2: Registered Road Transport Vehicles in Malaysia

Year	Motorcars	Motorcycles	Taxi	Busses	Good vehicles	Others	Total
1990	33.15	55.58	0.63	0.49	6.96	3.19	100
1995	37.02	52.32	0.80	0.52	6.39	2.95	100
2000	39.12	50.54	0.63	0.46	6.28	2.98	100
2005	43.69	47.30	0.53	0.39	5.43	2.66	100
2009	44.73	47.01	0.42	0.35	4.92	2.57	100
2014	53.42	40.50	0.54	0.10	3.12	1.90	100
2018	47.12	46.46	1.04	0.08	3.33	2.42	100

Source: Malaysia Energy Statistic Handbook 2020

Based on the growth of road transport shown in Table 3 below, from about 4.5 million in 1990 to 29.5 million in 2018, the number of motor vehicles in Malaysia increased by 7.1 percent per year on average. From this growth, passenger cars and motorcycles contribute to about 94% of the vehicles in the country. There are several reasons leading to the rapid growth in total road transportation in Malaysia.

Table 3: Growth of total transport in Malaysia from year 1990 to 2018

Year	Total Road Transport	Growth
1990	4,547,414	9.44
1995	6,897,434	10.3
2000	10,598,804	6.74
2005	14,816,407	7.64
2010	20,188,565	6.17
2015	26,301,952	4.78
2016	27,611,846	4.98
2017	28,737,696	4.08
2018	29,956,292	4.24

Source: Malaysia Energy Statistic Handbook 2020

Increased population size and disposable incomes, as well as fuel subsidies and decentralization, all lead to a rise in the number of vehicles in Malaysia. Malaysia's national car schemes have also contributed to the growth of motor vehicles by narrowing the government's options. The rapid rise in vehicle numbers was also helped by the growing population and urbanization. According to Dargay and Gately (1999), there is a positive relationship between wages, GDP, and transportation demand. This is factual in Malaysia, where rising GDP and income have made private motor vehicles more affordable and led to the growing demand for transportation services (Kasipillai and Chan, 2008). The debate over fuel subsidies, including their eventual reduction or removal, has direct implications for Malaysia's transportation sector, which consumes 40% of the country's total resources and is entirely reliant on fossil fuels (Oh et al., 2018). Subsidies obscure the true cost of transportation, meaning that motor vehicle users do not currently pay the full cost of travel, including

externalities like emissions, congestion, and injuries (Meyer et al., 1965). Consequently, Malaysia has experienced rapid motorization due to these artificially low prices. In terms of motor vehicle use, decentralization is a double-edged sword. Decentralization resulted in the same travel times, longer distances, and less congestion. As a result of public transportation's failure to reach many of the outlying areas, car dependence grew. Moreover, Malaysia's public transportation system is also in its infancy, thus due to the lack of established public transportation and high mobility, the number of private transportation grew rapidly in tandem with rising economic capability (Mustapa & Bekhet, 2016).

3. Emissions

According to Danielis (1995), it has been found that atmospheric concentrations of greenhouse gases such as carbon dioxide (CO_2), sulfur dioxide (SO_2), carbon monoxide (CO), sulfur dioxide (SO_2), and nitrogen oxide (NOx) have increased in recent decades. All these gases significantly have a negative environmental impact. This effect is linked to the rising transportation trend. As mentioned earlier, the transportation sector is the world's second-largest source of carbon emissions, with road transportation accounting for a significant portion of this. According to Zhu et al (2019), the road transportation industry in six Asia-Pacific countries such as Australia, Canada, China, India, Russia, and the United States already accounts for more than half of the global transportation industry's carbon emissions.

In Malaysia, the transportation sector accounts for 28% of total CO_2 emissions, of which 85% comes from road transport (Mustapa, & Bekhet 2016). Since conventional vehicles also use fossil fuels as their primary energy source, transportation is one of the major contributors to greenhouse gas (GHG) emissions. Furthermore, transportation-related CO_2 emissions are the fastest-growing source of CO_2, with the vast majority of estimated rises coming from developing countries. According to Ong et al. (2012), the transportation sector is contributing an increasing share of total emissions. Chandran and Tang (2013) state that energy consumption in the road transportation sector contributes significantly to environmental pollution in Malaysia, especially CO_2 emissions. Solaymani (2022) identifies trends and patterns in transport-related CO_2 emissions over recent years, showing an increasing trajectory largely driven by economic growth, urbanization, and rising vehicle ownership.

Figure 2 below shows the final energy consumption for every sector in Malaysia. Since 1997, the transportation sector has shown high energy consumption, and this reinforces the fact that transportation is the largest contributor to CO_2 emissions.

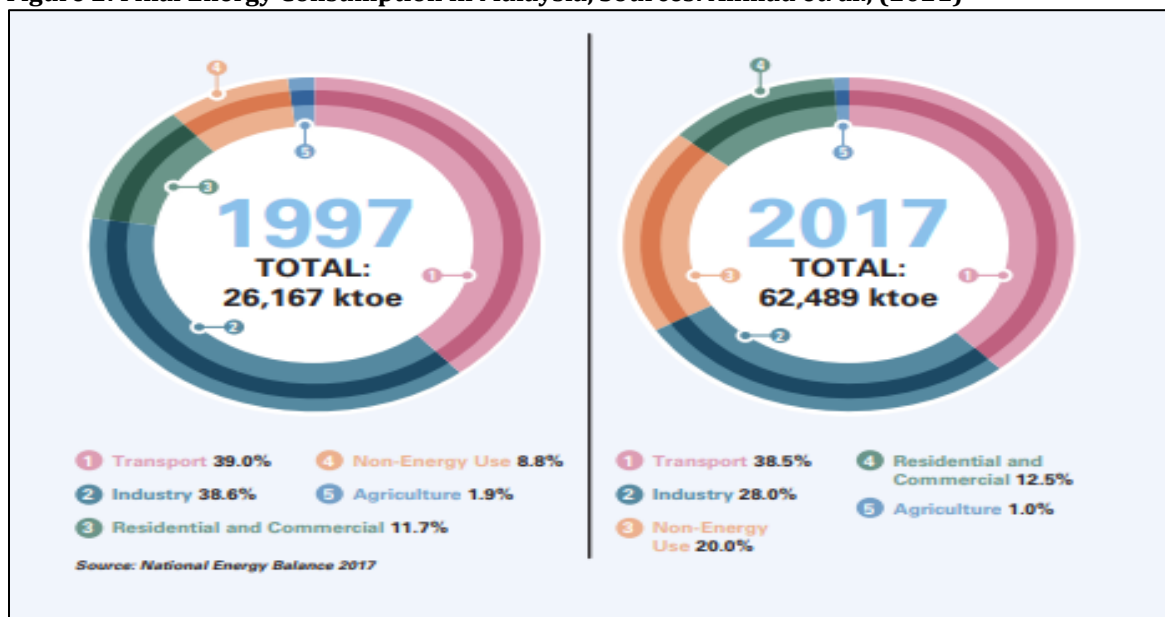
Figure 2: Final Energy Consumption in Malaysia, Sources: Ahmad et. al., (2021)


Table 4 shows the trend of energy use by the transportation sector based on fuel types in Malaysia. The transportation sector's overall energy usage rose from 7.83 Mtoe in 1995 to 24 Mtoe in 2016. With an average growth rate of 5.7 percent, this strong growth rate is more than double that of the previous year. In Malaysia, coal, diesel, aviation turbine fuel (AVF), aviation gasoline (AV gas), fuel oil, natural gas, and electricity were all used in the transportation sector. The primary source of energy is fossil fuel, with petrol being the most common, followed by diesel, ATF, and AV gas. Thus, it depicts petroleum products, with diesel and petrol accounting for more than 70% of crude oil products, the two most popular transportation fuels in Malaysia. Based on this fact, petrol consumption in the transportation sector was the primary driver of growth in 2016, with a positive trend of 6% in 2016.

Table 4: Energy use by the transportation sector in Malaysia

Year	Petrol	Diesel	ATF and AV gas	Fuel Oil	Natural gas	Biodiesel	Electricity	Total
1995	4477	2168	1160	17	5	0	0	7827
1996	5161	2417	1335	32	4	0	1	8950

Source: Malaysia Energy Statistic Handbook 2020

70% of petrol consumption comes from passenger cars as well as motorcycles. Based on Table 5, reveals that passenger cars lead to a high percentage of usage of petrol which is more than 50% of the total number of vehicles. Meanwhile, in 2018, motorcycles led the consumption of petrol. This is because of the high rise of motorcycles in Malaysia during that year. These two types of vehicles mostly use petroleum products for fuel. For diesel, other vehicle types as well as good vehicles contribute the largest consumption every year. This means that private transportation is the main source of CO2 pollution from road travel. As previously mentioned, the country has seen exponential growth in the number of private cars over the last two decades. It is predicted that it will continue to grow in the coming years. As a result, controlling emissions from private vehicles is the most difficult challenge in Malaysia's transportation sector in terms of reducing GHG emissions.

4. Green Technology Master Plan Malaysia 2017–2030

Ministry of Energy, Green Technology and Water Malaysia (KeTTHA) (2017)published the 'Green Technology Master Plan Malaysia 2017–2040' in June 2017, outlining strategic strategies to build green technology and establish a low-carbon, resource-efficient economy and lay out the country's immediate path for green development. Malaysia's priorities in the power and transportation sectors are outlined in the master plan. The three goals of the power sector are first, to expand renewable energy generation capacity to 25% in 2025 and 30% in 2030, secondly to introduce highly efficient coal-fired power, and to promote cogeneration for more efficient power generation. Lastly to reduce consumption of the residential and commercial sectors by 10% in 2025 and 15% by 2030.

As transportation contributes the highest emission, then this plan also touches on the transport sector's three-pronged approach to reducing CO2 emission. First, to double the modal share of public transport from 20.8% in 2018 to 40% in 2030. Second, to change the ratio of EEVs to private vehicles from 32.6% in 2015 to 100% in 2030. Third, to promote the introduction of eco-friendly fuels such as palm oil.

5. Malaysian Potential in CO2 Reduction

Malaysia's transportation sector is one of the major contributors to the country's greenhouse gas (GHG) emissions. In 2017, the transportation sector accounted for 22% of Malaysia's total GHG emissions, with road transport being the largest contributor. However, Malaysia has the potential to reduce its CO2 emissions from transportation through various initiatives.

One of the key initiatives is the promotion of electric vehicles (EVs) and the development of EV infrastructure. In 2019, the Malaysian government announced a target of having 100,000 EVs on the road by 2030, with plans to increase the number of EV charging stations across the country. In addition, the government has also provided incentives for the purchase of EVs, including exemptions from import duties and sales tax (MIDA, 2019). Transitioning road vehicles from traditional fossil fuels to natural gas can significantly lower CO2 emissions. Natural gas burns cleaner than gasoline or diesel, producing fewer greenhouse gases and pollutants. Encouraging the adoption of NGVs through incentives and supportive policies can contribute to a more sustainable transportation system. Solaymani (2022) suggests providing financial incentives and subsidies for the purchase and use of electric, hybrid, and other low-emission vehicles.

Another initiative is the promotion of public transportation, including the expansion of rail networks and the introduction of bus rapid transit systems. The government has also introduced policies to encourage the use of public transportation, including the implementation of congestion charges and the introduction of a cashless payment system for public transportation. Enhancing public transportation in terms of capacity, coverage, and quality is crucial for reducing reliance on private vehicles. Investments in expanding and improving public transit infrastructure, such as buses, trains, and light rail systems, can make public transport a more attractive option. This, in turn, reduces the number of vehicles on the road, thereby lowering CO2 emissions and easing traffic congestion.

Furthermore, Malaysia has also been exploring the use of alternative fuels, including biofuels and hydrogen fuel cells, for transportation. In 2019, Malaysia's first hydrogen fuel cell electric vehicle was unveiled, with plans to expand the use of hydrogen fuel cell technology in the transportation sector. According to a recent study by Al-Amin & Doberstein (2019), the adoption of hydrogen fuel cell vehicles in Malaysia could result in a significant reduction in CO2 emissions. The study found that the use of hydrogen fuel cell vehicles could result in a reduction of up to 60% in CO2 emissions from the transportation sector in Malaysia by 2050. Biodiesel is a renewable alternative to conventional diesel fuel, capable of reducing CO2 and CO emissions by 62% to 36%. Encouraging the production and use of biodiesel, especially in heavy-duty vehicles and public transport, can substantially decrease the overall carbon footprint of the transportation sector.

In addition, the government can implement taxation and pricing policies aimed at reducing CO2 emissions by making high-emission vehicles and fuels more expensive and promoting low-emission alternatives. This includes higher taxes on the purchase and registration of high-emission vehicles, increased fuel taxes, and congestion charges in urban areas. Low-emission vehicles benefit from tax rebates, exemptions, and subsidies, making them more affordable. These policies encourage consumers to choose cleaner transportation options, generate revenue for environmental initiatives, and directly contribute to reducing CO2 emissions and improving air quality. Proper implementation requires public support, infrastructure development, and consideration of economic impacts.

In conclusion, Malaysia has the potential to make significant contributions to CO2 reduction in transportation through the promotion of EVs and the development of EV infrastructure, the promotion of public transportation, and the exploration of alternative fuels. The adoption of hydrogen fuel cell vehicles, in particular, could result in a significant reduction in CO2 emissions.

Conclusion

In conclusion, addressing CO2 emissions from road transportation in Malaysia is a multifaceted challenge that requires a comprehensive approach. The significant rise in private vehicle use, primarily fueled by economic growth and government policies, has led to increased energy consumption and emissions. The Green Technology Master Plan Malaysia 2017–2040 sets ambitious targets for reducing CO2 emissions by enhancing renewable energy generation, improving energy efficiency, and promoting eco-friendly fuels. Key initiatives include the promotion of electric and hydrogen fuel cell vehicles, expansion of EV infrastructure, and enhancement of public transportation systems. By implementing these measures, Malaysia can significantly reduce its transportation sector's carbon footprint, contributing to a more sustainable and environmentally friendly future.

Abstract: This study utilizes the job demands-resources model to examine the relationship between job resources (like organizational climate, co-worker support, authentic leadership, knowledge diversity, and work-life support practices), burnout, psychological capital, and mental health among employees at multinational companies in Beijing. An online survey was filled out by 173 people, and the data were analyzed with PLS-SEM. The results suggest that authentic leadership and work-life support practices had no impact on psychological capital, whereas a positive work environment, helpful co-workers, and a broad range of expertise did. In addition to having direct effects on mental health, psychological capital also indirectly affects mental health through burnout. This study adds to the current literature by examining the mental well-being of employees working for multinational firms in Beijing.

Keywords: *Mental well-being, Multinational Companies, Knowledge diversity, Burnout, Psychological capital*

1. Introduction and Background

Numerous studies have highlighted the rising prevalence of mental health issues in workplaces globally. In 2017, the World Health Organization (WHO) reported that one in eight people globally had a mental health issue, which increased by almost 25% during the COVID-19 pandemic (World Health Organization, 2022). In China, where anxiety and depression dominate the mental health landscape, over 160 million people are grappling with mental illness (Zhang, 2022). Wu et al. (2021) stated the economic repercussions, including therapy costs and lost productivity due to absenteeism and tardiness, underscore the urgency of addressing mental health concerns in the workplace. Amid this backdrop, multinational corporations (MNCs) in Beijing, characterized by diverse cultural and ethnic workforces, confront significant challenges in fostering employee well-being. Expatriates and local staff from varied backgrounds face communication and collaboration hurdles, potentially exacerbating stress levels. Moreover, the dynamic market environment, driven by technological advancements and heightened consumer expectations, compounds employees' anxiety about job security and performance expectations (Gathercole et al., 2018). In many MNCs, a prevailing culture of working late perpetuates stress and burnout, particularly evident in sectors like banking, where employees grapple with heavy workloads and psychological strain (Naithani, 2021; Wu, 2020). Despite extensive research on mental health in various professions, studies focusing on MNC employees, especially in Beijing, remain scarce. Psychological capital, which encompasses individuals' resources and positive development states, has garnered attention for its role in combating burnout and enhancing performance and well-being.

Psychological capital, as defined by Luthans et al. (2004), is the capacity to overcome challenges and promote personal growth. It enables individuals to see variety as a strength rather than a weakness, aiding in communication and interactions across different cultures. (Youssef-Morgan & Hardy, 2014). However, the specific relevance of psychological capital to employees in Beijing's multinational companies remains uncertain, necessitating further investigation. Therefore, this study intends to identify the factors influencing psychological capital and mental well-being among MNC employees in Beijing while offering recommendations to safeguard their mental health. This research aims to analyze the relationship between workplace dynamics, cultural diversity, and psychological resources, which seeks to inform strategies for promoting employee resilience and fostering supportive organizational cultures. With mental health concerns looming large in contemporary workplaces, particularly in the context of multinational environments characterized by cultural diversity and rapid technological advancements, understanding the determinants of psychological capital becomes imperative for cultivating a thriving workforce.

The paper is divided into different sections. This section outlines the literature review and the formulation of hypotheses for the investigation. Next comes the methodology of the study. Section four contains the study's results. The research is concluded in the final portion.

2. Literature Review

Mental Well-Being: The topic of well-being spans philosophical, psychological, sociological, and healthcare literature (Islam & Amin, 2021). Crisp (2017) suggests that "well-being", "wellness", and "quality of life" are interchangeable terms, encompassing what is essential for an individual. Well-being, broadly defined, represents a favorable state of being (Chari et al., 2018). From a management perspective, Ryan and Deci (2001) define well-being as the highest level of psychological functioning and experience. Approaches to studying well-being include the hedonic, focusing on happiness and contentment, and the eudaimonic, emphasizing self-realization (Islam & Amin, 2021). Well-being comprises multiple dimensions, including mental, physical, emotional, psychological, occupational, and social aspects (Kowalski & Loretta, 2017). Good mental well-being enables individuals to effectively manage life's stresses, work efficiently, and contribute to their communities (Makhbul & Khairuddin, 2014; Simons & Baldwin, 2021; World Health Organization, 2022). Poor mental condition can result in mental disease, burnout, and reduced performance and satisfaction (Harvey et al., 2014). Mental health issues in the workplace have significant global implications for both employees and company performance (Thanem & Elraz, 2022).

Psychological Capital: Psychological capital, which refers to an individual's "positive developmental status" and their ability to overcome life's obstacles, is key to fostering productive and content workers (Luthans & Youssef, 2004). Psychological capital is defined as an individual's positive psychological state, consisting of four key components. Self-efficacy refers to the confidence in one's ability to successfully tackle challenges, while optimism involves a positive outlook on present and future success. Hope is the combination of motivation and strategies to achieve goals, and resilience is the capacity to recover from adversity and grow stronger through difficulties (Sabila & Febriansyah, 2021). Investing in employees' psychological capital can enhance organizational outcomes (Luthans et al., 2007). Early life experiences influence psychological capital, which can be enhanced by education and practical experience (Majumdar & Kumar, 2022). Research by Yuen et al. (2020) has shown that elevated levels of psychological capital are associated with enhanced individual and team performance, leading to overall organizational success. The foundations of psychological capital include optimism, hope, resilience, and self-efficacy as stated by Luthans et al. in 2004. Research by Luthans and Broad (2022) suggests that high psychological capital can bolster workers' confidence in challenging work environments. Self-efficacy pertains to one's confidence in achieving professional goals, while positivity relates to expecting positive results. Resilience refers to the capacity to recover from challenges such as stress and change (Malik & Singh, 2024).

Organizational Climate: Organizational climate, as defined by Schneider et al. (2013), encompasses employees' perceptions of rules, practices, and behaviors within the workplace. In today's competitive and technologically evolving landscape, organizational climate has become a strategic priority (Pomirleanu et al., 2022). Lauchlan (2018) emphasizes the importance of ethical leadership in shaping organizational culture, while Nickolopoulos (2021) stresses the significance of collaboration and relational environments. Bartell Machinery Systems (2018) advocates for fostering creativity within the organizational climate to align with company goals. Qadeer & Jaffery (2014) suggest that a positive organizational climate enhances employees' resilience and self-efficacy. Malik and Garg (2020) emphasize that the organizational environment plays a crucial role in promoting continuous learning and empowerment, which in turn boosts optimism and self-efficacy in employees. Andersen (2001) emphasizes the importance of effective communication in fostering improved relationships, particularly crucial for multinational corporations facing challenges in supervisor-follower communication. Li et al. (2022) propose that the organizational climate has a favorable effect on employees' psychological capital, especially within the maritime sector. However, research on how organizational climate affects psychological capital in multinational firms in Beijing remains limited. Hence, the hypothesis is formulated as follows.
H1: Organizational climate positively impacts employees' psychological capital.

Authentic Leadership: Leadership is essential for establishing a work climate that promotes employee

engagement and well-being (Farrukh et al., 2022; Singh et al., 2019). In multinational organizations, effective leadership is particularly vital due to challenges in supervisor-follower communication (Al-Shammari, 2018). Authentic leadership, characterized by honesty, transparency, and ethics, has emerged as a highly effective leadership philosophy (Banks et al., 2016). Avolio and Luthans (2003) suggest that authentic leadership enhances employee loyalty, and well-being, and fosters a healthy work environment. Four key characteristics define authentic leaders: balanced processing, relational transparency, self-awareness, and internalized moral perspective that can foster personal development among followers, inspiring them to achieve individual and collective goals (Walumbwa et al., 2008). Authentic leadership positively influences employees' optimism, self-efficacy, self-discipline, hope, and resilience (Gardner et al., 2011; Bryan & Vitello-Cicciu, 2022). Several researchers endorse the positive impact of authentic leadership on employees' psychological capital (Li et al., 2022; Niswaty et al., 2021; Adil & Kamal, 2020). Akhtar et al. (2022) suggest that authentic leadership enhances followers' task-related abilities, while Bento and Ribeiro (2013) highlight its role in cultivating positive emotions and emotional resilience in followers. Sarwar et al. (2023) show that authentic leadership has a beneficial effect on psychological capital in the Chinese education industry. The results back the theory that genuine leadership has a favorable impact on employees' psychological capital. Based on the reasons described above, the following hypothesis was formulated.
H2: Authentic leadership positively impacts employees' psychological capital.

Co-Worker Support: Social support, comprising emotional, practical, and informational assistance from one's social network, plays a vital role in managing life challenges (Houston et al., 2015). Social identity theory posits that individuals undergo cognitive processes of social categorization, identification, and comparison to form a group identity (Hogg, 2016). This leads to greater social support, potentially boosting psychological capital (Avanzi, 2015). Studies have consistently shown that increased social support correlates with higher psychological capital (Wang & Xue, 2021; Gu et al., 2021), social support is an important resource that can boost psychological capital. (Peepratoom et al., 2020; Lee et al., 2013). Co-worker support, encompassing emotional, instrumental, and trust-based assistance, is crucial for employees' psychological capital and mental health (Karasek & Theorell, 1990). Particularly in the context of COVID-19, co-worker support becomes increasingly valuable for maintaining a positive psychosocial workplace environment (Sigursteinsdottir & Karlsdottir, 2022). Co-worker support fosters hope, resilience, and optimism, positively influencing psychological capital (Pauksztat, 2017; Li et al., 2022). It fosters open communication and trust within the team, which improves self-efficacy (Choi et al., 2003). Co-worker assistance in global organizations promotes idea-sharing and learning, which enhances creativity (Huang & Liu, 2015). Additionally, assisting colleagues morally alleviates psychological stress associated with uncertainty and demanding tasks (Cao & Zhang, 2020). Thus, the above-mentioned arguments inform the hypothesis as below.
H3: Co-worker support has a positive impact on psychological capital.

Work-Life Support Practices:
In today's business environment, there is an increasing prevalence of working couples, single-parent families, and dependents aged 65 and older (Ronda et al., 2016). Consequently, employees are facing greater challenges in balancing work and home responsibilities, leading to heightened work-home conflicts (Roy et al., 2023). For the younger generation, work-life balance is a critical factor in evaluating job opportunities, as highlighted by a global study involving 2,700 participants from over 100 countries (HBR Ascend Staff, 2019). Employers are, therefore, compelled to implement work-life support practices to help employees manage their professional and personal obligations (Gathercole et al., 2018). These practices typically include flexible work schedules, telecommuting, working from home, dependent care programs, family leave programs, and childcare services (Roy et al., 2023). The implementation of work-life support practices by employers has been shown to positively impact employees' job satisfaction and overall well-being. According to Roy et al. (2023), such practices enhance employee engagement, leading to a greater sense of accomplishment at work. Thompson and Prottas (2005) also identified a positive correlation between work-life support practices and employees' sense of life fulfillment. Additionally, Yu et al. (2020) noted that the sense of family and life fulfillment independently contributes to employees' subjective well-being. When employees achieve satisfaction in both their work and personal lives, they experience increased optimism, resilience, hope, and self-efficacy. Moreover, Wang et al. (2011) found that employees are more committed to organizations that respect and support their work-life balance. Conversely, the need to juggle work and personal responsibilities can lead to high job demands, depleting personal resources and exacerbating emotional exhaustion (Huang et al., 2016).

The hypothesis is therefore developed as follows.
H4: Work-life support practices have a positive impact on psychological capital.

Workforce Knowledge Diversity: Workforce diversity includes surface variety, such as age and gender, and knowledge diversity, which refers to variations in experience, knowledge, and functional background (Webber and Donahue, 2001). Globalization has increased the difficulties organizations face regarding diversity (Van Dijk et al., 2017). Cox and Blake (1991) suggest that diversity enhances innovation and production, however, Cunningham and Sagas (2004) discovered that it had a detrimental effect on employee job engagement and satisfaction. Global workforce diversity management faces unique obstacles across different regions, with varying emphasis on specific diversity dimensions (Kharroubi, 2020). Trade openness and innovation ecosystems are linked to workforce diversity in knowledge-based economies (Soral et al., 2023). The concept of diversity management has evolved, becoming an integral part of human resource management (Seliverstova, 2021). In higher education, workforce diversity data collection practices vary globally, reflecting different national priorities and histories (Wilson et al., 2022). However, recent studies suggest that knowledge diversity positively influences employee well-being compared to surface diversity (Jaiswal & Dyaram, 2020). This fosters efficient communication, lowers societal costs, and develops mutual respect and trust among employees (Jaiswal & Dyaram, 2020). This mutual trust enhances employees' hope, confidence, positive attitudes, and resilience (Jaiswal & Dyaram, 2020). Knowledge diversity has a favorable impact on creativity and innovation in the workplace, as shown by Corrocher and Lenzi (2022). Knowledge diversity can also intensify interpersonal and procedural arguments and promote task-related discussions and information sharing with less resistance (Zellmer-Bruin et al., 2008). The elaboration of information will promote efficient contact and communication while lowering societal costs (van Dijk et al., 2017). Based on the above discussions, the hypothesis is proposed as follows.
H5: Workforce knowledge diversity positively impacts psychological capital.

Psychological Capital and Mental Health: Luthans (2015) found that personnel with elevated levels of psychological capital, such as competence, optimism, hope, and resilience, had enhanced productivity and improved mental well-being. Gupta and Shukla (2018) found that psychological capital significantly contributes to the well-being of working women, while Majumdar & Kumar (2022) concluded that it enhances employee well-being in India. Li et al. (2022) showed a direct link between psychological capital and mental well-being among seafarers. In a multinational company, employees operate in a multicultural environment and tackle challenging tasks (Darawong & Igel, 2012). Psychological capital helps employees manage stress (Newman et al., 2014) and perceive workplace diversity as an opportunity rather than a challenge, promoting interaction with diverse peers (Youssef-Morgan and Hardy, 2014). Basinska and Rozkwitalska (2022) found that psychological capital positively correlates with learning and satisfaction with cross-cultural relationships. Additionally, it enhances vitality and positivity within multinational corporations. This leads to the hypothesis stated below.
H6: Psychological capital positively impacts mental well-being.

Psychological Capital and Burnout: The job demands-resources model elucidates the development of burnout due to stress and imbalance as proposed by Demerouti et al. (2001) and Maslach and Leiter (2016). Intensive job requirements, necessitating continual physical, emotional, or cognitive exertion, have been consistently associated with burnout (Demerouti et al., 2001). Coping with burnout necessitates positive physical and psychological resources (Bitmis & Ergeneli, 2015). For instance, resilient individuals perceive workplace challenges as less daunting, requiring fewer resources to combat emotional exhaustion (Ventura et al., 2015). Similarly, hopeful individuals remain motivated by their goals, persevering without experiencing diminished achievement (Li et al., 2022). Students with greater psychological capital exhibit lower burnout risk and greater optimism regarding their goals (Chang et al., 2000; Barratt & Duran, 2021). Optimistic seafarers, possessing abundant resources, are better equipped to cope with burnout (Chapman & Chi, 2017). Considering the above discussion, the following hypothesis is suggested.
H7: Psychological capital hurts burnout.

Burnout and Mental Well-being: Burnout in the workplace occurs when job expectations surpass available resources, like a heavy workload, role conflict, poor autonomy, and insufficient social support (Edú-Valsania et al., 2022; Wan et al., 2023). Burnout has a significant impact on the mental well-being of an individual and

the company's performance (White et al., 2019; Bakker et al., 2014). As Pluut et al. (2018) point out, burnout often causes tension, anxiety, and upset. Burnout may lead to serious health problems such as depression (Ahola & Hakanenm 2007), sleep disturbances (Umehara et al., 2007) and chronic back pain (Mat Rifin & Danaee, 2022). Burnout may lead to serious health problems. To support physical and mental health, it is important to prevent burnout and intervene when it occurs (Wen et al., 2023). This will negatively impact mental well-being. Hence, this hypothesis is proposed.
H8: Staff burnout hurts employees' mental well-being.

Mediating Effect of Burnout: This study views burnout as a mediator in the relationship between psychological capital and employee mental well-being. The job demands-resources model highlights how positive psychological capital can improve employees' mental well-being and prevent burnout. Manzano-Garcia and Ayala (2017) found that positive psychological capital reduces burnout and increases psychological well-being in autism care providers. Lupşa and Vîrgă (2020) found that burnout acts as a mediator in the connection between psychological capital and health. Li et al. (2022) discovered that burnout acts as a mediator in the connection between psychological capital and the mental well-being of seafarers. Thus, the subsequent hypothesis can be formulated.
H9: Burnout mediates the relationship between psychological capital and mental well-being.

3. Research Methodology

Research design: This study employs a quantitative way to evaluate the framework and hypotheses. A Chinese online survey tool called Wenjuanxing is used to create and publish survey questionnaires. Questionnaires are shared via social networks like WeChat and Weibo, as well as through email. SPSS and SmartPLS statistical analysis software are utilized for analyzing the data obtained from the survey questionnaire.

Development of Survey Instrument: This study assesses organizational climate, authentic leadership, co-worker support, work-life support practices, workforce knowledge diversity, employee psychological capital, burnout, and mental well-being by drawing on various sources including Rogg et al. (2001), Neider and Schriesheim (2011), and Maslach et al. (2016). 46 measurement items were generated for the 8 latent components. In other words, the instrument was adapted from multiple sources to align with the study's objectives. The items were translated into Chinese to ensure more precise responses. For validation purposes, six specialists assessed the substance, clarity of phrasing, and statements of the items. The study employs a seven-point Likert scale ranging from 1 for strongly disagree or never to 7 for strongly agree or always (Krosnick & Presser, 2010). Validity testing, including content validity through expert reviews and construct validity via CFA in SmartPLS-SEM, was thoroughly conducted, ensuring the reliability and accuracy of the measurement model. The measurement model in this study comprises reflective constructs. Each indicator reflects the underlying latent variable and high internal consistency among indicators is expected. The analysis focuses on evaluating the reliability and validity of these reflective constructs. All reflective constructs showed satisfactory factor loadings above 0.70, Composite Reliability (CR) values above 0.70, and AVE values above 0.50, indicating good convergent validity (Hair et al., 2017; Gefen & Straub, 2005). Discriminant validity (Henseler, Ringle & Sarstedt, 2015) was confirmed using the Fornell-Larcker criterion (Fornell & Larcker, 1981) and Heterotrait-Monotrait Ratio (HTMT) (Gold et al. (2001).

Sampling Method and Respondents: Respondents are employees of multinational companies in Beijing. There are more than 20,000 MNCs listed in LexisNexis's Directory of Corporate Affiliations, with a revenue threshold of $50 million. The number of MNCs with headquarters in Beijing in 2016 was 926, including domestic parent companies and foreign regional headquarters (Wang et al., 2021). This study adopts a convenience sampling method. The online questionnaires were sent to relatives, previous colleagues and friends working at multinational companies in Beijing and asked them to distribute to their friends who fit the criteria for the target group. PLS-SEM analysis requires 147 samples to achieve a 0.05 significance level and 0.1 R^2, with a maximum of 5 arrows pointing at a construct. In total, 173 valid responses were collected. Therefore, this sample is sufficient for performing PLS-SEM. Table 1 displays the demographic characteristics of the respondents. The study is based on the job demands-resources model, known for its effectiveness in predicting employee job performance and well-being (Bakker & Demerouti, 2006). This idea explains that stress arises from disparities between the requirements of a work and the resources accessible to manage them. Job

demands refer to the physical and/or psychological efforts needed for a job, whereas resources help reduce these demands, promoting personal development and achieving goals. This study explores job resources including organizational climate, authentic leadership, co-worker support, knowledge diversity, and work-life support practices (see Figure 1).

Figure 1: Theoretical Framework

4. Results

Table 2 displays indicator reliability, with factor loadings above 0.7 considered acceptable. Items falling between 0.4 and 0.7 were evaluated, but no removal was warranted as it did not impact AVE and CR. Despite some loadings between 0.5 and 0.7, all items were retained for consistency. The internal consistency, evaluated by Cronbach's alpha and Composite Reliability (CR), ranged from 0.865 to 0.93 and 0.905 to 0.947, respectively, meeting reliability criteria (Nunnally, 1994). Discriminant validity was established by meeting the Fornell-Larcker and HTMT criteria. The Fornell-Larcker analysis showed that the square root of Average Variance Extracted (AVE) was higher than the correlations, and HTMT ratios below 0.9 suggested significant discriminant validity (Henseler et al., 2015). Tables 3, 4 and 5 illustrate satisfactory outcomes for both criteria, ensuring discriminant validity.

Structural Model Results: Analysis of the structural model showed that 6 out of 8 hypotheses were statistically significant at the 0.05 and 0.01 levels, as indicated in Table 6. Organizational climate (β = 0.337), co-worker support (β = 0.303), and knowledge diversity (β = 0.147) positively influenced psychological capital, supporting H1, H3, and H4 respectively. Moreover, psychological capital positively impacted employees' mental well-being (β = 0.483), while negatively affecting burnout (β = -0.558), corroborating H6 and H7. Additionally, burnout negatively affected mental well-being (β = -0.353), supporting H8. However, authentic leadership (β = 0.115) and work-life support practices (β = -0.018) did not significantly influence psychological capital and mental well-being, rejecting H2 and H5. Burnout mediated the relationship between psychological capital and mental well-being in a significant way (β = 0.197). R^2 values indicated that psychological capital and mental well-being accounted for 54.9% of variations in mental well-being. Q^2 values revealed high predictive relevance for psychological capital, moderate for mental well-being, and low for burnout. Effect sizes showed large effects of psychological capital on mental well-being (f^2 = 0.357) and burnout (f^2 = 0.452), with smaller effects for organizational climate, co-worker support, and knowledge diversity on psychological capital. Authentic leadership and work-life support practices had minimal effects on mental well-being (see Table 7).

Table 6: Path Coefficient, T-Statistics and Significance Level Hypothesized Paths

Hypothesis	Relationship	Path coefficients	T statistics (|O/STDEV|)	P values	Decision
H1	OC -> PC	0.337	2.934	0.00	Supported
H2	AL -> PC	0.115	1.185	0.24	Not supported
H3	CS -> PC	0.303	3.31	0.00	Supported
H4	KD -> PC	0.147	2.236	0.03	Supported
H5	WLSP -> PC	-0.018	0.251	0.80	Not supported
H6	PC -> WB	0.483	6.384	0.00	Supported
H7	PC -> BU	-0.558	14.173	0.00	Supported
H8	BU -> WB	-0.353	6.164	0.00	Supported
H9	PC -> BU -> WB	0.197	5.174	0.000	Supported

Table 7: The results of R^2, Q^2, f^2

Endogenous Construct	R^2	Q^2	Path	f^2	Effect Size
Psychological capital	0.545>0.5	0.398>0.35	Organizational climate -> Psychological capital	0.069	Small Effects
			Authentic leadership -> Psychological capital	0.01	No Effects
			Co-worker support -> Psychological capital	0.09	Small Effects
			Knowledge diversity -> Psychological capital	0.036	Small Effects
			Work-life support practices -> Psychological capital	<0.001	No Effects
Burnout	0.311>0.25	0.14>0.02	Psychological capital -> Burnout	0.452	Large Effects
Mental well-being	0.549>0.5	0.336>0.15	Psychological capital -> Mental well-being	0.357	Large Effects
			Burnout -> Mental well-being	0.19	Medium Effects

Note: $f^2 < 0.02$: No Effects; $f2 > 0.02$: Small Effects; $f2 > 0.15$: Medium Effects; $f2 > 0.35$: Large Effects

Discussion

The study uncovers important connections between many elements concerning job resources and employees' psychological capital. Organizational climate demonstrates the strongest association with psychological capital ($\beta = 0.337$, $p < 0.01$). This finding aligns with Mulki and Lassk (2019), who argue that a supportive work environment is essential for mitigating the adverse effects faced by employees, particularly in multinational settings where cultural and operational complexities are heightened. A positive organizational climate fosters a sense of security, belonging, and support, which are crucial in enhancing employees' psychological capital. This is particularly important in multinational corporations where the organizational environment must accommodate diverse cultural backgrounds, thus amplifying the need for a climate that is both inclusive and supportive. Following closely, support from coworkers also significantly impacts psychological capital ($\beta = 0.303$, $p < 0.01$). This result corroborates the findings of Peepratoom et al. (2020) and Lee et al. (2013), who highlight the importance of social support in resource development, especially for employees dealing with cross-cultural obstacles. In workplaces where cross-cultural interactions are frequent, the support of coworkers becomes a vital resource that helps employees navigate challenges, build confidence, and enhance their psychological capital. This peer support not only provides emotional sustenance but also fosters knowledge-sharing and collaborative problem-solving, which are essential for personal and professional

growth in diverse environments. While the relationship between knowledge variety and psychological capital is less pronounced ($\beta = 0.147$, $p < 0.05$), its significance should not be underestimated. Knowledge variety contributes to fostering inclusivity and a sense of connection among employees, particularly in diverse teams where the exchange of varied perspectives can lead to innovative solutions and a richer workplace experience.

Shore et al. (2011) and Jaiswal and Dyaram (2020) emphasize that diversity management when effectively implemented, can enhance psychological capital by promoting an environment where different viewpoints are valued and integrated into decision-making processes. In this context, knowledge variety plays a key role in cultivating an inclusive culture that supports the development of psychological resources among employees. Contrary to expectations, authentic leadership ($\beta = 0.115$, $p = 0.236$) and work-life support practices ($\beta = -0.018$, $p = 0.802$) show negligible effects on psychological capital. These findings suggest that in multinational corporations, the influence of leadership and work-life balance initiatives on psychological capital may be diminished by the hierarchical management structures and cultural influences prevalent in such organizations. Authentic leadership, typically characterized by transparency, ethics, and a focus on employee development, may not have the desired impact in environments where rigid hierarchies and cultural norms limit the expression and reception of leadership behaviors. Similarly, work-life support practices may be perceived as less relevant or effective in settings where work demands and cultural expectations around work-life balance differ significantly from one region to another.

The study also finds a strong correlation between psychological capital and mental well-being ($\beta = 0.483$, $p < 0.01$), reinforcing the notion that employees with higher levels of psychological capital are better equipped to maintain good mental health. This supports Luthans' (2015) assertion that psychological capital—comprising hope, efficacy, resilience, and optimism—serves as a robust foundation for mental well-being, enabling employees to cope more effectively with stress and adversity. The significant role of psychological capital in mitigating stress ($\beta = -0.558$, $p < 0.01$) further underscores its importance as a buffer against burnout. This finding aligns with Bitmis and Ergeneli (2015), who argue that psychological resources are crucial in combating the detrimental effects of work-related stress, particularly in high-pressure environments such as multinational corporations. Burnout, in turn, slightly worsens mental health ($\beta = -0.353$, $p < 0.01$), acting as a mediator between psychological capital and mental well-being ($\beta = -0.353$, $p < 0.01$). The result is aligned with previous studies of Manzano-García and Ayala (2017) and Li et al. (2022), who explore the complex interplay between psychological capital, burnout, and mental health. Their research indicates that while psychological capital can reduce the likelihood of burnout, the presence of burnout can, in turn, diminish the positive impact of psychological capital on mental health. Therefore, interventions aimed at enhancing psychological capital should also address factors that contribute to burnout, ensuring a comprehensive approach to improving employee well-being. In a nutshell, this study contributes to a deeper understanding of the intricate relationships between job resources and psychological capital, offering valuable insights for organizations, particularly those operating in multicultural and multinational contexts. By highlighting the central role of organizational climate and coworker support, the research underscores the importance of creating a supportive and inclusive work environment that fosters the development of psychological resources, ultimately leading to better mental health outcomes for employees.

5. Managerial Implications and Recommendations

The results of the structural equation analysis in this study reveal important connections among many factors in the setting of multinational corporations (MNCs) in Beijing. Firstly, the work environment significantly influences employees' psychological capital, accentuating the need to cultivate a positive and supportive workplace to address the challenges present in multinational corporation settings. Secondly, social support from coworkers emerges as another significant factor influencing psychological capital, highlighting the importance of cultivating strong interpersonal relationships within diverse teams. Additionally, while knowledge variety doesn't exhibit a strong direct link with psychological capital, it remains crucial for promoting inclusivity and a sense of belonging within MNCs, emphasizing the need for robust diversity management policies. However, the study suggests that traditional notions of leadership in MNCs may not significantly impact psychological capital, possibly due to entrenched hierarchical structures. Surprisingly, work-life support practices show no significant effect on psychological capital, suggesting that employees prioritize professional growth over personal pursuits in the competitive landscape of Beijing's MNCs. The study

highlights the significant influence of psychological capital on mental health and stress reduction, emphasizing its importance as a vital resource in dealing with the demands of the corporate setting, especially in addressing burnout. The results highlight the complex elements that affect psychological well-being in multinational corporations, emphasizing the significance of fostering supportive organizational cultures and utilizing resources to improve employee resilience and mental health.

Conclusion

There are multiple constraints on this study. The data analysis result may be biased due to the use of convenience sampling in this study, which is a self-administered sampling approach. The findings must be comprehensively understood and widely utilized as a result. Only 173 replies were collected due to time constraints. Increasing the number of responses will enhance the representativeness of the target group and improve the accuracy of the results. Lastly, in addition to the five components mentioned in the research review that directly affect psychological capital, other variables including employees' personalities, traits, and autonomy may also influence psychological capital and mental well-being. This study indicates that authentic leadership does not have a substantial impact on employees' psychological capital and mental well-being. Therefore, other leadership styles, such as transformational leadership, should be taken into account when assessing the influence on psychological capital. Finally, it is advised to research MNCs in other nations or different categories of organizations.

Abstract: This study experimentally investigates the relationship between economic growth and government spending in Malaysia from 1990 to 2022 using time series data. The study analyzes the impact of total government spending on economic growth, covering housing, healthcare, social services, military, and education while identifying which sector has the most effect on economic growth. The Autoregressive Distributed Lag (ARDL) method is employed to evaluate the effects of these expenditures. The findings demonstrate that, in the short run, all variables significantly affect economic growth, hence refuting the null hypothesis. However, only trade openness and labor spending positively impact long-term economic growth. Research indicates that housing and education expenditures are the primary long-term drivers of economic growth in Malaysia. The data suggest that the Malaysian economy contradicts the Keynesian theory, as less government spending appears to improve the real GDP growth rate. The inverse relationship between government spending and economic growth indicates that government expenditure may not be the primary catalyst for economic growth, hence supporting Wagner's law. These findings provide policymakers with essential insights for optimizing government spending to improve economic development results.
.

Keywords: *Economic growth, ARDL, government expenditures, Keynesian, total expenditure*

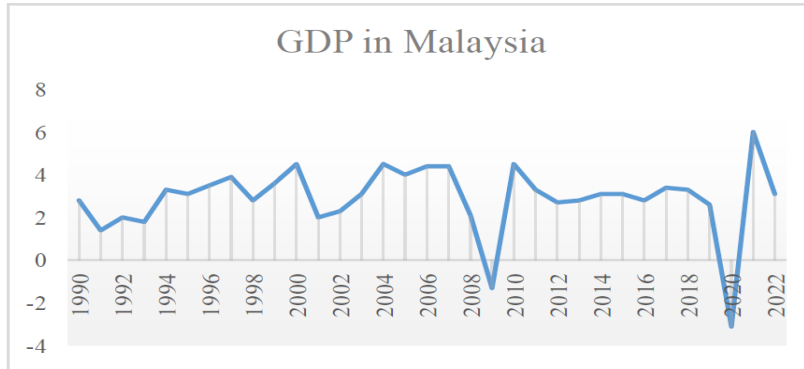
1. Introduction and Background

Economic growth is fundamental to the prosperity of nations, characterized by an increase in the productive capacity of the economy, which in turn raises national output and income over time. Smith (2003) defines economic growth as the venture where the increasing level of production of the economy is realized over time to produce higher national income and output. This definition underscores the importance of GDP growth rates as key indicators of economic health.

Government expenditures are often considered an important indication for promoting and maintaining expansion in the economy. In recent decades, a growing number of economists and policymakers have expressed interest in the correlation between government expenditure and economic growth. Odo et al. (2016) highlighted the importance of government expenditure as an essential instrument for maintaining substantial economic growth rates. Government expenditure is an essential factor in facilitating economic recovery. Hasnul (2015) emphasizes that government expenditure significantly influences economic activity and the achievement of policy objectives. Among the others, Abdullah et al. (2016) further examine the positive correlation between government expenditure and economic growth, positing that government expenditure serves as an essential variable in promoting economic progress.

In Malaysia, government expenditure is a crucial factor that affects economic activity and policy objectives. Kannan et al. (2014) assert that government expenditure is essential for economic recovery, especially during periods of economic hardship. This is also supported by Ahuja & Pandit (2020) where increasing government expenditure is important for maintaining and achieving high levels of economic growth, as it can help stabilize the economy and foster development. Figure 1 illustrates the changes in Malaysia's gross domestic product growth from 1990 to 2022. Between 1990 and 2022, Malaysia's gross domestic product (GDP) exhibited substantial fluctuations, notably observing a significant decline from 7.3 in 1997 to -7.4 in 1998. The Gross Domestic Product (GDP) exhibits a significant fall from 2019 to 2020, shifting from an upward trend of 4.4 to a decline of -5.5, followed by another climb until 2022. This demonstrates that Malaysia persists in addressing external developmental challenges and risks associated with a more liberal economic framework, despite the substantial efforts conducted in macroeconomic governance. (Kamis et al., 2020). As we can see in Figure 1, Malaysia has been experiencing a fluctuating trend of economic growth despite the substantial government

efforts in macroeconomic management over the past 5 years, however, the economic growth is inconsistent. The study focuses on the significance of government expenditure on economic growth in Malaysia. The main objective of this article is to assess the impact of government expenditure on economic growth in Malaysia, employing data from 1990 to 2023. This research seeks to explain the impact of various government expenditures on GDP in promoting economic stability and development. Various categories of government spending—such as housing, healthcare, social services, defense, and education are employed to reaffirm the effectiveness of each government effectiveness on economic growth. This analysis is particularly important given the mixed results found in existing literature, where some studies indicate positive correlations between government spending and economic growth, while others suggest negative or insignificant effects.

Figure 1: Malaysia's GDP growth (annual %)


Source: World Bank Data

This study employed various indices of government spending on economic development. Uwatt's (2019) study highlights the important role of the housing sector in economic growth and development. The industry significantly impacts a nation's social and economic advancement. The research emphasized the crucial role of both government and private sectors in promoting sustainable growth and improving economic output through the development of high-quality housing. Moreover, IMF, (2023) stated that with the help of numerous initiatives, the housing sector's recovery can boost the economy and lead to general growth. In the context of government spending, "housing expenditure" usually refers to the money allotted or spent by the government on housing-related projects, programs, or subsidies. The purpose of government housing spending is to meet the population's housing needs, promote affordable housing, and address several housing sector issues.

In terms of healthcare, the study by Bloom et al., (2004) states that health is important to promote economic growth. Employees in better physical and mental health are more energetic and persistent. They produce more and make more money. According to the Ministry of Health, in 2019, Malaysia's GDP was 4.3% of its total health expenditure (TEH). A healthier workforce, higher productivity, and better health outcomes are frequently linked to higher healthcare spending, all of which can support economic growth. Spending more on healthcare is frequently linked to better health outcomes, higher productivity, and a healthier workforce which may contribute to economic expansion. (Bloom and Canning, 2003) For social expenditure, the study from (Alper & Demiral, 2016) concludes that social expenditures in all three dimensions can contribute substantially to economic expansion. The overall findings highlight the fact that, in the case of certain OECD countries, public spending can be profitable as an investment. The term "healthcare expenditure" refers to the money that the government sets aside or spends on infrastructure, services, and programs related to healthcare. The goal of this spending is to keep and enhance the population's health and well-being. The amount of money allocated by the government to healthcare varies depending on the priorities, policies, and healthcare system of the nation.

This study by Aziz & Asadullah(2017), found that the effect of military spending on growth in case of internal conflicts is positive and significant but, it is not confirmed when external conflicts exist. Farther than that, however, even though the studies directly targeting defense spending and national security in Malaysia are lacking, the government usually finances the national defense expenditure which is important for the growth

of the economy because of its impact on national security, stability and critical infrastructure protection. (Kamis et al., 2020)

For education expenditure, the study from Abdul Latif et al., (2007) suggests that there is a co-integrating relationship between GDP per capita and education as measured by primary, secondary, and higher education enrolment rates. Next, a study from Hussin et al., (2012) demonstrates the significance of human capital, such as education, in influencing Malaysia's economic growth. Based on the above existing literature, this study examines the impact of government expenditure by focusing on the above-mentioned five sectors including housing, healthcare, social, defense security, education expenditure, capital expenditure, trade openness and labor expenditure.

Next, in terms of capital expenditure, according to reports, one of the most important components of public spending for a nation's comprehensive and long-term economic growth is capital spending. Nevertheless, it is a difficult undertaking to manage capital expenditures, expenses, and distribution in an equitable way to achieve economic growth in each fiscal year. (Al-Sharif, 2019). Based on the above-mentioned studies, the paper will further investigate the role of government expenditure on economic growth by focusing on how various categories of government spending—such as housing, healthcare, social services, defense, and education-impact economic growth. Hence, the second objective of the paper.

The remaining of the study is organized into five sections. In section two, the paper addresses the existing theoretical and empirical literature on various government expenditures on economic growth; section three introduces estimation technique and methodology, section four shows the empirical research analysis and section five concludes the study and recommendations.

2. Literature Review

The relationship between government spending and economic growth has been a commonly examined subject in economic studies. Wagner's Law and Keynesian Theory influence the relationship by providing various perspectives on the function of government expenditure. Wagner's Theory posits that as an economy grows, government expenditure increases, whereas economic growth leads to higher public spending due to increased demand for public services and infrastructure. According to this theory, as the economy evolves, the government's activities and functions tend to expand. Consequently, the proportion of public spending relative to national income typically rises during economic development (Magazzino et al. 2015). Economic growth, or GDP, refers to the increases in an economy's productive capacity, leading to the creation of a significantly greater quantity of goods and services. Several studies support Wagner's hypothesis, showing a positive correlation between economic growth and government spending. For instance, Wu et al. (2010) found a bidirectional causal relationship between government expenditure and economic growth regardless of the perspective on the size of the government using data from 182 countries. In a similar study by Uzuner et al. (2017), the long-term correlation between public spending and economic growth is found in Turkey, supporting Wagner's law with Johansen's cointegration test and Granger's causality test for the period from 1975 to 2014.

Keynes (1936) argued in his book "General Theory of Employment, Interest, and Money" that governments must step in during economic downturns to boost aggregate demand as a short-term remedy. As Government spending is one of the determinants of aggregate demand, any upward movement of it leads to the multiplier that increases output and employment. Keynes argued that government spending is fiscal policy and is a mechanism for affecting the economy. As a result, he asserted that public spending was exogenous. This is consistent with an Italian study by Magazzino et al., (2015), who supports the Keynesian theory of government expenditure. Additionally, the research conducted in Nigeria by Ayo et al. (2011) demonstrates a two-way causal relationship between government expenditures and economic growth that operates in both the short- and long-term. Among the others, Jiranyakul (2020) and Babatunde (2011) for Nigeria. By using Granger's causality test and conducting a cross-country investigation in five Asian nations, Wu et al., (2010) discovered a Keynesian connection only in the Philippines case.

The empirical findings on the correlation between government spending and economic growth cover various sectors including housing, healthcare, social services, defense, education, capital, trade openness, and labor. In the early stages of development, governments in countries like China and South Korea often discouraged housing investments, believing that they yielded lower returns compared to manufacturing and infrastructure sectors. However, more recent studies highlight the significant role of housing in economic growth. Housing investments contribute to job creation, income generation, and overall economic development. For example, Uwatt (2019) noted that improved housing can enhance productivity in other economic areas. Andrews et al. (2011) further emphasized the need for better housing policies to promote economic growth, advocating for targeted social housing systems and flexible housing allowances.

The World Health Organization (WHO) asserts that healthcare spending is a significant component of national budgets, offering substantial opportunities to impact national economies. Health is both a desirable outcome and a key determinant of economic productivity. Grossman (2004) described health as a commodity that individuals both produce and consume. Healthier populations are more productive, which boosts economic growth. Studies in East Africa (Gisore, 2020) and Malaysia (Kamis et al., 2020) have found positive correlations between healthcare expenditure and economic growth. However, some studies, like those by Hasnul (2015) and Velenyi (2016), suggest a complex relationship between health spending on economic growth, indicating the health channel is country-specific, and the effects on economic growth may vary by context.

Among the others, Alam et al. (2010) examined the long-term effects of social sector spending on economic growth in developing Asian nations, finding positive impacts. Social sector spending, including on health, nutrition, housing, education, and social security, is generally seen as beneficial for the economy. Social expenditures also improve employment opportunities, income levels, and productivity, which in turn foster economic growth. The positive and long-run relationship between social expenditures and economic growth is also supported by Ayuba & Ayuba (2014). Ayuba & Ayuba (2014) used Vector Error Correction (VEC) model-based causality to examine the impact of social expenditures and economic growth in Nigeria between 1990 to 2009.

The relationship between defense spending and economic growth is complex and contentious. Benoit (1978) found that defense expenditures had a positive impact on economic growth in less developed countries, a finding known as the "Benoit Hypothesis." However, more recent studies present mixed results. Yildirim & Ocal (2016) observed a positive effect of military spending on economic growth in Middle Eastern countries, while Braşoveanu (2010) found that defense spending negatively affected economic growth in Romania.

Investment in education is crucial for developing human capital, which is a key driver of economic growth. Studies in developing countries (Idrees & Siddiqi, 2013) and Malaysia (Hussin et al, 2012) found that education spending positively correlates with GDP growth. The quality of education is capable of increasing a country's economic growth. However, some existing studies (Suwandaru et al, 2021) argue that the relationship between education and economic growth is not always straightforward, suggesting that other factors may influence this relationship in Indonesia.

Government capital expenditure on infrastructure and other investment goods is essential for economic growth. Empirical research by Waweru (2021) confirmed the positive relationship between government capital expenditure and economic growth in East Africa by using the panel least square (OLS) method. Nonetheless, some studies, like those by Paudel (2023), question the assumption that all capital expenditures equally contribute to growth, indicating that the effectiveness of such investments can vary.

Overall, the theoretical examination emphasizes Wagner and Keynes's views as the most significant theories for comprehending the relationship between government expenditure and economic growth. Keynesian theory emphasizes the use of fiscal policies, including increased government expenditure, to stimulate economic activity during recessions. In summary, the existing theoretical and empirical literature provides a comprehensive foundation for examining the impact of different types of government expenditures on economic growth across different countries. While some studies support a positive relationship between government expenditure and economic growth, others indicate insignificant effects.

3. Research Methodology

This study focuses on the impact of government expenditure on economic growth in Malaysia from 1990-2022. The data are sourced from the World Bank and include GDP per capita, and expenditures on housing, healthcare, social services, defense, education, capital, trade openness, and labor participation. The measurements for each variable are summarized in Table 1.

Table 1: Variable's definition and proxies' measurement

Variables	Proxies	Explanation
GDP	Gross domestic product used to measure economic growth in Malaysia	GDP per capita at local currency unit (LCU)
EXP	The total government expenditure in different sectors includes housing expenditure, healthcare expenditure, social expenditure, defense expenditure, and education expenditure.	All the government expenditure is in Ringgit Malaysia (RM)
C	Gross capital fixed as a proxy to measure capital in Malaysia	Constant local currency unit (LCU)
OPEN	Trade Openness	Constant local currency unit (LCU)
LB	Labor	Labor force, total

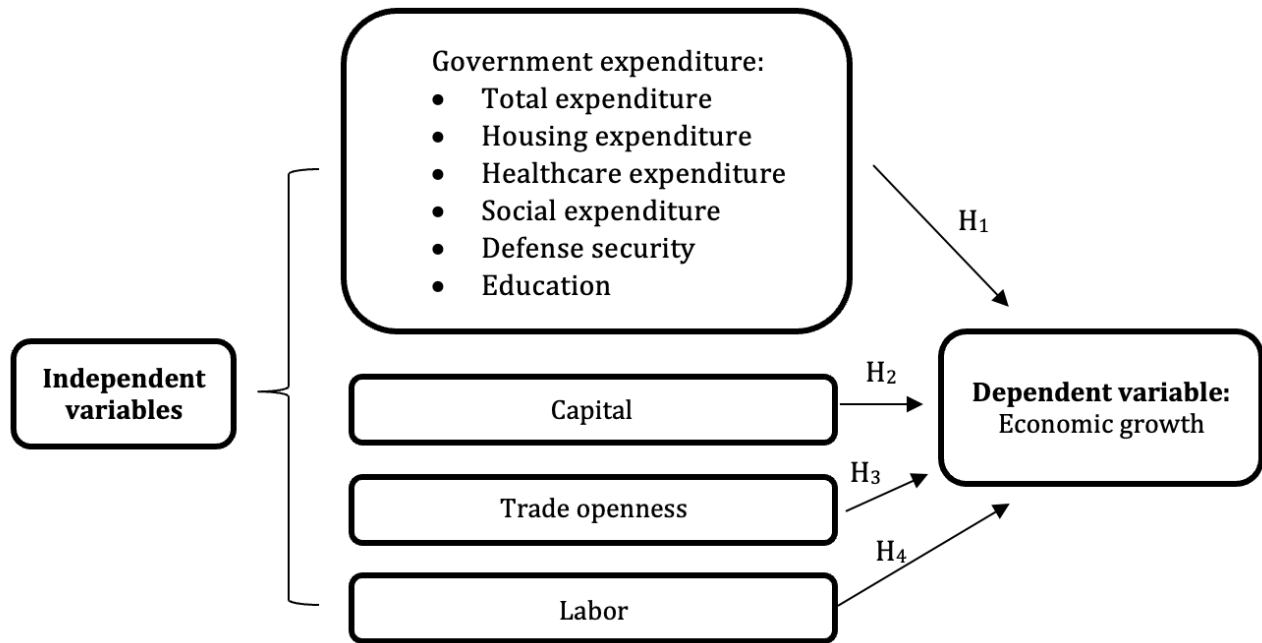
We employed a time series analysis to examine data made up of evaluations of the values of variables at various points in time. The model is employed to comprehend the basic components and strengths of the observed data.

EQ(1) below is the model specification:

$$GDP_t = \beta_0 + \beta_1 EXP_t + \beta_2 C_t + \beta_3 OPEN_t + \beta_4 LB_t + \varepsilon_t$$

Where
GDP = economic growth
EXP = government expenditure
C = capital
OPEN = trade openness
LB = labor
ε = error term

Trade openness and labor force participation are added into the model specification as a vital catalyst for economic growth, enhancing market access and resource allocation. Studies by Huang and Chang (2014) and Tahir and Azid (2015) found positive correlations between trade openness and economic growth. Wong (2005) also highlighted the significant impact of trade openness on Malaysia's economic growth. Studies in Indonesia by Nadilla and Ichsan (2023) show that higher labor force participation rates positively impact GDP. The quality and availability of labor are crucial for sustaining economic development, as highlighted by Jajri and Ismail (2010).

Figure 2: Theoretical Framework


From the theoretical framework in Figure 2, we expect that the Malaysian economy will adhere to the endogenous growth theory and the Keynesian hypothesis, which contend that increased government spending may accelerate economic growth. As a result, all the independent variables are expected to be positively correlated with the GDP aside from the error term, which will likely be zero.

4. Results and discussion

The analysis starts with descriptive statistics testing, followed by unit root testing using the Augmented Dickey-Fuller test. The autoregressive distributed lag (ARDL) short-run estimation approach was also implemented to measure the short-run impact as well as the ARDL Bound test to measure long-run impact. All variables are estimated in logarithm form. According to the ADF test results, all the variables were stationary at the first difference, and none were stationary at a level as shown in Table 2.

Table 2: Unit root test

Variables	Augmented Dickey-Fuller (ADF)	
	Level	First Difference
GDP	0.4889	0.0000
EXP	0.5143	0.0008
C	0.4555	0.0000
OPEN	0.0656	0.0089
LB	0.9493	0.0019

There were 162 models assessed, and the best-fitting ARDL model selected through the regression method for this dataset was ARDL (2,0,2,0,0). The Schwarz criteria (SIC) was chosen as the model selection approach since it produces a lower value for the model, which is preferable.

The ARDL short-run estimation mainly determines the short-run relationship between the dependent variable, GDP, and the independent and control variables in this study, EXP, C, OPEN, and LB. The results in Table 3 show that all of the factors have a short-run association with GDP. Two of the variables, EXP and C, indicate a negative short-run association, but OPEN and LB show a positive relationship with GDP.

For the bound test and long-run estimation, the findings in Table 4 reveal that the value of the F-statistic is 15.48471, indicating that it is greater than the upper bound values at a 5% significance level. The results show that there is cointegration in the dataset, demonstrating the presence of a long-run link in this model.

The result for the long-run estimation is shown in Table 5. Based on the result, two of the variables shown to have a positive long-run relationship with the GDP are OPEN and LB meanwhile another variable EXP and C show a negative long-run relationship with GDP. This can conclude that in the long run, some of the variables are significant namely EXP, OPEN and LB which indicates the null hypothesis. Is rejected. It means that there is a significant relationship between total government expenditure, trade openness and labor expenditure with economic growth. Meanwhile, for LB, this study accepts the null hypothesis which states that there is no significant relationship between capital expenditure and economic growth.

Table 3: ARDL short-run estimation

Variable	Coefficient	Std. Error	t-Statistic	Prob.
GDP (-1)	0.278003	0.152140	1.827287	0.0813

Next, the estimation divides government spending into five economic sectors: housing, healthcare, social, defense security, and education expenditure. Based on the results of the long-run ARDL test reported in Table 6, this study concludes that two categories of expenditures provide considerable value: housing and education expenditures. This conclusion contradicts Alshahrani and Alsadiq's (2014) claim that expenditure in the housing sector boosts output. Meanwhile, findings confirming Kamis et al.'s (2020) analysis indicate a negative relationship between education expenditure and Malaysian economic growth.

5. Conclusion

According to the results and discussion, this study found that the changes in independent variables, total expenditure which sum of housing, healthcare, social, defense security and education expenditure meanwhile control variables are capital, trade openness and labor had an impact on economic growth in the short run and long run. The result obtained by the ARDL test and Bound Test indicates that there is a long-run relationship between variables.

These findings show that the Malaysian economy does not fit the Keynesian hypothesis. In other words, the evidence suggests that lower government expenditure improves the real GDP growth rate. The fact that government spending and economic growth have a negative relationship suggests that it may be a signal that government expenditure is not a cause of economic growth, as has been suggested by Wagner's law.

Based on the estimated result, the total expenditure has been found to have a significant impact on economic growth in Malaysia. The total expenditure is the sum of housing, healthcare, social, defense security and education expenditures. In detail, for housing, this outcome is consistent with the findings by past researcher Uwatt, (2019) states that there is an excellent possibility that the housing industry and the services it provides will spur economic expansion and development. The housing industry has been used as a growth engine in many of the world's economies.

Subsequently, in the context of healthcare, this finding aligns with Kamis et al. (2020), which asserts that healthcare represents the most significant component of government expenditure impacting economic growth in Malaysia. Additionally, the study by Alam et al. (2010) concludes that social sector expenditures can influence economic growth. Social expenditures enhance productivity through the provision of infrastructure, healthcare, and education, while also resolving the interests of public and private sectors. This outcome aligns with findings from prior research regarding defense security. Yildirim and Ocal (2016) demonstrate that military spending and GDP exhibit a close geographical variation. Exploratory spatial analysis indicates a statistically significant positive spatial association between real income and military spending. In the meantime, with respect to education expenditure, analysis within 14 Asian countries (Bangladesh, China, Hong Kong, India, Japan, Nepal, Pakistan, Malaysia, The Philippines, Saudi Arabia, Singapore, Sri Lanka, Thailand, and Turkey) indicate a positive and statistically significant effect of education expenditures on economic development (Mallick et al, 2016). in summary, this study concludes that total expenditures, covering housing, healthcare, social services, defense security, and education, can enhance economic growth in Malaysia.

Other than that, capital which uses gross capital fixed as a proxy, the result indicates that the impact on economic growth is insignificant. According to the classical growth theory, capital will advance economic development. This result is inconsistent with the results reported by Alexiou (2009). Meanwhile, for trade openness which uses the total of imports and exports as a proxy, the results show a significant impact on economic growth. This supports the previous study by Hasnul (2015) states that the effect of the level of trade on economic growth turns out to be negative and significant in the base model. Lastly for labor, this study indicates that labor also has a significant impact on fostering economic growth in Malaysia. A past study from Hasnul(2015), shows a positive correlation with economic growth.

This research has several limitations. The study only examines a small number of distinct economic sectors. This may have an impact on the variables' ability to depend on one another. It also takes time to look at every facet of the economy. Every variable takes time to produce, and in Malaysia, there aren't as many variables available to measure the government's expenditures as there are in the World Bank's data. The policy implications of a study on government expenditure and economic growth are crucial for guiding policymakers in formulating effective strategies to foster sustainable development. In this study, some variables show a positive significant impact on economic growth which are trade openness and labor expenditure. Hence, policymakers may consider maintaining or increasing fiscal stimulus during economic downturns to boost aggregate demand. Meanwhile, for the insignificant which indicates that the expenditure does not influence the economic growth, a more cautious approach to budgeting may be necessary.

Recommendations
As for the recommendation for better future research in government expenditure, the researcher can expand the empirical study with cross-country comparison as the effects may vary from different country settings. By comparing the role of government expenditure on economic growth with different country settings, it can identify best practices and possible areas for improvement. Apart from that, the econometric analysis will also assist in giving Malaysian policymakers direction on how to comprehend and investigate the key elements influencing economic growth. They could find new measurements that were possibly overlooked because the country's trends are always shifting.

Abstract: The paper analyses the relationships between Foreign Direct Investment (FDI), Energy Consumption, Unemployment, and their effects on Income Distribution in Malaysia from 1990-2022. Despite economic growth, Malaysia faces income inequality, especially among ethnic groups. The study uses ARDL regression to find that FDI promotes income distribution by creating jobs and facilitating technology transfer. Increased energy availability boosts industrial production, which is crucial for equitable income distribution. High unemployment, particularly among graduates, exacerbates income inequality. Government initiatives aim to address unemployment through skills enhancement and entrepreneurship. The study concludes that FDI and energy consumption positively influence income distribution, while unemployment has a negative impact. The findings are valuable for policymakers in fostering inclusive growth and equitable income distribution in Malaysia. As Malaysia is an export-oriented country, these insights can lead to impactful improvements in the export sector, further boosting employment opportunities and economic resilience.

Keywords: *Income Distribution; Energy Consumption, Foreign Direct Investment, Unemployment*

1. Introduction and Background

Income distribution is a crucial measure of economic health and social equality, reflecting how wealth and resources are allocated within a population (Butt et al., 2022). In Malaysia, historical economic disparities originated during colonial times when different ethnic groups were assigned specific economic roles: the Chinese in trade and industry, Indians in plantation agriculture, and Malays in subsistence farming. Post-independence, the New Economic Policy (NEP) of 1971 aimed to address these disparities by enhancing the economic participation of Malays and other indigenous groups (Bumiputeras) through affirmative action (Mamun et al., 2020). Although the NEP reduced extreme poverty and increased Bumiputera's economic involvement, structural imbalances and urban-rural disparities persisted. The Gini coefficient, measuring income inequality from 0 (perfect equality) to 1 (perfect inequality), showed a downward trend in Malaysia over recent decades inequality (Azam et al., 2021; Esquivias et al., 2022; Rahman et al.,2022). In the 1970s, the coefficient was around 0.51 but improved to 0.39 by 2019 due to economic development and government initiatives. Despite progress, income inequality remains exacerbated by the COVID-19 pandemic, which intensified job losses among low-income groups (Masseran et al., 2019). The government responded with stimulus packages and financial aid, but long-term impacts on income distribution are yet to be fully seen. The pandemic also accelerated Malaysia's digital transformation, highlighting the need to bridge the digital divide. Foreign Direct Investment (FDI) has been crucial for Malaysia's economic growth, especially in manufacturing, services, and high-tech sectors (Malik and Tamat, 2019). Although FDI declined during the pandemic, recovery signs were evident in 2021 and 2022. The oil and gas sector and investments in renewable energy and tourism remain significant for FDI. Energy consumption, predominantly from fossil fuels, is essential for economic growth (Abbas et al., 2022). Malaysia's energy intensity is high compared to global standards, though it has improved. The government's focus on sustainability reflects efforts to reduce carbon emissions (Ali, 2022). Unemployment has varied over time, peaking at 5.3% in May 2020 due to the pandemic. Youth and gender disparities in unemployment highlight ongoing inequality issues.

The literature on the impact of Foreign Direct Investment (FDI) on income distribution presents mixed views. Some research suggests that FDI promotes equal income distribution, while other studies indicate it exacerbates income inequality. In Malaysia, evidence on the relationship between foreign investment and income inequality needs to be clarified, with findings suggesting that FDI might influence income inequality directly or indirectly through its effects on economic growth. This highlights the need for further investigation into this complex relationship. Another significant factor influencing income inequality is the energy market. There is a notable dynamic between energy consumption and income distribution. The use of renewable energy

has been linked to reductions in income inequality, as energy security—ensuring a reliable and stable supply of energy at reasonable prices—plays a crucial role in economic and social development (Rodon et al., 2021). Energy is essential for domestic activities such as lighting, cooking, and heating. Disruptions in energy access can severely impact households, affecting their social and economic well-being. Therefore, understanding how energy consumption affects income inequality is crucial for policymakers. Malaysia's economy is driven by a robust export industry, which generates a lot of job possibilities, particularly in the manufacturing and services sectors. The nation supports industrial growth by ensuring a steady supply of resources through a strategic energy policy. These measures promote economic growth and raise living standards while helping Malaysia maintain its competitiveness on the world stage.

The research gap this study addresses is the limited exploration of the combined effects of foreign direct investment (FDI), energy consumption, and unemployment on income distribution in Malaysia. While previous studies may have examined these factors individually, more comprehensive research needs to analyze their interconnected impact over an extended period, particularly from 1990 to 2022. This study seeks to fill that gap by providing a holistic understanding of how these variables collectively shape income inequality in Malaysia, which is crucial for informed policymaking. It seeks new insights into addressing income inequality, a significant concern for the Malaysian government. Whether strategies to attract more FDI, enhance energy access, and reduce unemployment will effectively address income inequality remains to be seen. The government aims to implement strategies to lower the Gini coefficient and improve income distribution (Sani et al., 2020). Understanding the underlying causes of income inequality is essential for developing effective policies and refining existing ones. This study focuses on three key variables—FDI, energy consumption, and unemployment—to evaluate their effects on income inequality.

2. Literature Review

Income Distribution In Malaysia
The relationship between economic growth and income distribution has been a central focus of economic research, with the "Kuznets Curve" being one of the most influential hypotheses in this domain. Proposed by Simon Kuznets in 1955, the Kuznets Curve posits that income inequality follows an inverted U shape as a country progresses through different stages of economic development. According to Kuznets, income inequality tends to rise during the initial phases of economic growth. This increase is attributed to structural transformations within the economy, where a shift from agriculture to industrialization typically benefits a minority with capital or skills suited to the emerging sectors, leaving the majority initially behind.

The Relationship Between Foreign Direct Investment of Malaysia and Income Distribution
Developing and transitioning countries increasingly see FDI as a role in economic development, modernization, income growth, and job creation. The Solow-Swan model highlights its role in increasing capital formation, technological progress, and productivity. According to Solow (1956) and Swan (1956), FDI contributes to economic growth by bringing in new technology, managerial expertise, and investment capital, increasing the host economy's productive capacity. This influx of capital and knowledge can lead to higher economic growth rates as domestic industry benefits from increased efficiency and innovation (Bekmurodova, 2020). Foreign direct investment (FDI) can support long-term income growth through productivity impacts and technology spillovers. There are two ways that the productivity spillover from FDI can impact the development of regional income. The first is through the vertical engagement of international and domestic businesses, fostering stronger ties and spillovers with clients and suppliers. Second, because local businesses gain from the demonstration, foreign enterprises can provide spillovers to domestic businesses operating in the same industry through horizontal partnerships.

Empirical studies indicate that FDI has been a significant driver of economic growth in Malaysia, contributing substantially to the country's industrialization and modernization efforts. Hira et al. (2019) document how FDI has facilitated Malaysia's transition from an agriculture-based economy to an industrially diversified one. However, the distribution of these benefits has been uneven. FDI in Malaysia has predominantly flowed into manufacturing sectors, particularly the electronics and petroleum industries. Ismail (2001) notes that these sectors have created numerous jobs and increased wages, contributing to economic growth. While FDI can create jobs and stimulate economic growth, there is a concern that it may exacerbate income inequality if not

adequately managed. Referring to Rasiah, Asirvatham, and Adamu (2017), policymakers in Malaysia need to implement measures that promote inclusive growth and ensure that the benefits of FDI are shared among all segments of society. One way to achieve this balance is through targeted policies encouraging FDI in sectors with a high potential for job creation and value addition. The inverse link implies that macroeconomic volatility may exacerbate the income gap in Africa. Malik and Tamat (2020) investigated the effects of FDI on wealth inequality and the ability of relationship-dependent children to absorb information using data from 54 countries between 1980 and 2005. Studies from Mukaramah-Harun (2015) show that although FDI has contributed to overall economic growth and development, it has also increased income inequality in specific periods and regions. This observation implies that FDI can increase income disparity when a country first develops but reduce inequality as development continues.

H₁: There is a positive relationship between Foreign Direct Investment in Malaysia and Income Distribution.

The Relationship Between Energy Consumption in Malaysia and Income Distribution

The economic literature well documented the relationship between energy consumption and economic growth. Utilizing sophisticated econometric models and statistical techniques, Walheer's studies reveal that fluctuations in energy consumption can lead to substantial variations in economic output. This theoretical framework posits that energy is not merely an ancillary input but a core driver of economic activity. For instance, when there is an increase in energy availability, it can significantly boost industrial production by enabling factories to operate at higher capacities and allowing businesses to expand their operations. This theoretical framework is particularly pertinent. Malaysia's rapid industrialization and economic development have historically been closely linked to its energy consumption patterns. Recent research by Rahman et al. (2017) and empirical studies on Malaysia corroborate Walheer's findings, demonstrating a strong correlation between energy consumption and economic growth.

Recent arguments highlight that as Malaysia continues to advance towards a knowledge-based economy, the role of energy in supporting technological innovation becomes even more critical (Shadman et al., 2021). Access to reliable and affordable energy is essential for powering high-tech industries and supporting digital transformation initiatives. This is particularly relevant in electronics, biotechnology, and information and communication technology (ICT), where energy-intensive processes are fundamental to production and innovation. Research by Schulte and Heindl (2017) indicates that low-income families tend to exhibit weaker responses to price fluctuations than high-income households. Environmental degradation, such as air and water pollution from fossil fuel use, disproportionately impacts low-income communities that may lack the resources to mitigate these impacts. Promoting sustainable practices in industries that heavily contribute to carbon emissions could positively affect the environment and income distribution (Ran & Xu, 2023). By incentivizing businesses to adopt greener technologies and reducing their reliance on fossil fuels through policies targeting greenhouse gas reductions, Malaysia could create an ecosystem where resources are allocated more equitably while mitigating climate change risks (Ismail et al., 2020). The findings suggest that increased consumption of renewable energy reduces income inequality.

H₂: There is a positive relationship between Malaysia's energy consumption and income distribution.

The Relationship Between Unemployment in Malaysia and Income Distribution

Unemployment refers to being without a job, while income distribution refers to how income is divided among individuals or households in a society (Janice et al., 2021). Phillips Curve Theory, formulated by economist A.W. Phillips in 1958, proposed an inverse relationship between unemployment and inflation. According to this theory, when unemployment is low, labor becomes increasingly scarce, causing employers to compete for workers by raising wages. Higher wages increase consumer purchasing power, leading to higher demand for goods and services, which can then raise prices, resulting in inflation. Conversely, when unemployment is high, the pressure on wages is reduced, and inflation tends to be lower (Sreenu, 2023). This theory suggests policymakers face a trade-off between reducing unemployment and controlling inflation.

Recent studies and empirical evidence suggest that Phillips Curve dynamics can be observed in the Malaysian economy (Fung & Nga, 2023; Norhashim et al., 2019; Ghorpade et al., 2024). For example, a period of low unemployment in Malaysia has been linked to rising wages, particularly in sectors experiencing labor shortages, such as manufacturing, construction, and services. Recent arguments highlight that the relationship between unemployment and inflation in Malaysia is influenced by several factors, including global economic

conditions, labor market dynamics, and policy interventions (Hassan et al., 2023). For example, external shocks such as international oil price fluctuations can affect inflation independently of the domestic unemployment rate. Chan and King (2020) claimed fewer job opportunities are often available if high unemployment rates are high. This can result in a higher concentration of wealth among those employed, leading to an unequal income distribution. Law (2018) states income inequality can also impact unemployment rates. The primary sector offers stable, high-paying jobs with benefits, while the secondary sector consists of low-paying, unstable jobs with minimal benefits. The findings suggest a negative relationship between unemployment and income distribution in Malaysia.

H₃: There is a negative relationship between Unemployment in Malaysia and Income Distribution.

3. Research Methodology

Data and Variables Explanation
Due to data availability, this study used annual data from 1990 to 2022 as a sample period. A summary of the data and its sources is shown in Table 1 below.

Table 1: Variables description

Variables	Indicator	Source
Income Distribution	Gini coefficient index (GINI)	World Development indicators
Foreign Direct Investment	Foreign direct investment, net inflows (% of GDP)	World Development indicators
Energy Consumption	Energy use	World Development indicators
Unemployment	Unemployment rate	World Development indicators

Note: The GINI index values range from 0 to 100, where 0 represents perfect equality while 100 represents perfect inequality. The higher the value of the coefficient, the higher the degree of inequality

Estimation Procedures
The general functional form of the income distribution model for Malaysia was derived as follows:

$GINI_t = f(FDI_t, ENC_t, UE_t,)$

where

$GINI_t$ represents income distribution,

FDI_t represents foreign direct investment inflows,

ENC_t represents energy consumption,

UE_t represents unemployment.

The variables in Equation were transformed into log-linear forms (LN). The log version of the variables indicates the short-run and long-run elasticity. The log version of the model derived from the Equation can be seen as follows:

$LNGINI_t = \beta_0 + a_1 LNFDI_t + b_2 LNENC_t + s_3 LNUE_t + \varepsilon_{it}$

FDI is crucial in boosting economic growth and improving citizens' living standards (Azam et al., 2021; Esquivias et al., 2022; Rahman et al.,2022). Foreign direct investment (FDI) has emerged as a critical driver of economic growth and development in countries worldwide. FDI refers to the investment made by individuals, businesses, or governments from one country into another to establish a lasting interest in the host country. Energy consumption plays a crucial role in shaping the income distribution dynamics of a country like Malaysia. The impact of energy consumption on income distribution dynamics cannot be understated, especially in Malaysia. Energy consumption affects the economy and significantly affects how wealth is distributed among different segments of society. How we produce and consume energy directly impacts job creation, economic growth, and access to essential services (Ayomitunde et al., 2021). Understanding the relationship between unemployment and income distribution is crucial for policymakers and economists alike. Unemployment refers to being without a job, while income distribution refers to how income is divided among individuals or households in a society (Janice et al., 2021). The two concepts are interconnected, as high levels of unemployment can lead to unequal income distribution and vice versa. Chan and King (2020) claimed fewer job opportunities are often available if high unemployment rates are high. As for these studies, we expected a

positive sign between FDI and energy consumption towards income distribution. To conclude, unemployment is expected to impact income distribution negatively.

The cointegration of the variables in the study was examined using an autoregressive distributed lag (ARDL) bound test. ARDL was applied to determine the cointegration of short-run and long-run relationships between variables. ARDL is relevant for small data sets and undertakes the variable's integration order at I(0) or I(1). The ARDL model based on the unrestricted error correction model (UECM) is stated below:

$$\Delta LNGINI_t = \beta_1 + \theta_0\, LNGINI_{t-1} + \theta_1 LNFDI_{t-1} + \theta_2 LNENC_{t-1} + \theta_3 LNUE_{t-1} +$$

$$S\Delta LNGINI_{t-i} + \sum_{i=0}^{b} \alpha_i\, \Delta LNFDI_{t-i} + \sum_{i=0}^{c} \gamma_i\, \Delta LNENC_{t-i} \sum_{i=0}^{d} \lambda_i\, \Delta LNUE_{t-i} + u_t$$

$$\Delta LNFDI_t = \beta_1 + \theta_0\, LNGINI_{t-1} + \theta_1 LNFDI_{t-1} + \theta_2 LNENC_{t-1} + \theta_3 LNUE_{t-1} +$$

$$the \sum_{i=1}^{a} \beta_i\, \Delta LNFDI_{t-i} + \sum_{i=0}^{b} \alpha_i\, \Delta LNGINI_{t-i} + \sum_{i=0}^{c} \gamma_i\, \Delta LNENC_{t-i} \sum_{i=0}^{d} \lambda_i\, \Delta LNUE_{t-i} + u_t$$

$$\Delta LNENC_t = \beta_1 + \theta_0\, LNGINI_{t-1} + \theta_1 LNFDI_{t-1} + \theta_2 LNENC_{t-1} + \theta_3 LNUE_{t-1} +$$

$$\sum_{the\ i=1}^{a} \beta_i\, \Delta LNENC_{t-i} + \sum_{i=0}^{b} \alpha_i\, \Delta LNGINI_{t-i} + \sum_{i=0}^{c} \gamma_i\, \Delta LNFDI_{t-i} \sum_{i=0}^{d} \lambda_i\, \Delta LNUE_{t-i} + u_t$$

Where Δ is the first difference operator, and it is the white-noise disturbance term? Residuals for the UECM should be serially uncorrelated, and the model should be stable. The diagnostic tests listed in the analysis section can be used to address this validation. According to the primary model, historical values might affect and clarify the income distribution (LNGINI) level. It, therefore, involves additional shocks or disruptions. The long-run elasticity from the UECM estimation equals the coefficient of the one-lagged dependent variable divided by the coefficient of the one-lagged explanatory variable (multiplied by a negative sign). The first differenced variable's coefficients capture the short-term effects. In the long-term connection, the null of no cointegration is defined as follows:

Hypothesis H0 (H0). Income Distribution = FDI = Energy Consumption = Unemployment = 0 (there is no long-run relationship), is
tested against the alternative.
Hypothesis H1 (H1). Income Distribution ≠ FDI ≠ Energy Consumption ≠ Unemployment ≠ 0 (a long-run relationship exists).

Assume the calculated F-statistic is smaller than the lower-bound critical value and apply the well-known F-test. Then, we do not rule out the null hypothesis of no cointegration. However, consider that the calculated F-statistics are higher than the 10% significant level's upper bound critical value. We then reject the null hypothesis that there is no cointegration.

4. Results

As with other time series analysis processes, the first step usually involves determining the unit root of each variable that will be studied. The data's stationarity was determined using two-unit root tests: Phillips-Perron (PP) and Augmented Dickey-Fuller (ADF). The unit root tests show that the energy use, FDI, and Gini coefficient are I(1) variables because they are non-stationary at their levels but become stationary after first differencing. This indicates that to attain stationarity, these variables must be differentiated due to their stochastic trend. We moved on to the PP unit root test since it was thought to be more effective than the ADF unit root test because of the mixed stationarity of this result. The mixed stationarity trend is once more identified for the PP

unit root test at the level, intercept, and trend. Therefore, we deduced that the mixed stationarity model—also referred to as ARDL estimation—satisfies the criterion for a bound test.

Table 2: Testing ADF and PP unit root

Variable	Unit Root Test			
	Augmented Dickey-Fuller		Phillips-Perron	
	Level	1st Difference	Level	1st Difference
Gini	-0.986 (0)	-5.542 (0) ***	-0.986 (0)	-5.624 (3) ***
FDI	-4.773 (0) ***	-6.449 (1) ***	-4.767 (2) ***	-24.954 (28) ***
Energy use	-2.410 (2)	-5.997 (0) ***	-4.513 (13) ***	-6.807 (6) ***
Unemployment	-2.383 (0)	-4.107 (0) ***	-2.253 (4)	-3.563 (9) **

Note: 1. ** and *** 5% and 1% of significant levels, respectively. 2. The optimal lag length is selected automatically using the Schwarz info criteria (SIC) for the ADF test. The bandwidth was selected using the Newey–West method for PP.

Next, we need to determine whether long-run cointegrating exists for our suggested model before moving on to ARDL short—and long-term forecasting. The F statistic validated the long-run cointegrating link between LNGINI, LNFDI, LNENC, and LNEU. At a 10% significance level, a long-run cointegrating vector in this model is validated by the F statistic of 3.925, which is more significant than the 10% threshold based on the income distribution model. The income distribution model will be the exclusive foundation for the following study.

We performed several diagnostic tests, including the serial correlation, multicollinearity, heteroscedasticity, normality test, and CUSUM/CUSUMSQ test, to ensure we could generate a trustworthy result. The results are shown in Figure 1, Tables 3, 4, and 5. It is verified that the model is free of all diagnostic issues since the probability value of every test is more than the 10% significant level. The blue line within the two dotted lines in the CUSUM and CUSUMSQ tests shows the model's short- and long-term stability.

Table 3: Diagnostic Test 1

Model	Lag Order	F Statistic
LNGINI = f (LNFDI, LNENC, LNUE)	(1, 1, 1, 2)	3.926**
LNFDI= f (LNGINI, LNENC, LNUE)	(1,0,1,0)	7.363**
LNENC= f (LNGINI, LNFDI, LNUE)	(1,0,0,0)	6.252**
LNUE= f (LNGINI, LNFDI, LNENC)	(1,0,0,0)	3.642
Critical Values for F Stat	Lower I (0)	Upper (1)
10%	2.37	3.2
5%	2.79	3.67
1%	3.65	4.66

Note: The critical values are based on Pesaran et al. (2001), case III: unrestricted intercept and no trend. 2. k is several variables equivalent to 6. 3. **and *** represent 5% and 1% significance, respectively. Estimation was based on the Schwarz criterion (SC). The maximum lag set is (2, 2).

Table 4: Diagnostic Test 1

(A)	(B)	(C)
Normality	Autocorrelation	Heteroskedasticity
[*p*-Value]	[*p*-Value]	[*p*-Value]
1.281884	0.021545	1.173274
[0.52679]	[0.9446]	[0.0018]

Table 5: Diagnostic Test 2

(D) Variable	Coefficient Variance	Uncentered VIF	Centered VIF
FDI	1.08E-20	7.272539	1.827202
ENERGY_USE	5.05E-07	36.62504	1.653174
UNEMPLOYMENT	0.568194	82.39304	1.136360

Note: The diagnostic test performed as follows: D. Multicollinearity Variance Inflation Factors

Figure 1: CUSUM and CUSUMQ
After confirming the model's reliability, we were ready to proceed with Auto Regressive Distributed Lag Models. In the short run, the elasticity coefficients indicate the immediate effects of changes in FDI, energy consumption, and unemployment on income distribution. The coefficient for the first difference of FDI is -0.005, which implies a negative but statistically insignificant short-run impact of FDI on income inequality. This suggests that short-term fluctuations in FDI do not significantly influence income distribution in Malaysia, consistent with findings by Borensztein et al. (2017) that emphasize the importance of absorptive capacity and the longer-term impacts of FDI on economic outcomes. The coefficient for the first difference in energy use is -0.046, indicating a negative short-run relationship between energy consumption and income inequality. Although this relationship is not statistically significant, the negative coefficient suggests that reduced energy use may initially influence income inequality, possibly due to the uneven distribution of benefits from energy-intensive industries. This reflects the complex nature of energy's impact on economic distribution, as discussed by Sadorsky (2010). The coefficient for the first unemployment difference is -0.035, showing a negative but statistically insignificant short-run effect on income inequality. This suggests that short-term changes in unemployment rates do not strongly affect income distribution, supporting the argument by Blanchard and Katz (1992) that labor market adjustments and their impact on income inequality are typically observed over more extended periods.

The CointEq(-1) coefficient, representing the speed of adjustment towards long-run equilibrium, is -0.477 and statistically significant at the 5% level. This indicates that approximately 47.7% of the disequilibrium from previous periods' shocks is corrected within the current period, highlighting a moderate adjustment speed toward equilibrium. This finding is consistent with the adjustment dynamics observed in similar studies, such as Narayan and Smyth (2006).

The long-run elasticity coefficients offer more robust insights into the relationships between the variables over an extended period. The long-run coefficient for FDI is -0.030, statistically significant at the 5% level, suggesting that an increase in FDI is associated with a reduction in income inequality over time. This finding aligns with the literature emphasizing the potential of FDI to foster economic growth and reduce inequality, particularly in developing countries, as highlighted by Chintrakarn et al. (2019). The long-run coefficient for energy use is -0.194, which is also significant at the 5% level, indicating that higher energy consumption is associated with decreased income inequality in the long run. This result may reflect the role of energy in supporting industrial activities that generate widespread economic opportunities, a relationship corroborated by the studies of

Apergis and Payne (2021). The long-run coefficient for unemployment is 0.082, which is not statistically significant. This suggests that unemployment does not have a considerable long-term impact on income inequality in Malaysia, consistent with studies that find mixed evidence regarding the relationship between unemployment and income distribution, such as those by Galbraith and Kum (2015).

The constant term in the long-run equation is 5.853 and is highly significant, capturing the baseline level of the Gini coefficient when all other variables are held constant. This aligns with the general observation that baseline income inequality can persist despite fluctuations in different economic variables.

Table 5: Short Run and Long Run Elasticities

Short-Run Elasticities		Long-Run Elasticities	
Variables	**Coefficient**	**Variables**	**Coefficient**
D(LFDI)	-0.005	LFDI	-0.030**
D(LENERGY_USE)	-0.046	LENERGY_USE	-0.194**
D(LUNEMPLOYMENT)	-0.035	LUNEMPLOYMENT	0.082
CointEq(-1)*	-0.477**	C	5.853**

Note: 1. ***, **, and * are 1%, 5%, and 10% of significant levels, respectively.

Discussion
First, the relationship between FDI and income distribution was significantly negative. This implies that an increase in FDI leads to a reduction in income inequality in Malaysia. Descriptive statistics reveal that over the observed period, substantial foreign capital inflows were observed. This influx of investment will likely contribute to economic growth and job creation, thus increasing income distribution. The regression coefficient indicates that each unit increase in FDI significantly reduces the Gini coefficient, a general measure of income inequality. This finding supports the hypothesis that FDI is vital in stimulating economic growth and promoting a more equitable distribution of wealth.

The study found that energy consumption has a similar negative effect on income inequality. Average energy consumption over the period reflects the country's increasing energy needs as its economy grew. The regression coefficient for energy consumption indicates that higher energy consumption is correlated with a reduction in the Gini coefficient. This relationship can be linked to the role of energy in driving industrial and economic activity, which in turn creates jobs and improves living standards. The study proved that ensuring access to affordable and reliable energy can help reduce production costs, lower the prices of goods and services, and ultimately contribute to a more equitable income distribution.

Unemployment, on the other hand, has been found to exacerbate income inequality. The average unemployment rate during the study period reflected the varying conditions of the labor market. The regression coefficient for unemployment indicates that a higher unemployment rate significantly increases the Gini coefficient. These findings underscore the critical importance of addressing unemployment to improve income distribution. High unemployment reduces household income and limits access to essential services and opportunities for upward mobility.

5. Managerial Implications and Recommendations

By aligning their strategies with broader socio-economic goals, companies can play an essential role in promoting equitable income distribution for organizations operating in Malaysia. This can involve investing in regions with high unemployment rates, adopting inclusive employment practices, and supporting local communities through corporate social responsibility (CSR) initiatives. Additionally, by integrating sustainability into their operations, companies can contribute to reducing the negative impact of energy consumption on income distribution. By adopting such practices, organizations can improve their corporate image and contribute to Malaysia's socio-economic development.

Malaysia also needs to shift towards more sustainable energy use practices. Policymakers should focus on

promoting energy efficiency and investing in renewable energy sources. This can help reduce production costs, lower the prices of goods and services, and reduce adverse effects on income distribution. Malaysia can ensure more equitable economic development by fostering a sustainable energy sector. This study emphasizes the importance of job creation and workforce development programs. Policymakers should prioritize initiatives that improve job skills, provide vocational training, and stimulate sectors with high employment potential. In addition, encouraging entrepreneurship and small business development can create job opportunities and contribute to a more balanced income distribution. By addressing unemployment, Malaysia can take essential steps towards reducing income inequality and fostering inclusive growth.

Future research can build on these findings by incorporating additional variables such as education, healthcare, and technological progress. Education, for example, plays a crucial role in income distribution by equipping individuals with skills that enhance their employability and earning potential. Higher levels of education can lead to more equitable income distribution by reducing income disparities between different segments of the population. Healthcare, on the other hand, impacts income distribution by influencing the productivity and economic participation of the workforce. Access to quality healthcare can reduce income inequality by ensuring that everyone, regardless of socioeconomic status, can contribute effectively to the economy. Technological progress is another critical factor that can significantly impact income distribution. Technological advancements can increase productivity and economic growth, creating more job opportunities and higher wages.

Conclusion
This research has carefully analyzed the effects of Foreign Direct Investment (FDI), energy consumption, and unemployment on income distribution in Malaysia. The relationship between FDI and income distribution was found to be significantly negative. This finding supports the hypothesis that FDI is vital in stimulating economic growth and promoting a more equitable distribution of wealth. As Malaysia continues to attract foreign investment, it is indispensable to ensure that such investment is channeled into sectors that generate extensive employment opportunities and foster inclusive growth. However, ensuring that FDI is directed to sectors that generate substantial employment and promote inclusive development is crucial. In addition, the government should create a conducive environment for investors by improving infrastructure, streamlining regulations, and ensuring political stability.

The study found that energy consumption has a similar negative effect on income inequality. This relationship can be linked to the role of energy in driving industrial and economic activity, which in turn creates jobs and improves living standards. The findings on energy consumption highlight the need for sustainable energy policies. Malaysia can sustain economic growth by promoting energy efficiency and investing in renewable energy sources while minimizing environmental impact. Ensuring access to affordable and reliable energy can help reduce production costs, lower prices of goods and services, and ultimately contribute to a more equitable income distribution.

Unemployment, on the other hand, has been found to exacerbate income inequality. High unemployment reduces household income and limits access to essential services and opportunities for upward mobility. The government should focus on job creation, skill development, and labor market reforms to reduce unemployment. Investing in vocational education and training can equip the workforce with the skills needed to thrive in a dynamic economy, thereby reducing unemployment and promoting equitable income distribution.

**The Effect of Work Stress and Work Environment on Job Performance in Manufacturing Industry:
A PLS-SEM Approach**

Abstract: Employee performance is a critical determinant of growth and success within manufacturing organizations, making it essential to understand the factors influencing it. This study delves into the effects of work stress and the work environment on job performance, specifically within the electronics manufacturing sector in Penang, Malaysia. The research addresses how role ambiguity and conflict can act as stressors and also explores how intrinsic and extrinsic motivation factors related to the work environment affect job performance. The study sample comprised 116 participants from five electronics manufacturing firms located in Bayan Lepas, Penang. Data collection was conducted through a structured questionnaire, and the analysis was performed using Partial Least Squares Structural Equation Modelling (PLS-SEM). The results confirmed that the measurement model was robust, providing a solid foundation for validating the structural model. The PLS-SEM analysis demonstrated that the model had significant predictive capability, revealing that both work stress and the work environment exert substantial effects on job performance within the electronics manufacturing industry in Penang. Specifically, role stressors such as ambiguity and conflict were found to negatively impact job performance, while a supportive and motivating work environment positively influenced it. The study's results align with the theoretical frameworks of role stressors and self-determination, suggesting that effective management of stressors and the cultivation of a motivating work environment are essential for optimizing employee performance in the manufacturing sector.

Keywords: *Works Stress, Work Environment, Job Performance, Electronics Manufacturing Industry.*

1. Introduction and Background

Competition in the manufacturing sector is increasingly intensified. The proliferation of new products and processes through invention and innovation has led to the firm's competitiveness. According to Solhi (2022), Penang is well on its way to becoming an innovation supercluster for the manufacturing industry because it adopted technology emerging from the fourth industrial revolution. This pertains to the correlation between employee productivity and the expectation for them to contribute extensively without taking into account the potential impact on their health and well-being (Engelbrecht et al., 2019). Stress has been an increasing problem in organizations and has been shown to negatively impact workplace productivity during the previous decade. Selye (1936) introduces the concept of stress in scientific research. Stress is a constant that affects workers all across the world (Dewe & Cooper, 2020). Employees' performance in the workplace is hindered by several factors. Every worker will likely experience some degree of stress related to their job at some point.

Employees' performance in the workplace is hindered by several factors. Every worker will likely experience some degree of stress related to their job at some point. Workers are the primary sufferers of work-related stress, but the company experiences the effect. Unhealthy health is a contributor to poor company efficiency, high turnover of workers, and sick days taken for both major and minor ailments, including obesity, heart disease, stomach issues, and mental health issues like anxiety and depression (Sari et al., 2020). There's a lot more stress in the workplace these days, and it's having an impact on everyone's productivity. Workplace stress is defined as the negative physiological and psychological reactions an individual has when their abilities, resources, and requirements do not match those of their employment. According to Sari et al. (2020), industrial sector employees might be negatively affected by work stress, which in turn leads to high turnover rates due to worker frustration caused by superior pressure.

Over the last few decades, the expansion of Malaysia's economy has been primarily reliant on the nation's electronics manufacturing sector, which has made major contributions to the country's gross domestic product, exports, and employment (Hashim & Abdullah, 2021). At the same time, studies conducted by Brady and Wilson

(2022) found that stress at work can significantly impact productivity. On the one hand, stress may be a driving force that gets people to do their best work and finish tough projects on time. That is because, these days, employers are becoming pickier about what they expect from their employees. Today's era has been aptly termed the 'Age of Anxiety and Stress' (Coleman, 1976). The level of stress experienced is generally related to the number of stressors one encounters. Conversely, Beehr and Newman (1978) describe stress as a condition where a person's usual functioning is disturbed or changed due to a shift in their psychological and or physiological state, whether for better or worse. Work stress has a negative and significant effect on employee performance, as found by the research of Putri and Suhartono (2021). Likewise, research shows that stress at work hurts productivity, there would not be any difficulties at work if stress levels were manageable. According to Nisa et al. (2023), the quality of the work environment has a significant effect on employee productivity. An improved work environment leads to increased productivity.

2. Literature Review

Job Performance
One of the critical determinants of a company's success is the management's ability to continually elevate performance standards across all levels of the organization. The topic of employee performance has been at the forefront of stakeholders' conversations for decades, and for good reason. In their study, Silitonga and Sadeli (2020) argued that the way an organization is perceived is directly affected by the performance of its employees. Performance has been seen as the result of both organizations and employees, according to Alase and Akinbo (2021). Organizational success and glory are attributed to productivity, service quality, employee happiness on the job, and loyalty to the company. As Pushpakumari (2008) emphasizes, the success of a company often hinges on how effectively management sets and maintains high-performance benchmarks for employees. This proactive approach ensures that only the most qualified candidates are selected and retained, fostering an environment where high performance is consistently achieved. The concept of job performance has been extensively explored in the literature, with Balouch and Hassan (2014) defining it as the effectiveness with which employees complete their assigned tasks. Performance is often viewed as a direct outcome of an individual's aptitude, skill, and effort within a given context, as noted by Lawler and Porter (1967). This perspective aligns with the notion that performance is not merely about the completion of tasks but also about the quality and efficiency with which these tasks are performed. Motowidlo (2003) offers a comprehensive definition, describing work performance as "the overall expected value to the organization of discrete behavioral episodes that an employee carries out over a standard period." This definition highlights the multifaceted nature of performance, which encompasses both the execution of specific job duties and the broader impact of these activities on organizational goals.

Work Stress
The term "stress" was coined by Dr. Hans Selye in 1956 to describe how people reacted to external factors that had an impact on their performance. Work stress has significant consequences on employee job performance and organizations, and it is present in all workplaces and all organizations because of the increased complexity of both. According to Rose (2003), long hours and high levels of concern about time decrease workers' motivation to do their best. Several factors contribute to stress at work, including family conflicts and work overload. According to Stamper and Johlke (2003), if an organization or its management fails to appreciate employees for their hard work or contributions, it can lead to increased stress and a higher likelihood of employees intending to leave the organization. According to Ahmed & Ramzan (2013), the research found that the majority of the workers were unhappy with the present culture where they were asked to work prolonged hours and cope with immense workloads while simultaneously reaching production objectives and deadlines.

When people are not able to manage their stress well, it shows in their interactions with everyone and everything around them, from coworkers to strangers. According to Virgiawan et al. (2021), the employee's performance at work was negatively impacted by the unfavorable symptoms they encountered. According to Greenberg et al. (2017), work stress is a concept that is very difficult to describe. Stress at work happens in someone when someone flees from difficulties as some workers raise the level of work to a predisposition to stress, job stress is a mix of causes of stress on the job, individual traits, and stressors outside the company. In view of the above, the following hypothesis was suggested for testing:

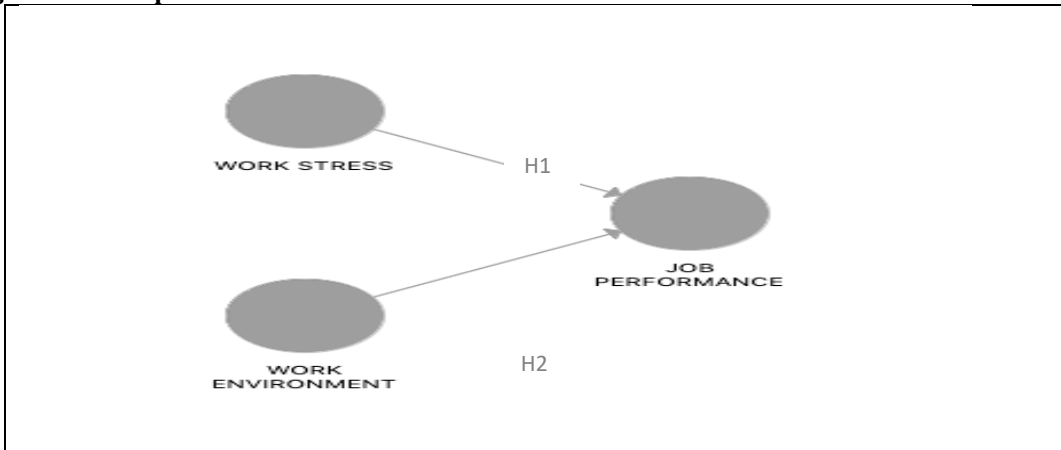
H1: A significant relationship exists between work stress and employee job performance within the manufacturing sector

Work Environment.
Normal temperatures, lack of unpleasant odors or dust, lack of crowding, and a serene atmosphere are all part of what we mean when we talk about a "work environment". Vischer, (2007), posits that unfavorable working circumstances contribute to employee stress and discontent on the job. Poor working circumstances may negatively influence the individual performance of workers. According to Aswar et al. (2022) "the work environment" refers to the physical setting in which workers perform their duties. Cleanliness, enough lighting, and a calm atmosphere are all features of this ideal workplace. Inside, there are two distinct personalities to be found in the workplace.

Furthermore, employees are easily distracted by a subpar working environment, resulting in less productivity (Yeow et al., 2014). Poor working conditions not only affect productivity but also increase the risk of occupational injuries. Capital returns might be negatively impacted by the prevalence of occupational accidents (Ng et al., 2014). According to research by Narasuci & Noermijati (2018), workers' productivity increases when they are provided with a pleasant and supportive workplace. Forms of environmental effects that give contextual characteristics promote or aid the formation of performance. In view of the above, the following hypothesis was suggested for testing:
H2: A significant relationship exists between the work environment and employee job performance in the manufacturing sector.

3. Research Methodology

This study adopted a quantitative approach that utilized a questionnaire survey in addressing the objectives of the study (1) To determine the relationship between work stress and employee job performance in a manufacturing company, (2) To determine the relationship between work environment and employee job performance in a manufacturing company. In addition, this study adopted the Likert scale to measure the responses. The study focuses on the impacts of work stress and work environment on job performance among manufacturer workers in selected electronic firms in Bayan Lepas, Pulau Pinang, Malaysia. Hence, the manufacturing workers will serve as the statistical unit of analysis in this study. The sample size was determined using the GPower calculator (effect size = 0.15 (for medium effect), alpha = 0.05, and power = 0.80). The GPower calculator suggested a minimum of 85 respondents. However, 116 usable responses conceived made a respectable percentage. This research will specifically examine the following research questions:
RQ1: What is the relationship between work stress and employee job performance in a manufacturing company?
RQ2: What is the relationship between work environment and employee job performance in a manufacturing company?

Figure 1: Conceptual Framework


The research examines two independent variables, work stress and work environment, and their direct influence on job performance (JP), which are measured through an observed variable. This study is grounded in the organismic metatheory of self-determination theory (SDT), which underscores the importance of developing internal resources for personality formation and behavioral self-regulation. Empirically, it has become a standard in the field of human motivation, and character is employed to assess their impact on overall job performance (Ryan et al., 1997). Figure 1 illustrates the study's conceptual framework, which includes the variables under investigation. Specifically, the latent variable of work stress (WS) is measured by five items, work environment (WE) is measured by five items, and job performance (JP) is measured by seven items. The best instrument to use to get standardized data from identical questions was a questionnaire survey. Thus, the questionnaire needs to be created according to the research objectives for this study. The questionnaire in this study was adapted from Sari et al. (2020) to align with the current study's context.

4. Results

The survey was conducted among employees from five selected electronics firms, and data was collected via an online questionnaire. Out of 145 distributed surveys, 121 were returned. After excluding five responses identified as outliers through an assessment of studentized residuals, the final dataset consisted of 116 usable responses. Outlier detection followed the guidelines proposed by Christopher et al. (2020), which suggest that studentized residuals outside the ±2 range warrant attention, while those beyond the ±3 range require serious consideration. Table 1.0 presents the outlier detection process, including the studentized residuals analysis performed using IBM SPSS.

Table 1: Outliers Detected using SPSS

RESPONDENT NO.	STUDENTIZED RESIDUAL
4	-3.87969
16	-2.74520
17	2.30179
23	2.16002
113	2.04360

Demographic data were collected and analyzed descriptively as the initial phase of the questionnaire, aiming to gather comprehensive, non-sensitive personal information from respondents, including age, gender, race, marital status, and monthly income. This detailed demographic information is crucial for contextualizing the study and understanding the characteristics of the participant pool.

As illustrated in Table 2.0, the majority of respondents were young adults aged between 20 and 29 years, comprising 74 employees, or 63.8% of the sample. The next largest age group was those aged 40 to 49 years, with 17 employees, or 14.7%, followed by individuals aged 50 to 59 years, totalling 10 employees, or 8.6%. Employees aged 30 to 39 years amounted to 8 individuals, or 6.9%, which is slightly higher than those below 19 years, who numbered 6 employees, or 5.2%. The smallest age category was those above 60 years, represented by only 1 employee, or .9%. Regarding gender distribution, the study included 69 male respondents (59.5%) and 47 female respondents (40.5%), indicating a higher proportion of male participants. Table 1.0 further reveals that most respondents were Malay, totalling 111 employees, or 95.7%, followed by Indian and other racial groups with 2 employees, or 1.7%, and Chinese respondents with 1 employee, or .9%.

In terms of marital status, 73 respondents were single (62.9%), 43 were married (37.1%), and there were no respondents classified as divorced, highlighting that a significant majority of participants were single. Regarding monthly income, the predominant income bracket was between RM1,201 and RM3,000, with 48 employees, or 41.4%, falling into this category. Additionally, 28 employees (24.1%) reported earning more than RM5,001, while 20 employees (17.2%) had incomes between RM3,001 and RM5,000, or below RM1,200. Consequently, the data suggest that most respondents' monthly incomes were concentrated in the RM1,201 to RM3,000 range, indicating a general trend towards financial stability among the participants.

Table 2: Demographic Profile of the Respondents (N=116)

Demographic	Category	Frequency (N)	Percentage (%)
	19 and under	6	5.2
	20–29	74	63.8
	30–39	8	6.9
Age	40–49	17	14.7
	50–59	10	8.6
	60 and above	1	.9
Gender	Male	69	59.5
	Female	47	40.5
	Malay	111	95.7
Race	Chinese	1	.9
	Indian	2	1.7
	Others	2	1.7
	Single	73	62.9
Marital Status	Married	43	37.1
	Divorced	0	0
	RM 1,200 and below	20	17.2
Monthly Income	RM 1,201 – RM 3,000	48	41.4
	RM 3,001 - RM 5,000	20	17.2
	RM 5,001 and above	28	24.1

To address the research objectives, this study utilized the SmartPLS 3 analytical tool to perform variance-based structural equation modelling (SEM) analyses, examining both the measurement and structural models. A two-stage approach was adopted in line with the methodological techniques proposed by Anderson. This approach involved distinct evaluations of the measurement model and the structural model. The first stage, focusing on the measurement model, is pivotal for assessing the reliability and validity of the study's items and latent constructs and the second stage is to assess the relationship between variables in the model, and it is essential for hypothesis testing (Ghozali & Latan, 2015; Sarstedt, Ringle, & Hair, 2021)

Measurement Model Analysis (First Stage)
During this phase, internal consistency was scrutinized through composite reliability (CR) and Cronbach's alpha, with the recommended thresholds set at .5 and .7, respectively (Fornell & Larcker, 1981; Hair et al., 2017). These initial outer model analyses were employed to ensure that the constructs demonstrated adequate reliability and validity. The results from the measurement model analysis confirmed that both the items and constructs met the requisite minimum cut-off points, thereby validating their robustness. Table 3.0 below provides a comprehensive presentation of the outcomes from these analyses, as obtained through the PLS-SEM technique for evaluating the measurement model.

Table 3: Internal Consistency and Convergent Validity Assessment.

Latent Construct	No. of Predictors (Items)	Cronbach Alpha	Composite Reliability (CR)	Average Variance Extracted (AVE)
WS (IV)	3 (2 were excluded due to low loading)	.894	.841	.645
WE (IV)	5	.816	.881	.598
JP (DV)	7	.894	.917	.612

In addition, measurement model assessment of discriminant validity was carried out, this study employed the HTMT (Heterotrait-Monotrait) criterion, a sophisticated approach for determining whether the constructs within the model are sufficiently distinct from one another (Henseler, Ringle, & Sarstedt, 2014; Hair et al.,2017). The selection of the HTMT criterion was deemed suitable by its advanced statistical capabilities and its superior

performance, especially in variance-based structural equation modelling (SEM), offering a more precise assessment of discriminant validity compared to traditional methods such as the Fornell-Larcker criterion or cross-loadings (Henseler et al., 2014; Sarstedt, Hair, Ringle, Thiele, & Gudergan, 2016).

Accordingly, established guidelines were referred to regarding the discriminant validity assessment. The analysis is confirmed to achieve discriminant validity if the HTMT coefficient falls below the critical threshold of .85 (Henseler et al., 2015). In this study, Table 4.0 provides a detailed presentation of the results obtained from the HTMT-based assessment, illustrating the effectiveness of this criterion in verifying the distinctiveness of the model's constructs.

Table 4: HTMT Criterion for Discriminant Validity Assessment.

	JP	WE	WS
JP (Job Performance)	1		
We (Work Environment	.790	1	
WS (Work Stress)	.738	.463	1

As for the measurement model assessments, the overall analysis results confirmed that the study employed valid and reliable measures for both items and constructs. The statistical justification for the measurement model indicated its suitability for further analysis of the structural model, specifically in predicting relationship paths and assessing the significance of the developed hypotheses.

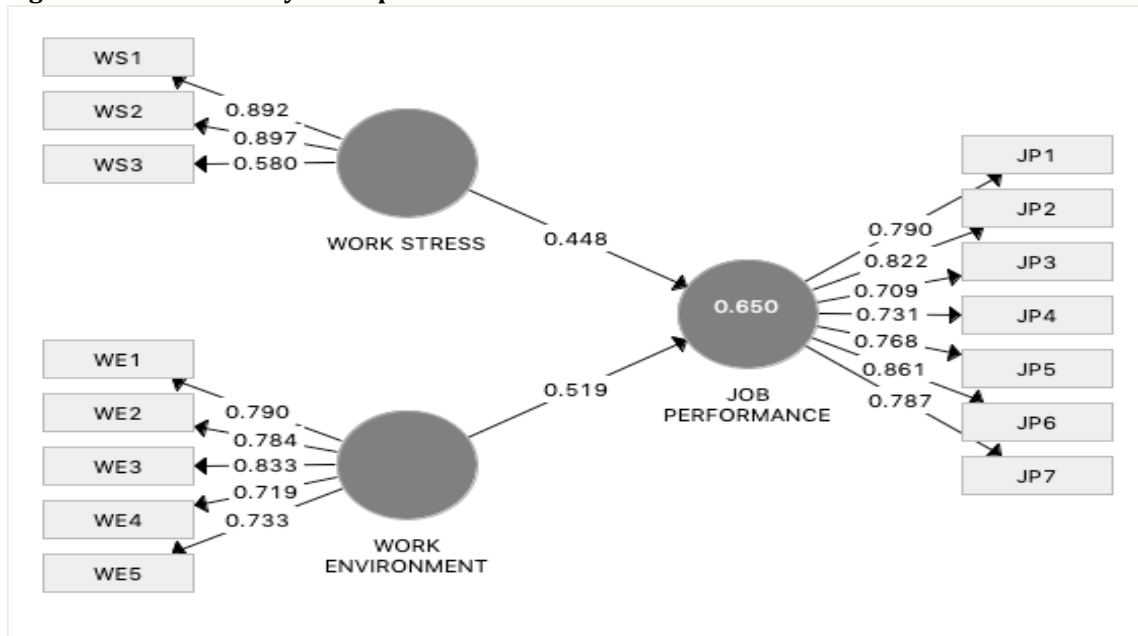
Structural Model Analysis (Second Stage).
After the evaluation of the measurement model, the second stage of the PLS-SEM analysis focused on the assessment of the structural model to scrutinize the causal relationships among the latent constructs. This phase involved a meticulous examination of path coefficients (β) and the outputs from the bootstrapping routine to determine both the strength and significance of these inter-construct relationships. The evaluation of path coefficients was based on Cohen's (1988) criteria, which suggest that β values range from -1 to 1, with values closer to 0 indicating weaker relationships and those further from 0 reflecting stronger associations (Cohen, 1988).

Furthermore, the bootstrapping routine was carried out. This statistical assessment provided compelling evidence of significant positive relationships of the path coefficient between variables under investigation. The significance relationship path analysis outcome explicated the following: work stress (WS) and job performance (JP) causal relationship was found to be β = .448, with a *t*-value of 6.903 and a highly significant *p*<.001. Likewise, the causal relationship between work environment (WE) and job performance (JP) was also positively significant, with a path coefficient of β = .519, a t-value of 9.043, and a *p* <.001 (Cohen, 1988; Hair et al., 2017). These results strongly support the hypotheses H1 and H2, confirming the validity of the proposed structural relationships within the model. Table 5.0 and Figure 2 below exhibit the PLS-SEM analysis outcome for the structural model assessment.

Table 5: Bootstrapping Output – Path Coefficient.

	Original Sample	Sample Mean	Standard Deviation	T-Statistics	P-Values
WS -> JP	.448	.441	.065	6.903	.000
WE -> JP	.519	.524	.057	9.043	.000

Source: SmartPLS output

Figure 2: PLS-SEM analysis output


Additionally, in the evaluation of the overall structural model, the R^2 (coefficient of determination) was assessed to measure the predictive power of the model concerning the endogenous constructs that linked to the exogenous construct. This assessment involved using all data for model estimation to determine the model's predictive power (Ghozali & Latan, 2015; Hair et al., 2017). The R^2 for the relationship between the exogenous and endogenous constructs was found to be convincing at .650, or 65%.

5. Discussion and Conclusion

This study examined the relationship between work stress and job performance within an electronics manufacturing company in Bayan Lepas, Penang. The findings confirm a significant relationship between work stress and job performance, thereby supporting the first hypothesis. These results suggest that reducing workplace stress could positively impact productivity. Factors such as excessive workloads, tight deadlines, and high-risk job conditions contribute to increased work stress, which in turn diminishes employee productivity, as noted by Widayati et al. (2022). This observation contrasts with Puspitasari (2024) study, which indicated that workplace stress negatively affects productivity.

Furthermore, the study explored the second hypothesis concerning the direct relationship between the work environment and job performance. The results indicate a strong, significant correlation between these two variables among employees at the electronics manufacturing company. This finding underscores the role of external factors, such as working conditions, in influencing organizational performance. Employee performance is influenced by intrinsic motivation, skills, and the ability to function effectively within and adapt to challenging environments. Al-Omari and Okasheh (2017) emphasize the importance of these factors, as neglecting them can lead to behavioral issues and poor performance. A positive work environment, including optimal sound conditions and supportive workplace features, has been shown to enhance productivity. Sari et al. (2020) report that a well-designed workspace and recognition from superiors contribute to improved mental health and performance.

In conclusion, the tested hypotheses reveal a statistically significant connection between the examined factors. It is essential to implement improvements comprehensively to enhance workers' performance and job satisfaction. While some challenges may be managed individually, a holistic approach involving systemic changes and managerial interventions can significantly improve both work style and productivity.

Abstract: Quality of life (QoL) among university students is a critical concern that impacts not only their academic success but also their overall well-being and prospects. Social relationships are critical for university students' quality of life. Positive social interactions and a supportive network can enhance students' sense of belonging and emotional well-being. However, many students struggle with loneliness and social isolation on campus. This study aims to investigate the association between civic engagement (social engagement, social network, and social embeddedness) and the QoL among university students. We conducted this cross-sectional study among 179 university students on the UiTM Puncak Alam campus via an online survey. We adapted the questionnaire from previous studies and used SPSS version 29 to analyze the data. The Pearson correlation test revealed a link between all the independent variables and the dependent variable, demonstrating both convergent and concurrent validity. The regression analysis showed that social embeddedness was the best predictor of QoL, followed by attitude and behavior. A secure social environment can help one adapt more effectively and provide emotional support, which lowers the risk of depressive symptoms and improves the QoL. In addition, active involvement in social activities helps to increase the sense of belonging to the university community. Identifying oneself as a member of a group of peers, faculty, and staff contributes to the student's self-concept and higher self-esteem, which is vital in terms of psychological health and QoL.

Keywords: *Social Engagement, Social Network, Social Embeddedness, Quality of Life (QoL), University Students*

1. Introduction and Background

The term quality of life (QoL) refers to an intricate and multifaceted concept that is difficult to define, categorize, and analyze. The concept encompasses a range of factors, including social, cultural, economic, political, and environmental dimensions, which pose challenges in terms of identification and quantification (Shin & Jung, 2020). QoL, as defined by the World Health Organisation (WHO) in 2021, is the way an individual sees their living circumstances about their culture and society, taking into account their personal goals and standards. The concept encompasses several aspects of contentment in everyday existence, encompassing life satisfaction, overall well-being, and the experience of happiness (Shin & Jung, 2020). QoL is influenced by multiple factors, such as personal health encompassing physical, mental, and spiritual well-being, relationships, educational attainment, work environment, social standing, wealth, sense of security, freedom, autonomy in decision-making, social connections, and physical environment (Shin & Jung, 2020; Amanfu, 2022; Achangwa et al., 2022).

Civic engagement, which includes social engagement, social networks, and social embeddedness, is one of the elements that contribute to QoL (Sun et al., 2023). It involves how people actively participate in community life to improve the lives of others and create the community's future (Mellet, 2022). Civic involvement activities include community service, membership in environmental organizations, voting, and donating to civic causes (Remr, 2023; Sun et al., 2023). Individuals can make a major difference in their communities by completing these steps and influencing change at the local, regional, and national levels. Scholars such as Rewakowski (2021) and Cui (2022) have emphasized the intimate relationship between civic engagement and QoL.

Civic engagement among university students is crucial to their academic progress, mental health, overall university experience, and QoL. Recent research has emphasized a variety of factors and methods that promote

social engagement, indicating a more advanced understanding of its dynamics and consequences. College students require social involvement because it fosters a sense of belonging and community. BMC Public Health (Chen, Bian, & Zhu, 2023) released a study that found that social support had an indirect impact on academic engagement, with life happiness and academic motivation serving as mediators. Students with strong social networks report higher life satisfaction, which is associated with increased motivation and participation in academic pursuits. These are the anecdotal impacts that a strong social connection between students can have on their academic and overall well-being, suggesting a cause-and-effect relationship that improves resilience to future adversity. Another factor that contributes to boredom in the classroom and lowers academic achievement is social engagement, often known as peer interaction. Students also learn more effectively when they connect with their classmates through collaborative learning in class or group project work, as well as social activities outside of the classroom. Engagement between students and academic staff at an institution improves a variety of outcomes, including dropout rates and course completion. This interchange of ideas and mutual support among students encourages them to thrive in their academics and raises their motivation level (Alalwan, 2022).

Universities serve as centers where students not only gain knowledge but also cultivate vital proficiencies in diverse disciplines (Ahmad et al., 2022). During their time in university, students actively participate in civic engagement, expanding their knowledge of societal matters via both theoretical study and practical application. Nevertheless, it is imperative to study the elements that impact students' engagement in civic activities. In their study, Ahmad et al. (2022) surveyed undergraduate students from three colleges at Universiti Utara Malaysia (UUM) and discovered that a mere 41.2 percent of students actively participate in civic activities. Ahmad et al. (2022) found that students in Malaysia had limited exposure to political participation, which is a crucial national factor contributing to their modest participation in civic engagement. Hence, the objective of this study is to examine the correlation between social engagement, social network, social embeddedness, and quality of life (QoL) among university students.

2. Literature Review

Social Engagement
Social engagement refers to a structured and voluntary activity that seeks to address and identify public concerns. The study by Sun et al. (2023) elucidates how individuals participate in communal endeavors to enhance the well-being of others and foster the future growth of their society. Social involvement encompasses both individual and collective efforts aimed at increasing public awareness of societal challenges, identifying and implementing solutions, and enhancing the overall well-being of society. Community service is a notable form of civic engagement that encompasses activities such as participating in charitable fundraisers. Community service aims to involve individuals in activities that benefit the broader community. However, those who participate in these activities may also derive personal benefits from their involvement (Fenn et al., 2022). Social engagement refers to the collective endeavor of individuals to tackle societal problems, exercise their rights, and contribute to the efficient functioning of their community. Social involvement encompasses several activities such as participating in elections, engaging in political campaigns, protesting or boycotting, volunteering or engaging in community service, practicing pro-environmental behavior, making charitable donations, and providing informal assistance (Wray-Lake et al., 2017).

Doolittle & Faul (2013) categorize social participation into two distinct dimensions: attitudes and behaviors. Attitude refers to an individual's subjective viewpoint and emotions on their involvement in their community and their perception of their capacity to influence that community. The attitudes of university students are influenced by a combination of psychological, social, and environmental elements, which affect their perceptions and behaviors in various situations, including their overall QoL (Chaudhry et al., 2024). As researchers and teachers delve into the complexities of how attitudes are formed and how they affect student learning and growth, there is an urgent requirement for interdisciplinary research and collaborative initiatives to tackle the various issues that modern university students encounter. Universities may foster a more conducive climate for active student engagement in civic activities and cultivate a favorable disposition towards community involvement by addressing these crucial aspects. Attitude is a complex concept that is closely connected to how humans think and behave. It acts as a perspective that shapes how individuals see and engage with the world. Starting from a young age, people start forming attitudes along with other cognitive

and emotional abilities, which shape their perspective on the world and impact how they react to different events and stimuli (Albarracin & Shavitt, 2018). Various elements, such as individual experiences, social interactions, cultural norms, and societal expectations, significantly impact the development of these attitudes (YanJu et al., 2022).

Behavior refers to the way individuals respond or act about external stimuli or within a particular setting. According to the New South Wales (NSW) Health (2020), an individual's behavior is reflected through their activities. Each action is driven by a certain motive and has a distinct underlying cause. Examples of these encompass the use of nonverbal cues such as body language, gestures, facial expressions, and silence to facilitate communication. Additionally, they serve many purposes such as fulfilling demands, capturing attention, eliciting internal or sensory sensations, obtaining access to goods or activities, or evading circumstances. Rahaded et al. (2020) define behavior as the collective accumulation of information, comprehension, mannerisms, values, attitudes, roles, life concepts, and belongings within a group of people. These elements are acquired over generations through collective effort and personal beliefs in the ability to achieve desired outcomes through actions. Moreover, human behavior refers to the capacity to participate in various physical, mental, and social activities during different life phases (Lerner et al., 2024). Like other organisms, humans undergo various stages in their life cycle, each characterized by distinct physical, physiological, and behavioral characteristics. The prevalence of behavioral features, such as mental health concerns, among Malaysian university students is a matter of great concern. According to the World Health Organisation (WHO) in 2021, approximately 14% of individuals between the ages of 10 and 19 experience mental health problems. However, these difficulties often receive inadequate attention and improper care. College students often face significant stress and encounter significant physical and mental challenges due to their demanding academic workload, difficulties in managing their classes, and peer pressure. In recent years, there has been a noticeable increase in mental health problems among students (Radzi et. al., 2022; Wong et al., 2023).

Social Network
According to Del Castillo et al. (2020), social networks are digital platforms that allow users to create personal profiles and share information, fostering engagement with others and connecting with real-life friends, strangers, and relatives. Furthermore, it can offer emotional support, resources, and counsel to people who feel alone in their communities. Social networks also relate to an individual's interpersonal relationships with people in their lives (Kim et al., 2024). Social networks include a wide range of social ties, including personal friends, relatives, neighbors, and casual acquaintances. Individuals can use these connections to easily chat, post, and share information. Bakhshandeh-Bavarsad and Stephens (2024) defined social networks among older individuals as a web of social interactions that include family, friends, and acquaintances and are essential for life satisfaction, mental health, and overall well-being. It is significant because it can help people have happy and rewarding lives as they age.

Social networks influence how people connect, communicate, and share information. They enable people to interact and form relationships that would otherwise be impossible owing to time and distance barriers. Furthermore, social networks have been a prominent focus in computational social science for the majority of the twenty-first century. This branch of study investigates a variety of topics using quantitative approaches, such as machine learning, complexity analysis, major data mining, and simulation modeling (Arya, 2021). These techniques enable researchers to evaluate vast amounts of data created by social network interactions, identify patterns and trends, and create models that can predict future behaviors and results. The earlier study, conducted by Owunna et al. (2022), investigated the association between teens' use of social networking sites. The study's findings indicate a link between increased social network engagement and individuals' desire for social connections, particularly among those who suffer high degrees of loneliness and anxiety. Compared to persons who are less socially anxious, those who are more socially anxious are more likely to prioritize and seek social support online to improve their well-being and receive social acceptability that they would not expect in person (O'Day & Heimberg, 2021).

Social Embeddedness

Social embeddedness (SE) is the type, intensity, and scope of an entity's link to its social context, such as a community (Czernek-Marsza, 2020). This idea classifies relationships into strong, thoroughly integrated links (socially embedded) and weaker, more remote ones (Mikulionienė et al., 2022). Another definition of SE is a broad form of connection to a social unit. Researchers identified two types of embeddedness: relational embedding and structural embedding. Relational embeddedness refers to how well people communicate, depend on, and trust one another in networks, whereas structural embeddedness refers to how interconnected and central network interactions are (Albaram & Lim, 2023).

Schulz et al. (2023) explored how first-year university students may use their classmates as a social resource while seeking academic assistance. The study looks into how SE, specifically the availability of close peer ties, and group awareness, which refers to being aware of peers' knowledge, affect measures of academic performance such as accomplishment, contentment, and dropout intention. According to the study, SE and group awareness make it simpler for students to successfully request academic assistance, which improves their academic performance (Schulz et al., 2023). The findings indicate that SE has little to no impact on academic performance or motivation to drop out. However, SE has an impact on student satisfaction, particularly among engineering students. For engineering students, SE is a prerequisite for effective help-seeking (HS), but this relationship is not mediated by gratifying HS behavior. This means that, while SE promotes HS success and enhances student satisfaction, HS behavior may not be the direct cause of the causal association between SE and satisfaction. Bere's previous research (2019) looked at context-driven use and SE in student adoption of mobile technology in educational settings, with a focus on WhatsApp-mediated interactions. Geographical hurdles, connectivity difficulties, and knowledge gaps among students and educators all had an impact on WhatsApp use. SE evidence includes various perceptions of technology, varying human capacities triggered by its usage, and dissimilar uses compared to developed contexts. It also noted the challenges of successfully integrating mobile technologies into education, including knowledge gaps among peers, teachers, and students, as well as geographical dispersion.

Quality of Life (QoL)

The term QoL denotes the comprehensive condition of welfare encountered by either a populace or an individual at a specific moment in time (Wilzer et al., 2024). According to Gobbi et al. (2023), it refers to a person's assessment of their present situation, which includes their objectives, aspirations, standards, concerns, and dominant ways of life and value systems. This all-encompassing notion encompasses multiple components, including physical and mental well-being, personal convictions, social relationships, and their interplay with important parts of life. Chattu et al. (2020) define QoL as a complex concept that encompasses various aspects, including experiences, states, assessments, actions, capacities, and emotional responses to events. Shin and Jung (2019) suggest that QoL refers to the personal and societal satisfaction experienced in daily living. They argue that QoL includes factors such as life satisfaction, subjective well-being, and overall happiness. Wilzer et al. (2024) suggest that when discussing QoL, it is common to consider factors such as well-being, functioning, life satisfaction, functionality, and interference. These factors refer to the parts of life that contribute to a sense of fulfillment and make life meaningful. The investigation of QoL attracts worldwide attention as a result of growing apprehensions about physical and mental well-being (Pitil et al., 2020). Prior research examining QoL has considered specific variables that are unique to individuals, such as the physical surroundings, contentment with social connections, and encounters with social disputes (Shin & Jung, 2019).

In addition, Alkatheri et al. (2020) observed that students pursuing health sciences, such as medicine, nursing, or allied health professions, are especially prone to experiencing a lower QoL in comparison to the overall population. This observation aligns with prior research, notably, the study conducted by Ramón-Arbués et al. (2022), which similarly identified a decrease in QoL among university students pursuing health-related disciplines. Ghassab-Abdollahi et al. (2020) emphasized the distinct difficulties encountered by these students in their academic education, such as an excessive amount of tasks, rigorous clinical practice requirements during internships, and the expectation of good academic achievement, particularly at public institutions. These factors of stress contribute to a demanding academic setting that can have a substantial effect on students' mental health and general QoL. Research demonstrates the substantial influence of academic stress on students' general well-being, underscoring the importance of addressing stressors to reduce negative consequences and enhance students' QoL. Pitil et al. (2020), Chattu et al. (2020), and Wilzer et al. (2024)

assessed the QoL by employing the World Health Organization Quality of Life-BREF (WHOQOL-BREF) questionnaire. This instrument consists of 26 items that are categorized into four domains: physical health (seven items), psychological health (six items), social relationships (three items), and environmental health (eight items). Furthermore, it encompasses inquiries regarding the entire QoL and overall health. Participants evaluate each item using a five-point ordinal scale, ranging from 1 to 5. They assess a wide range of aspects, including daily activities, medical support, energy levels, mobility, pain levels, sleep patterns, work capacity, personal beliefs, emotions, self-esteem, body image, cognitive abilities, learning capacity, satisfaction with personal and social life, safety, living conditions, possessions, financial adequacy, access to essential services and information, and transportation.

3. Research Methodology

Research Design
The study employed a cross-sectional research design to investigate the relationship between social engagement, social networks, social embeddedness, and QoL among university students in Malaysia. We collected data randomly over 2 months, from May to June 2024, using an online survey (Google Form) from two distinct categories: social sciences students from the Faculty of Business and Management and science and technology students from the Faculty of Pharmacy at UiTM Puncak Alam Campus. The survey recorded a total of 179 respondents.

Instrument
We adapted the questionnaire from the established one, modifying the items to elicit the necessary responses to the research questions. The questionnaire consists of several sections, namely Section A, to request demographic information of respondents such as gender, course, year of study, faculty, and living arrangement. Section B includes items such as social engagement, which consists of 12 items (attitudes and behaviors) (Doolittle & Faul, 2013), social network, which consists of 6 items (Topaloglu et al., 2016), and social embeddedness, which consists of 6-items (Momtaz et al., 2014). Attitude is a personal opinion and feelings that people have about their participation in their community and their sense of ability to change that community, while behaviors have been defined as the steps one takes to actively participate in and improve their community (Doolittle & Faul, 2013). Social networks are a web of social relationships encompassing family, friends, and acquaintances, a fundamental aspect of life satisfaction and overall well-being (Bakhshandeh-Bavarsad & Stephens, 2024), while social embeddedness refers to the nature, intensity, and extent of an entity's connection to its social environment, such as a community. This concept categorizes relationships from strong, deeply integrated connections (socially embedded) to weaker, more distant ties (Mikulionienė et al., 2022). Section C focuses on measuring QoL which was measured using the Quality of Life Scale (QOLS). The QOLS was created originally by American psychologist John Flanagan in the 1970s and has been adapted for use in chronic illness groups (Flanagan, 1978). This form of the QOLS has 16 items rather than the 15 found in the original Flanagan version. Item #16, "Independence, doing for yourself," was added after a qualitative study indicated that the instrument had content validity in chronic illness groups but that it needed an item that reflected the importance to these people of remaining independent and able to care for themselves.

The questionnaire used closed-ended questions with a fixed range of possible answers, as well as a 5-point Likert scale with the following values: 1 = strongly disagree, 2 = disagree, 3 = uncertain, 4 = agree, and 5 = strongly agree to assess the independent variables (social engagement, social network, and social embeddedness) in Section B. The scale used for Section C (QoL) was the 7-point Likert scale (1 = terrible, 2 = unhappy, 3 = mostly dissatisfied, 4 = mixed feeling, 5 = mostly satisfied, 6 = pleased, and 7 = delighted).

Data Analysis
We used statistical software, specifically SPSS version 29, to analyze the collected data. The study uses both descriptive and inferential statistics. The descriptive statistics include the mean and standard deviation. Besides, a linear multiple regression was used to test the effect of social engagement, social network, and social embeddedness on QoL among university students.

4. Results

Profile of Respondents
The data analysis revealed that 91 (50.8%) of the respondents were male and 88 (49.2%) were female and participated in this study. We collected the data from university students at UiTM Puncak Alam Campus, including social sciences students from the Faculty of Business and Management (49.7%) and science and technology students from the Faculty of Pharmacy (50.3%). In terms of living arrangements, or the type of residency, 91 (49.7%) of the respondents resided on campus, while 88 (49.2) were off-campus or non-residential students.

Reliability, Correlation & Regression Analysis
Table 1 presents the results of the reliability and correlation analysis for this study. We derive the reliability results from Cronbach's alphas and present them in parentheses along the diagonal. All variables have Cronbach's alpha values higher than the threshold value of 0.75 as suggested by Kaur and Paruthi (2019), indicating the items are reliable for measuring the intended variables. The Cronbach alpha value ranges from 774 to 962.

According to the study's mean results, the mean score for social attitude is 4.06. It means that most of the respondents agreed that "they felt responsible for the community," "felt confident in helping others who are in difficulty," "believed it is important to be involved in community programs," and "believed that all citizens have a responsibility to their community." The mean score for social behavior is 3.75. The results show that the respondents moderately agreed that "they were involved in volunteering activity in the community," "they helped members of the community," "they participated in discussions that raised issues of social responsibility," and "they contributed to charitable organizations within the community." The mean scores for social networks and social embeddedness are 3.76 and 3.78. The findings revealed that a majority of the participants expressed moderate agreement with the statements, "They perceive social networks/online networks as highly beneficial," "They experience greater comfort on these platforms than in social environments," and "They experience a sense of closeness with their parents, siblings, relatives, and friends, confident in their ability to reach them for assistance." them for help." Aside from that, the mean score for QoL is 5.51. The results showed that universities' QoL levels are moderately satisfactory. Generally, they were satisfied with their basic needs, such as accommodation, food, and financial support; satisfied with their current health condition; satisfied with their learning quality; and satisfied with their relationships with others.

All independent variables showed significant correlations with each other, according to the correlation analysis results. The highest correlation is between attitude and behavior (r =.57, p.01), followed by the relationship between behavior and social embeddedness (r =.375, 01). The social network and social embeddedness have the lowest correlation (r =.257, p.01). When assessing the relationship between independent variables and dependent variables, the results revealed that all independent variables show a relationship with QoL. The relationship between social embeddedness and QoL has the highest correlation (r =.464, p =.01), followed by the relationship between attitude and QoL (r =.458, p =.01), and the relationship between social network and social embeddedness has the lowest correlation (r =.21, p =.01). In this study, the Pearson correlation analysis results show convergent and concurrent validity.

Table 1: Result of Correlation and Reliability Analysis (n=179)

No	Variables	Mean	SD	1	2	3	4	5
1	Attitude	4.06	.587	(.872)				
2	Behavior	3.75	.672	.570**	(.854)			
3	Social Network	3.76	.713	.321**	.360**	(.823)		
4	Social Embeddedness	3.78	.735	.348**	.375**	.257**	(.774)	
5	Quality of Life (QoL)	5.51	.958	.458**	.437**	.210**	.464**	(.962)

Notes: **. Correlation is significant at the 0.01 level (1-tailed); *. Correlation is significant at the 0.05 level (1-tailed); Cronbach's alphas along the diagonal in the parentheses; N=179.

We conducted a multiple regression analysis to identify the factors that influence students' QoL. With an R^2 of.336, the regression model is good; it shows that attitude, behavior, social network, and social embeddedness,

which are the independent variables, explain 33.6% of the variation in QoL. The F value of 22.061 is significant, denoting that the data fits the model very well. The root MSE Durbin-Watson coefficient of.984 indicates that the regression model does not have an autocorrelation problem. Looking at the contribution of independent variables in explaining QoL, two independent variables are significant at 0.01 (attitude and social embeddedness), while behavior shows a significant value at 0.05. The strongest predictor that contributes to QoL among respondents is social embeddedness, followed by attitude, and the least factor that contributes to QoL is social behavior. Contrary to expectations, social networks show no significant association with QoL among university students.

Table 2: Summary Results of Regression Analysis (n=179)

Variables	Standardized Beta Values Quality of Life
Attitude	.250**
Behavior	.183*
Social Network	-.017
Social Embeddedness	.313**
R	.580
R^2	.336
Adjusted R^2	.321
F values	22.061
Sig. F values	.000
Root MSE	.984

** Sig. At the 0.01 level, * Sig. At the 0.05 level

Discussion
Based on the findings, the respondents' QoL is moderately high. This suggests that the majority of university students are content with the overall standard of living they experience while on campus. In general, they expressed contentment with material comforts such as housing, nourishment, amenities, and financial stability. They were also content with their physical well-being, feeling physically strong and energetic. Additionally, they reported a moderate level of satisfaction in their relationships with their parents, siblings, and other relatives, specifically in terms of communication, visits, and assistance. They also indicated contentment with their learning experience, attending classes, deepening their comprehension, and gaining extra knowledge. They were also satisfied with their self-awareness, understanding their strengths and shortcomings, and comprehending the fundamental nature of life. The QoL among university students is crucial since it has a substantial impact on their academic achievement, psychological well-being, and general welfare. A favorable QoL, characterized by sufficient availability of resources, social assistance, and chances for individual growth, is linked to improved academic achievement and increased levels of student contentment. In a study conducted by Alharbi and Smith (2018), it was found that students who have a higher QoL exhibit greater resilience and are less prone to experiencing stress and burnout, which are prevalent issues in the university environment. In addition, creating supportive workplaces and ensuring balanced workloads can result in better mental health outcomes, more engagement, and higher retention rates (Nabavi, 2020). Thus, institutions should prioritize enhancing the students' QoL to create a favorable atmosphere for their academic and personal development.

The findings of this study also demonstrated that there is a correlation between social engagement (attitude and behavior) and QoL among the participants. University students greatly benefit from social involvement as it cultivates a feeling of inclusion, improves academic achievement, and positively impacts overall welfare. Participating in social activities and establishing relationships with classmates and professors can result in the formation of supportive networks, which are crucial for successfully navigating the difficulties of university life. Studies indicate that students who actively participate in social activities demonstrate increased levels of academic motivation, improved mental well-being, and a higher probability of completing their education (Astin, 1999). In addition, Tinto (2012) establishes a connection between social involvement and the acquisition of essential soft skills, such as communication, teamwork, and leadership, which are highly advantageous for achieving success in one's future job. Thus, colleges must give priority to the establishment

of opportunities for social involvement, acknowledging its substantial influence on students' academic and personal growth.

Social embeddedness refers to the extent to which an individual is integrated into social networks that provide support, information, and a feeling of belonging. Social embeddedness is of paramount importance for university students, as it significantly impacts their academic success, mental health, and overall well-being. The transition to university life frequently entails substantial alterations in students' social surroundings, rendering the examination of social embeddedness especially pertinent. The study findings demonstrated a significant correlation between social embeddedness and QoL in university students. Smith et al. (2022) conducted a study that found a positive correlation between strong social ties among students and the likelihood of receiving academic support from peers. This support has the potential to improve their learning experiences and outcomes. In a recent study conducted by Lee and Robbins (2023), it was discovered that students who had higher degrees of social embeddedness reported experiencing lower levels of stress and exhibited better mental health results.

5. Conclusion

Multiple variables, such as physical well-being, psychological well-being, interpersonal connections, academic stressors, and financial worries, impact the overall well-being of college students. To tackle these problems, a comprehensive strategy is needed, encompassing institutional backing, mental health provisions, and lifestyle changes. By employing these tactics, universities may optimize the well-being of their students, resulting in enhanced academic achievement, personal growth, and overall life contentment. Universities and students can utilize a range of tactics to improve social interaction. These tactics prioritize the creation of chances for social contacts and the facilitation of students in establishing and sustaining their social networks with other individuals, such as their classmates, lecturers, university personnel, and community members. Active participation in social activities is a crucial element of the university experience, exerting a substantial impact on academic achievement, psychological well-being, and individual growth. Gaining insight into the variables that influence social interaction and employing tactics to amplify it might result in a university experience that is more encouraging and fulfilling for students. As colleges evolve to accommodate shifting social dynamics and technological progress, cultivating robust social networks among students will continue to be a crucial objective.

Abstract: Effective innovation is possible when one can innovate. Malaysia has serious problems due to a lack of R&D and innovation skills. Furthermore, small and medium-sized firms (SMEs) in developing nations have received less attention in past research on Malaysian innovation. A quantitative strategy is employed to meet the study's goals. A survey approach is used to collect data from the owners, chief executives, and management of ICT SMEs. The research collected and analyzed a total of 200 respondents. The research models and hypotheses were assessed using the Partial Least Squares (PLS) technique. This research comprises the difference between Innovative Centric Human Resource Management (ICHRM) (Acquisition; Development; Egalitarian; Collaborative; Documentation, Information System) and Innovation Capability (Radical; Incremental), also the relationship between ICHRM and Innovation Capability, using Knowledge Management Capacity as a mediator. Based on the findings of this study, the majority of HRM practices are suitable for SMEs' incremental innovation capabilities. This study also presents empirical evidence of the impact of ICHRM on knowledge management capacity on innovation, focusing on the impact of each dimension in ICHRM components that were linked to organizational processes, with a focus on the influence on incremental and radical innovation.

Keywords: *ICHRM, Development, Egalitarian, Collaborative; Documentation, Information System, Innovation Capability, SMEs*

1. Introduction and Background

Innovation is considered a vital factor in advancing Malaysia toward achieving developed nation status with a high-income classification (Inovasi Malaysia, 2022). The presence of innovative and competitive SMEs is essential for the success and future advancement of nations, particularly Malaysia (Cakar & Erturk 2010). Due to the essential nature of innovation for a firm's existence and development, possessing innovation capabilities has become increasingly vital (Francis & Bessant, 2005). Companies with enhanced innovation capabilities are likely to be more adept at managing innovation than their competitors and more effective in capitalizing on new ideas (Francis & Bessant, 2005).

Innovation is a crucial element for Malaysia to achieve developed nation status and a high level of living by 2020. (Hilmi, Pawanchik, Mustapha, & Mahmud, 2012; Sulaiman, Muhamad, & Sanusi, 2012). The future prosperity and expansion of Malaysia hinge on the presence of creative and competitive small and medium-sized enterprises (SMEs) (Cakar & Erturk, 2010). For a company to prosper and expand, enhancing its capacity for innovation is becoming increasingly essential (Francis & Bessant 2005). A corporation with a high degree of innovation aptitude is likely to manage and implement new ideas more effectively than its competitors (Francis & Bessant 2005).

The critical factor in maximizing innovation is the necessity of a creative idea or vision, whether it pertains to new business processes, organizational changes, or modifications in products and services. Innovation serves both the user's and the business's interests. Comprehending innovation typically involves a certain level of imagination, albeit not all innovations require it. Innovative developers implement creative ideas to effectuate definite and substantial changes in the area of innovation inside an organization (Hertog, Aa & Jong, 2010). Small and medium-sized enterprises (SMEs) encounter difficulties in attracting and retaining human resources; therefore, the success of SME-ICT firms in Malaysia necessitates the efficient management of human resources essential for facilitating technology and knowledge transfers, ultimately fostering the growth of Malaysian ICT SMEs. Furthermore, the function of market sensing as a moderator is crucial, as it is essential to answer client expectations. Innovation, knowledge management, and human resource management challenges are critical in

the context of SME-ICT Malaysia. This indicates the necessity for a comprehensive examination of the relationship among HRM, knowledge, and innovation in SME-ICT Malaysia.

Numerous studies acknowledge the pivotal function of ICT in enhancing the corporate environment by generating exceptional chances for growth, job expansion, and innovation acceleration. Few SMEs are fully harnessing the potential of digitalization. The paper 'Accelerating Malaysian Digital SMEs: Escaping the Computerization Trap', produced by SME Corp, examined the present state of innovation within the Malaysian SME sector and determined that the majority have only minimally engaged with technology as a catalyst for growth. The growth and success of small and medium-sized enterprises (SMEs) are crucial in today's global ICT landscape, irrespective of economic conditions (Abdullah & Beal, 2003). Small and medium-sized enterprises (SMEs) throughout the information and communication technology industry, especially in Malaysia, encounter intense competition and a dynamic worldwide market. They must continually pursue novel methods to enhance their capacity for innovation to achieve sustained growth and improved company success. Calantone, Cavusgil, and Zhao (2002) assert that a company's innovative capacity is essential for its competitiveness and performance, but Hurley and Hult (1998) and Terziovski (2008) contend that innovation competence is a vital component of successful innovation.

SMEs need to generate exceptional new goods or services to use emerging technologies (Hadjimanolis 1999). Small and medium-sized firms (SMEs) have a historical record of innovation despite constrained resources (Rosenbusch, Brinckmann & Bausch 2011). Companies' competitiveness and economic performance decline when their potential for innovation fails to expand and be maintained (Capaldo, Landoli, Raffa & Zollo 2003). Therefore, a company's capacity for innovation must be enhanced to remain competitive in the marketplace.

In the global information and communications technology (ICT) landscape (Abdullah & Beal, 2003), small and medium-sized enterprises (SMEs) are regarded as vital to the economic well-being of any nation, including Malaysia. Small and medium-sized enterprises in the ICT sector, especially in Malaysia, encounter heightened rivalry and a dynamic business landscape as a result of globalization. To achieve sustained development and enhanced business performance, they must continually explore new methods to enhance their capacity for effective innovation. Calantone, Cavusgil, and Zhao (2002) and Hurley and Hult (1998) assert that innovation and the capacity to innovate are the paramount aspects influencing an organization's competitiveness.

To compensate for the decline of conventional revenue streams, firms used digital initiatives. A corporation that fails to adopt digital practices is unlikely to survive, let alone prosper. Small and medium-sized enterprises (SMEs) constitute 99 percent of Malaysia's 920,624 firms. In 2018, small and medium-sized firms (SMEs) comprised 66.2 percent of Malaysia's workforce and contributed RM522.1 billion, representing 38.3 percent of the nation's GDP. Small and medium-sized enterprises can be categorized into micro, small, and medium classifications based on their industry, revenue, and employee count. Seventy-six-point-five percent of Malaysian SMEs are classified as micro-enterprises. Conversely, merely 2.3% of SMEs qualify as medium-sized enterprises (Amos & Rachel, 2020).

Human resource functions have already been examined concerning knowledge management competence (Lengnick-Hall et al., 2009). Research predominantly centers on Human Resource (HR) tasks that emphasize innovation, specifically recruiting, selection, and performance evaluation. However, there seems to be insufficient study about the influence of HR functions within the framework of Innovation Centric HR on knowledge management and innovation. This research will analyze two forms of innovation: radical and incremental. This study seeks to address the existing gap in the literature through investigation. Therefore, the objective of this thesis is to examine the relationship between the human resource management of Malaysian ICT SMEs and their capacity to manage knowledge. Also, This study investigates innovative-focused HRM practices and knowledge management capabilities, which have not been extensively explored in Malaysian ICT SMEs.

2. Literature Review

HRM Practices and Knowledge Management Capacity

Acquisition through the creation, sharing, and implementation of radical new concepts, HRM practices help businesses enhance their ability to manage knowledge (Baer, 2007, Kang, et al., 2007). Organizations have access to a wider range of information and resources the more diversified the external networks that people have built, which broadens their understanding of the most recent institutional and technological developments. Collaborative HRM practices improve knowledge acquisition, knowledge sharing, and application by promoting better teamwork and collaboration among stakeholders (Youndt and Snell, 2004). Unrestricted HRM practices that eliminate hierarchical differences in the organization have been found to encourage employees to acquire, share, and apply knowledge.

Employee knowledge acquisition, sharing, and application are supported by HRM practices by requiring employees to create and populate knowledge storage devices such as information systems, manuals, and standard operating procedures (Davenport & Prusak, 1998). Using information technology infrastructure, technological HRM practices aid in the codification, capture, and management of organizational knowledge (Youndt & Snell, 2004). In this case, various technologies such as online databases, groupware, data warehouses, and information processing software help a company's KM function (Kamhawi, 2010).

Therefore, the relationship between a firm's HRM practices and knowledge management appears to be straightforward, as existing literature provides compelling evidence that innovation-centric HRM approaches directly impact knowledge management capabilities. Thus, the following hypotheses are proposed:

H1: *The Acquisition HRM practices directly and positively influence its Knowledge Management Capacity.*
H2: *The Development of HRM practices directly and positively influences its Knowledge Management Capacity.*
H3: *The Egalitarian HRM practices directly and positively influence its Knowledge Management Capacity.*
H4: *The Collaboration HRM practices directly and positively influence its Knowledge Management Capacity.*
H5: *The Documentation HRM practices directly and positively influence its Knowledge Management Capacity.*
H6: *The Information HRM practices directly and positively influence its Knowledge Management Capacity.*

Mediating Relationships between Constructs

Human Resource Practices, Knowledge Management Capacity and Radical Innovative Capability

According to Damodaran and Olphert (2010), knowledge management systems (KMS) are defined as "information systems that are believed to enhance organizational learning by capturing both content and process knowledge and making this knowledge accessible to all employees." As stated by Abubakar et al. (2017), "Knowledge Management encompasses various components, including human resource practices, technology, culture, and organizational structures; hence, it represents a systematic approach to optimizing a firm's knowledge economy and fostering innovations" (pg.13). The deployment of KMS encompasses not only technological aspects but also human factors (Shrafat, 2018). This may be interpreted as knowledge-based human resource management strategies enhancing the rate of radical innovation adoption. The implementation of radical innovations should also influence the profundity of organizational knowledge. An increased number of professionals facilitates the comprehension of novel technical concepts and the formulation of methods for their implementation. This approach, however, presupposes that the professionals are sufficiently concentrated to facilitate effective communication among themselves. The concentration fosters a greenhouse effect for the cultivation and sustenance of innovative ideas, particularly when these ideas signify substantial alterations in the conceptualization of a manufacturing process.

They asserted that a proactive strategy enhances industry performance by fostering flexibility, innovation, improved opportunity recognition, and superior foresight of market fluctuations. Abernathy and Clark (1985) delineated the difference between gradual and radical innovation. Radical innovations are characterized by a significant divergence from current technical pathways. The extent of technological novelty—a novelty to enterprises, the industry, and the consumer—dictates whether an innovation is classified as radical. The corporation can utilize the knowledge that affects the nature of innovation generated, whether gradual or drastic (Subramaniam & Youndt, 2005). The research serves as a significant reference in this study, as it is among the limited empirical investigations that assess inventive capability. In conclusion, the examined

literature indicates that both radical and incremental inventive capacities are established notions that warrant additional examination due to their significant business ramifications. The inquiry into how organizational knowledge might yield varying outcomes in radical or incremental innovation remains unresolved.

It is essential to highlight that knowledge inside organizations resides with employees. The subsequent section will explore the topic of human resource management (HRM), which focuses on the management of employees inside organizations. This conversation aims to explore how Human Resource Management might affect an organization's capacity for innovation. In organizations, "knowledge management" (KM) denotes a strategy for effectively utilizing individuals' knowledge and experience to generate value (Scarborough, 2003). The resource-based theory of the organization is often cited as a primary reference in numerous KM studies, including those by Chen and Huang (2009) and Seleim and Khalil (2007), which acknowledge knowledge as a vital organizational resource (Nonaka & Takeuchi, 1995). In addition to the resource-based theory, knowledge management academics sometimes reference the firm's knowledge-based theory.

The knowledge-based theory of the firm posits that organizations function as systems for the development, utilization, and dissemination of knowledge, with positive performance reliant on their capacity to process knowledge (Seleim & Khalil, 2007). The resource-based theory posits that organizations get advantages from distinctive resources, but the knowledge-based theory extends this notion by asserting that knowledge is the paramount organizational resource (Nonaka & Takeuchi, 1995).

The knowledge-based theory is an addition to the resource-based theory of the company (Seleim & Khalil, 2007; Nonaka & Takeuchi, 1995). In conclusion, the firm's resource-based and knowledge-based theories assert that innovation is closely associated with 2 organizational resources: knowledge and employees, which serve as fundamental repositories of information. Knowledge is a major asset essential for attaining competitive advantage in organizations, as it fulfills the criteria of being rare, valuable, distinctive, and inimitable (de Pablos, 2004). Multiple studies have demonstrated that HRM strategies can be employed to acquire and retain human resources possessing unique and hard-to-replicate attributes, subsequently enhancing their competencies into organizational capabilities that generate sustainable competitive advantage for organizations. Consequently, in this investigation of organizational innovation, the theories function as foundational principles.

Nonetheless, despite the substantial contributions of both resource-based and knowledge-based models of the company, academics caution that evidence indicates organizational resources alone may not inherently provide competitive benefits to organizations (Ray, Barney & Muhanna, 2004). Employees and knowledge must be cultivated, underpinned by management processes, and utilized to attain specified objectives that confer a competitive advantage to the organization. To improve the organization's innovation performance, they need to be effectively managed.

This research aims to thoroughly document the resources and organizational procedures that facilitate innovation in companies. This section examines how social ties and learning processes within organizations facilitate innovation. Knowledge Management Capability (KMC) is typically defined as the organization's capacity to generate, disseminate, and utilize knowledge resources to produce principles of competitive advantage. KMC allows organizations to discover, analyze, and manage necessary and available knowledge to enhance knowledge resources and attain organizational objectives (Chawla & Joshi, 2010). Most scholars concur that KMC encompasses the processes of acquiring, sharing, and applying knowledge (Chen & Huang, 2009). Knowledge acquisition pertains to a firm's capacity to seek and obtain new information and knowledge from pre-existing knowledge. Also, Knowledge sharing is the process by which people share their knowledge and experience to improve and produce insightful new ideas (Liao & Wu, 2009).

Numerous research has substantiated the correlation between knowledge management capability and innovation aptitude. Le and Lei (2019) assert that a firm's capacity for innovation is significantly contingent upon its proficiency in knowledge transformation and implementation. Innovation is not the only focus of knowledge management; it also creates an atmosphere that encourages innovation. Ling and Nasurdin (2010) assert that good knowledge management enhances a firm's organizational capacity for innovation by perpetually evolving its administrative processes, information systems, and organizational structure into

innovative frameworks. Costa and Monteiro (2016) assert that knowledge management capability substantially enhances innovation by transforming tacit knowledge to explicit knowledge, also improving the capacity to identify knowledge gaps, subsequently making this knowledge available and accessible. Costa and Monteiro (2016) evidenced the substantial impact of knowledge management capability on diverse types of innovation through a rigorous analysis of 45 seminal works. KMC enables organizations to deliberately control knowledge inflows and outflows, facilitating the effective execution of external exploitation and internal innovation. Naqshbandi and Jasimuddin (2018) found that Knowledge Management Capabilities (KMC) enhance and expedite the acquisition and application of knowledge, hence augmenting the innovation capacity of 172 French enterprises.

Recent research indicates that the primary factors influencing an organization's innovation processes are the acquisition, diffusion, and application of knowledge resources (Le & Lei, 2019). Additionally, regarding the relationship between KMC and ambidextrous innovation, Andriopoulos and Lewis (2009) asserted that KMC enables organizations to leverage existing knowledge and experiences for incremental innovation while simultaneously enhancing their capacity to explore new knowledge to promote radical innovation. Organizations with a higher KMC are anticipated to exhibit greater efficiency in striking a balance between exploitative and exploratory technological innovations in an ambidextrous manner. The findings indicated that KMC has a positive correlation with exploitative practices and ERIs. Despite the acknowledged positive link between Knowledge Management Capability(KMC) and innovation, empirical research examining the relationship between KMC, and several facets of innovation remains insufficient.

H7: The KMC Mediates the Relationship between Acquisition and Radical Innovation Capability.
H8: The KMC Mediates the Relationship between Development and Radical Innovation Capability.
H9: KMC Mediates the relationship between Egalitarian and Radical Innovation Capability.
H10: The KMC Mediates the Relationship between Collaboration and Radical Innovation Capability.
H11: The KMC Mediates the relationship between Documentation and Radical Innovation Capability.
H12: The KMC Mediates the Relationship between Information and Radical Innovation Capability

Human Resource Practices, Knowledge Management Capacity and Incremental Innovative Capability
Businesses have recognized the importance of knowledge management (KM) due to its capacity to facilitate innovation through effective knowledge utilization. Numerous multinational enterprises (MNEs) are currently using Knowledge Management (KM) to optimize the value of the knowledge possessed by their existing and prospective customers and shareholders. Lichtenthaler (2017) posits that a company's ability to acquire, retain, and utilize knowledge in open innovation is most accurately characterized by the notion of organizational learning. Collaboration, innovative initiatives, and efficient knowledge management frameworks are crucial for multinational enterprise innovation endeavors. Both internally and externally, a company's innovative concepts can proliferate rapidly due to the dissemination of information across several locations. A company's knowledge management practice encompasses a range.

Knowledge management capacity is crucial for innovation as it identifies knowledge deficiencies, amalgamates internal and external knowledge, and enhances its availability and accessibility for the innovation practice (du Plessis, 2007). Multinational enterprises can enhance their innovative endeavors by adopting the open innovation paradigm, which involves obtaining external knowledge and utilizing external channels for the commercialization of new insights. A benefit of knowledge management is that it enhances the organization's open innovation initiatives. Tan and Nasurdin (2011) assert that knowledge management capacity functions not only as a prelude to organizational innovation but also as an intermediary mechanism linking organizational elements, such as human resource management practices, to innovation outcomes. These authors assert that HRM strategies empower organizations to improve employees' capacity to generate expertise in their field and maximize the influence of group knowledge on organizational innovation. This study aims to elucidate the mediation mechanism by which knowledge management capacity influences the effects of Human Resource Management (HRM) practices on exploitative and Employee Retention Intention (ERI) behaviors, thereby addressing existing research gaps.

An organization's knowledge management capacity denotes the degree to which knowledge resources are generated, disseminated, and utilized across functional boundaries. The KM capability is dynamic, allowing organizations to manage their knowledge bases by reorganizing and realigning the processes of knowledge

exploration, retention, and exploitation both internally and externally (Lichtenthaler & Lichtenthaler, 2009). The pace of invention is exceedingly rapid, and the intense battle for market share is escalating daily. Innovators, business executives, and specialists often concentrate on developing groundbreaking breakthroughs to generate new markets and categories for technologies, products, and services, thereby securing a substantial advantage over competitors. Although this is accurate, the significance of incremental innovation must not be disregarded. The market impact can be substantial, even if it is not immediately evident or quantifiable at the time of introduction. Therefore, this research posits that:

H13: *The KMC mediates the relationship between Acquisition and Incremental Innovative Capability.*
H14: *The KMC mediates the relationship between Development and Incremental Innovative Capability.*
H15: *The KMC mediates the relationship between Egalitarian and Incremental Innovative Capability.*
H16: *The KMC mediates the relationship between Collaboration and Incremental Innovative Capability.*
H17: *The KMC mediates the Relationship between Documentation and Incremental Innovative Capability.*
H18: *The KMC mediates the relationship between Information and Incremental Innovative Capability.*

3. Methodology

Research Design
This research aims to investigate how factors correlate to one another (constructs), such as distributive human resource practices, KM, and organizational innovation, quantitative research is appropriate. The variables were measured with a research instrument, and the data gathered was then analyzed statistically (IBM SPSS Statistics and PLS-SEM). In terms of data collection, a survey was used because it is associated with the deductive approach and has been cited as one of the most prominent data collection strategies in business-related research (Sekaran & Bougie, 2010). The survey is appropriate because many respondents were needed for this study, and it is highly economical practically.

Population and Sample
This study approach is supported by research findings which have found that subjective self-reports, in terms of organization perception employee perception of their organizational practices. As such, to understand the HR practices for knowledge flow and innovation from the perspective of individual employees, an organization the research population identified all SME-ICT in Malaysia.

Sampling Design
SME Corp., Malaysia provided a list of companies from which to sample for this thesis. As the secretariat for the National SME Development Council (NSDC), SME Corp serves as the primary source of information and advice for all Malaysian small and medium enterprises (SMEs). An alphabetical list of small and medium-sized enterprises (SMEs) is available on the website. It was necessary to obtain the list of businesses included in the ICT sector for this investigation. At the time of access in August 2020, there were 500 companies on the list, which served as a population frame. Businesses in Malaysia's Greater Kuala Lumpur/Klang Valley region, which includes the city of Kuala Lumpur as well as its surrounding suburbs, cities, and towns in the state of Selangor, were selected.

Survey Instruments
The survey questionnaire for this study was created by modifying and compiling a number of survey instruments that had been used by other researchers in the past. As indicated in Table 1, the study's questionnaire was modified from previous research.

Table 1: Survey Items

	Constructs	Dimensions	Sources of Measurement Scales	Adopt/Adapt	No of items
1	Innovative capability	Incremental innovative capability	Subramaniam & Youndt (2005)	Adapt	3
		Radical innovative capability			4
2	Knowledge management capacity	Knowledge management capacity	Chen & Huang (2009)	Adapt	7

3	Innovative-centric HRM practices	Acquisition HR	Youndt & Snell (2004)	Adapt	34
		Egalitarian HR			
		Documentation HR			
		Information System HR			
		Collaborative HR	Kang, Morris, & Snell (2007)		
		Development HR			

Data Analysis
This paper suggests that a partial least squares (PLS) technique is frequently more appropriate when there is a relatively fresh or evolving model, or when the theoretical model or measurements are not well-formed (Chin & Newsted,1999). Partial Least Square (PLS) has gained attention among behavioral researchers to explore a new theory or research model in the studies.

4. Results and Discussion

Demographic
The research population comprised SMEs from the ICT sector in Malaysia. Data were collected from the SMEs in Selangor, the Federal Territory, Cyberjaya, and Putrajaya. The minimum sample size for this study is 160, as determined by the G-Power analysis. This study successfully gathered 200 replies following data collection. This thesis was derived from a list of companies on the SME Corp, Malaysia website. SME Corp serves as the secretariat for the National SME Development Council (NSDC) and acts as the primary source of information and consulting services for all SMEs in Malaysia. The website offers an alphabetical listing of SMEs categorized by several industry groupings. The list of firms in the ICT industrial sector was obtained for this research. In December 2020, the access point had a list of 6,594 companies, serving as the population frame. The demographic information of the respondents included gender, age, educational attainment, work position, tenure, and the number of employees in the SME company.

Table 2 indicates that there were 110 male respondents, constituting 55 percent, and 90 female respondents, representing 45 percent. The respondents' ages varied, with the predominant group being 36 to 45 years old (49.8 percent), followed by 25 to 35 years old (29.9 percent) and 46 to 55 years old (15.4 percent). Only 8 employees were above 55 years old, constituting 4.0 percent, while those under 25 years old represented 1 percent. Most respondents possess a degree (85.0 percent), a diploma (7 percent), or a master's degree (8 percent). The employees represented four distinct job levels. Most respondents possess a degree (85.0 percent), a diploma (7 percent), or a master's degree (8 percent). The workforce comprised four managerial job levels (85.5 percent), management/director positions (8.9 percent), the owner (4.0 percent), and top executives (5 percent). The duration of services is categorized as follows: 5 to 10 years (73.5 percent), 3 to 5 years (19.0 percent), less than one year (5.0 percent), and more than 10 years (2.5 percent). The employee distribution across 200 organizations was as follows: more than 75 employees (71 percent), 10 to 30 employees (12.5 percent), 30 to 60 employees (10 percent), and fewer than 10 employees (6.0 percent).

Table 2: Demographic factors

Demographic Profile		Frequency	Percentage
Gender	Male	110	55.00
	Female	90	45.00
Age	below 25 years old	2	1.0
	25-35 years old	60	29.9
	36-45 years old	100	49.8
	46-55 years	31	15.4
	More than 55 years	8	4.0

Level of Education	Diploma Degree	14	7.0
	Master	170	85.0
		16	8.0
Job Level	Owner Top	8	4.0
	Management/Direct or	5	2.5
	Managerial	16	8.0
		171	85.5
How long have you been in the organization	Less than 1 year 3-5 years	10	5.0
	5-10 years	38	19.0
	More than 10 years	147	73.5
		5.	2.5
How many employees are in your company organization	Less than 10	12.0	6.0
	10-30	25	12.5
	30-60	21	10.0
	More than 75	142	71.0

Data Screening
Missing Data
There were 10 variables including six independent variables, two dependent variables 1 mediating variable, and 1 moderating variable. Overall, the total items for 10 variables were 48 items. The number of cases was 200 cases, and the total value was 7600. Therefore, there were no missing values in this study.

Outliers
In assessing the outliers, Mahalanobis distance is one measure of that multivariate distance. The values, then there are issues with the outliers. The findings showed that the Mahalanobis distance values (D2) ranged from a minimum of 0.364 to a high of 12.403. D2 values for 21 of the cases were evaluated, and the results showed that the report contained multivariate outliers. Thus two-one of the data was deleted. As a result, there was no outlier, as the highest Mahalanobis value decreased from 24.93 to 12.403.

Common Method Bias (CMB)
For this study, since the total variance explained was 6.39 percent, which is less than 50 percent, it can be concluded that there were no issues with common method variance in this study.

Descriptive Statistic
This study conducted a descriptive analysis that included mean, standard deviation, minimum, maximum, kurtosis, and skewness for each dimension. In the realm of egalitarianism, the least answer value was 1.0, while the maximum was 5.0. The mean value is 3.741, and the standard deviation is 0.688, indicating a high level of egalitarian behavior among the respondents in this study. The five elements of egalitarian exhibited a skewness of -0.429 and a kurtosis of 1.211. Kline (2011) states that the appropriate range of normalcy is characterized by skewness values below 3 and kurtosis values below 10. Therefore, this signifies that the data for this investigation was normally distributed.

The minimal value for collaboration was 1.25 and the maximum value was 5.0. The mean value was 3.917, and the standard deviation was 0.643, indicating a high level of collaborative practice among the respondents in this study. The eight components of collaboration exhibited a skewness of -0.936 and a kurtosis of 2.866, indicating that the data for this study was normally distributed.

The lowest value for the development of HRM practice was 1.00, while the highest value was 5.00. The mean value was 3.936, and the standard deviation was 0.667, indicating a high level of HRM practice growth among the respondents in this study. The eight components of HRM development exhibited a skewness of -0.936 and a kurtosis of 2.866, indicating that the data for this study was normally distributed.

The lowest value for the documentation of HRM practice was 1.00, while the maximum value was 5.00. The mean score was 4.018, and the standard deviation was 0.692, indicating a high level of HRM practice growth

among the respondents in this survey. The four components of HRM development exhibited a skewness of -1.236 and a kurtosis of 3.556, indicating that the data for this study was normally distributed.

The subsequent step was the descriptive analysis of the information system. The minimum value for information system practice was 1.00, while the maximum value was 5.00. The mean value was 3.75, and the standard deviation was 0.692, indicating a high level of information system practice among the respondents in this survey. The four components of the information system revealed a skewness of -0.723 and a kurtosis of 1.829, indicating that the data for this investigation was normally distributed.

The four acquisition elements reveal that the least acquisition practice value was 1.00, while the maximum value was 5.00. The mean value was 3.59, and the standard deviation was 0.648, indicating a high level of information system practice among the respondents in this study. In the four acquisition items, the skewness was -0.641 and the kurtosis was 1.576, indicating that the data for this study was normally distributed.

The six components of knowledge management capacity demonstrate that the minimal value for its practice was 1.00, while the highest value was 5.00. The mean value was 3.89, and the standard deviation was 0.659, indicating a high degree of knowledge management capability practice among the respondents in this study. In the six acquisition items, the skewness was -0.987 and the kurtosis was 3.136, indicating that the data for this study was normally distributed.

The three components of incremental innovation capabilities demonstrate that the minimal value for its practice was 1.00, while the highest value was 5.00. The mean score was 3.69, and the standard deviation was 0.791, indicating a high level of incremental innovation capability among the respondents in this study. The three market sense capability items had a skewness of -0.443 and a kurtosis of 0.280, indicating that the data for this study was normally distributed. The minimal value for radical innovation capabilities practice was 1.00, while the maximum value was 5.00. The mean score was 4.07, and the standard deviation was 0.805, indicating a high level of incremental innovation capability among the respondents in this study. The three market sense capability items had a skewness of -1.410 and a kurtosis of 3.479, indicating that the data for this study was normally distributed.

Assessment of Measurement Model
Factor Loading for Endogenous Constructs
According to Hair et al. (2014), To be regarded as having high internal consistency reliability, the loading needs to be more than 0.7. To extract the average variance with a minimum value of 0.50 and greater than 0.7, the item should be removed from the construct if the loading is less than the threshold value. The result for PLS revealed that all of the 48 items have a high factor loading with values that are greater than 0.5 and above 0.7.

The evaluation of composite reliability (CR) was conducted to ascertain dependability following the removal of components. Hair et al. (2014) assert that composite reliability should exceed 0.70, and the average variance extracted should be above 0.50 to ensure excellent internal consistency reliability and validity. Table 3 demonstrated the composite validity for the following values: acquisition (0.81), collaboration (0.902), development (0.889), documentation (0.851), egalitarian (0.881), information system (0.839), incremental innovation capability (0.846), knowledge management capability (0.902), and radical innovation capability (0.891). All indicators exhibit strong internal consistency values exceeding 0.7 for the evaluation of composite dependability. The findings validated the reliability of the 51 items.

Table 3: Assessment of measurement model

Construct	Number of Items	Item Deleted	Loadings for Retained Items	Composite Reliability	Average Variance Extracted (AVE)
1. Egalitarian	5	EGA1	0.577	0.881	0.601
		EGA2	0.700		
		EGA3	0.857		
		EGA4	0.844		
		EGA5	0.857		

2. Collaborative	8	COLAB1	0.718	0.902	0.536
		COLAB2	0.718		
		COLAB3	0.782		
		COLAB4	0.735		
		COLAB5	0.809		
		COLAB6	0.638		
		COLAB7	0.705		
		COLAB8	0.776		
3. Documentation of HRM Practice	4	DOCU1	0.711	0.851	0.588
		DOCU2	0.798		
		DOCU3	0.828		
		DOCU4	0.725		

The evaluation of average variance extracted (AVE) was conducted to ascertain reliability following the removal of components. Hair et al. (2014) assert that the variance extracted must exceed 0.50 to ensure excellent internal consistency reliability and validity. The composite validity for the values of acquisition (0.519), collaboration (0.536), development (0.538), documentation (0.588), egalitarian (0.601), information system (0.571), incremental innovation capability (0.647), knowledge management capability (0.571), and radical innovation capability (0.673) is presented. All indicators exhibit strong internal consistency values exceeding 0.7 for the evaluation of composite dependability. The findings validated the reliability of the items.

Table 4: Assessment of measurement model (continued)

Construct	Number of Items	Item Deleted	Loadings for Retained Items		Composite Reliability	Average Variance Extracted (AVE)
4. Development of HRM Practice	8	DEVELOP2	DEVELOP1	0.545	0.889	0.538
			DEVELOP3	0.74

			KMC4	0.818		
			KMC5	0.674		
			KMC6	0.780		
			KMC7	0.701		

8. Radical Innovative Capability	4	RADIC1 0.871	0.891	0.673
		RADIC2 0.805		
		RADIC3 0.899		
		RADIC4 0.691		
9. Incremental Innovative Capability	4	INNOC1 0.835	0.846	0.647
		INNOC2 0.728		
		INNOC3 0.846		

Discriminant Validity
Additional analysis was conducted to ascertain the discriminant validity. The Fornell and Larcker criterion was employed to assess the cross-loadings among the other constructs (Fornell & Larcker, 1981). Table 6 indicates that the cross-loadings of the construct exceed those of the other constructions, hence satisfying the requisite assumption. The cross-loadings of all objects in the reflecting model range from 0.695 to 0.839. Consequently, this outcome indicates that no item was loaded more significantly on constructs that were not intended for measurement.

Table 6: Discriminant model

Constructs	1	2	3	4	5	6	7	8	9	10
1. Acquisition	**0.721**									
2. Collaboration	0.717	**0.732**								
3. Development	0.627	0.698	**0.734**							
4. Documentation	0.600	0.668	0.717	**0.767**						
5. Egalitarian	0.622	0.743	0.55	0.592	**0.775**					
6. Information System	0.711	0.702	0.681	0.753	0.593	**0.756**

9. Radical Innovation Capability	0.536	0.596	0.929	0.652	0.468	0.577	0.457	0.527	0.597	**0.82**

Assessment of Structural Model (Hypotheses Testing)

R Square
The R^2 values of the incremental innovation capability are 0.589 (58.9%), radical innovation capability was 0.873 (87.3%), and knowledge management capability 0.956 (95.6 %), which suggested highly explained by eight exogenous constructs of acquisition, collaboration, development, documentation, egalitarian, information system, and knowledge management capability.

Direct Relationship Human Resources Practice with Knowledge Management Capacity
Correlation between human resources and knowledge management capacity in terms of collaboration (β= 0.446), development (β= 0.029), and egalitarianism (β= 0.675). The path coefficient was negative for acquisition (β= -0.091), documentation (β= -0.017), and information system (β= -0.029), whereas it was positive for knowledge management capacity (β= 0.424) and market sense capability (β= 0.765). The subsequent stage is to ascertain the significance of the link. Bootstrapping is necessary for each data collection, necessitating a minimum of 500 samples. The p-value and t-value must be below 0.05 ($p < 0.05$) to accept the hypotheses on the link. The subsequent stage is to ascertain the significance of the link.

Each data set necessitates bootstrapping, which requires a minimum of 500 samples. The p-value and t-value must be below 0.05 ($p < 0.05$) to accept the hypotheses on the link. The findings indicate that acquisition

(t=2.603, p <0.05), collaboration (t=10.61, p <0.05), and egalitarianism (t=16.03, p <0.05) significantly influence knowledge management capacity since the t-values surpass 1.96 and the p-values are less than 0.05. Consequently, the hypotheses on the link (H1, H3, & H4) were validated. The other construct did not significantly affect radical innovation capability, since the t-values were below 1.96 and the p-values exceeded 0.05.

Mediating Effect of KMC on HRM and Radical Innovation Capability
The results indicate that the path coefficients for acquisition (β= 0.039), documentation (β= -0.007), and information system (β= 0.012) were positive. The path coefficients for collaboration (β= -0.189), development (β= -0.012), and egalitarian (β= -0.286) were negative. The subsequent step is to evaluate the importance of the link. The data necessitate bootstrapping with a total of 500 samples per data set. To validate the importance of the association, the p-values must be below 0.05 (p<0.05) and the t-value must surpass 1.96 to accept the hypotheses regarding the link. The findings indicate that knowledge management capability did not mediate the association between human resources and radical innovation capability, as the t-value was below 1.96 and the p-value exceeded 0.05. Consequently, the assumptions regarding the association (H7-H12) were not substantiated.

Mediating Effect of KMC on HRM and Incremental Innovation Capability
The results indicate that the route coefficients for collaboration (β = 0.465), development (β = 0.03), and egalitarian (β = 0.704) were positive. Conversely, the route coefficients were negative for acquisition (β= -0.095), documentation (β= -0.018), and information system (β= -0.03). The subsequent step is to evaluate the importance of the link. The data necessitate bootstrapping with a total of 500 samples per data set. To validate the importance of the relationship, the p-values must be below 0.05 (p<0.05), and the t-value should surpass 1.96 to accept the relationship hypotheses.

The findings indicate that information management mediates the association between collaboration and incremental innovation capability (t=2.617, p<0.05) as well as egalitarianism (t=2.576, p<0.05), with the t-values above 1.96 and p-values being less than 0.05. Consequently, the hypotheses regarding the link (H15 and H18) were validated. The outcomes of H13, H14, H16, and H17 were not corroborated.

5. Discussion and Conclusion

In this section, the findings from the data analysis are further discussed and compared with the previous findings. The purpose of the discussion is to compare and verify the findings with the other studies. In the next subsection discussion according to the objectives of this study.

Direct Relationship Innovative Centric Human Resources Practices with KMC
The findings of the study indicate that human resources practices have substantial knowledge management capabilities. The practices of acquisition, egalitarianism, and collaboration (H1, H3, H4) are crucial for enhancing knowledge management ability in human resources. This outcome (H1, H3, H4) aligns with the findings of Sheng and Chien (2016), who addressed the acquisition of new knowledge and the development of new goods for new clients or emerging markets in the context of exploration.

The principles of acquisition, egalitarianism, and collaboration can be elucidated through ongoing organizational learning. The acquisition enables the individual to learn from peers and acquire new experiences. Furthermore, egalitarianism enables employees at all levels to acquire knowledge within the organization. Collaboration across several departments facilitates the flow of information and experiences among personnel. Consequently, human resources practices are vital to the organization since they enhance opportunities and benefits for organizational performance. The organization's continuous learning orientation enhances its competencies and bolsters the competitive advantage of its human capital (Sheng & Chien, 2016).

The adoption of HRM techniques enables organizations to improve their ability to manage knowledge through the generation, dissemination, and implementation of innovative concepts. According to Zheng et al., (2010), organizations derive greater benefits from diversified external networks developed by employees, as these networks provide varied information kinds and resources, hence enhancing their understanding of recent

technological and institutional advancements. HRM strategies facilitate knowledge sharing, acquisition, and application by promoting improved teamwork and cooperation among stakeholders (Youndt and Snell, 2004). Also, Egalitarian HRM approaches that reduce or eliminate hierarchical disparities have been shown to promote employee engagement in the acquisition, dissemination, and application of knowledge.

Documentation HRM approaches facilitate employee sharing, acquisition, and application of knowledge by mandating the creation and completion of knowledge storage devices, including information systems, manuals, and standard operating procedures (Davenport & Prusak, 1998). Technological HRM methods facilitate the formulation, capture, and management of organizational knowledge by using information technology infrastructure (Youndt & Snell, 2004). A firm's knowledge management role is enhanced by approaches including online databases, groupware, data warehouses, and information processing software (Kamhawi, 2010).

Collaborative HRM strategies facilitate knowledge sharing, acquisition, and application by promoting improved cooperation and collaboration among stakeholders (Youndt and Snell, 2004). Egalitarian HRM approaches that reduce or eliminate hierarchical disparities have been shown to promote employee engagement in the acquisition, sharing, and application of knowledge (Youndt and Snell, 2004). Consequently, human resources practices are crucial to the organization since they enhance opportunities and benefits for organizational performance. The organization's continuous learning orientation enhances its competencies and augments the competitive advantage of its human capital (Sheng & Chien, 2016).

Consequently, human resources practices are crucial to the organization since they enhance opportunities and benefits for organizational performance. The organization's continuous learning orientation enhances its competencies and strengthens the competitive advantage of its human capital (Sheng & Chien, 2016). Thus, the amalgamation of acquisition, egalitarianism, and cooperation has enhanced knowledge management capabilities.

Nonetheless, the development, documentation, and information were not substantial about knowledge management capacity (H2, H5, H6). This has been attributed to inadequate administration of the database system. An SME company is a small enterprise that is unable to consistently maintain its collection of papers. They must allocate substantial resources for an effective database management system. Furthermore, the development necessitates an investigation of novel concepts that are currently absent among the personnel. The employees require exposure and training, rendering development inconsequential to knowledge management capabilities.

Hypothesis H5 posits that documentation does not influence knowledge management. Capabilities in Documentation and Knowledge Management. These indicated that the absence of an adequate documentation system in the majority of small and medium-sized firms may account for the ineffectiveness of organizational learning capability and its correlation with other factors. The standardization of procedures and documents inside the SME is not yet highly developed. The potential for information integration and document standardization among firms is significant, given that the cluster has been functioning for less than five years. Moreover, the predominant proportion of respondents (73.5%) engaged in this study had been employed at the organization for a duration of 5 to 10 years, so limiting their ability to establish an effective documentation system that enhances their knowledge management capabilities.

Among these challenges include the lack of standardization and regulations for document management, along with the restricted utilization of electronic documents and Electronic Document Management Systems (EDMS). Certain criteria evaluated, including executive management commitment and a favorable opinion of document management methodologies and practices, are regarded as strengths for the cluster. Consequently, SMEs will be more proficient in standardizing documents and processes and executing an EDMS. The overwhelming majority of surveyed SMEs engage in document management. A position such as this indicates a company's dedication to investing. Although these investments seem inadequate for the implementation expenses of EDMS, prevailing management practices in this sector, which depend on the administration of paper and electronic documents, validate this assertion. Despite the rapid evolution of document formats in recent years,

corporations continue to depend on conventional techniques, as demonstrated by their storage tools and the limited adoption of electronic documents for information dissemination.

An information system was determined to be not significant for knowledge management competence. Research indicates that the accessibility of information and knowledge management steers corporate innovation processes towards enhanced competitive advantage (Mao, Liu, Zhang, & Deng, 2016). Owners and managers of small and medium-sized enterprises may derive advantages from some findings of our research. Our research yields two key findings: This research indicates that Information Technology capabilities significantly facilitate the development of higher-order capabilities. Surpasses the performance of tiny enterprises. The allocation of finances alone is insufficient for the integration of Information Technology into their processes; nonetheless, it is essential to acknowledge that Information Technology can yield beneficial outcomes if they opt to apply or enhance its more advanced or complex capabilities.

The Mediating Effect of KMC between Human Resource Management Practices and Radical Innovation Capability
The findings indicate that knowledge management capacity did not moderate the association between human resources and radical innovation capability, since the t-value was below 1.96 and the p-value was below 0.05. The suggestions regarding the link from H7 to H12 were not substantiated. This may be elucidated by the inclination of SME ICT enterprises in Malaysia towards radical innovation. Most organizations typically encounter difficulties in handling the introduction of products founded on radical innovations. They lack the proficiency to navigate the hurdles and capitalize on the commercial opportunities associated with the introduction of disruptive or discontinuous technology (Alfawaire & Atan, 2021). The unpredictability of outcomes and market applications for a novel concept renders the function of knowledge management capabilities a significant challenge in forecasting the new product. It became harder to evaluate an innovation's potential and market acceptance the more radical it is. There is a substantial knowledge gap between theory and practice due to the growing complexity and market dynamics. Numerous organizations lack the structure to foster innovative ideas, identify critical market trends, swiftly react to evolving market conditions, or initiate market reforms. This case elucidates why knowledge management capability did not mediate the association between human resource management practices and radical innovation capability. Implementing radical innovation is inherently tough.

The Mediating Effect of KMC between HRM Practices and Incremental Innovation Capability
The study reveals that knowledge management capacity moderates the association between egalitarian and incremental innovation capabilities, and the relationship between cooperation and incremental innovation potential is mediated by knowledge management capacity. Collaboration within teams enables all members to acquire new information and experience from one another, and the principle of equality effectively facilitates knowledge management capacity for incremental innovation. The integration of new knowledge with existing knowledge facilitates the reconfiguration of organizational capacities and competencies, resulting in value-added products. Knowledge management skills are crucial for organizations and SMEs to foster product and process innovation capabilities, attaining competitive advantage.

However, knowledge management capacity did not mediate the interaction between acquisition, development, documentation, and information, and both radical and incremental innovation capability. Acquisitions in SMEs facilitate business expansion through the purchase of an existing enterprise, leading to a substantial increase in resources and knowledge, which often enhances diversity and transforms a company's resource and knowledge foundation. However, in the absence of resource sharing throughout the broader organization, novel combinations and opportunities may remain unreal.

The mediation effect of KMC did not influence the connection between development approaches and innovative capabilities. This occurs in SMEs because KMC did not moderate the relationship between development practices and innovation capability. Training and development activities can enhance alignment between employees' existing and necessary knowledge and skills, fostering knowledge creation and advancing human capital. However, skills may decline and become outdated, and the capacity for knowledge management did not mediate the relationship between acquisition and innovative capabilities.

Poor record management in documentation processes hinders KMC procedures and leads to business innovation failures. Insufficient planning, design, coordination, and assessment are factors that hinder KMC from mediating the relationship between information systems and innovation capabilities. The insufficient expertise of knowledge managers and staff leads to the use of the information system for fostering innovative capabilities. Furthermore, SMEs face difficulties with inadequate planning and inflated expenses associated with the implementation of new information technology. Therefore, the capacity for knowledge management did not mediate the relationship between acquisition and innovative capabilities.

Conclusion

Research has shown that innovation is a crucial driver of growth and competitive advantage for organizations. However, Malaysia's level of innovation is still low, and studies on factors affecting innovation capability and corporate innovation are scarce. Human capital is the primary resource for fostering innovation, as it provides expertise, knowledge, and skills that can transform an organization. Common practices in human capital management include acquisition, collaboration, development, documentation, egalitarianism, and information systems.

Malaysian ICT SMEs possessing significant social capital promote collaboration both internally and externally among firms. Employees with exceptional competence, creativity, and intelligence are considered essential for enhancing innovation capabilities. These employees enhance the organization's innovation capacity by delivering services and products that offer unique advantages over competitors, addressing client challenges with innovative methods, proposing creative solutions and ideas, presenting original solutions to clients, and pursuing unconventional solutions to problems.

Knowledge management (KMC) is a vital resource that affects innovative capabilities. KMCs promote collaboration both internally and externally among firms, allowing employees to acquire proficiency in collaboration, identify and resolve issues, engage in dialogue and idea exchange, disseminate information, learn collectively, and establish partnerships with customers, suppliers, alliance partners, and others.

In conclusion, further research is needed to ensure the growth of local businesses in Malaysia through organizational innovation. The HR framework of a Malaysian company can be structured to promote knowledge acquisition, information exchange, and knowledge application to enhance innovative skills within Malaysian organizations.

Abstract: Homestay have been a part of the tourism industry for a long time, however, their prevalence is still lower than the other travel-related services. Determining the factors that homestays should have to improve their performance and level them with other tourism services is the goal of this pilot study. Thus, this study aims to investigate how homestay performance can be improved by using the TOE Framework. To do this, a self-administered questionnaire was distributed among 50 homestay coordinators in the pilot study. To verify the validity and internal consistency of the measures, a few tests were carried out on the data by using SPSS 29 software. The three factors examined in this study which are technology, organization and environment factors were all determined to be significant. The findings show that homestays should give each of these factors top priority if they want to improve their performance and stay competitive in the tourism industry. In conclusion, the uniqueness of this study has contributed to the development of the most effective homestay business plan and provided empirical data for the study, both of which are essential resources for decision-makers engaged in the execution of future research.

Keywords: *TOE Framework, Homestay, Homestay performance, MOTAC, Tourism*

1. Introduction and Background

The government of Malaysia has allocated RM 237.61 million to the Ministry of Tourism, Arts and Culture (MOTAC), in an attempt to boost the tourism industry (Zulkefli, Che Aziz and Mohd Radzol, 2021). These kinds of grants support the economic development of rural communities with limited resources by facilitating a variety of business transactions of commodities, crafts and services. This provides the opportunity for the community to seek careers in business. Therefore, Community Based Tourism (CBT) is viewed as an excellent option to launch a number of activities that encourage tourists to learn about accessible natural treasures. Homestay is a common CBT program that allows participants to visit neighboring towns and villages as well as reside with local foster families (Phunnarong, 2021). This is because the Homestay program is one of the initiatives that the rural community takes part in to enhance living circumstances, strengthen community bonds and reap equitable benefits from the homestay (Kunjuraman, Hussin, and Aziz, 2022). As stated by Azman (2020); Ramele and Yamazaki (2020), this Homestay program was officially launched in 1995 and distributed to all rural villages in Malaysia.

Additionally, guests can stay with host families through this program, interacting with family members and taking in the customs and daily activities of the community (Azhar et al., 2021). Furthermore, Zulkefli et al. (2021) found that this program was designed to provide unique experiences to tourists who are eager to learn about the local way of life and culture, as well as to develop a fresh and reasonably priced rural tourism service for the global market.

According to Balasingam and Bojei (2019), this program also will help in enhancing the social and economic status of the community by reducing unemployment and creating job opportunities. Where the program offers various advantages to the community, including generating income, developing the handicraft sector and fostering rural culture (Janjua et al., 2021).

Even with all of the government incentives that the Homestay program has received, it is still a slowly expanding industry. There is a problem with registered homestays declining interest in taking part in the

program. This is in line with Ismail et al., (2016) study stated that the homestay program faces numerous challenges, due to external and internal factors in its business environment that affect the program's performance and efficiency. Thus, to what extent the usage of the TOE Framework in the Homestay Program is yet to be determined. In addition, there is less evidence on how the TOE Framework is utilized in practice, reflecting the context of use in a homestay program, which is confined and susceptible to situational constraints (Agyeiwaah, 2018; Siti Nabiha, Nordin, and Poh, 2021). Thus, to enrich the literature, this study seeks to investigate the influence of TOE factors on the performance of homestay in Malaysia.

2. Literature Review

There are a number of well-known frameworks that aid the explanation of why individuals or organizations decide to accept or reject new technologies. The TOE framework, which integrates technology, organization, and environment, has gained significance in analyzing the ways in which different elements impact the financial performance of businesses, including homestays. The purpose of this literature study is to examine how the TOE framework has been used to evaluate homestays' financial performance, with an emphasis on the ways in which these elements support both operational effectiveness and profitability. This review attempts to provide a thorough understanding of how homestays can use the TOE framework to improve their financial performance by highlighting important findings and gaps in the literature through a synthesis of recent research. Hence, this is how the TOE framework and homestay performance are summarized

TOE framework
The TOE framework is a well-known theoretical model that explains how technology is adopted and integrated into businesses (Fan et al., 2023). This framework was first proposed by Tornatzky and Fleischer during the progress of technology (Tornatzky & Klein, 1982). It includes technological, organizational and environmental factors. Compared to the other theory, the TOE framework has the advantage of being able to identify both internal and external impacts, as well as offering a more comprehensive research perspective (Zhong and Moon,2023). Perceived relative advantage, perceived compatibility and other pertinent technologies utilized by the company are all included in the technological factors (Amini and Jahanbakhsh, 2023). Organizational factors comprise the firm's characteristics and features, including its size, the level of competence of its human resources, the quantity of resources at its disposal, and its organizational structure (Kwabena et al., 2021). According to Ramlan et al., (2023), the environmental context includes external factors that have an impact on the company.

Technological Factors
Technological factors refer to the creative efforts made by an organization to acquire new technologies that could improve its performance (Wang et al., 2016). Tornatzky et al. (1990) highlighted the importance of company capabilities in managing technology by emphasizing the technological aspect within the TOE framework. In terms of putting technological components into practice, Yalcin and Daim (2021) have recommended acquiring technology as well as having the ability to manage, integrate, and develop with these elements successfully. Technology will continue to grow as long as internal factors continue to drive it and performance will also increase with it. Naturally, internal R&D alone is not enough to improve an organization's performance. Some companies that have a long R&D cycle and a high difficulty coefficient can achieve twice the outcomes in half the time by introducing new technology. Thus, the introduction of new technology can improve an organization's performance in innovation. Technological advancement is the key factor driving this improvement.

Organizational Factors
Kwabena et al., (2021), claimed that organizational factors affect an organization's performance. In accordance with Stenberg and Nilsson, (2020), "internal resource bases and procedures that affect an organization's ability to respond to both the internal and external environment" are referred to as organizational factors. It may affect the planning, overall performance and strategic objectives. Additionally, Ellstrom et al., (2022) stated that organizational expertise and innovation are necessary for organizations to improve their performance. In this regard, businesses should be able to strategically create long-term goals (AlNuaimi et al., 2022). Organizational skills are also necessary for this organizational aspect. Some of its constituents are an agile organizational structure (Adel, 2022), effective decision-making procedures and the capacity to reallocate

personnel and resources as necessary (Asker and Mergel, 2022).

Environmental Factors
Based on Amini & Jahanbakhsh (2023) stated that environmental factors are things that affect and impede particular operational characteristics. This element includes the demands of the market and customers, trading partners, readiness, sociocultural considerations, government support and technical infrastructure (Zhong and Moon, 2023). This is in line with Ramlan et al. (2023) defined the environmental context as external factors that impact the firm, like competition from competitors and pressure from suppliers or customers. Moreover, regarding the environmental element, businesses need to be able to respond quickly to external factors such as market trends, industry upheavals, and regulatory changes (Steininger et al., 2022). In this instance, organizations require governance-risk-management-compliance (GRC) to manage the environment and guarantee that, through risk management and regulatory compliance, the organization can obtain performance from the application of the TOE Framework (Abdurrahman et al., 2023).

Homestay
The official homestay program is known as a cluster homestay and is managed by the Ministry of Tourism and Culture (MOTAC) (Bachok, Hasbullah, Ab Rahman, 2018). Moreover, according to Ramele & Yamazaki, 2020; and Azhar et al. 2021 stated that MOTAC started promoting the homestay program in 1995. They also have produced a set of guidelines and regulations that these cluster homestays must follow (Ramele & Yamazaki, 2020). Therefore, recognition and program licenses will only be granted to property owners who comply with the rules and regulations for hosting visitors (Noor and Awang, 2018).

Moreover, MOTAC also established branches of the Malaysian Homestay Association (MHA) in every state in Malaysia so that they could participate in the inspection of the host family house throughout the registration process for cluster homestay (Velan, 2019). This Association will coordinate discussions and negotiations between the host family and MOE. Additionally, they also took part in marketing and advertising for homestays, which prompted a lot of visitors to sign up for the program (Ramele & Yamazaki, 2020). Furthermore, Nor and Awang (2018) stated that the MOTAC Homestay logo is placed in front of the house and marks it as a "cluster homestay," making it easy to recognize the homestays that have been registered with MOTAC in Malaysia. They also claimed that MOTAC is the owner of the logo's patent and prohibits unregistered homestay providers from using it (Nor and Awang, 2018).

Figure 1: Logo Cluster Homestay

Nevertheless, based on Wang et al.' (2016) stated that the Homestay program is a tourism product that gives visitors a sense of local community life and a pleasant rural environment. Adli and Chin (2021) further define homestay as a type of lodging in which visitors stay in private houses with a host family, who typically reside on the premises. This is in line with Ayupp, Jaafar and Tinggi, (2021) stated that the guests will have the opportunity to participate in community events and communicate with the hosts to exchange information, customs, and life experiences.

Additionally, the program seeks to generate income and economic booster for rural communities (Kayat et al., 2016). This is reached by their engagement in operating homestays out of their homes and by taking part in other activities that are part of the packages that are offered to the visitors (Mapjabil et al., 2017). In addition, according to MOTAC (2024), based on statistics, showing that there were about 208 homestay programs registered in Malaysia involving the participation of a total of 450 villages and 3397 operators in December

2023 which is a decreasing number from previous years. There is a problem with cluster homestays declining interest in taking part in the program which affects the performance of the homestay (Ramele & Yamazaki, 2020; Nor and Awang, 2021).

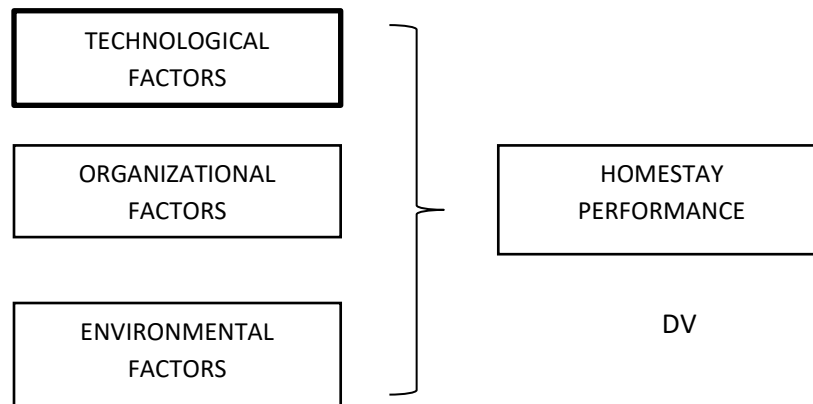
Performance of the Homestay
The performance of an organization can be evaluated using both financial and nonfinancial parameters (Zulkefli et al., 2021). Based on Dawayana et al., 2021 stated that productivity, sales growth, cash flow, and profitability are examples of financial criteria measurements. On the other hand, non-financial goals contribute to alternative success measures, such as customer satisfaction, effective leadership, strong partnerships with public and private organizations and uniqueness of homestay attractions (Zulkefli et al., 2021).

Homestay is an initiative taken by the government to enhance the standard of living among the participating rural communities (Kunjuraman, Hussin, and Aziz, 2022). There was little research done on performance evaluation in homestay settings (Yong et al., 2021). Moreover, Walker and Brown (2004) claimed that the relationship between financial and nonfinancial variables indicates actual performance for success and can be explained more thoroughly. Previous studies have indicated that a multitude of factors may impact the homestay's performance; however, this particular study focuses exclusively on its financial performance.

Furthermore, according to Golovkova et al. (2019), financial performance is the phrase used to describe financial operations. The achievement of financial objectives is frequently indicated by financial performance. Golovkova et al. (2019) define it as the process of evaluating how a company's policies and operations affect its bottom line. Thus, to enhance the effectiveness of homestay performance, homestay operators should persist in their focus on creating unique business approaches (Devadas and Jayasooriya, 2021).

The theoretical framework is then demonstrated in the next section, followed by the methods for data collection and analysis in the next section, and finally, the main conclusions and results are presented. The context-specific information that follows should be especially helpful in pointing out potential areas for improvement.

Conceptual Framework



```
┌─────────────────┐
│  TECHNOLOGICAL  │
│     FACTORS     │
└─────────────────┘

┌─────────────────┐               ┌─────────────────┐

│     FACTORS     │
└─────────────────┘

        IV
```

The framework above is drawn to evaluate the relationship between all variables. On the left side of the model are the independent variables (TOE Factors) as influencing factors. The right side of the model shows the dependent variable which is the Homestay Performance.

3. Research Methodology

In this section, the researcher outlines the methodology strategy, which includes defining the target population, the survey's nature, sample size estimation and survey instruments.

Research design
This paper is a pilot study that uses a structured questionnaire with a quantitative research design to gather data from the homestay coordinators. The purpose of the study is to look into the relationship between the financial performance of the homestay and the TOE framework, which considers technological, organizational, and environmental factors. The study focuses on the major concepts included in the TOE framework and examines the connections between these factors and the financial performance of the homestay using SPSS 29 software.

Population and Sampling
Data was collected from homestay coordinators who act as the representatives to represent the cluster homestay that are registered with MOTAC. The rationale for selecting these respondents is that they are the people who will report the homestay's performance as a whole to MOTAC, have the knowledge to provide accurate responses and are the best people to complete the questionnaire.

The researcher employed quantitative research and a self-administered survey questionnaire was used as an instrument to collect data. The type of sampling used for this research was the probability sampling technique by using purposive sampling method. For a pilot study, a smaller sample size is often deemed appropriate to test the research instruments and collect preliminary data. However, it is important to ensure that the sample size is large enough to generate reliable results.

Sampling and Data Collection Process
A total of 50 questionnaires for the pilot study were distributed to get higher response and only 30 questionnaires were completed and returned, yielding a response rate of 60%. This response rate is considered adequate for pilot studies but highlights the need for efforts to improve participation in larger-scale studies. Moreover, the survey questions were made bilingually (English and Bahasa Malaysia translation) to make it easier for the respondents to answer the questions. Section A will describe the respondents' demographic profile. Sections B, C, D and E were used to assess respondents' level of agreement and the results were analyzed using SPSS 29. All constructs were measured using established scales adopted from existing literature on a seven-point Likert scale.

4. Results of the Study

Descriptive Analysis
The total number of respondents for this study was 30 respondents which consisted of Homestay coordinators.

Table 1: Frequency analysis

Variables	Items	Frequencies	Percentage
Gender	MALE	19	63.3
	FEMALE	11	36.7
Age	21-40	3	10
	41-60	12	40
	ABOVE 61	15	50
Education	SPM	18	60
	CERTIFICATE DIPLOMA	3	10
	DEGREE AND ABOVE	5	16.7
		4	13.3
Type of Social Media Use	Facebook	19	63.3
	Instagram	2	6.7
	TikTok	0	0
	Other	9	30

Based on Table 1, show the frequency analysis for the study. Overall, of the 30 respondents, 63.3 percent were male respondents and 36.7 percent were female. Respondents age above 61 years old were collected as the highest sample with 15 people (50%) from the whole sample size. Respondents age between 21 to 40 years old

represent the lowest sample for overall research. Additionally, most of the respondents have SPM as their educational level which is 18 respondents (60%). Besides that, the type of social media used by all the respondents was also gathered. The least respondents use Instagram by 2 respondents (6.7%) to promote their homestay. Continuously, the highest percentage of respondents who prefer to use Facebook to promote their homestay was 63.3 percent or 19 respondents.

Table 2: Reliability analysis

Variables	Cronbach's Alpha	N of Items
Technological	.823	10
Organizational	.732	8
Environmental	.685	9
Homestay Performance (DV)	.8.55	11
OVERALL	.872	38

Table 2 shows the results of the reliability test. It demonstrates that there are different degrees of internal consistency amongst the various constructs. The technological and homestay performance variables have reliability (0.823), indicating that the items that measure these constructs are regularly dependable and in good alignment with the dimensions in which they are contained. Additionally, the Organizational factor shows an acceptable reliability of 0.732, which demonstrated generally consistent measurement, though there is room for potential improvement. While, the environmental variable has a moderate reliability of 0.685, indicating that further modification of the environmental component measurement may be necessary to attain higher consistency.

In conclusion, a total Cronbach's Alpha of 0.872 indicates that the measuring instrument has good internal consistency for all variables. As a result, there can be confidence in the consistency and reliability of the study findings, even in the face of some variability in the individual variables that make up the combined instrument. Reviewing and perhaps changing the Environmental factor's elements to increase internal consistency would help produce the most accurate and trustworthy findings.

Table 3: Normality analysis

	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Technological Factors	.166	30	.200*	.930	30	.600
Organizational Factors	.106	30	.200*	.974	30	.657
Environmental Factors	.120	30	.200*	.972	30	.607
Homestay Performance	.143	30	.200*	.960	30	.513

The normality test was used to determine whether or not the study data had a normal distribution. Table 3 shows the results of the normality test on each of the constructs in this pilot study. It indicates that all the data for each of the constructs has a normal distribution. This is supported by the fact that the estimated p-values are greater than the significance level (0.05). Consequently, the study data for the research is distributed normally.

Table 4: Validity analysis

	KMO values	Bartlett's Test of Sphericity (Sig.)
Technological Factors	.666	<.0001
Organizational Factors	.748	<.0001
Environmental Factors	.776	<.0001
Homestay Performance	.742	<.0001

Exploratory Factor Analysis (EFA) was used to determine the basic structure of the instruments used in this investigation. The validity test, which includes KMO values and Bartlett's Test for all constructs which are technological, organizational, environmental and homestay performance is shown in Table 4. The scores are

0.666 for technology, 0.748 for organizational, 0.776 for environmental and 0.742 for Homestay performance. A strong correlation between the variables is shown by an overall KMO value above 0.6 and a p-value for Bartlett's test of sphericity below 0.05, which is considered acceptable. Thus, Lorenzo (2003) claimed that the data is appropriate for factor analysis.

5. Implications

Theoretical implication
The theoretical implications of this study are the contribution to knowledge in several ways. Firstly, it adds to the existing literature on performance by expanding the relationship between the TOE Framework and organization performance, focusing on the homestay industry. Second, based on the findings all the results were significant and it confirms the need for the TOE Framework to improve homestay performance. Third, this study also provides empirical findings on how the TOE Framework can be used to study small businesses and not only large corporations as the main respondents of this study were homestay operators who are mainly small business owners from mostly in rural areas.

Practical implication
This study also provides managerial contributions, especially for the homestay industry in Malaysia. The implication of the findings will help homestay operators comprehend the variables affecting the homestay program. Therefore, to strengthen the homestay program, the Ministry of Tourism, Arts, and Culture of Malaysia (MOTAC) and homestay operators should use these components as a standard. Moreover, it is essential to comprehend the TOE components that affect performance to design a program with a strong structure. Furthermore, the study is effective in pinpointing traits that enhance the effectiveness of the homestay program. In general, a number of parties, including researchers, MOTAC, homestay operators, and the tourism industry, will benefit from the data and conclusions from this study.

Conclusion
This study aims to investigate the influence of TOE factors on the performance of homestay in Malaysia. The TOE framework was used as a suitable theoretical foundation for the suggested conceptual model. To accomplish the study's aims, a quantitative field survey was conducted using a self-administered questionnaire, which was distributed to obtain data from a purposive sample. The data analysis and results were presented, including the details of the respondents in the survey sample. It can be concluded that there are strong relationships between Homestay performance and each of the three TOE framework components.

This suggests that the independent variables (technological, organizational, and environmental) have an impact on the dependent variable, which is homestay performance. Technology has the greatest influence on a homestay's performance, according to every hypothesis that was investigated and proven to be accurate. The results of this study have significant implications for both practitioners and researchers, especially in relation to how the homestay is carried out. Consequently, the findings support the Homestay Program's ability to manage tourism resources while serving as a catalyst for community development. Additionally, it also assists them in developing their knowledge and skills in managing the homestay effectively. Therefore, to boost the regional economy and create job opportunities in remote areas.

Limitations and Recommendations
Despite the significant findings, this research addressed a few limitations in examining the TOE framework to enhance homestay performance. Firstly, the respondents were all homestay coordinators. Examining the perceptions of other prospective users in the homestay organization such as the homestay operator and officer in MOTAC could probably give more insights and different reviews regarding the Homestay performance.

Next, the issue of generalizability arises, as the findings rely solely on data from the Homestay industry. To enhance applicability, future research may consider extending the study to other industries. Hence, recognizing that diverse regulations, cultural norms and business practices could influence the relevance of the framework. The last limitation is that researcher would be beneficial to test this model with data from the homestay industry in different countries, as it allows for potential modifications and enhancements to the model. Another area of research involves expanding and developing various inputs within the TOE framework.

The Determinants of Bank's Liquidity: Comparative Analysis From Global Islamic Banks and Conventional Banks

Abstract: This study investigates the determinants of bank liquidity in both Islamic and Conventional banks across 15 countries, focusing on key variables such as profitability, capital adequacy, bank size, and credit risk. Utilizing data from 107 Islamic banks and 506 Conventional banks spanning from 2013 to 2022, the analysis reveals significant differences in liquidity management between the two banking systems. The Random Effect Model (REM) was employed based on the Hausman test results to ensure robustness. The findings indicate that profitability negatively impacts liquidity in Islamic banks, likely due to investments in less liquid, Sharia-compliant assets, while it positively influences liquidity in Conventional banks, where profits are often reinvested into liquid assets. Capital adequacy emerges as a crucial determinant of liquidity in both bank types, highlighting the importance of maintaining strong capital buffers. The study also finds that credit risk significantly reduces liquidity in Conventional banks, whereas it has a lesser impact on Islamic banks. These insights contribute to a deeper understanding of liquidity management practices in Islamic and Conventional banks, offering valuable implications for bank managers, policymakers, and regulators.

Keywords: *Islamic banks, Conventional banks, Liquidity, Shariah compliance, Random Effect Model (REM)*

1. Introduction and Background

The banking sector is integral to global economic development, providing the financial infrastructure that supports businesses, facilitates trade, and ensures overall economic stability. At the core of banking operations lies the critical task of liquidity management, which enables banks to meet short-term obligations and maintain customer trust and confidence. Whether operating under conventional frameworks or Islamic principles, banks must navigate the complexities of liquidity management to safeguard against financial instability. However, the approaches to liquidity management differ significantly between conventional and Islamic banks due to their distinct operational principles and regulatory environments (Majeed & Zainab, 2021; Moussa, 2015).

Islamic banks(IB), governed by Shariah law, are characterized by their prohibition of interest (riba) and their commitment to ethical, asset-backed transactions. These unique characteristics present Islamic banks with challenges not typically encountered by their conventional counterparts. For instance, the limited availability of Shariah-compliant financial instruments can restrict Islamic banks' ability to manage liquidity effectively, thereby increasing their exposure to liquidity risk. This issue is particularly critical in a globalized economy where financial shocks can quickly ripple across borders, impacting banks of all types (Jedidia, 2020; Ghenimi et al., 2021).

Despite the importance of effective liquidity management, recent years have witnessed significant challenges for both Islamic and conventional banks. The collapse of Lehman Brothers in 2008, which triggered a global financial crisis, is a stark reminder of the catastrophic consequences that can arise from poor liquidity management. More recently, the failures of Silicon Valley Bank and other financial institutions in the United States have underscored the ongoing vulnerabilities within the banking sector, despite advances in regulatory oversight and risk management practices (Kwaku & Mawutor, 2014). These incidents emphasize the pressing need for banks to develop robust liquidity management strategies that are resilient in the face of economic uncertainties.

The challenges faced by Islamic banks in managing liquidity are further compounded by the constraints imposed by Shariah law. The prohibition of interest and the need to engage only in ethical, profit-and-loss-sharing transactions limit the tools available to Islamic banks, making liquidity management more complex and

less flexible compared to conventional banks. Moreover, there is a significant gap in the academic literature regarding the comparative effectiveness of liquidity management practices between Islamic and conventional banks. While numerous studies have explored the determinants of bank liquidity, few have provided a comprehensive analysis specifically comparing these two banking systems on a global scale (Ghenimi et al., 2021; Jedidia, 2020).

Over the past few decades, the global banking industry has undergone profound transformations driven by rapid technological advancements, evolving regulatory frameworks, and shifting economic landscapes. Banks, whether Islamic or conventional, play a crucial role as intermediaries in the economy, balancing the supply and demand for financial capital. This intermediary function is vital for maintaining liquidity, which is the lifeblood of any financial institution. Liquidity enables banks to fulfill their short-term obligations, such as customer withdrawals and interbank loans, without incurring significant losses. The management of liquidity is, therefore, essential for the stability of banks and, by extension, the broader economy (Moussa, 2015; Munteanu, 2012).

In conventional banking (CB), liquidity management is typically achieved through the use of interest-based instruments and interbank lending. However, Islamic banks, adhering strictly to Shariah principles, face additional challenges in this regard. The prohibition of interest necessitates the use of alternative, Sharia-compliant financial instruments, which are often less flexible and less readily available than their conventional counterparts. Consequently, Islamic banks must navigate a more complex landscape in managing liquidity, balancing the demands of Shariah compliance with the practical needs of maintaining sufficient liquidity levels (Majeed & Zainab, 2021).

As the global Islamic banking industry continues to grow—now accounting for a significant portion of global banking assets—it is imperative to develop a deeper understanding of how liquidity is managed within this sector. The distinct operational principles of Islamic banks necessitate a different approach to liquidity management compared to conventional banks, raising important questions about the comparative effectiveness of these approaches. This study seeks to address this gap by conducting an in-depth comparative analysis of the determinants of bank liquidity in global Islamic and conventional banks. By focusing on key bank-specific factors such as profitability, capital adequacy, bank size, and credit risk, this research aims to uncover the nuanced ways in which these variables influence liquidity across different banking systems namely Islamic banking, conventional banking and banks. The findings are expected to contribute valuable insights into the unique challenges faced by Islamic banks and provide broader implications for the stability and performance of the global banking sector (Munteanu, 2012; Moussa, 2015).

2. Literature Review

Bank liquidity management has been a critical area of study, particularly in understanding the trade-offs banks must navigate between profitability and liquidity.

The Trade-off Theory suggests that banks face a fundamental decision: they can either hold liquid assets to safeguard against insolvency or invest in less liquid assets that typically offer higher returns. According to Eljelly (2004) and Achampong (2022), while liquid assets enhance a bank's ability to meet short-term obligations, they generally yield lower returns, thus reducing overall profitability.

The Too Big to Fail (TBTF) Theory further complicates this dynamic. This theory, which gained prominence in the 1984 bailout of Continental Illinois Bank, argues that large banks may engage in riskier behavior because they expect government intervention in the event of failure. As Gorton and Tallman (2016) note, TBTF institutions might deprioritize liquidity management, assuming they will be bailed out, which could exacerbate their vulnerability during financial crises.

The Bad Management Theory posits that poor internal management practices, including inadequate risk assessment and liquidity management, can lead to significant financial distress. This theory emphasizes that internal factors, such as inefficient asset-liability management, can create liquidity problems even in the absence of external shocks (Ghoshal, 2005).

Finally, the **Buffer Capital Theory** suggests that maintaining a capital buffer above the regulatory minimum can protect banks against unexpected losses and improve their liquidity positions. This theory argues that well-capitalized banks are better positioned to absorb shocks and maintain liquidity during periods of financial stress (Munteanu, 2012).

Empirical Literature Review
Empirical research on bank liquidity has identified several key factors that influence liquidity management across different banking systems. These factors include profitability, capital adequacy, bank size, and credit risk.

Profitability is often seen as a double-edged sword in the context of liquidity management. On one hand, profitability can enhance a bank's capital base, providing more resources for liquidity. However, studies by Al-Harbi (2020) and Mokni and Rachdi (2014) suggest that higher profitability may lead banks to invest in less liquid, higher-yielding assets, thereby reducing their overall liquidity. This inverse relationship is particularly evident in Islamic banks, where profitability is often lower than in conventional banks due to the constraints of Shariah-compliant financing.

Capital Adequacy is another critical determinant of bank liquidity. Capital adequacy ratios, which measure a bank's capital relative to its risk-weighted assets, are crucial for ensuring financial stability. Munteanu (2012) and Al-Harbi (2020) found that banks with higher capital adequacy ratios tend to have better liquidity management. This is especially true for Islamic banks, which must maintain higher capital buffers to comply with Shariah principles and mitigate liquidity risks.

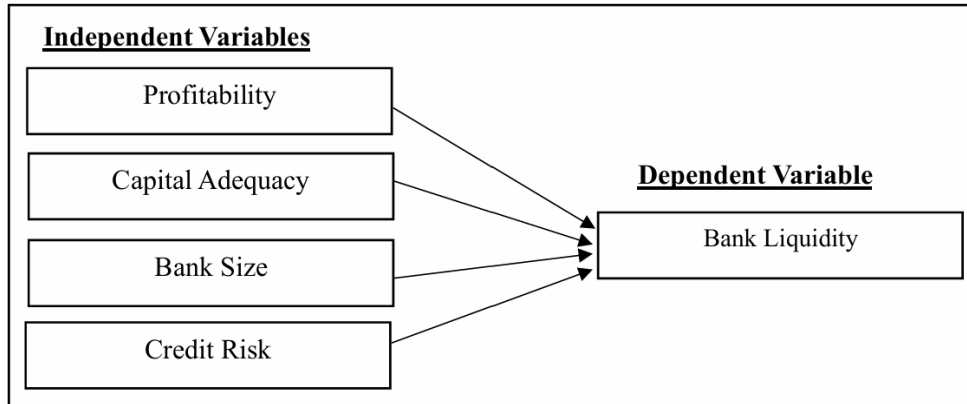
Bank Size also influences liquidity management, though its impact can vary. Larger banks typically have more diversified portfolios and greater access to external funding, which can enhance their liquidity. However, as Al-Homaidi et al. (2019) and Vodová (2019) observed, larger banks might hold fewer liquid assets due to their broader investment opportunities, making them potentially more vulnerable to liquidity crises.

Credit Risk is closely linked to liquidity, as higher credit risk can undermine a bank's ability to convert assets into cash. Munteanu (2012) and Al-Harbi (2017) demonstrated that banks with higher credit risk tend to have lower liquidity, as they may struggle to liquidate assets without incurring significant losses. This relationship highlights the importance of effective credit risk management in maintaining adequate liquidity.

3. Research Methodology

The study examines the relationship between the dependent and independent variables. The dependent variable is the LIQ, while the independent variables are selected based on the review of previous studies which are PROFIT, CAP, BSIZE, CR and type of banks. The research methodology outlines the theoretical framework, hypothesis statements, variables and measurements, data collection methods, and the statistical techniques employed to analyze the data.

Theoretical Framework
The study consists of three models of the theoretical framework because this study compares the factors determining the LIQ in IBs and CBs globally. Model A and Model B address Islamic banking and conventional banks respectively while Model C focuses on the whole groups of banks.

Figure 1: Proposed Framework


Models A, B and C

Table 1: Variables and Measurement

Variables	Notation	Proxy and Measurement	Unit
		Dependent Variable	
Bank Liquidity	LIQ	**Net Loan to Deposit Ratio =** $\frac{Net\ loans}{Deposit} \times 100$	%
		Independent Variables	
Profitability	PROFIT	**ROAA =** $\frac{Net\ income}{Average\ Total\ Asset\ Value} \times 100$	%
Capital Adequacy	CAP	**Tier 1 Cap. Ratio =** $\frac{Tier\ 1\ Capital}{Total\ risk-weighted\ asset} \times 100$	%
Bank Size	B SIZE	**Natural Logarithm of Total Asset =** log (total assets)	USD Million
Credit Risk	CR	**NPL Ratio =** $\frac{NPL}{Gross\ loan} \times 100$	%
		Dummy Variable	
Type of Banks (Dummy)	TYPE	0 is for Islamic banks, 1 is for Conventional bank	

Data Collection

The study examines the determinants of bank liquidity in a sample of global Islamic and Conventional banks across 15 countries, including Malaysia, Saudi Arabia, Indonesia, and others. Data were collected from 107 Islamic and 506 Conventional banks, covering the years 2013 to 2022, to capture the most recent trends in liquidity. These countries were selected based on their performance in the Islamic Finance Development Indicator (IFDI) 2022 report. The study utilizes data from FitchConnect, resulting in 6,130 observations (1,040 from Islamic banks and 5,090 from Conventional banks). The data were refined through several tests to ensure accuracy and were analyzed using Stata 12 SE.

Multiple Linear Regression Models
To investigate the determinants of bank liquidity, the study employs multiple linear regression models. These models enable the analysis of the relationship between the dependent variable and several independent variables (profitability, capital adequacy, size, and credit risk).
Model A: Islamic banks
$LIQ_{it} = \alpha_0 + \alpha_1 PROFIT_{it} + \alpha_2 CAP_{it} + \alpha_3 BSIZE_{it} + \alpha_4 CR_{it} + \varepsilon_{it}$
Model B: Conventional banks
$LIQ_{it} = \beta_0 + \beta_1 PROFIT_{it} + \beta_2 CAP_{it} + \beta_3 BSIZE_{it} + \beta_4 CR_{it} + e_{it}$

Model C: Islamic and Conventional Banks
$LIQ_{it} = \gamma_0 + \gamma_1 PROFIT_{it} + \gamma_2 CAP_{it} + \gamma_3 BSIZE_{it} + \gamma_4 CR_{it} + \gamma_5 TYPE_{it} + u_{it}$
Where,
LIQ_{it} =Bank liquidity *I* at year *t*
$PROFIT_{it}$= Profitability of the bank *I* at year *t*
CAP_{it}= Capital adequacy of the bank *I* at year *t*
$BSIZE_{it}$ = Size of the bank *I* at year *t*
CR_{it}= Credit risk of the bank *I* at year *tTYPE_{it}*= Types of banks *I* at year *t*
$\varepsilon_{it,}, e_{it}, u_{it}$ = error termα, β, γ = intercept
β_1,…,β_5 = regression coefficient

Estimation Techniques
To estimate the parameters of the regression models, this study employs both the Fixed Effects Model (FEM) and the Random Effects Model (REM). These techniques are chosen based on the nature of the panel data and the results of the Hausman test, which determines the suitability of FEM or REM for the dataset.
Fixed Effects Model (FEM): Controls for time-invariant characteristics of the firms, addressing potential biases due to unobserved heterogeneity.
Random Effects Model (REM): Assumes that individual firm effects are random and uncorrelated with the independent variables, offering efficiency in estimation if the assumption holds.
Diagnostic Tests
The validity of the regression models is evaluated through various diagnostic tests:
Multicollinearity Test: Assesses the presence of multicollinearity among the independent variables using the Variance Inflation Factor (VIF).
Heteroscedasticity Test: Checks for heteroscedasticity using the Breusch-Pagan/Cook-Weisberg test.
Autocorrelation Test: Evaluate the presence of autocorrelation using the Wooldridge test for panel data.

4. Data Analysis and Results

The data analysis involves several steps:
Descriptive Statistics: Summarize the central tendencies and dispersion of the variables.
Correlation Analysis: Examine the relationships between the independent variables and the dependent variable.
Regression Analysis: Assess the impact of the independent variables on the dividend payout ratio using FEM and REM.
Diagnostic Tests: Include multicollinearity, heteroscedasticity, and autocorrelation tests to ensure the validity and reliability of the regression models.

Results
This study analyzes the determinants of bank liquidity in Islamic and Conventional banks across 15 countries, covering the period from 2013 to 2022. The data includes 107 Islamic banks and 506 Conventional banks, focusing on key variables such as profitability (PROFIT), capital adequacy (CAP), bank size (BSIZE), and credit risk (CR). The descriptive statistics reveal that Conventional banks generally exhibit higher profitability and liquidity compared to Islamic banks, which tend to maintain stronger capital adequacy ratios.

Table 2: Descriptive Statistics for Islamic Banks (2013-2022)

Variable	Mean	Median	Maximum	Minimum	Std. Dev.
LIQ	65.32	66.45	89.71	43.12	18.45
PROFIT	1.89	2.10	4.56	-0.89	0.74
CAP	18.76	18.22	25.64	12.45	4.67
B SIZE	12.45	12.32	14.78	10.34	1.29
CR	3.56	3.12	5.89	1.34	1.08

Table 3: Descriptive Statistics for Conventional Banks (2013-2022)

Variable	Mean	Median	Maximum	Minimum	Std. Dev.
LIQ	71.58	72.34	101.23	45.56	22.16
PROFIT	2.34	2.56	6.12	-1.12	1.02
CAP	16.21	15.78	22.34	9.56	3.85
B SIZE	13.78	13.89	16.23	11.12	1.57
CR	4.12	4.00	6.78	1.89	1.25

Table 4: Descriptive Statistics for Islamic and Conventional Banks (2013-2022)

Variable	Mean (IBs)	Std. Dev (IBs)	Mean (CBs)	Std. Dev (CBs)
LIQ	65.32	18.45	71.58	22.16
PROFIT	1.89	0.74	2.34	1.02
CAP	18.76	4.67	16.21	3.85
B SIZE	12.45	1.29	13.78	1.57
CR	3.56	1.08	4.12	1.25

Note: LIQ is measured as the loan-to-deposit ratio, PROFIT as return on assets (ROA), CAP as the capital adequacy ratio, BSIZE as the natural logarithm of total assets, CR as the ratio of non-performing loans (NPLs) to total loans.

Correlation Analysis

Correlation analysis reveals that profitability has a significant negative relationship with liquidity in Islamic banks, suggesting that higher profitability leads to reduced liquidity, likely due to investments in less liquid, Sharia-compliant assets. This finding is consistent with previous studies, such as those by Eljelly (2004) and Mokni and Rachdi (2014), which also noted the trade-off between profitability and liquidity in Islamic banks. Conversely, in Conventional banks, profitability positively correlates with liquidity, indicating that profits are often reinvested into liquid assets, aligning with the findings of Al-Harbi (2020).

Capital adequacy shows a positive correlation with liquidity in both types of banks, underscoring the importance of robust capital buffers. This relationship aligns with studies by Munteanu (2012) and Al-Homaidi et al. (2019), which emphasize the role of capital adequacy in maintaining liquidity.

Table 5: Correlation Matrix for Islamic and Conventional Banks

Variables	LIQ (IBs)	LIQ (CBs)	PROFIT (IBs)	PROFIT (CBs)	CAP (IBs)	CAP (CBs)	BSIZE (IBs)	BSIZE (CBs)	CR (IBs)	CR (CBs)
LIQ	1.00	1.00	-0.45**	0.58**	0.33**	0.41**	-0.12	-0.37**	-0.09	-0.48**
PROFIT	-0.45**	0.58**	1.00	1.00	0.29**	0.35**	-0.08	-0.42**	-0.16	-0.55**
CAP	0.33**	0.41**	0.29**	0.35**	1.00	1.00	-0.15	-0.28**	-0.11	-0.46**
B SIZE	-0.12	-0.37**	-0.08	-0.42**	-0.15	-0.28**	1.00	1.00	0.14	0.23**
CR	-0.09	-0.48**	-0.16	-0.55**	-0.11	-0.46**	0.14	0.23**	1.00	1.00

$p < 0.05$, $p < 0.01$

Regression Analysis
The regression analysis was conducted to examine the impact of the independent variables on liquidity in both Islamic and Conventional banks. Based on the Hausman test, the Random Effect Model (REM) was selected as the appropriate method for both bank types. The REM was chosen because the Hausman test indicated that individual-specific effects are uncorrelated with the independent variables, making the REM more suitable given the diverse geographical coverage of the sample across 15 countries.

Table 6: Regression Results for Islamic and Conventional Banks (Random Effect Model)

PROFIT	-0.583***	0.092**
CAP	0.053**	0.024***
B SIZE	-0.233*	-0.002
CR	-0.004	0.001**
Constant	7.258***	1.123***
Adj. R^2	0.124	0.526
F-Stat	4.977***	53.027***

$p < 0.05$, $p < 0.01$, *$p < 0.001$

The results from the Random Effect Model show that in Islamic banks, profitability negatively impacts liquidity, indicating that as profitability increases, liquidity tends to decrease, possibly due to the investment in less liquid, Sharia-compliant assets. This finding is consistent with the Trade-off Theory, which suggests that banks face a trade-off between liquidity and profitability (Eljelly, 2004). Capital adequacy is a significant positive determinant of liquidity, suggesting that better-capitalized banks have stronger liquidity positions, a result that aligns with findings by Munteanu (2012).

In Conventional banks, profitability positively influences liquidity, showing that profits are often reinvested into liquid assets. This finding is supported by the study of Al-Harbi (2020), which observed a similar positive relationship. Capital adequacy also positively affects liquidity, while credit risk negatively impacts it, reflecting the increased exposure to default risks associated with aggressive lending practices. This is consistent with the findings of Al-Homaidi et al. (2019), who noted that higher credit risk can erode liquidity in Conventional banks. Bank size, however, does not have a significant impact on liquidity in Conventional banks, suggesting that larger size does not necessarily lead to better liquidity management.

Discussion
The findings illustrate distinct liquidity management practices between Islamic and Conventional banks. Islamic banks tend to reduce liquidity as profitability increases, likely due to investments in less liquid, Sharia-compliant assets. This relationship reflects the constraints Islamic banks face in balancing profitability with the principles of Shariah law, which limits their investment options (Mokni & Rachdi, 2014). In contrast, Conventional banks reinvest profits into liquid assets, enhancing their liquidity, which is aligned with their broader investment strategies and diversified product offerings (Al-Harbi, 2020).

Capital adequacy emerges as a crucial determinant of liquidity in both banking systems, highlighting the importance of maintaining strong capital buffers to ensure financial stability. The positive impact of capital adequacy on liquidity suggests that well-capitalized banks are better equipped to manage liquidity risks, a finding consistent with existing literature (Munteanu, 2012). However, the impact of bank size and credit risk differs between the two types of banks. In Islamic banks, larger bank size negatively impacts liquidity, possibly due to the operational complexities and the need to comply with Shariah principles. On the other hand, credit risk significantly reduces liquidity in Conventional banks, reflecting their exposure to higher default risks associated with more aggressive lending practices (Al-Homaidi et al., 2019).

These findings contribute to the understanding of how Islamic and Conventional banks manage liquidity differently. The study highlights the challenges Islamic banks face in maintaining liquidity while adhering to Shariah principles and the contrasting approach of Conventional banks, which leverage profitability to enhance liquidity.

5. Managerial Implications and Recommendations

Based on these findings, it is recommended that Islamic banks develop more innovative Sharia-compliant financial instruments to enhance liquidity while balancing profitability. Both Islamic and Conventional banks should prioritize maintaining strong capital buffers to ensure financial stability. This is especially important for Islamic banks, which may face additional challenges due to the constraints of Shariah compliance (Mokni & Rachdi, 2014). Conventional banks should refine their credit risk management processes to mitigate the impact of high-risk lending on liquidity, aligning with the suggestions of Al-Homaidi et al. (2019). Policymakers and regulators should provide tailored guidelines that support effective liquidity management in Islamic banks, facilitating the creation of more liquid, Sharia-compliant investment opportunities. Additionally, banks should invest in financial technology solutions, such as blockchain and AI-driven analytics, to improve liquidity management and risk assessment capabilities. These technologies could offer more efficient and real-time solutions to the challenges of liquidity management, particularly in the rapidly evolving financial landscape.

The study's findings underscore the importance of a nuanced approach to liquidity management in different banking systems. Future research could build on these insights by exploring additional variables, such as macroeconomic factors and regulatory differences, that may influence liquidity. Moreover, expanding the sample to include more countries could provide a more comprehensive understanding of global banking practices. Finally, qualitative research could offer deeper insights into the decision-making processes behind liquidity management in both Islamic and Conventional banks, further enriching the field's understanding of these critical issues.

Conclusion

This study provides valuable insights into the determinants of liquidity management in Islamic and Conventional banks. The results indicate a negative relationship between profitability and liquidity in Islamic banks, suggesting that as these banks become more profitable, they may invest in less liquid assets, which are in line with Shariah compliance. This is consistent with the findings of Eljelly (2004) and Mokni and Rachdi (2014). Conversely, Conventional banks show a positive relationship between profitability and liquidity, indicating that profits are often reinvested into liquid assets, enhancing their overall liquidity position, as noted by Al-Harbi (2020). Capital adequacy consistently emerges as a critical factor in ensuring liquidity across both banking systems, though the impact of bank size and credit risk varies.

Abstract: This paper explores the correlation between managerial coaching, emotional intelligence, social support, employee resilience, and retention among healthcare workers in Malaysia's public healthcare sector. Retaining healthcare staff has become a severe difficulty in the *BANI* (Brittle, Anxious, Non-linear, Incomprehensible) environment, worsened by the COVID-19 epidemic. The study suggests that managerial coaching, emotional intelligence, and social support are essential for developing resilience among healthcare workers. This resilience, in turn, impacts their ability to stay in their jobs. The study will employ a quantitative cross-sectional survey approach to examine the links inside specific public hospitals in Malaysia. The results are anticipated to offer a vital understanding of how public healthcare in Malaysia can strategically improve staff resilience and retention, guaranteeing the long-term viability of the healthcare workforce in a world after the pandemic. This study enhances our comprehension of the intricate processes that impact staff retention in the public healthcare industry, providing practical implications for policymakers and healthcare managers.

Keywords: *Employee Retention, Managerial Coaching, Emotional Intelligence, Social Support, Employee Resilience*

1. Introduction and Background

Employees are vital assets in both public and private organizations, as they play a crucial role in helping organizations accomplish their goals and objectives. The unique expertise, competencies, capabilities, and insights possessed by each employee are essential and can actively contribute to the organization's day-to-day activities and have a beneficial influence on the organization's overall goals and objectives (Zainal et al., 2022; Johennesse & Chou, 2017; Mangala & Ramachandra, 2017). However, in today's brittle, anxious, non-linear, and incomprehensible world known as the *BANI* world, public healthcare in Malaysia faces adversity in retaining healthcare workers in the public healthcare sector.

In 2020, Jamais Cascio developed the *BANI* world; he provided a detailed explanation of his approach to reality and discussed the current state of the world during the pandemic. He elucidates his theory by outlining the conditions of existence in a pandemic reality using the BANI model. Musiol (2022), a philosophical psychotherapist, shared in her journal that the BANI world exists due to the COVID-19 pandemic, the ongoing effects of a pandemic caused by the SARS-CoV-2 coronavirus continue to influence our environment, and the *BANI* world makes it quite challenging for the government to retain healthcare workers in public hospitals.

Public healthcare systems are essential for guaranteeing fair and equal access to medical treatments, especially for lower-income individuals. Mulcahy et al. (2021) found that Higher government expenditure on healthcare is linked to a decrease in the utilization of private medical providers, especially among individuals with lower incomes. This suggests that investing public funds in healthcare services can help alleviate inequality in accessing healthcare. According to Govender et al. (2021), People with lower incomes frequently select public healthcare systems because they are affordable and convenient. However, some may choose private treatment for perceived higher quality and convenience. This underscores the significance of public healthcare in delivering easily obtainable treatments to individuals unable to pay for private medical treatment.

This study investigates the relationship between managerial coaching, emotional intelligence, and social support contributing to employee resilience among healthcare workers in Malaysian government hospitals,

ultimately impacting employee resilience and retention. Public healthcare systems are vital in addressing socioeconomic disparities by providing affordable and accessible care and reducing financial strain on lower-income families. As essential components of a nation's healthcare framework, public hospitals safeguard public health and ensure well-being. Effective strategies and robust health system governance are crucial for improving the quality and accessibility of public healthcare, particularly as populations age and the need to cater to older adults increases. Retaining healthcare workers in public hospitals is critical for maintaining a robust healthcare system that benefits all citizens, especially those in lower-income groups.

Problem Statement
The COVID-19 epidemic has had a profound impact on Malaysians, resulting in substantial mental health difficulties. Numerous individuals have experienced the unfortunate loss of family members or employment, leading to heightened levels of anxiety, stress, and sadness. The Public Service Department, led by Tan Sri Mohd Khairul Adib Abd Rahman, implemented the Holistic Well-being Inventory (IKH) to evaluate the mental well-being of federal personnel. This tool assesses six key dimensions of well-being: emotional well-being, overall life satisfaction, psychological functioning, social well-being, occupational well-being, and mental health.

According to Berita Harian, the Ministry of Health's Mental Health and Psychosocial Support Service (MHPSS) offered psychological assistance to 64,366 individuals during the Movement Control Order (MCO) period. According to Mohd Khairul Adib's report, as of September 2020, more than 15,000 civil servants had undergone counselling, and 22.5% of the population had sought Psychological First Aid (PFA) services for health-related issues. Healthcare personnel, as reported by Tharanya Arumugam in the New Straits Times in 2021, have been greatly affected, with a substantial number displaying symptoms of intense stress or burnout.

According to a report by Bulletin TV3 on February 1, 2023, 95% of 1,652 healthcare professionals, including government physicians and nurses, believed the nation's public health system is currently experiencing a crisis. Moreover, 73% of individuals contemplate resigning, while 80% of participants in the CodeBlue health news website study concur that their compensation is insufficient, and 78% voice apprehensions regarding overwhelming workloads.
Amidst the pandemic, healthcare personnel have encountered substantial mental health difficulties. Therefore, it is imperative to investigate methods to bolster resilience and improve staff retention. This study examines the influence of managerial coaching, emotional intelligence, and social support on employee resilience and retention. It aims to identify effective treatments to assist employees in coping with ongoing problems and maintaining a stable workforce.

2. Underpinning Theory

Job Demand Resource Theory
The Job Demand-Resource (JD-R) Theory is a theoretical framework that explores the connections between employee satisfaction, job efficiency, and organizational achievements. The concept, initially laid forth by Demerouti et al. (2001) and subsequently expanded to encompass several work-related factors, posits that the combination of job demands and job resources has a cumulative effect on employee stress and motivation, eventually influencing organizational performance.

The intricate nature of healthcare jobs in Malaysia's public healthcare system has been amplified by several factors, including the rising need for patient-centered care, the extensive use of new medical technologies, collaboration among healthcare professionals, and the emergence of contagious diseases. The continuous existence of COVID-19 and other potential health risks enhances this intricacy. The study is primarily based on the JD-R Theory, which offers a complete viewpoint on the impact of managerial coaching, emotional intelligence, and social support on employee retention in Malaysia's public healthcare sector.

The study also investigates the role of employee resilience in mediating these correlations. The theory builds upon the Job Demand-Control (JDC) model created by Karasek in 1979 and the Effort-Reward Imbalance (ERI) model introduced by Siegrist in 2002. The JD-R Theory offers a more inclusive framework compared to earlier models, as it considers both the positive elements (resources) and negative elements (demands) of work environments. The JD-R Theory, formulated by Arnold Bakker and Evangelia Demerouti in 2016, is a well-

recognized framework that explores the relationship between job demands, job resources, employee well-being, and work-related outcomes, including resilience and retention. The theory suggests that every occupation involves specific demands (such as workload, time constraints, and emotional pressures) and resources (such as social support, autonomy, and feedback). While job demands can exhaust people and cause stress, employment resources can help alleviate these negative impacts and foster personal development and progress.

Demerouti and Bakker (2023) highlight the crucial role of leaders in providing resources and facilitating communication during challenging times to handle uncertainty and boost employee motivation effectively. Indispensable job resources are required to efficiently manage workplace demands, enhance work engagement, and sustain well-being. Evangelia Demerouti researches several aspects of performance and well-being, covering many issues, including the JD-R model. Furthermore, implementing inclusive leadership can positively impact psychological distress in difficult circumstances. This highlights the interconnectedness of personal and professional aspects, as significant life events can impact an individual's dedication and efficiency in their job.

According to the JD-R Theory, employees exert control over their job settings by efficiently handling the requirements and assets of their occupations. Job demands require constant dedication with a chance to induce stress and weariness if not effectively managed—however, employment resources aid in achieving work goals, reducing job pressures, and promoting personal development. The interaction between job requirements and available resources substantially impacts employee drive, achievement, and well-being. Sufficient employment resources mitigate the negative effects of challenging job requirements, leading to enhanced employee commitment and flexibility. The equilibrium, influenced by factors such as the quantity and kind of job requirements and resources, personal resources of individuals, and organizational support, plays a crucial role in employee retention and enhancing well-being.

Social Exchange Theory

The conceptual foundation of Social Exchange Theory (SET) is derived from the pioneering research undertaken by scholars such as George Homans, Peter Blau, and Richard Emerson throughout the mid-20th century (Homans, 1958; Heath, 1971). These scholars explored the fundamental principles that govern social interactions. Originally driven by economic principles, these scholars viewed many social interactions as similar to "benefit exchanges," mimicking monetary transactions. Homans made a vital contribution to the development of Social Exchange Theory by suggesting that social activity can be understood as the exchange of tangible and intangible resources, such as goods and services, as well as social approval (Homans, 1958; Cole et al., 2002). As the theory progressed, scientists delved deeper into its core concepts, examining the roles of authority, influence, and the creation of small-scale organizations within the larger framework of social trade (Homans, 1958).

Blau's research focused on how power imbalances in social interactions affect employees' resilience to adversities and their likelihood of staying with the organization. Particularly, individuals who hold abundant resources or possess significant influence tend to have greater authority over the method of exchange, which might impact the level of loyalty that employees have towards staying with the business (Homans, 1958). Emerson's research on network architectures demonstrates the impact of exchange mechanisms inside an organization on the distribution of resources and authority among individuals. The interaction of network variables can either enhance or hinder an employee's ability to cope with challenges and maintain commitment, therefore affecting employee resilience (Cole et al., 2002).

This study used Social Exchange Theory as its main theoretical framework to examine the influence of managerial coaching, emotional intelligence, and social support on employee retention in Malaysia's public healthcare sector. The circumstance involves an examination of employee resilience as a mediator. The study tries to understand the interactions and collective impact of these variables on the retention of healthcare personnel using this theoretical framework. The study investigates the influence of managerial coaching on the improvement of employees' skills and fulfillment in their jobs. It also explores how emotional intelligence creates a supportive and empathetic work environment. Additionally, the study evaluates the impact of social support in lowering workplace stress and increasing resilience. The aim is to provide pragmatic and valuable

information that may guide decision-making and tactics to improve the effectiveness of Malaysia's public healthcare sector and bolster employee retention.

3. Literature Review

Employee retention is the deliberate and intentional implementation of measures to motivate employees to remain with an organization for a prolonged duration (Naz et al., 2020; Yang et al., 2021; Krishnamoorthy & Aisha, 2022; Zainal et al., 2022; Ngah et al., 2024). Additionally, it is connected to the workers' inclination to stay in their present positions, which is impacted by the incentives and assistance they are provided with (Das & Baruah, 2013; Naidu et al., 2023). Comprehending this pivotal signal is essential as it offers valuable insights about employees' pleasure with their work, their degree of dedication, and their overall involvement with the organization. Multiple studies have investigated the variables that influence employee retention in different industries. It is crucial to comprehend the precise aspects that affect the public healthcare sector, as it poses distinct problems for its staff. Studies have investigated factors influencing employee retention in several demographic categories, including pharmaceutical staff (Zaman et al., 2021) and nurses (Matsuo, 2021).

Supervisory assistance is a well-acknowledged characteristic that significantly impacts employee retention in various businesses and geographic areas. The literature has extensively shown the significant influence of supervisory assistance on employees' career satisfaction (Matsuo, 2022), commitment (Kyei-Frimpong et al., 2023), and retention (Kaur & Mittal, 2022) in organizations. According to Ladyshewsky (2010), managerial coaching is essential to supervisory support. In 2009, the European Foundation for Management Development (EFMD) and the European Mentoring and Coaching Council (EMCC) highlighted five primary advantages of coaching: "enhanced performance," "heightened motivation," "strengthened team cohesion," "greater employee retention," and "improved conflict resolution." Additionally, their study revealed that coaching is mainly offered to managers and individuals who are recognized as having high potential within the company's talent pool.

Although there has been considerable research on the influence of supervisory support on employee retention, there remains a notable lack of understanding of the precise function of managerial coaching in this particular setting. Therefore, researching the correlation between managerial coaching and staff retention in the public healthcare sector should offer the government helpful knowledge as it pursues efficient approaches to improve employee retention.

According to Ellinger (2003), coaching is not a manager's responsibility and does not necessitate extra exertion. Additionally, it can foster a tendency among employees to disregard their job duties and neglect their obligations to manage their time effectively. Ali, Raza, Ali, and Imtiaz (2020) contend that managers must prioritize the assistance and advancement of their workers. Additional investigation is required to explore this topic further. Concurring with the viewpoints of Ali, Raza, Ali, and Imtiaz, it is imperative to recognize that managers have a vital responsibility to promote the growth and advancement of their staff. Managers must possess a high level of positive energy to coach their personnel correctly. This state of mind can be expressed as immediate emotional responses to certain occurrences or enduring emotional conditions unconnected to specific circumstances. It is a type of pleasant emotional stimulation described by Quinn and Dutton in 2005. Energy can be understood as having motivational effects, influencing an individual's decision-making and the effort they invest in their actions. Positive emotions signal the appeal of other options, which affects the effort someone is willing to exert. People typically put consistent effort into activities they believe have sufficient energy (Quinn & Dutton, 2005). Managers can support employees during challenging times by engaging in managerial coaching, which includes empowering them, offering helpful advice, providing moral support, and giving constructive feedback. This approach helps employees recognize the effectiveness of their efforts, reducing stress and building greater resilience. This research examines the complex relationship between managerial coaching and employee resilience, highlighting the importance of understanding how managerial coaching influences resilience to grasp workplace challenges and support systems better. Thus, the following hypothesis is proposed:
H1: Managerial coaching positively influences employee resilience

Emotional Intelligence (EI) is a vital factor in employee retention within the public healthcare sector because it involves the ability to recognize, understand, express, and regulate emotions in oneself and others, significantly influencing various aspects of life (Coronado-Maldonado & Benítez-Márquez, 2023). While competitive salaries and benefits are essential, healthcare workers face unique challenges beyond financial compensation. The demanding nature of the job, including long hours, limited family support, and high-stress environments (Marzo et al., 2022), can lead to higher turnover rates. Therefore, healthcare workers need strong emotional intelligence to manage these challenges effectively, which can help reduce turnover and enhance retention (Binsaeed et al., 2023).

A study by Macaleer and Shannon (2002) highlights the significant role of Emotional Intelligence (EI) in the overall success of organizations. Emotional intelligence is crucial for employers and employees (Papoutsi et al., 2019). Those with high emotional intelligence are better equipped to navigate the complex social interactions in the workplace. By developing these skills, individuals can improve their interpersonal relationships, manage stress more effectively, and show greater resilience in difficult situations (Drigas & Papoutsi, 2019; Doğru, 2022; Coronado-Maldonado & Benítez-Márquez, 2023).

Emotional intelligence is crucial for increasing employee resilience. It enables employees to navigate workplace problems effectively by increasing self-awareness, managing emotions effectively, and improving relationships with others. This leads to a workforce that can withstand and adjust to challenges. Emotional intelligence is crucial for enhancing the resilience of healthcare workers who encounter distinct obstacles in their duties. According to Aránega, Sánchez, and Fernández-Vázquez (2021), emotional intelligence (EI) boosts employee resilience by bolstering confidence in their capacity to adjust and excel in uncertain circumstances. Healthcare professionals with high emotional intelligence demonstrate superior self-awareness of their emotions (Littlejohn, 2012), identification of stressors (Asiamah et al., 2016), and comprehension of elements that can lead to fatigue or emotional exhaustion.

Employees who are fatigued and experiencing burnout may face challenges in delivering optimal patient care. This is a prevalent problem in the present government healthcare system, as certain personnel find it hard to hide their exhaustion from excessive workloads. Recognizing the significant demands of their roles and refraining from unfairly attributing blame to these obstacles is crucial. Healthcare personnel must possess robust emotional intelligence to effectively manage the impact of interpersonal pressures on emotional tiredness, affecting their performance and client satisfaction.

This entails keeping composure and providing exceptional service, even while interacting with complex patients who challenge their patience. This study investigates the substantial correlation between emotional intelligence and the ability of employees to bounce back from challenges and setbacks. Gaining insight into the impact of emotional intelligence on employee resilience is crucial for understanding workplace difficulties and adaptive strategies. Thus, the subsequent hypothesis is put forward:
H2: Emotional Intelligence positively influences employee resilience.

Social support from colleagues is another crucial factor in fostering a positive attitude that enhances employee resilience and retention. Social support has long been a critical topic in management and organizational behavior, with research highlighting its significant impact on employee well-being, job satisfaction, and overall business outcomes (Reblin & Uchino, 2008). Social support can come from various sources, including informal networks like family, friends, coworkers, and supervisors, and more formal support systems such as healthcare professionals and human service workers (Glanz et al., 2008). In the public healthcare sector, understanding the complexities of social support among healthcare workers is particularly important due to the sector's significant challenges in employee retention and resilience. This study will focus on the social support provided within informal networks, particularly among coworkers.

Okojie et al. (2023) assert that employees who possess resilience can expedite their recuperation from hardship and efficiently cope with stress by utilizing social support systems. Resilience pertains to the psychological aspect, whereas social support refers to employees engaging in conversations with their peers to address their issues and concerns. During challenging periods, employees frequently require a confidant with whom they can communicate their emotions since their coworkers can relate to their circumstances and

comprehend their diminished drive. Emotional contagion, as described by Herrando and Constantinides (2021), refers to the phenomenon where one person's emotions affect and impact the emotions of those around them, resulting in the experience of shared emotional states, whether they are happy or bad.

Numerous studies indicate that social support is vital for building organizational employee resilience. For example, research at the Social Security Organisation (SOCSO) in Kedah, Malaysia, found a strong correlation between employee resilience and social support (Zakaria et al., 2023). Additionally, educators in private colleges benefit significantly from the support of family, leaders, and colleagues. Social support fosters trust, friendships, and information exchange, enhancing an employee's resilience in adversity (Okojie et al., 2023). This study will examine the link between social support and employee resilience, aiming to better understand social support's impact on workplace challenges. Thus, the following hypothesis is proposed:
H3: Social support positively influences employee resilience.

Adversity is an inevitable part of life, which is also valid for life within an organization. Organizational academics from several fields have developed an interest in resilience, which refers to coping with challenges due to the growing complexity of work stresses and rapid organizational change (Richard, 2020). Employee resilience is significantly influenced and improved by the presence of robust social support systems. It establishes a work environment where individuals can face challenges, recover from setbacks, and steadfastly commit to their professional obligations, aided by positive relationships and networks. Ultimately, this contributes to the achievement of organizational objectives and the improvement of employee well-being.

The healthcare sector is not an accessible sector in which to work. It involves human life, and the pressure that healthcare workers face daily, the long working hours, and the commitment they give to their patients make it difficult. Therefore, healthcare workers must be highly resilient to ensure they provide their patients with the best service. As highlighted by Baker et al. (2021), resilience is a crucial competency that employees must cultivate to effectively overcome the diverse obstacles encountered in the workplace, such as excessive workloads, traumatic incidents, and other forms of adversity.

According to Cooke, Cooper, Bartram, Wang, and Mei (2019), resilience refers to an individual's ability to effectively adapt to new situations and restore balance in the presence of significant challenges. Resilience refers to the ability to maintain or repair one's mental well-being in adversity (Herrman et al., 2011). Based on the definition, employees need resilience to maintain efficiency if the job is highly stressful. According to Norman Garmezy, his research on academic resilience led him to conclude that a particular aspect of resilience has a more significant impact on mental health than previously believed.

Resilience in the workplace can be defined as the capacity not only to endure but also to develop in demanding and stressful conditions. This is because, in high-pressure settings, such as a professional environment, individuals are frequently faced with conflicting expectations from colleagues and supervisors, necessitating the need to maintain composure and respond positively. Resilience on the job is a highly advantageous quality that enables individuals to maintain concentration and productivity while handling challenging conditions effectively. Change is increasingly becoming a standard practice in numerous enterprises and the healthcare sector. Research has affirmed the significance of employees in effectively dealing with change (Bardoel et al., 2014). According to the study conducted by Bardoel et al. (2014), resilient persons demonstrated a higher ability to adjust to work conditions that were continually changing.

Healthcare workers must cultivate resilience when they encounter several crucial situations while ensuring the well-being and survival of their patients. Simultaneously, they must deliver accurate medical treatments for the cases they encounter regularly, as human lives are a concern. Addressing instances where patients may not survive despite the best efforts of medical professionals presents complexity, as these circumstances involve considerations of mortality. Humans find it inherently challenging to handle such challenges due to the profound emotional and existential aspects involved when lives are at risk.

Studies have shown that the ability of staff to bounce back from challenges, known as resilience, is crucial in the healthcare sector. It allows for the establishment and maintenance of a stable environment that facilitates rapid adjustment in the face of unforeseen dangers (Liukinevičienė & Blažienė, 2022). This research will

investigate the relationship between employee resilience and employee retention. Understanding how employee resilience influences employee retention is integral to comprehending the challenges in the current workplace. Thus, the following hypothesis is suggested:
H4: Employee resilience positively influences employee retention

In today's job market, individuals can choose their employers based on their skills and expertise. To retain a talented workforce, organizations must focus on keeping their employees. High-quality employees are crucial as they provide a competitive edge, making their skills and knowledge highly valuable. The success of an organization relies on having the right people, and in this context, employee resilience—defined as the ability to handle pressure, overcome adversity, and maintain psychological well-being—has become increasingly important (Näswall et al., 2019). This attribute is essential for navigating the complex demands of modern workplaces (Mulyono et al., 2024).

The Job Demands-Resources (JD-R) Theory, introduced by Demerouti et al. (2001), suggests that every job includes both resources (like autonomy and managerial support) and demands (such as workload and time constraints) that affect workers' performance and well-being. Managerial coaching, as a resource providing guidance, feedback, and support, plays a critical role in employee retention by making employees feel valued and supported, which enhances their commitment to the organization. Employee resilience mediates in this relationship, helping individuals adapt and succeed in facing challenges. Effective managerial coaching fosters resilience, enabling employees to manage changes, handle stress, and overcome obstacles more effectively. As resilience grows, employees can better manage their responsibilities, leading to increased job satisfaction and reduced turnover intentions. Therefore, by enhancing resilience through coaching, employees' ability to handle challenges is improved, and their dedication to the organization is reinforced, thereby amplifying the positive effects of coaching on retention.

Social Exchange Theory, developed by Blau (1964), posits that workplace relationships are built on reciprocal exchanges of resources and support. Managerial coaching involves the strategic allocation of resources by managers to support their employees' development and well-being. Managers investing time and effort into coaching fosters a sense of reciprocal engagement and trust. Managers need to bring positive energy to coaching because interpersonal interactions can trigger emotional responses through emotional contagion, where one person's emotions influence another's. Employees who feel recognized and supported are likelier to commit their efforts and loyalty to the organization. They are also more inclined to develop resilience when they perceive their work environment as conducive to personal growth.

Research shows a strong link between employee and organizational resilience, emphasizing the role of employee resilience in maintaining engagement and performance (Liang & Cao, 2021). Management coaching is crucial for developing resilient behaviors in employees, which affects retention rates (Caniëls & Curseu, 2024). Resilience acts as a mediator by lessening the negative impacts of job stress and enhancing the benefits of coaching. Resilient employees manage job constraints, setbacks, and uncertainty more effectively, displaying higher flexibility, optimism, and emotional intelligence, which helps them sustain high performance and engagement (Luthans et al., 2006). Thus, resilient employees are likely to view management coaching as valuable and effective for their growth and well-being, leading to increased retention rates. JD-R and Social Exchange Theory offer valuable insights into how employee resilience mediates the connection between managerial coaching and employee retention. Organizations may boost coaching effectiveness and promote employee well-being and commitment by comprehending the impact of coaching on resilience and retention and establishing supportive work environments.
Thus, based on the JD-R model and Social Exchange Theory, this study puts forward the following hypothesis:
H5: The connection between managerial coaching and employee retention is influenced by employee resilience.

4. Research Methodology

The study employs a quantitative cross-sectional survey methodology to explore the relationships between managerial coaching, emotional intelligence, social support, employee resilience, and employee retention. This approach involves a thorough examination of these variables at a single point in time across public hospitals in Malaysia that are engaged in treating COVID-19 patients. The sample includes six hospitals from different regions: three from the central area (Hospital Sungai Buloh, Hospital Kuala Lumpur, and University Malaya Medical Centre), one from the southern region (Hospital Tunku Jaafar Seremban), one from the eastern region (Hospital Tengku Ampuan Afzan), and one from East Malaysia (Hospital Umum Sarawak). This diverse selection aims to provide a well-rounded understanding of the research objectives within Malaysia's dynamic public healthcare sector.

Data will be gathered through structured questionnaires designed to assess key factors such as managerial coaching, emotional intelligence, social support, employee resilience, and retention. These surveys will be distributed across various departments and levels of administration within the hospitals to ensure a broad and representative sample. Once collected, the data will be analyzed using PLS (Partial Least Squares) Structural Equation Modelling to evaluate both the direct and indirect effects of the studied variables. This methodology is tailored to ensure accuracy and consistency throughout data collection, processing, and analysis, facilitating a thorough investigation of the relationships within the selected organizational contexts.

5. Conclusion

This conceptual paper highlights the importance of managerial coaching, emotional intelligence, and social support in enhancing employee resilience and retention in Malaysia's public healthcare system. Healthcare workers are facing more difficult barriers in the *BANI* environment. These factors are increasingly vital in helping individuals handle their occupations' requirements effectively, maintain their overall health, and be committed to their organizations.

The study predicts that more intensive managerial coaching, heightened emotional intelligence, and improved social support will increase employee resilience. Resilience is anticipated to decrease turnover rates since resilient individuals are more inclined to remain dedicated to their positions despite the stressful and demanding healthcare environment. The anticipated results encompass a more lucid comprehension of the interplay between these elements in enhancing employee retention, providing flexible insights that might inform public hospital policy decisions and management practices. Enhancing the capacity to bounce back and adjust through focused interventions in coaching, emotional intelligence, and social support is vital for sustaining a dedicated and proficient healthcare workforce, thereby improving the overall effectiveness and durability of Malaysia's public health system.

Abstract: This study explores the couple's role in managing finances and marital satisfaction from the perspective of newly married couples. By delving into individual demographic and behavioral segments, we reveal how couples manage and plan finances to achieve financial well-being and marital satisfaction, further identifying the role of gender in household financial management. Through a phenomenological method, we conducted semi-structured interviews with seven middle-income newly married couples residing in Klang Valley. Interviews with informants took 6 months between February 2022 and July 2022. The duration of the interview is between sixty and ninety minutes. The interpretation of qualitative data was analyzed thematically using N-Vivo 13 software. The results of the study shed light on the couple's financial management practices to achieve financial well-being and marital satisfaction. The husband is the main pillar in the household's financial affairs. This study offers value in the enrichment of data that reveals couples' understanding of managing finances and plans for their future. By focusing on newly married Malay couples, we gained a deeper insight into simple strategies implemented by household financial managers, division of financial responsibilities, and course of action. Findings that reveal the understanding and behavior of middle-income newlyweds in the Klang Valley towards financial well-being can be used by policymakers, governments, and non-governmental organizations to formulate financial health policies, programs, and campaigns to educate the public about early planning towards financial well-being and enjoying marital satisfaction.

Keywords: *Financial management, family resource management, marital satisfaction, newly married couples, qualitative method*

1. Introduction and Background

The post-pandemic era shows the struggle of households in trying to meet daily needs while adapting to the increase in the price of goods and the cost of living where the rise in income is unable to cope with the rate of inflation. In a situation where many people live paycheck to paycheck, the wages earned at the beginning of the month seem to disappear overnight before the end of the month often leading to financial stress and problems in marriage.

The Department of Statistics Malaysia in November 2023 recorded that the divorce rate increased by 43.1 percent in 2022 compared to the previous year and divorce among Muslim couples was the highest. Although there have been many cases of divorce in the past, it has continued to increase since the COVID-19 pandemic hit the country and the implementation of the movement control order (MCO) which hampered economic movement to the point of affecting household income is seen as the biggest cause of divorce (Parzi, 2021). Selangor recorded the highest number of 12,479, followed by Johor (7,558); Kedah (5,985), Kelantan (5,982), Perak (5,921) and 5,098 in Terengganu (Sinar Harian Online, 2021). In addition to finances being the main issue of domestic conflict, the National Population and Family Development Board's (LPPKN) study in 2021 also recorded emotional stress, depression, work arrangements, and domestic violence as the cause of the increase in divorce rates.

Although four years have passed, the community is still struggling in the post-pandemic era with economic uncertainty that affects well-being and quality of life. Well-being includes physical and mental health, happiness, and life satisfaction. Marriage is one of the ways to experience a purposeful life, happiness, and peace of mind where life feels more meaningful. However, marital satisfaction is a complex phenomenon that

is influenced by various factors including personality characteristics, communication, conflict resolution, and economic stability (Abolghasemi et al, 2024). Financial well-being (FWB) is one of the factors that determine the quality of life. It refers to the sustainability of individuals in ensuring that needs are met and the comforts of life are enjoyed without worry due to sufficient income and savings (Carton et al, 2022). An individual's perception of FWB depends on the current financial position which involves the adequacy of income to cover expenses, savings, emergencies and future security. In addition, knowledge related to financial products, financial services and the availability of formal and informal finance also influence individual perceptions. (Fu, 2020).

For newly married couples, Saxey et al. (2024) found that finances have a direct relationship with marital satisfaction. According to Falahati and Sabri (2015), many young adults are unable to manage their spending wisely and thus fall into financial stress. According to Frączek and Klimontowicz (2015), young people lack financial knowledge and financial skills causing them to be weak in financial literacy. Relationship satisfaction is achieved when partners share financial values (Mao et al, 2017). However, possessions and financial values can also undermine satisfaction in relationships (Ward et al, 2021; Yoo et al, 2021). This research seeks to reveal how newly married young couples (NMC) manage money and financial conflicts based on family resource management theory to distinguish the couple's future financial motivations that affect marital satisfaction by taking into account the roles played by husbands and wives.

2. Literature Review

As early as the household model was formed, Becker (1981) and McElroy and Horney (1981) suggested that couples would choose and perform household tasks based on comparative advantages whilst financial decisions were made through negotiation. The division of household tasks includes psychological and sociological factors, contractual relationships, and finances (Antonides, 2011). Meanwhile, recent studies show that there is an unequal division of tasks between couples (Ciciolla & Luthar, 2019). These tasks include household budgeting, planning family activities, anticipating future needs, delegating tasks, and prioritizing and reviewing outcomes (Robertson et al, 2019). Several past studies showed that the value of income influences power in determining household financial decisions. Husbands who usually have higher incomes have higher control over household finances (Alsemgeest & Grobbelaar, 2015; Antonides, 2011; Friedberg & Webb, 2006; Grossbard-Shechtman, 2003).

According to Cheraghian et al. (2024), the existence of a household financial manager and the ability to balance income and expenses can result in marital satisfaction. Preceding research (Cooper & Zhu, 2016; Elder, 2003; Hilgert & Hogarth, 2003; Johnston et al, 2015; L'Esperance, 2019) suggested that age, education, employment, and wages are important factors that determine who had the most power to 'holds the purse strings'. In West Bengal, age, occupation, and family type determine women's participation in household financial affairs showing that their involvement is higher for those living in urban than in rural areas (Biswas et al, 2020). Majlesi's (2016) study of Mexican households shows that working-class wives can make financial decisions related to medical costs and children's health. In fact, according to L'Esperance (2016), higher-income wives tend to handle most of the financial tasks that include paying bills, managing savings and investments, shopping, and preparing family budgets.

There are three methods of making financial decisions in dual-income families in Malaysia; done alone by the husband or wife and done jointly by the husband and wife (Zaimah et al, 2015). Josephson (2017) found that households who practice partial pooling with no full family insurance, insure each other for essentials (food, clothing, education, and healthcare) but not luxury items (cigarettes, alcohol, recreation, housing, and utilities). Bertocchi et al. (2014) stated that household financial decision-making depends not only on economic differences between the spouses but also on human capital and experience differences.

Family Resource Management Theory
The household economic model suggests that marriage is closely related to the allocation of resources where couples benefit from joint consumption (Dupuy & Galichon, 2014; Lundberg, 2012). Chen et al. (2012) indicated that when couples coordinate their respective resources including emotions, finances, information, and services together to meet each other's needs, it is a process of family resource management. When it comes to

household financial decisions, it usually focuses on where, by whom, how much, and why it is necessary and has been spent. (Kamleitner et al, 2016).

Family resource management theory was initiated by Deacon and Firebaugh (1988). It conceptualizes the framework of household financial management by emphasizing that resource planning and implementation is the management of family resources to meet household demands. In the household, there needs to be a financial manager who manages all the family's resources, not just the allocation of money. This theory emphasizes that their responsibility is to allocate resources wisely to achieve financial objectives. To achieve financial well-being and optimize satisfaction, couples need to divide household tasks (Perry-Jenkins, 2020). The division of financial and household tasks is closely related to social factors implementation among couples is quite difficult but not impossible to do with the discussion, especially for low- and middle-income groups (Carlson et al, 2018). This is because to increase household resources, outsourcing was also done and to maximize satisfaction, market substitutes for domestic work such as cleaning, cooking, and taking care of children are used (Kornrich & Roberts, 2018).

Nuclear families consisting of parents and children are found to be more efficient than extended families (living with in-laws) in allocating household economic resources (Kazianga & Wahhaj, 2017). Therefore, the allocation of resources such as land and farms received by the nuclear family is greater than the extended family. As noted by Atwood (2012), marital satisfaction is influenced by the household economy where the spouse's economic achievement is crucial. In a conventional household, the husband plays the main role in managing and controlling finances (Bisdee et al, 2013). However, according to Pahl (1995), although the main breadwinner in most households is the husband and the wife often acts as a supporter in helping the family economy, in most situations, the wife still prioritizes the needs of the family over her desire to spend her money.

In conclusion, family resource management theory suggests couples share resources and divide responsibilities to optimize resources. It is also used to see how NMC shares limited economic resources and distributes household financial responsibilities. Many previous studies have linked financial issues to divorce, discord in family relationships, and domestic violence (Cheraghian, 2024; Dean et al, 2009; Kerkmann et al, 2000; LeBaron-Black et al, 2024; Peetz & Joseph, 2024). Hence, identifying financial management practices and how to deal with financial conflicts of NMC is imperative to suggest that couples' behavior towards finances, money motives, and their understanding of financial well-being is closely related to a good marital relationship.

3. Research Methodology

Procedure
This study focused on seven newly married Malay couples from the M40 income category residing in the Klang Valley. Semi-structured interviews were conducted with couples together. Interviews with informants took 6 months between February 2022 and July 2022. The duration of the interview is between 60 to 90 minutes. Starting with a pilot study, the intensity sampling method paid attention to young adults aged between 25 and 35 years with a marriage duration between 3 to 5 years. Young adults according to the Malaysian National Youth Development Policy are those between the ages of 15 and 40. Before the interview, all informants were informed of the purpose of the study. They were given a confidentiality guarantee and asked to sign the consent form. The interview was conducted by the researcher with the assistance of a research assistant at the informant's home at the time and date agreed upon. Informants were given the option to answer questions in their preferred language. As informants chose to be interviewed in Bahasa Malaysia, bilingual translators' expertise was used to avoid ambiguity in understanding the content of the interviews.

Measures and Analysis
Data interpretation is guided by the family resource management theory. Besides focusing on financial management, plans and efforts to improve the level of income were also used as a foundation to formulate the research questions. Data triangulation and theory triangulation were carried out. The informants' statements were cross-examined through observation, field notes, and documents obtained from them. In addition, the convergence between theories also serves as additional validation. Maxwell (2013) stated that the results of qualitative studies are necessary for the construction of theory, but Saldana (2015) challenged this by pointing out that qualitative studies should be based on well-known theories. Hence, this study takes an approach to

comply with the view of Miles and Huberman (1994) in which, the presence of two theories may not necessarily provide perfect convergence, but partial convergence is adequate to support the anticipated connection through various researchers and participants at different times and situation. The study also conducted member checks as another validation technique which is a great tool for improving the credibility, authenticity, and accuracy of data.

Researchers used the methods proposed by Chenail (2011), Gray (2018), King and Brooks (2017), and Yin (2011) to slacken bias and to elude prejudice against the informants' statements. According to Yin (2011), transparency is imperative in explaining research procedures. Meanwhile, Chenail (2011) proposed an interview method to enrich the data. From simply taking 'explanations' to achieve the objectives of the study, King and Brooks (2017) suggest qualitative researchers 'understand' the meaning conveyed by the informant. Next, from simply putting assumptions to causes and actions, qualitative researchers need to take an interpretive approach, by translating and understanding the meaning of the informant's experience (Gray, 2018).

The instruments of inquiry are seven main semi-structured interview questions. Interviews were recorded using a Sony Stereo IC Recorder, model ICD-UX560F. Phenomenological methods were used in the transcriptional analysis (Eddles-Hirsch, 2015). The analysis was performed using N-Vivo 13. It involves two main stages. First, coding of phrases and second identifying relationships between themes emerged, which were identified in the first stage. When a connection between themes appears, the theme is clustered into a superordinate theme. Transcripts need to be read over and over again to make sure the themes that emerge reflect what informants want to convey. The excerpts extracted from the data were then examined according to a new theme using N-Vivo 13 software.

Descriptive and thematic analysis is the cornerstone of data analysis in this study. Descriptive analysis was a platform that provided a richer context through enhanced representation based on data from other angles of the studied phenomena (Given, 2008). Through descriptive analysis, the original dialogue was presented as support and evidence for the analysis made.

Data Saturation and Validation
The uniqueness of qualitative research lies in the enrichment of data collected from informants directly. Thus, sample size plays a minor role where data saturation is determined by the study element; until Repeated and reasonable information is reached and new information cannot be unearthed new data. The Collection is unnecessary (Saunders et al, 2018). In this study, data saturation is inferred through inductive logic; data is collected based on research questions and then analyzed based on theory. Qualitative studies emphasize the validity of data as a guarantee of the reliability, validity and accuracy of Results as evidence that the study is conducted ethically (Merriam, 2009). Qualitative studies emphasize the validity of data as a guarantee of reliability, validity and accuracy of results as evidence that the study is conducted ethically.

Table 1: Stages in the validation strategy

No	Validation stages	Procedures
1	Triangulation technique	Interviews are a source of primary data collection and observation is a source of secondary data to strengthen insights and results.
2	Members check	Tentative findings were confirmed by the informant through transcripts that detailed the narration during the interview.
3	Peer review	The researchers involved in this study conducted a review process using N-Vivo 13 by listening to the interview data, checking, comparing the data and forming categories. Data Coding was also done at this stage.

4. Results

The data explained through semi-structured interviews covers three phases; the existence of a household financial manager, the division of financial responsibilities, and the course of actions. The perspectives and approaches discussed resulted in themes that explained the role of couples towards their roadmap in pursuit

of FWB. Descriptive analysis with data enrichment allows the phenomenon of the study to be explained more deeply to achieve the objectives of the study.

Course of Action
In terms of resource management of household income, the primary theme that appears is the awareness to form an efficient way of managing inflows and outflows of money. Although both work and have their income, they still have a household financial manager who takes the initiative to effectively manage the household's money activities. The course of action results from the activities of financial managers who record expenses, keep proof of payment, and review expenses periodically. Financial managers use Excel sheets to track monthly finances and make annual financial plans. This simple technique is used to keep track of any large expenses that may occur once in a while. At the same time, it is a warning of the current financial position of the family. The financial review carried out periodically aims to ensure that the family's financial commitments are in order and that they are always prepared in the event of an emergency or unforeseen event. This method has been practiced by husbands since before marriage. The track made is to ensure loans and bills are paid on time. It also makes it easier for them to plan vacations and festival expenses. They keep these financial records on a laptop for easy future reference.

> *"…if you see my workstation in my office, I have an Excel sheet, yeah, even my wife, even she'll have a Headache if she looks at my Excel sheet. My spending every month, err, I will record, you know, okay, all. the amounts that I have spent." (Ahmad, couple 1).*

Their financial record data in an Excel sheet has details on regular expenses such as home bills, monthly debt commitments, and savings. The pattern of monthly expenditure for household needs rarely changes, therefore they do not go into detail. They recorded it based on categories such as grocery items, entertainment, clothing, and so on. Surprisingly, all the informants do not have a background in business and accounting. Throughout their university studies, they were not exposed to financial knowledge, nor did they ever meet with a financial advisor to learn the best way to record household finances. The initiative that was taken arose from financial awareness when seeing and reading about the situation of the community burdened with financial issues and involved with uncontrollable debt.

> *"Looking at other people. When we see our friends, using credit cards, the desire to spend is higher, Because they can buy on credit, and then, in the end, they get a letter, stating that they have been Blacklisted [for non-payment], that's what happens…". (Yusof, Couple 6).*

In addition, they also consider efforts to accumulate wealth and assets. It included planning for savings, investments, and future financial strengthening. With limited finances, they choose a safe investment plan. At the moment, three couples (couples 2, 3, and 7) were actively seeking information on gold bar investment. Couple 5 plans to start with ASB financing in which they believe that the annual dividends earned can be used to settle the monthly payments or used for other possible matters. Meanwhile, couple 1 is aiming to be involved in property investment and made a forecast for the expected income from the property business.

> *"hmm… nowadays there are many auction houses so he is interested in buying and renting. We went to The CIMB auction but for now there is no chance of winning yet". (Ana, Couple 1).*

Although the financial management model practiced by these couples seems less systematic, their determination to manage family finances can be emulated. Without the financial and accounting education background, they were striving to create the most easily understood system to track their financial flows. Despite less skill in terms of applying the convenience of the smartphone app, the husband, as the head of the family, took the initiative to design a recording system that made it easier for him to check on household expenses and debts. In terms of tracking expenses, this study is in line with Kaye et al. (2014) where they form a financial system that fits their daily routine although it is not an ideal notion it is an adequate financial management practice for them.

The Husband is a Household Financial Manager
This study revealed that all the couples interviewed had a household financial manager. Life in the post-pandemic era, they feel that managing finances is increasingly critical, not to mention the slightly reduced salary from before the pandemic and the price of goods being quite burdensome. Although all the informants have the same level of education; holders of a bachelor's degree from a local university, it turns out that the

husbands are more fortunate as they have a higher income than the wives. Although there is no clear statement or discussion between the couple, the husband is seen to have the power to manage the family's finances. They admitted that the discussion took place for the purchase of relatively expensive and large items such as new furniture, electrical items, kitchen renovations, and family vacation arrangements. However, the final decision for the financial budget is usually the husband's decision.

> *"Before I make any purchases, I will let him know, so, if he says "Err, this month, we need to save some. Money first", then I won't buy, if it's okay, then I'll buy it". (Fiza, couple 3).*
> *"For the big-ticket [costly items}, I will decide". (Faris, couple 3).*

The wife also plays a role in managing finances but it is more on a small scale such as the purchase of children's clothes and daily expenses. The wives explained that financial affairs are easier to hand over to the husband because the husband is more careful in comparing prices, more diligent in keeping records and checking expenses, also wiser in planning expenses and budgeting. Husbands are more rational in spending and always prioritize needs over wants. Although frugal in spending, when it comes to some important items, they will not compromise on the quality. Choosing quality items is more worthwhile because they are more durable. Although quality goods are quite expensive, these husbands are very clever in finding ways to buy them at a worthwhile price. They will choose quality goods at reasonable prices either online, using vouchers, coupons, or reward points collected from previous purchases. They prioritize their wives and children over themselves when shopping.

> *"…I buy second-hand items for myself, leather, durable, err, as long as it's wearable, that's okay, no. Problem. But, for her (wife) and children, at least, once a year I will withdraw some money and buy for Them and I choose the one that is of a good quality and course of their choice". (Haqem, Couple 4).*
> *"We want to buy… but we know, we can't afford it. So, what I do is… I do some research, and then I see, "oh… instead of paying RM3,000 at a boutique, we can buy it from a Malaysian [personal] shopper who buys items from the US, I see that it's less than RM1,000, maybe even just a few hundred only". (Ahmad, Couple 1).*

There is one thing in common among these financial managers, they like to delay spending. According to Them, this is a way to save money. But this postponement is only for items of desire, not necessity. The postponement was also made to spend some time to find a more economical alternative. It is very different from wives who like to make quick decisions in purchases. Impulsive buying situations mostly happens when the wife shops alone. However, when they do their monthly grocery shopping, they prepare a shopping list to avoid waste. These couples preferred to use cash against credit as a way to control spending. As a measure of frugality, price comparisons were made to get quality goods at reasonable prices. Nevertheless, during the promotion of cheap sales, the number of purchases increased. In addition to having a member card to collect reward points, they also choose grocery stores that offer low prices.

> *"Err… if for groceries… either Giant or Mydin. For clothing… err… usually… either Aeon or Sogo. We look for a cheap one but if [we] wanna buy clothes, like children's clothes, err… we choose the cheaper one, but It's still of good quality. We] didn't buy the latest products". (Dania, Couple 7).*

Although these informants are working couples with a moderate income, they admit that there are times when the monthly income cannot cover unexpected expenses. Hence the use of credit cards is sometimes necessary. However, only three couples have credit cards. Another four couple have their reasons for not using a credit card. For these three couples, only the husband has a credit card. Credit card use is limited to emergencies and relatively large expenses to accumulate reward points and avoid getting caught up in impulsive spending.

> *"…this credit card is mainly used for specific cases, for example, for car repair, immediately, you need RM2000 err, I don't have it, so, I pay using my credit card first". (Qazem, Couple 5).*
> *"CIMB and Maybank. The CIMB [card], I don't use it actually. The CIMB [card] is just for emergencies". (Yusof, Couple 6).*

The household financial manager is not appointed but it happens naturally based on trust and willingness. To take responsibility. This study highlights the need for a financially savvy person who is willing to make financial decisions to manage household finances. The role of the financial manager arises when one of the spouses is indirectly able to influence decisions involving large amounts of money. In addition, he must also, be knowledgeable about the family's financial assets. This study discovered that these couples. Implicitly

recognized that their husbands were the family financial managers. This finding was similar to Bisdee et al. (2013); Carlson et al. (2018); and Codod (2015). Bisdee et al. (2013) stated that traditionally, the husband's role was to manage family finances as this would manifest the credibility of a husband.

Division of financial responsibility

All the couples interviewed have one to two children except one couple who has no children. This working couple agreed to manage the household tasks together. Although the husband is the financial manager, the wife still has financial responsibilities. For these young couples, financial responsibilities include family expenses, childcare costs, and intergenerational transfers within immediate family members. Ensuring that basic needs are met is the husband's responsibility. The basic needs meant by them are in line with the theory introduced by Maslow (1943). Among the elements he emphasized were water, food, shelter, health, and safety. However, some fundamentals are agreed upon by all, which are not impossible to obtain, and the minimum requirements for life; are food, clothing, and shelter.

> *"Err… every month I pay the [mortgage] installments. Also, every month, I allocate another RM300 for Groceries, internet connection as well as our insurance". (Ahmad, Couple 1).*

In terms of food and clothing expenses for family members, all couples took different approaches. For couples 3, 4, and 5, the husband provided expenses for groceries and daily meals. While, for couple 2, the provision of groceries was the responsibility of the wife. Besides, Ahmad (couple 1), Khaliq (couple 2), Faris (couple 3), Haqem (couple 4), and Qazem (couple 5) explained that their income was also allocated for family medical needs. While for Yusof (couple 6) and Daud (couple 7) they not only shared in medical costs (if any, as they said, it was very rare) but they also shared childcare costs.

> *"…err… housing, food, err… illness, fever [healthcare], err… clothes, … that's my responsibility, …and then, For… err… hospital bills and electricity bills, I pay for all that. And then, she [Hani], the car that belongs to Her, she pays [for it], her makeup, she pays…". (Khaliq, Couple 2).*

Speaking of the distribution and use of the wife's income, all couples gave a similar pattern. They indicated that wives used most of their income for personal needs and to pay their debts. The wives have more debt commitments than their husbands before marriage. Among the debts that the wives brought into the marriage are vehicle loans, personal loans, and education loans.

> *"Groceries, his [responsibility] (looking at her husband while laughing). I have an education loan, PTPTN. Then I have a car loan. I've also taken an ASB loan, so I paid my loan only". (Dania, Couple 7).*

This study has found that wives have more debt brought into the marriage than husbands. All seven couples in this study each have their vehicle. However, none of the husbands had a new car, they all bought a used car when they started working. All wives buy new cars as soon as they work for the reason of commuting and therefore have car loans. All husbands also still use the old motorbikes that their fathers gave them when they were still studying. From this data, it is easy to conclude that husbands are more careful in spending. While the wife easily incurs debt. It turns out that the decision to divide financial responsibilities is based on the commitment and financial burden borne by the spouse. This finding is in line with Coelho (2014) where spouses are responsible for different categories of common expenses. This study also supports the findings of Hitczenko (2021) where making financial decisions is the responsibility of men because it is in line with higher household income. However, the additional data obtained from this study is the wife's financial position and the wife's behavior towards money is the main driver for the husband to manage the household finances.

Discussion

The objective of this study is to relate the role of gender in household money management in the post-pandemic era to examine how the methods implemented affect marital satisfaction and avoid financial conflicts. The informant is a working couple with a bachelor's degree from a local public university. The income range of the informant's household is between RM7,850 to RM12,500 per month. While the age range of informants is between 27 to 34 years. Each couple has at least one motorcycle and 2 cars. They rent a house in the Klang Valley with an estimated rent of between RM650 to RM800 per month.

The findings of the study show that all couples can meet basic needs. None of the couples were affected by the COVID-19 pandemic, but the increase in the price of goods made them more cautious in spending matters.

Family financial matters are the husband's responsibility where the husband will manage house rent, bill payments, and monthly groceries. Only three couples use credit cards that are limited to emergencies and contingencies where the husband is the holder. Husbands only have PTPTN financial loans but on average wives have long-term debts such as education loans, ASB loans, vehicle loans, and personal loans. Financial affairs are carefully organized by the husbands by recording the flow of money in and out, planning the expenses of family vacations and celebrations, and making and checking the annual budget for the children's schooling and family savings. Expenses involving a large amount of money will be discussed together and the husband will decide according to the sufficiency of money and the appropriateness of time. These results show that discussing and accepting decisions openly is a method of avoiding financial conflicts and resulting in healthy relationships and marital satisfaction. Effective communication between couples supports the study of Girma (2022) and Omoboye et al. (2024) where effective communication fosters resilience, resolves marital conflicts and increases marital satisfaction.

All wives put all their trust in their husbands for financial matters and they also have joint savings. This trust is the main key to marital satisfaction and can avoid financial conflicts. Wives are less concerned about the main financial affairs of the household and their wages are only used for the purchase of personal items and loan payments. Having a good and healthy perception also produces satisfaction in marriage. This is in line with Wondimu (2024) that positive beliefs in marriage are one of the factors that shape marital satisfaction.

5. Managerial Implications and Recommendations

This study intentionally focuses on newly married couples with moderate income residing in Klang Valley to identify their financial management practices in the post-pandemic era. Among the contributions of this study to newly married young couples is that managing finances prudently is very important to enjoy marital satisfaction and avoid conflict in the household. In a household where there are two individuals from different backgrounds, different thoughts, and different ways of living, there is a need for healthy communication and open discussion especially in financial issues. Women are known for their love of shopping, so as a husband you need to control and advise. In a marriage, there needs to be someone who can manage finances wisely and have clear future financial goals. This study also offers methodological implications by presenting a deeper understanding through first-hand information. Many studies related to financial management are carried out quantitatively but through qualitative methods, data enrichment is obtained not only through descriptive analysis but also through observation. It indirectly closed the literature gap by providing deep insight into these couples' understanding, beliefs, and feelings. Face-to-face interviews help us understand the meaning of the words conveyed by these informants through their facial expressions. Practices shared by the husbands in this study such as prioritizing needs over wants and methods of tracking finances can be used as a campaign to emulate. Policies for forced savings can be improved by policymakers to ensure that savings are made a must for society. This study suggests that policymakers, governments, and non-governmental organizations formulate financial health policies, programs, and campaigns to educate the public about early planning for financial well-being.

Conclusion
This study aims to identify the role of gender in household financial management. The husband with a higher Income and less debt were the financial managers of the household. The husband has the power in Determining major expenses and investments. For newly married Malay couples, men play an important role in managing household finances even though they are dual-income households. The wife also has a role but it is for daily expenses and involves a small amount. Indeed, among the factors that affect marital satisfaction are financial issues. Financial awareness and financial savvy form motivation towards financial well-being. The trust that exists between the couple and the future financial motives are discussed with the couple can Avoid financial conflicts in the household.

The Influence of Extrinsic Motivation and Cross-Cultural Adjustment on Foreign Worker Commitment: The Mediating Role of Cross-Cultural Adjustment and Moderating Role of Employer Trust

*Amelia Binti Ramli, Noor Azzah Said

Abstract: Palm oil is a key income source in Malaysia, with the industry heavily reliant on foreign workers. This reliance necessitates a focus on their welfare to address workforce shortages. This study examines the relationship between extrinsic motivation and organizational commitment, mediated by cross-cultural adjustment and moderated by employer trust among foreign workers. This study employed a quantitative research design, using SPSS for data analysis, and surveyed 242 foreign workers from companies listed on the Malaysian Palm Oil Council (MPOC) website in 2022, achieving a 100% response rate. The key findings show that organizational commitment positively influences extrinsic motivation, with cross-cultural adjustment significantly enhancing both. Employer trust moderates the relationship between organizational commitment and cross-cultural adjustment, underscoring its importance in cultural adaptation and motivation. These insights highlight the need for targeted strategies to improve job satisfaction and retention among foreign workers by addressing extrinsic motivational factors and cultural adaptation challenges. The research contributes to the literature by detailing the interplay of organizational factors and cultural adaptation in shaping motivational outcomes, suggesting future research to explore longitudinal studies and other moderating variables. These findings offer valuable implications for improving workforce performance and retention strategies in the palm oil industry.

Keywords: *Extrinsic motivation, organizational commitment, cross-cultural adjustment, employer trust, foreign workers.*

1. Introduction and Background

As the global shift toward sustainable development progresses, organizations must balance societal, environmental, and economic goals (Thakhathi et al., 2019). Businesses face increasing pressure to adopt sustainable practices, as evidenced by the rise of sustainability reporting, with over 93% of Fortune Global 250 companies publishing such reports (International, 2017). However, these reports often conceal operational scrutiny (Nor Ahmad et al., 2022). The palm oil industry, significant yet controversial, is crucial to Malaysia's economy but faces potential EU bans due to environmental concerns (Naidu & Moorthy, 2021). In 2022, palm oil contributed RM116.3 billion to Malaysia's export revenue (Ministry of Plantations and Commodities, 2022). Despite its economic contributions, the sector suffers from labor shortages, with only 19% of the required foreign workers authorized to work in 2022.

Foreign workers play a vital role in Malaysia's economy, particularly in low-skilled jobs within the manufacturing, construction, and agriculture sectors (Wahab, 2020a; Lee, 2019). While immigration helps address labor shortages, reliance on foreign labor has led to challenges such as deindustrialization and policy enforcement issues (Orrenius & Zavodny, 2020). This study explores the relationship between extrinsic motivation and organizational commitment among foreign workers, mediated by cross-cultural adjustment and moderated by employer trust. Effective management of foreign personnel is essential in today's global business environment (Hua et al., 2019). The research aims to provide insights to better align organizational practices with sustainable development goals and improve workforce performance in Malaysia's palm oil industry (Thakhathi et al., 2019; Passetti et al., 2018).

Problem Statement: Recent media reports from *The Star* and the *New Straits Times* highlight severe labor shortages in Malaysia's oil palm industry, a situation worsened by the COVID-19 pandemic. This shortage, emphasized by Kadir (2022), poses a significant threat to the industry's competitiveness and sustainability. The issue is critical given that Malaysia accounts for 25% of global palm oil production and 33% of global exports (IPAD, 2023).

The sector's labor force, predominantly foreign, has declined, with 74% of the 391,000 workers in 2021 being foreign nationals, down from 80% of 437,000 workers in 2020. By August 2022, there was a shortfall of 54,630 workers, with only 382,582 employed out of the 437,212 required. Delays in permits for 32,000 approved foreign workers further strained the industry. The Malaysian Estate Owners Association (MEOA) has warned of missed revenue opportunities due to the labor shortage, estimating a need for 120,000 workers to capitalize on high palm oil prices. The MPOC adjusted its 2022 output forecast from 18.9 million to 18.6 million tonnes, with further declines possible if labor issues persist.

Research gaps exist in understanding how extrinsic motivation, cross-cultural adjustment, and employer trust impact organizational commitment among foreign workers in the palm oil industry. Cross-cultural adjustment, or how foreign workers adapt to local norms, and employer trust, the belief in employer fairness and support, are critical but underexplored factors. Additionally, there is a lack of theoretical integration of Social Exchange Theory, Expectancy Theory, and Cultural Adjustment Theories.

This study aims to investigate these relationships to address labor shortages and improve recruitment and retention, thereby contributing to the industry's long-term sustainability and competitiveness.

Objectives
RO1: To assess the impact of extrinsic motivation on organizational commitment among foreign workers in the Malaysian palm oil industry.
RO2: To investigate how cross-cultural adjustment mediates the relationship between extrinsic motivation and organizational commitment among foreign workers in the Malaysian palm oil industry.
RO3: To examine the moderating effect of employer trust on the relationship between cross-cultural adjustment and organizational commitment among foreign workers in the Malaysian palm oil industry.
RO4: To evaluate the indirect effect of employer trust on the relationship between extrinsic motivation and organizational commitment, with cross-cultural adjustment as a mediator, among foreign workers in the Malaysian palm oil industry.

2. Literature Review

This chapter provides a comprehensive review of the literature on extrinsic motivation and organizational commitment, explaining how a theoretical framework is constructed using theoretical insights such as Self-Determination Theory (SDT). It examines the impact of extrinsic rewards on intrinsic motivation and the importance of balancing these with strategies that foster long-term engagement. The chapter also explores cross-cultural adjustment, emphasizing the need for organizational support to facilitate cognitive, emotional, and behavioral adaptation among foreign workers. Additionally, it discusses the role of employer trust in enhancing employee engagement and performance and details how organizational commitment—encompassing affective, continuance, and normative dimensions—influences employee behavior and organizational effectiveness. The chapter lays the groundwork for empirical research to test these hypotheses and provides practical implications for improving job satisfaction and commitment among foreign workers.

Extrinsic Motivation and Organizational Commitment: Extrinsic motivation, through financial incentives, career advancement opportunities, and recognition programs, is crucial for enhancing job satisfaction, retention, and commitment among foreign workers, particularly in industrialized nations where they seek to improve their wealth and income (Chua & Ayoko, 2021). Effective use of these motivators aligns with organizational goals, fostering a motivated workforce and enhancing overall productivity and engagement (Earley & Ang, 2021). Creating a supportive environment that acknowledges diverse backgrounds further strengthens this commitment, which helps organizations attract and retain top global talent, thereby maintaining a competitive edge in the global market (Chen, 2019). Thus, leveraging extrinsic rewards can significantly inspire foreign employees to dedicate themselves to both their company and career (Shin & Jung, 2021).
H1: There is a relationship between extrinsic motivation and organizational commitment.

Mediating Role of Cross-Cultural Adjustment: Integrating insights from SDT and organizational commitment literature, cross-cultural adjustment plays a crucial mediating role in the relationship between extrinsic motivation and organizational commitment. SDT suggests that external incentives, such as financial rewards and career opportunities, significantly influence foreign workers' behaviors and attitudes in new cultural contexts (Escobar Fandiño et al., 2019). When aligned with personal goals, these incentives encourage greater job effort and commitment (Shin & Jung, 2021; Stupnisky et al., 2018). Social Exchange Theory and SDT further highlight that successful cultural adaptation fosters a sense of belonging and emotional attachment to organizations, thereby strengthening relationships and commitment to organizational goals (Hua et al., 2019). Practical strategies to support this adjustment include cultural orientation programs, tailored incentive structures, and supportive management practices (Caligiuri & Tarique, 2019). These approaches facilitate smoother integration, reduce cultural barriers, and enhance job satisfaction, thereby improving organizational commitment (Earley & Ang, 2021). Therefore, understanding and leveraging cross-cultural adjustment can significantly enhance the performance and dedication of foreign workers, leading to greater organizational success.

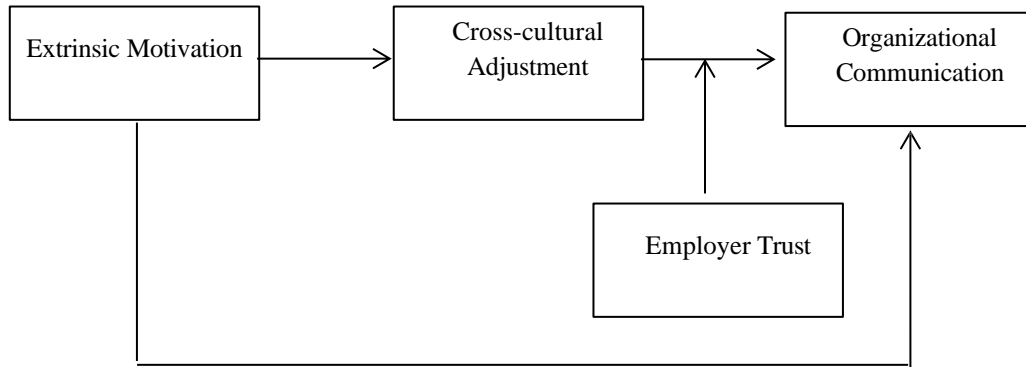
H2: There is a relationship between extrinsic motivation and organizational commitment mediated by cross-cultural adjustment.

Moderating Role of Employer Trust: Trust, defined as "a psychological condition characterized by a readiness to embrace vulnerability to another based on favorable expectations about that other's intentions or behavior" (Heyns & Rothmann, 2021), can be categorized into supervisor trust and leader trust (Kim et al., 2018). Supervisor trust involves employees' confidence in their immediate supervisors who oversee daily operations, while leader trust pertains to confidence in higher-level executives responsible for strategic decisions (Hambrick & Wowak, 2021). Trust is pivotal in the employee-manager relationship (Kloutsiniotis & Mihail, 2018), with mutual trust promoting positive behaviors (Ye et al., 2021). For foreign workers, trust in supervisors provides essential support and guidance in navigating a new environment, enhancing job security and income stability (Chen et al., 2018). High levels of supervisor trust lead to greater employee confidence and motivation, fostering active engagement and adaptation (Nedkovski et al., 2017). Conversely, low supervisor trust can cause insecurity and isolation, hindering cultural adjustment and organizational commitment (Osborne & Hammoud, 2017). Therefore, it is hypothesized that:

H3: The relationship between cross-cultural adjustment and organizational commitment is moderated by employer trust.

In developing hypotheses about the moderating roles of employer trust and cross-cultural adjustment, theories such as Social Exchange Theory, Expectancy Theory, and Cultural Adjustment Theories offer valuable insights. Social Exchange Theory suggests that employer trust fosters a reciprocal relationship where employees feel valued and reciprocate with higher commitment and effort, particularly when extrinsic rewards are present (Cropanzano & Mitchell, 2005). Expectancy Theory posits that effective cross-cultural adjustment aligns workers' expectations with achievable rewards, thus enhancing organizational commitment (Linderbaum & Jordan, 2018). Cultural Adjustment Theories, like Ward's Model, emphasize that mastering cultural norms and achieving psychological comfort enable foreign workers to effectively leverage extrinsic motivators, leading to sustained commitment (Ward & Geeraert, 2016). Integrating these perspectives, the hypothesis proposed is that fostering high employer trust and facilitating effective cross-cultural adjustment can optimize the motivational impact of extrinsic rewards on organizational commitment among foreign workers. Therefore, the following hypothesis is proposed:

H4: The relationship between extrinsic motivation and organizational commitment is moderated by the indirect effect of employer trust via cross-cultural adjustment.

Theoretical Framework:
Figure 1: Theoretical Framework (Pham et al., 2023)


3. Research Methodology

This chapter outlines the research methodology employed in this study, encompassing research design, population, sampling, instrument design, pre-testing, data collection, analysis, and ethical considerations. A survey research approach was utilized, with data gathered via a questionnaire from foreign workers in Malaysia's oil palm plantation industry, specifically targeting 10 prominent companies listed on the MPOC website. The sample size, determined using the Raosoft Calculator, exceeded the minimum requirement, ensuring reliability and validity. Instrument reliability and validity were assessed through expert reviews and pre-testing, which revealed moderate to poor reliability for some constructs, necessitating refinement. Data collection was conducted online, enhancing respondent privacy and data quality. Analysis was performed using IBM SPSS software, including data screening, descriptive statistics, correlation, and regression analysis. Ethical approval ensured adherence to standards regarding participant welfare, confidentiality, and data handling.

4. Results

This chapter, which analyses data collected from students via survey, will provide a comprehensive overview of the findings derived from various analytical techniques. It will begin with a detailed discussion of the descriptive analysis results, including summaries such as means, standard deviations, and distributions of the survey responses, thereby presenting the basic characteristics of the data. Following this, the chapter will delve into the findings from correlation analysis, exploring how different variables —such as cross-cultural adjustment, employer trust, and organizational commitment— relate to each other as well as to the outcome variable, extrinsic motivation. Significant correlations will be highlighted, as indicated by Pearson correlation coefficients and their significance levels. The regression analysis findings will then be addressed, interpreting regression coefficients to assess the impact of cross-cultural adjustment, employer trust, and organizational commitment on predicting extrinsic motivation scores. This section will discuss the model's goodness-of-fit (R-squared), and the significance of predictors (p-values), and provide insights into how well the model explains variations in extrinsic motivation. Finally, the chapter will address the hypotheses formulated at the outset of the study, presenting conclusions drawn from the data analysis. It will offer insights into whether the hypothesized relationships between variables were supported by the survey data, tying together the analytical findings into a coherent narrative that informs the reader about the implications and significance of the survey results for understanding the student population and their characteristics.

Response Rate: In survey research, the response rate is the percentage of completed surveys returned out of the total distributed, serving as a key indicator of data quality and representativeness. A high response rate generally signifies more reliable and reflective results of the target population. In this study, the response rate was exceptional, with 100% of the 242 distributed questionnaires being returned and none deemed unusable. This full participation ensures that the data is highly representative of the target population, enhancing the credibility and reliability of the findings. Such a high response rate reduces non-response bias, providing a robust foundation for analyzing and drawing conclusions about extrinsic motivation, cross-cultural adjustment, organizational commitment, and employer trust in the oil palm plantation industry in Malaysia.

Frequency: Frequency in research refers to counting the occurrences of specific values or categories within a dataset, providing crucial descriptive statistics. In this study, frequency analysis summarizes the demographic profiles of respondents, as shown in Table 4.1. All 242 respondents were male, highlighting a gender-specific focus or predominantly male workforce. Marital status data revealed that 27.7% were married and 72.3% were single, suggesting a younger workforce or distinct socio-economic characteristics. The age distribution showed no respondents were under 20 years old; 74.8% were between 21 and 30 years old, and 25.2% were 31 years or older, indicating a predominantly young workforce with some experienced individuals. Racial diversity included 24.4% Bangladeshis, 28.9% Indonesians, 24.0% Nepalis, and 22.7% Myanmarese, reflecting the multinational nature of the workforce. Working experience varied, with 44.6% having 1 to 3 years, 31.0% having 2 to 5 years, and 24.4% having more than 5 years, suggesting a mix of new and experienced workers. This comprehensive demographic overview is essential for understanding workforce composition and tailoring strategies to enhance organizational commitment, cross-cultural adjustment, and employee satisfaction in Malaysia's palm oil industry.

Table 1: Frequency

VARIABLE	FREQUENCY	PERCENTAGE
GENDER		
Males	242	100.00%
Females	0	0.00%
Total	**242**	**100.00**%
MARITAL STATUS		
Married	67	27.70%
Single	175	72.30%
Total	**242**	**100.00**%
AGE		
Under 20	0	0.00%
21-30	181	74.80%
31 and above	61	25.20%
Total	**242**	**100.00**%
RACE		
Bangladesh	59	24.40%
Indonesia	70	28.90%
Nepal	58	24.00%
Myanmar	55	22.70%
Total	**242**	**100.00**%
WORKING EXPERIENCE		
Less than 1 year	0	0.00%
1 year – 3 years	108	44.60%
2 year – 5 years	75	31.00%
more than 5 years	59	24.40%
Total	**242**	**100.00**%

Descriptive Statistics: Descriptive analysis in this study offers a foundational overview of key variables—extrinsic motivation, cross-cultural adjustment, employer trust, and organizational commitment—within Malaysia's palm oil industry. The analysis utilizes descriptive statistics, including mean, median, mode, and standard deviation, to provide insights into the average levels and variability of these variables among respondents. For extrinsic motivation, the mean is 3.04 with a standard deviation of 0.58, indicating moderate and consistent motivator levels. Cross-cultural adjustment has a mean of 3.10 and a standard deviation of 0.62, reflecting moderate adaptation with some variability. Employer trust scores an average of 3.03 with a standard deviation of 0.74, highlighting moderate trust but greater variability in perceptions. Organizational commitment averages 3.06 with a standard deviation of 0.61, showing moderate commitment with some differences among employees. Overall, these descriptive statistics offer a clear summary of respondent attitudes, setting the stage for deeper statistical analyses and interpretation of relationships between these variables.

Normality: Normality analysis assesses whether the data distributions of variables such as extrinsic motivation, cross-cultural adjustment, employer trust, and organizational commitment in the Malaysian palm oil industry approximate a normal distribution. This is crucial for the validity of many statistical techniques. Graphical tools like histograms and Q-Q plots, alongside skewness and kurtosis statistics, assist in this assessment. According to Table 4.2, extrinsic motivation shows a positively skewed distribution (skewness = 1.34) with high kurtosis (4.25), indicating a concentration of responses around higher values and heavy tails. Cross-cultural adjustment also displays positive skewness (0.84) and moderate kurtosis (2.47), suggesting a right-skewed distribution with a somewhat peaked shape. Employer trust displays slight positive skewness (0.50) and near-normal kurtosis (0.81), indicating a distribution that approximates normality. Organizational commitment exhibits positive skewness (1.15) and moderate kurtosis (2.89), revealing a moderately right-skewed distribution with a more pronounced peak. These results guide the choice between parametric and non-parametric statistical methods, ensuring accurate and reliable analyses.

Table 2: Normality Analysis

Variable	Skewness		Kurtosis	
	Statistic	Std. Error	Statistic	Std. Error
Dependent Variable **Extrinsic Motivation**	1.34	0.16	4.25	0.31
Mediator variable **Cross-cultural Adjustment**	0.84	0.16	2.47	0.31
Moderator Variable **Employer Trust**	0.50	0.16	81	0.31
Independent Variable **Organizational Commitment**	1.15	0.16	2.89	0.31

Reliability: Understanding Cronbach's alpha is crucial for assessing the reliability of the scales used in this study. Cronbach's alpha values range from 0 to 1, with higher values indicating better internal consistency. According to Table 4.6.1, Extrinsic Motivation and Organizational Commitment show moderate reliability, with alphas of 0.68 and 0.66, respectively. This suggests some internal consistency but also room for improvement. Cross-cultural Adjustment and Employer Trust exhibit poor reliability, with alphas of 0.40 and 0.44, indicating significant issues with the consistency of these scales. Addressing these reliability issues by refining measurement items and conducting pilot tests is essential for enhancing the robustness of the analysis and ensuring accurate insights into the variables within the Malaysian palm oil industry context.

Table 3: Reliability Analysis

Variables	Cronbach's Alpha	Strength
Dependent Variable **Extrinsic Motivation**	0.68	Moderate
Mediator variable **Cross-cultural Adjustment**	0.40	Poor
Moderator Variable **Employer Trust**	0.44	Poor
Independent Variable **Organizational Commitment**	0.66	Moderate

Correlation: The correlation analysis in this study reveals significant relationships between extrinsic motivation, cross-cultural adjustment, employer trust, and organizational commitment among employees in the Malaysian palm oil industry. Specifically, extrinsic motivation is strongly positively correlated with both cross-cultural adjustment (0.619) and organizational commitment (0.546). This indicates that employees who are motivated by external rewards tend to adapt better to cultural differences and exhibit higher levels of commitment to their organization. Additionally, extrinsic motivation is positively related to employer trust (0.528), suggesting that employees with higher extrinsic motivation are more likely to trust their employers. Cross-cultural adjustment also shows positive correlations with both employer trust (0.512) and organizational commitment (0.461), highlighting that employees who adapt well to cultural differences are generally more trusting of their employers and more committed to their organization. Lastly, there is a positive

correlation between employer trust and organizational commitment (0.399), indicating that higher levels of trust in the employer are associated with greater organizational commitment. These findings underscore the interconnectedness of these variables and suggest that improvements in one area can positively influence the others, thereby enhancing overall employee engagement and organizational effectiveness.

Table 4: Pearson Correlation

Variable		Extrinsic Motivation	Cross-cultural Adjustment	Employer Trust	Organizational Commitment
Extrinsic Motivation	Pearson Correlation	1			
Cross Cultural Adjustment	Pearson Correlation	0.619**	1		
Employer Trust	Pearson Correlation	0.528**	0.512**	1	
Organizational Commitment	Pearson Correlation	0.546**	0.461**	0.399**	1

**. Correlation is significant at the 0.01 level (2-tailed).

Regression: Regression Analysis Between Extrinsic Motivation and Organizational Commitment

Table 5: Result of Coefficients Analysis

Model		Unstandardised Coefficients		Standardized Coefficients	t	Sig.
		β	Std. Error	Beta		
1	(Constant)	1.30	0.18		7.39	<.001
	Organizational Commitment	0.58	0.05	0.55	10.10	<.001

Table 5 presents the results of the coefficients analysis, which elucidates the relationship between Organizational Commitment and the dependent variable, Extrinsic Motivation. The unstandardized coefficients reveal that the constant term is 1.30, with a standard error of 0.18. This constant represents the predicted value of Extrinsic Motivation when Organizational Commitment is zero. The associated t-value is 7.39, and the significance level is less than .001, indicating that the constant term is statistically significant and provides a robust baseline for the model. The coefficient for Organizational Commitment is 0.58, with a standard error of 0.05. This unstandardized coefficient suggests that for each unit increase in Organizational Commitment, Extrinsic Motivation is expected to increase by 0.58 units. The standardized coefficient (Beta) is 0.55, reflecting the strength and direction of the relationship in standardized terms. The t-value for this coefficient is 10.10, with a p-value less than .001, signifying that Organizational Commitment is a significant predictor of Extrinsic Motivation.

In summary, the analysis of the coefficients substantiates the significant positive impact of Organizational Commitment on Extrinsic Motivation. The high t-values and low p-values for both the constant term and the predictor coefficient underscore the statistical significance of the findings, highlighting the substantial role of Organizational Commitment in influencing Extrinsic Motivation.

Regression Analysis Between Extrinsic Motivation, Organizational Commitment, and Cross-cultural Adjustment:

Table 6: Result of Coefficients Analysis

Model		Unstandardised Coefficients		Standardized Coefficients	t	Sig.
		β	Std. Error	Beta		
1	(Constant)	1.09	0.19		5.80	<.001
	Organizational Commitment	0.45	0.07	0.42	6.24	<.001
	Cross-cultural Adjustment	0.20	0.07	0.20	2.94	<.001

Table 6 presents the coefficients analysis results for the regression model examining Organizational Commitment, with Cross-cultural Adjustment and Extrinsic Motivation as predictors. The constant term has an unstandardized coefficient of 1.09 and a standard error of 0.19, representing a baseline level of Organizational Commitment when the predictors are zero. This coefficient is statistically significant, with a t-value of 5.80 and a p-value of less than .001. Extrinsic Motivation has an unstandardized coefficient of 0.45, a standard error of 0.07, and a standardized coefficient (Beta) of 0.42. The t-value is 6.24, with a significance level below .001, indicating a strong and statistically significant positive impact on Organizational Commitment. Cross-cultural Adjustment has an unstandardized coefficient of 0.20, a standard error of 0.07, and a standardized coefficient (Beta) of 0.20. The t-value is 2.94, and the significance level is less than .001, demonstrating a statistically significant positive effect on Organizational Commitment. These findings highlight the significant roles of both Extrinsic Motivation and Cross-cultural Adjustment in influencing Organizational Commitment within the model.

Regression Analysis Between Extrinsic Motivation, Organizational Commitment, and Cross-cultural Adjustment:

Table 7: Result of Coefficients Analysis

Model		Unstandardised Coefficients		Standardized Coefficients	t	Sign.
		β	Std. Error	Beta		
1	(Constant)	4.58	0.52		8.78	<.001
	Cross-cultural Adjustment	-0.90	0.02	-0.64	-3.84	<.001
	Employer trust	-0.15	0.03	-0.88	-4.81	<.001
	Cross-cultural Adjustment_Employer Trust	0.27	0.00	1.85	6.37	<.001

Table 7 presents the results of the regression analysis examining the effects of cross-cultural adjustment, employer trust, and their interaction on organizational commitment. The constant term, with an unstandardized coefficient of 4.58, is statistically significant (p < .001), indicating that when both cross-cultural adjustment and employer trust are zero, the expected level of organizational commitment is 4.58.

The analysis reveals that cross-cultural adjustment has a significant negative impact on organizational commitment, with an unstandardized coefficient of -0.90 and a standardized coefficient (Beta) of -0.64. This suggests that a one-unit increase in cross-cultural adjustment is associated with a decrease of 0.90 units in organizational commitment. The negative relationship is further supported by a t-value of -3.84 and a p-value of less than .001, signifying statistical significance.

Similarly, employer trust exhibits a negative effect on organizational commitment, with an unstandardized coefficient of -0.15 and a standardized coefficient (Beta) of -0.88. This indicates that each one-unit increase in employer trust results in a 0.15-unit reduction in organizational commitment. The significant t-value of -4.81 and a p-value of less than .001 confirm the robustness of this negative relationship.

Furthermore, the interaction term between cross-cultural adjustment and employer trust demonstrates a significant positive effect on organizational commitment. The unstandardized coefficient of 0.27, combined with a standardized coefficient (Beta) of 1.85 and a t-value of 6.37, with a p-value less than .001, suggests that employer trust moderates the relationship between cross-cultural adjustment and organizational commitment. This interaction highlights the complexity of the dynamics influencing organizational commitment, indicating that the presence of employer trust amplifies the effect of cross-cultural adjustment on organizational commitment.

In summary, the findings indicate that while both cross-cultural adjustment and employer trust have negative direct effects on organizational commitment, their interaction positively influences organizational commitment which reflects the nuanced interplay between these factors.

Regression Analysis Between Extrinsic Motivation, Organizational Commitment, Cross-cultural Adjustment, and Employer Trust:

Table 8: Result of Coefficients Analysis

Model		Unstandardised Coefficients		Standardized Coefficients	t	Sign.
		β	Std. Error	Beta		
1	(Constant)	1.08	0.17		6.44	<.001
	Extrinsic Motivation	0.66	0.05	0.62	12.22	<.001
2	(Constant)	1.09	0.19		5.80	<.001
	Extrinsic Motivation	0.45	0.07	0.42	6.24	<.001
	Cross-cultural Adjustment	0.20	0.07	0.20	2.94	.004
3	(Constant)	0.00	0.00			
	Cross-cultural Adjustment	1.00	0.00	1.00		
	Employer Trust	0.00	0.00	0.00		
	Cross-cultural Adjustment_Employer Trust	0.00	0.00	0.00		

Table 8 presents the results of the coefficients analysis examining the interrelationships among Extrinsic Motivation (EM), Cross-Cultural Adjustment (CcA), Organizational Commitment (OC), and the moderating effect of Employer Trust (ET).

The first model assesses the influence of extrinsic motivation on cross-cultural adjustment. The results demonstrate a robust and statistically significant positive relationship, with an unstandardized coefficient (β) of 0.66, a standardized coefficient (Beta) of 0.62, a t-value of 12.22, and a p-value of less than 001. This indicates that higher levels of extrinsic motivation are associated with improved cross-cultural adjustment, underscoring the pivotal role of motivational factors in facilitating adaptation to new cultural environments.

The second model evaluates the effects of both extrinsic motivation and cross-cultural adjustment on organizational commitment. The findings indicate that extrinsic motivation positively affects organizational commitment, with an unstandardized coefficient (β) of 0.45, a standardized coefficient (Beta) of 0.42, a t-value of 6.24, and a p-value of less than .001. Additionally, cross-cultural adjustment significantly influences organizational commitment, as evidenced by an unstandardized coefficient (β) of 0.20, a standardized coefficient (Beta) of 0.20, a t-value of 2.94, and a p-value of.004. These results suggest that both increased extrinsic motivation and enhanced cross-cultural adjustment contribute to higher organizational commitment, emphasizing the importance of these variables in fostering employees' dedication to their organization.

The third model examines the roles of cross-cultural adjustment, employer trust, and their interaction on cross-cultural adjustment. However, the analysis reveals non-significant results for all components, including coefficients of zero for cross-cultural adjustment, employer trust, and their interaction term. This suggests that these variables do not significantly impact cross-cultural adjustment within this model, indicating that the interaction between these factors may not substantially influence individuals' adjustment to new cultural settings.

In summary, the analysis shows that extrinsic motivation positively influences both cross-cultural adjustment and organizational commitment. Specifically, for every increase in extrinsic motivation, cross-cultural adjustment improves by 0.66 units, and organizational commitment increases by 0.45 units. Cross-cultural adjustment also positively impacts organizational commitment, with an increase of 0.20 units per unit increase in cross-cultural adjustment. The indirect effect of extrinsic motivation on organizational commitment through cross-cultural adjustment, calculated as 0.66 × 0.20 = 0.13, highlights that part of the relationship between extrinsic motivation and organizational commitment is mediated by cross-cultural adjustment. However, employer trust does not significantly moderate the relationship between extrinsic motivation and cross-cultural adjustment in this dataset.

Summary of Hypothesis:

Table 9: Summary of Hypothesis

No	Hypotheses	Result
H1	There is a relationship between extrinsic motivation and organizational commitment.	Positive
H2	There is a relationship between extrinsic motivation and organizational commitment that is mediated by cross-cultural adjustment.	Positive
H3	There is a relationship between cross-cultural adjustment and organizational commitment that is moderated by employer trust.	Positive
H4	There is a relationship between extrinsic motivation and organizational commitment that is moderated by the indirect effect of employer trust via cross-cultural adjustment.	Negative

5. Managerial Implications and Recommendations

Future research should explore several avenues to extend and deepen the insights gained from this study. Firstly, examining the long-term effects of extrinsic motivation strategies through longitudinal studies could yield valuable insights into the sustained impact of these strategies on organizational commitment over time. Secondly, a comprehensive exploration of intrinsic motivation alongside extrinsic factors would provide a more nuanced understanding of the drivers behind foreign workers' commitment. Factors such as personal growth, job satisfaction, and a sense of purpose may interact with extrinsic motivators in complex ways. Thirdly, a detailed investigation into the cultural dimensions of cross-cultural adjustment is warranted. Future studies could explore how varying cultural backgrounds influence the adjustment process and whether specific cultural traits facilitate or impede integration. Comparative studies involving foreign workers from diverse countries could provide further insights into these dynamics.

Furthermore, analyzing the influence of organizational culture on foreign workers' commitment and adjustment would be highly beneficial. Understanding how organizational values, leadership styles, and corporate practices impact foreign workers can assist in the design of more effective integration and retention strategies. Additionally, research into the role of social support networks, both within and outside the workplace, on workers' well-being and commitment would provide further valuable insights. Finally, given the rapid pace of technological advancements, future research should explore the potential of digital tools and platforms in supporting cross-cultural adjustment and enhancing motivation. Innovative approaches, such as virtual reality training programs, online support communities, and mobile applications for language learning and cultural orientation, represent promising areas for exploration. Addressing these research directions will contribute to a more nuanced and practical understanding of how to effectively manage and support foreign workers within the palm oil industry and beyond.

Conclusion

This study has shed light on the complex relationships between extrinsic motivation, cross-cultural adjustment, and organizational commitment among foreign workers in Malaysia's palm oil industry. The findings reveal several critical insights. Firstly, extrinsic motivation exerts a significant impact on organizational commitment among foreign workers. Key factors such as financial incentives, job security, and favorable working conditions are pivotal in enhancing workers' dedication and loyalty.

Secondly, cross-cultural adjustment serves as a crucial mediator in the relationship between extrinsic motivation and organizational commitment. Workers who effectively navigate and adapt to the local culture and work environment exhibit higher levels of commitment. This adaptation is facilitated by robust support systems, comprehensive training programs, and inclusive workplace practices. Thirdly, employer trust emerges as a significant moderating factor. High levels of trust between employers and foreign workers amplify the positive effects of extrinsic motivation on organizational commitment, leading to a more motivated and committed workforce, improved job performance, and a positive organizational climate.

Foreign workers encounter various challenges in adjusting to the local culture, including language barriers, differing work practices, and social integration issues. Effective support systems and training programs are

essential for addressing these challenges, facilitating smoother cultural integration, and enhancing job satisfaction. By understanding these factors, employers can develop targeted strategies to improve job satisfaction and retention rates. Addressing the unique needs and challenges faced by foreign workers can result in a more committed, motivated, and productive workforce.

The implications of these findings underscore the necessity of addressing extrinsic motivation, cross-cultural adjustment, and employer trust to enhance organizational commitment. Employers should prioritize competitive remuneration, job security, and improved working conditions, while also implementing effective support systems and fostering an inclusive work environment. Building employer trust through transparent communication and fair treatment is also crucial. These measures are expected to significantly enhance workforce stability, productivity, and overall industry sustainability.

Abstract: The purpose of this article is to cover the themes central to psychological contract theory as well as its impact on student retention. While psychological contract theory has been extensively studied and applied in work-related settings, its influence in educational settings has not been fully explored. To address this gap, this study collected and analyzed data following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. Data was collected from studies published between 2013 and 2023, resulting in the analysis of 24 eligible papers from various academic databases in the review. Based on the number of eligible papers within a ten-year timeframe indicates a scarcity of research on psychological contracts in educational contexts, particularly concerning student retention. The findings from the 24 eligible papers were synthesized and reported using descriptive analysis and tabulation, thus shedding light on how psychological contract theory influences student retention. The analysis suggests that unfulfilled psychological contracts between students and academic staff can contribute to student attrition, especially when students' expectations, formed during earlier educational experiences, are not met. This systematic literature review emphasizes the importance of the psychological contract in educational settings particularly in managing the dynamic student and academic relationship. The review made suggestions for practical implications for academic leaders, policymakers, and education administrators, stressing the need for adaptive, inclusive, and forward-looking approaches in education, and recommendations for future studies.

Keywords: *Psychological contract, student retention, education, systematic literature review, PRISMA*

1. Introduction and Background

In the evolving landscape of higher education, understanding and addressing the complex expectations that students bring to university settings is crucial for fostering a successful academic experience. Students arrive at universities with diverse expectations shaped by personal aspirations, cultural backgrounds, socioeconomic influences, and prior educational experiences (Tinto, 1993). These expectations, when unmet, can significantly influence student retention. Faculty members, especially academic staff, play a vital role in meeting these expectations, which is essential for maintaining student interest and promoting retention.

The theory of psychological contract, introduced by Argyris (1960) and later expanded by Rousseau, primarily addresses the implicit expectations in employer-employee relationships. This theory has gained significant traction in the field of organizational studies particularly to understand employee behavior and retention. However, it has significant implications for educational environments as well. Recently, researchers have applied psychological contract theory to examine students' expectations of higher education institutions, focusing on the psychological contracts formed between students and their academic staff (Itzkovich, 2021).

In an organizational context, a psychological contract refers to an individual's beliefs about mutual obligations in an exchange relationship, such as employment. These beliefs are rooted in perceived promises that both parties must honor (Rousseau, 2000), with shared responsibilities benefiting the organization (Gorde, 2019). This unwritten agreement is crucial for determining employee engagement and is based on how employees interpret their relationship with their employer (Zacchaeus, 2021). Similarly, in educational settings, psychological contracts are formed between students and academic staff, shaping students' academic experiences and influencing their decisions to remain at an institution.

The fulfillment of psychological contracts in educational contexts is vital for student retention. Retaining students benefits institutions financially and academically while also contributing to broader national economic growth, as education is closely linked to individual and societal development. Despite extensive research on student retention, few studies have approached the topic from a psychological perspective. This

study aims to fill that gap by reviewing the impact of psychological contracts on student retention, focusing on research published over the past decade.

2. Literature Review on psychological contract in an organizational setting

Rousseau (1989), a key figure in psychological contract theory, defines a psychological contract as the expectations and beliefs individuals hold about their mutual agreement in a relationship. This concept has been widely studied across various industries, including banking (Gulzar et al., 2021; Ngobeni et al., 2022), hospitality (Arasli et al., 2019), public and private sectors (Yu, 2022; Zacchaeus, 2021), mining (Li & Chen, 2018), social services (Battisti et al., 2007; Welander et al., 2020), automotive (Liu et al., 2020), aviation (Löffert & Diehl, 2023), and both small and large-scale industries (Ntalianis & Dyer, 2021; Choi et al., 2019). Across these diverse industries, this highlights that psychological contracts play a critical role in understanding the dynamics of employee retention.

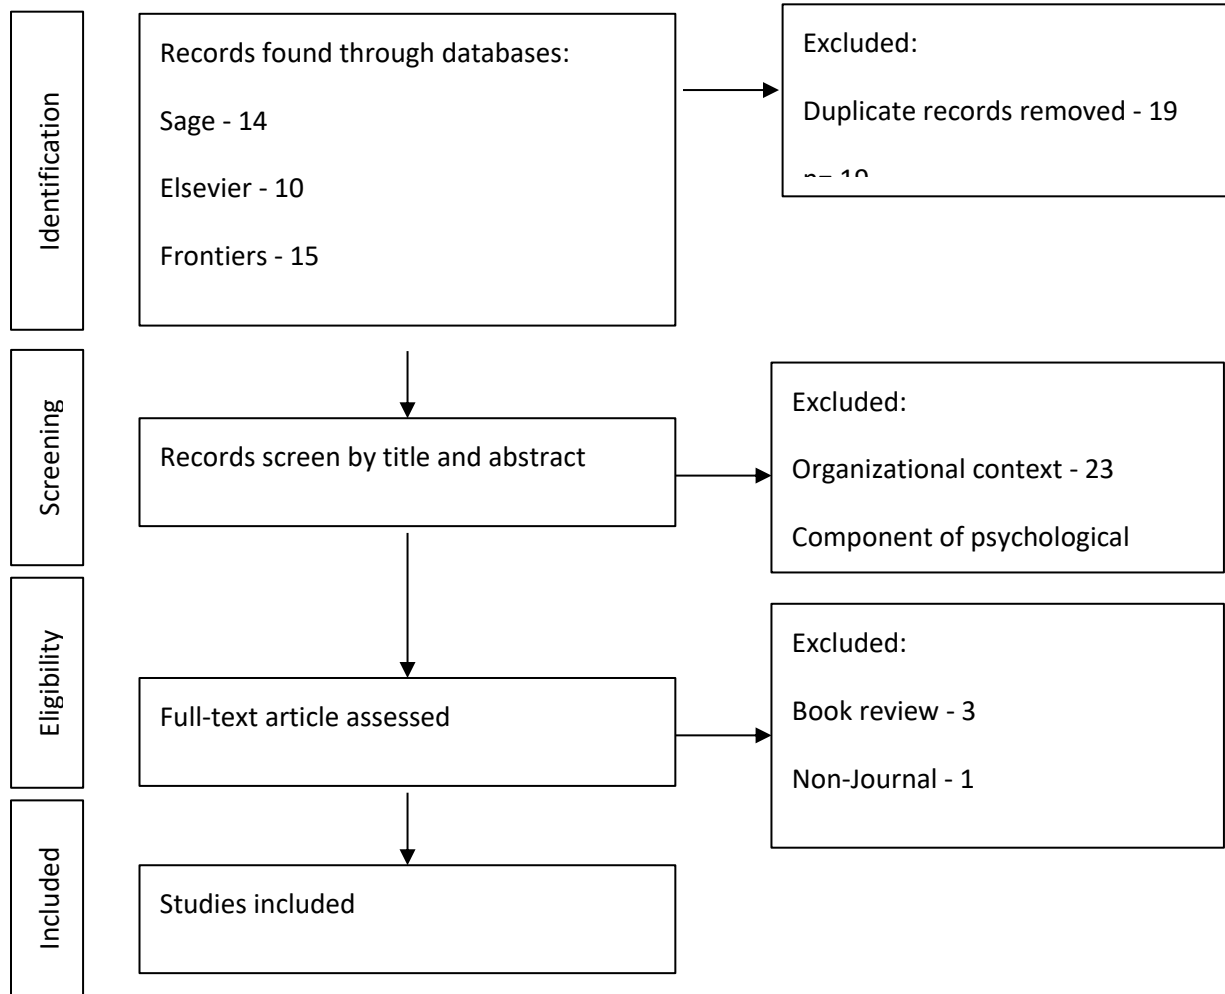
In an organizational setting, the psychological contract is mostly built around the expectation that employers should provide job security, fair compensation, and opportunities to grow with the organization, which focuses on favorable working conditions for employees. Employers too pose expectations that employees must be loyal, committed, and productive. When both parties fulfill these expectations, a positive working relationship is possible, leading to better employee attitudes and behaviors (Gorde, 2019). This reciprocal relationship is in line with the social exchange theory, which suggests that when expectation, promises or the contract is honored employees are motivated to maintain the relationship and stay in the employment.

Since psychological contracts are extremely personal and vary between individuals, making them vulnerable to both breaches and positive reinforcement. Whether the contract is honored or not, it can significantly influence the relationship between the employee and the employer, affecting important outcomes such as job satisfaction, organizational commitment, and turnover intentions. This dynamic has been explored across numerous sectors, including the military (Kiili, 2016; Kraak et al., 2022; Lu, 2020; Pohl et al., 2016; Soares & Mosquera, 2019) and healthcare (Collins & Beauregard, 2020; Grama, 2020), where the psychological contract plays a crucial role in employee retention.

While psychological contracts have been extensively studied in organizational settings, there is limited study in higher education. For universities that value students highly, understanding and meeting students' expectations are essential for fostering long-term engagement and retention. However, the literature on psychological contracts in educational settings, particularly in relation to student retention, remains scarce (Koskina, 2013; Beenen & Arbaugh, 2019). This study seeks to fill this gap by exploring how psychological contracts between students and academic staff can influence retention rates in higher education institutions.

3. Methodology

This systematic review process was guided by the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) framework, as depicted in Figure 1. PRISMA provides a standardized framework that ensures a thorough and transparent review process and places importance on the quality and reproducibility of systematic reviews. The process incorporates four main steps; identification, screening, eligibility and finally inclusion.

Figure 1: Reporting items for the systematic review (adapted from the Preferred Reporting Items for Systematic Reviews (PRISMA) statement).


A review protocol was established, detailing the search strategy, data extraction process, data analysis methods, and article selection criteria which are discussed next.

Data Sources and Search Strategies

After defining the research objective, the author conducted systematic searches using electronic databases including SAGE, Elsevier, Frontiers, Taylor & Francis, and Google Scholar. The search focused on articles published between 2013 and 2023, with keywords such as "psychological contract" AND "student retention" OR "retention". Multiple databases were used to capture a wide range of perspectives on the topic.

Table 1: Keywords applied during the systematic literature review process

Databases	Keyword
SAGE	
Frontiers	
Taylor & Francis	"psychological contract" AND "student retention" OR "retention"
Google Scholar	

Selection of Studies: Inclusion and Exclusion Criteria
The selection process involved three rounds. The first round involved screening titles and abstracts, followed by a detailed analysis of the articles' relevance to the research topic. In the final round, full-text articles were thoroughly reviewed, and those not addressing psychological contract-related student retention were excluded.

Titles and abstracts were initially screened to assess their relevance. Table 2 guided the selection of the study to be included in this systematic literature review. Only articles that were written in English, in peer-reviewed journals, available in full-text, written between 2013 to 2023 were included. Plus, a paper that has students as participants in the study was included in this review.

Unpublished theses and dissertations, book reviews, conference papers for the period under review in this study were not included in the articles for the analyses in the PRISMA. Also, articles that were published before 2013 were not included in the analyses and articles published after December 2023. Papers with participants that did not involve students were excluded from this study. Other reasons for exclusion are mentioned in the adapted PRISMA flow diagram in Figure 1.

Table 2: Inclusion and Exclusion Criteria

Criteria	Inclusion	Exclusion
Year	From 2013 to 2023	Anything published before 2013
Access	Open access	Close access
Document Type	Full-text article	Book review, conference paper, unpublished thesis and dissertation
Source type	Peer-reviewed journal	Book, conference paper
Language Subject	English language	Other than English language
Participant	Student	Employees

Data Extraction Process and Quality Assessment
Data from the selected studies were systematically recorded in an evidence table (see Table 3, in Section 3.0). The extraction process focused on capturing key information relevant to the research questions.

4. Results

The systematic review yielded a total of 24 relevant articles from the initial pool of 220. In the first round of screening, a total of 19 duplicates were removed which makes 201 sources remain for screening of title and abstract based on the inclusion and exclusion criteria (Table 2). A total of 165 were excluded for all the reasons in Table 2, and upon a complete reading of each article, another 13 were removed, of which only 24 were included in this systematic literature review.

Table 3 describes all 24 articles included in this review. The articles were tabulated according to author, year, and title, the objectives of the study, sample, method, and analysis as well as the primary findings of the studies. These articles were then tabulated according to several dimensions, including publication trends, journal distribution, author contributions, and the tools and techniques employed in the studies.

Table 3: Psychological contract and student retention articles included in the SLR

Author, Year & Title	Objective	Sample & Method	Analysis	Findings
Author: Barnhill, Czekanski & Turner (2013) **Title**: Psychological Contracts and Student-Athlete	To examine the impact that perceived breaches of psychological contracts have on student-athletes effective outcomes	**Sample**: 258 student-athletes **Method**: Questionnaire	CFA	Athletic departments should stress to their coaches the importance of clear communication lines with their student-athletes
Author: Koskina (2013) **Title**: What does the student psychological contract mean?: Evidence from a UK business school	Explores the concepts and relationships that students attach to the psychological contract	**Sample**: Postgraduate students **Method**: Interview	-	Students' perceptions were supplemented with academics' perceptions, to give a more rounded picture of the student psychological contract
Author: Barnhill & Turner (2015) **Title**: The Impact of Psychological Contract Breach on Student-athlete Perceived in-role-performance and Organizational Citizenship Behavior	To explore how psychological contracts affect student-athletes behaviors and performance	**Sample**: 248 student-athletes **Method**: Questionnaire	IBM SPSS	Psychological contract breaches might affect student-athletes differently than other types of organizational members
Author: Pleitz, MacDougall, Terry, Buckley & Campbell (2015) **Title**: Great expectations examining the discrepancy between expectations and experiences on college student retention	Evaluating the degree to which the discrepancy between student expectations and experiences can result in greater rates of attrition in education	**Sample**: 225 students **Method**: Questionnaire	Logistic Regression Results	Students are entering higher education with an inaccurate idea of what college life will be like. Students have preconceived notions and corresponding expectations concerning social life, institutional characteristics, and academic rigor. Students who reported a greater discrepancy in their expectations and experiences within the social areas of the institution were also more likely to leave
Author: Glazier (2016) **Title**: Building rapport to improve retention and success in online classes	To hypothesize that the difficulty of establishing student-instructor rapport in online classes contributes to lower student success	**Sample**: 465 online students **Method**: Interview	Means tests, logit models, and OLS regression	The students in the rapport condition feel like the instructor is engaged and accessible, and this perception translates into measurably better outcomes for students
Author: Klapproth, Schaltz, Brunner, Fischbach, Ugen & Martin (2016) **Title**: Short-term and medium-term effects of grade retention in Secondary School on academic Achievement and Psychosocial Outcome Variables	To examine how grade retention in secondary school would affect students' academic achievement and psychosocial adjustment	**Sample**: 2,835 students who completed primary school in the sixth grade **Method**: Questionnaire	MANOVA	Grade retention resulted in short-term benefits for the retained students but in the medium term, there were no significant differences between the retained and promoted students in academic achievement
Author: Wofford (2016) **Title**:	To gain a deeper understanding of one teacher's perceptions of	**Sample**: 518 elementary students	Observation chart	Retention in kindergarten was a common practice that used to address the needs of

Students who believe that the university is fulfilling its obligations are less likely to leave the school
Author: Budiman (2018) **Title**: Factors Related to Students' Drop Out of a Distance Language Learning	Examined the reasons for dropping out of a distance language learning program offered by an open university in Indonesia	**Sample**: 405 students **Method**: Questionnaire	NVivo	Some students enrolling in the program of studies have very limited knowledge and understanding of distance learning, including self-managed learning
Author: Yang, Chen, Rhodes & Orooji (2018) **Title**: A longitudinal study on risk factors of grade retention among Elementary school students using a multilevel analysis focusing on material hardship and lack of school engagement	Examines the relationship between material hardship, school engagement, and grade retention among at-risk elementary school children	**Sample**: 4329 students **Method**: Interview	Chi-square, T-tests	Children in families experiencing material hardship need interventions not only for basic needs but also for interventions that increase levels of engagement in school
Author: Ampofo-Ansah, Antiaye & Ampofo Ansah (2019) **Title**: Psychological contracts between university students and lecturers	Investigated the psychological contract between lecturers and students	**Sample**: 30 respondents: 15 first-year students 10 second-year students 5 academics from the lecturer **Method**: Interview	-	Students learning enthusiasm was promoted by lecturers performing their desired behavior, while students' learning initiative and efficiency are damaged when lecturers' desired behavior is unfavorable
Author: Beenen & Arbaugh (2019) **Title**: Flipping Class: Why Student Expectations and person situation fit matter	To explore why flipped classes may have both benefits and pitfalls	**Sample**: 96 undergraduates students **Method**: Questionnaire	CFA	Students who expected traditional in-person lecture-based instruction, yet received flipped instruction (indicative of contract violation) were less satisfied and less intent on taking a flipped class later, yet they showed more in-class effort than students who expected and received traditional instruction
Author: Bordia, Bordia, Milkovitz, Shen & Restubog	Examine the content, formation, and fulfillment of international student	**Sample**: 57 internationals	-	International students use social and institutional sources to create the

(2019) **Title**: What do international students really want: An exploration of the content of International students' psychological contract in business education	psychological contracts	students (Male 47, female 10) **Method**: Interview		contract, which, when fulfilled, leads to positive educational and psychological outcomes
Author: Russell & Jarvis (2019) **Title**: Student Withdrawal Retention and Their Sense of Belongings in their words	Provides insight into the students' experiences of non-continuation in one English University	**Sample**: 80 participants **Method**: Interview	-	Most students interviewed in this study experienced a mixture of internal and external factors that lead to their non-continuation
Author: Ugwuanyia, Ndujib, Elejerec & Omeked (2020) **Title**: Effect of Flipped Classroom and Think Pair Share Strategy on Achievement and Retention Among Senior Secondary School Physics Students	To determine the effect of flipped classrooms and think pair share strategy on achievement and retention among senior secondary school physics students	**Sample**: 3965 secondaries school student **Method**: Questionnaire	ANCOVA	The flipped classroom is superior in enhancing the achievement and retention of physics students
Author: Haverila & McLaughlin (2020) **Title**: Variables Affecting the Retention Intentions of students in higher education institutions: A Comparison between International and Domestic Students	To investigate the differences between domestic and international students with regard to the variables affecting students' retention intentions.	**Sample**: 395 college students **Method**: Questionnaire	ANOVA	The flipped classroom is superior in enhancing the achievement and retention of physics students
Author: James (2022) **Title**: Students as Stakeholders Understanding Expectations Can Increase Student Retention	To answer the following research question: RQ1: What is the relationship between adult students expectations of time commitment, technical and computer skills, and level of difficulty in their online classes and their academic persistence in the Phoenix Success Series?	**Sample**: 205 privates university student **Method**: Questionnaire	SPSS version 25	This study's findings provide insight into what students perceive in relation to time commitment, required technical and computer skills, and difficulty level for online classes, and how this perception might predict the degree to which they persisted in online courses
Author: Itzkovich (2021) **Title**: Constructing and validating students' psychological contract violation scale	To construct and validate the efficient measurement of the violations of the student-faculty psychological contract, capturing the different dimensions of	**Sample**: Phase1: 78 college students Phase2: 244 students Phase3: 154	PFI	Students expect to be emotionally involved in the process, feel it, be engaged with it, and consequently, emotionally aroused

	such violations	undergraduates College students **Method**: Questionnaire		
Author: Loukeris & Soulis (2021) **Title**: Retention in Kindergarten for Students with Autism Spectrum Disorder Improvement Delusion or Both	Examined the impact of students' retention with ASD in their cognitive and social domain	**Sample**: 110 students **Method**: Questionnaire	Tukey HSD Post Hoc Test	The most significant improvement regarding retention is shown by the students with ASD who visit the integration class
Author: Robertson (2021) **Title**: To retain or not retain a review of literature related to kindergarten retention	Reviews some literature illustrating divergent views regarding kindergarten retention	**Sample**: 40 children	-	It is agreed that careful attention should be given to the decision to retain or promote children in kindergarten
Author: Boyd, Liu & Hirrisian (2022) **Title**: Impact of Community Experiences on Student Retention Perceptions and Satisfaction in Higher Education	To examine if a sense of community (which contains a subconstruct of belonging) is a better predictor of satisfaction and retention perceptions compared with academic achievement and engagement	**Sample**: 3,600 undergraduate enrollments **Method**: Questionnaire	AMOS CFA	Human connection and a sense that one belongs within a social group are powerful
Author: Mcculloh (2022) **Title**: An exploration of parental support in the retention of rural first-generation college students	Explored the parental support that promoted retention of rural FGCSs attending a small, private university, where withdrawal rates of this population are higher than that of continuing-generation students	**Sample**: 12 rural first generation college student **Method**: Interview	A qualitative inductive analysis	Support from those with whom they have close relationships, particularly parents, contributed to their accomplishments
Author: Pedler, Willis & Nieuwoudt (2022) **Title**: A sense of belonging at university student retention, motivation and enjoyment	To explore the relationships between university students' sense of belonging and student retention	**Sample**: 578 participants **Method**: Questionnaire	ANOVA	University students' sense of belonging is important to higher education institutions as it increases students' academic motivation and enjoyment in their studies, which can impact student achievement and reduces the likelihood of students considering leaving university before completing their studies, thus contributing to student retention
Author: Tantry & Sofi (2022) **Title**: Effectiveness of computer-aided	(1) To see how CAI compares to the lecture method when it	**Sample**: All students in class 10th	T-test	Learners who received computer-assisted training recalled more fundamental facts than pupils who received

instruction in academic achievement and retention of biological sciences secondary school students of Kashmir division	comes to how well class 10th students do in biological science (2) To compare class 10th students' retention levels in biology after being taught using the CAI technique versus the lecture mode of instruction			lecture-based teaching
Author: Fan, Trimble, Kember, Muir, Douglas, Wang, Masters & Mainsbridge (2023) **Title**: Supporting engagement and retention of online and blended--learning students	Investigated the perceptions of students in online and blended-subjects, regarding both the academic and institutional support they were provided	**Sample**: 41 online and blended-learning students **Method**: Interview	Iterative thematic analysis	Lack of adequate support for purely online students at the institutional/central level and the school level

Analysis of Publication Trends

The number of publications per year between 2013 and 2023 is shown in Figure 2. The highest number of publications occurred in 2022, with a total of five articles. The lowest publication years were 2014 and 2017, with no articles published.

Figure 2: Frequency of publication per year
List of Papers per Journal

Table 4 presents the distribution of articles across various journals. The "Journal of College Student Retention: Research, Theory, and Practice" published the most articles, with a total of four.

Table 4: List of Journal

Strengths and Limitations
This review followed the PRISMA guidelines to ensure a comprehensive search and selection process. By broadening the search terms and databases, the review aimed to capture a wide range of relevant studies. However, the study was limited to 24 articles from 20 journals, which may not fully represent the global research landscape.

Discussion
This section presents the findings from the systematic literature review (SLR) in alignment with the research themes that guided the analysis. The analysis of the objectives, methodologies, and outcomes of the included studies reveals a significant impact of the psychological contract on student retention in educational contexts. Notably, when students perceive that their expectations and the promises made by their institutions are fulfilled, they are more likely to remain enrolled and continue their studies until completion.

5. Psychological Contract from the Student Perspective (Higher Education Students)

Koskina (2013) explored students' understanding of the psychological contract in a higher education context. Her findings suggest that the psychological contract perceived by students differs from that in employment contexts. Students primarily expect the university to provide necessary learning resources in exchange for their tuition fees, and they expect instructors to deliver quality education, while they, in turn, engage and participate actively in learning activities.

Beenen & Arbaugh (2019) examined the psychological contract in the context of flipped classrooms. Their study found that students who anticipated traditional teaching methods but experienced flipped instruction perceived this as a breach of the psychological contract, leading to dissatisfaction. However, these students still demonstrated increased effort in the classroom despite their dissatisfaction, indicating complex reactions to perceived breaches in the psychological contract.

Fulfillment of the Psychological Contract in Students
The concept of psychological contract fulfillment, where both parties meet their expectations, was found to be critical in fostering positive educational outcomes. Bordia et al. (2019) conducted a study on international students in Australian business schools, finding that fulfillment of the psychological contract led to positive psychological and educational outcomes. This was further supported by Aybat (2018), who found that psychological contract fulfillment is linked to higher student retention and future alumni engagement.

Breach of the Psychological Contract in Students
Conversely, breaches in the psychological contract, where expectations are unmet, often lead to negative outcomes. Barnhill et al. (2013) explored the impact of perceived breaches in psychological contracts among student-athletes, revealing that such breaches negatively affect their emotional and academic engagement. This was echoed in Itzkovich (2021), where unmet expectations by faculty members led to perceived breaches, negatively impacting student motivation and learning experiences.

Pleitz (2015) linked breaches in psychological contracts to higher attrition rates, noting that a significant gap between student expectations and actual experiences contributes to student dropout. Similarly, Ampofo (2019) found that breaches in psychological contracts, particularly when lecturers failed to meet student expectations, led to decreased student enthusiasm and a reluctance to recommend the institution to potential new students.

Connection with Teachers and Retention
Glazier (2016) highlighted the importance of teacher-student connections in promoting student retention, particularly in online learning environments. The study found that students who felt a strong connection with their instructors were more likely to succeed and continue their studies, emphasizing the role of instructor rapport in improving retention rates.

Retention Across Educational Levels
Retention strategies have been examined across various educational levels. In kindergarten, Loukeris (2021) found that retention practices significantly benefited students with Autism Spectrum Disorder (ASD) in both

social and cognitive domains. At the elementary level, Wofford (2016) observed that retention is often used to prepare students for subsequent grade levels, while Mi Youn Yang (2018) identified a correlation between low school engagement and grade repetition.

In secondary education, Klapproth et al. (2016) and Christian et al. (2020) demonstrated that retention strategies, such as grade repetition and flipped classrooms, can have both positive and negative impacts on student academic achievement and psychosocial adjustment.

Retention in Higher Education
Retention in higher education is influenced by various factors, including university support and the sense of community. Russell & Jarvis (2019) and Boyd et al. (2022) emphasized the importance of a supportive university environment in promoting student retention. Pedler, Willis, and Nieuwoudt (2022) found that students with a strong sense of belonging were more motivated and likely to persist in their studies. McCulloh (2022) also identified the critical role of parental support in the retention of first-generation college students.

Retention in Online and Distance Learning
Retention challenges are also prevalent in online and distance learning contexts. Budiman (2018) and James (2022) identified factors such as poor teaching quality, lack of communication, and insufficient student-teacher interaction as significant contributors to dropout rates in online courses. Effective communication and support mechanisms were found to be essential in mitigating these challenges and improving retention in online education.

Retention Among International and Domestic Students
Haverila and McLaughlin (2020) examined the differences in retention factors between international and domestic students, finding that while both groups face similar challenges, international students have unique needs that must be addressed by educational institutions to enhance retention.
In summary, the review highlights the critical role of the psychological contract in shaping student retention across various educational levels and contexts. The findings underscore the need for educational institutions to understand and manage student expectations effectively to foster positive educational outcomes and reduce attrition.

Conclusion
This systematic review has delved into the intricate relationship between psychological contracts and student retention, spanning from kindergarten to higher education and across various learning environments, including traditional, online, and distance education. Our exploration underscores how crucial it is for educational institutions to understand and manage students' expectations and experiences, as these factors heavily influence their decisions to stay or leave.

The review highlights a clear pattern: when students feel that their expectations are met and their needs are supported, they are more likely to stay committed and engaged with their studies. On the other hand, when these expectations are not fulfilled, dissatisfaction grows, which can lead to students dropping out or losing motivation. Building strong, supportive relationships between students and faculty, as well as creating a welcoming and inclusive environment, are essential steps toward enhancing student retention.
Our findings also point to the importance of aligning institutional practices with the diverse needs of students, particularly in online and distance learning settings. Ensuring that students feel connected and supported can make a significant difference in their academic journey.

There's still much to explore in this field. Future research could benefit from examining a wider range of sources and including students from various educational levels and backgrounds to gain a more comprehensive understanding. By addressing these gaps, we can develop more effective strategies to support students and improve retention rates.

In summary, understanding and managing psychological contracts is key to fostering a positive educational experience. By focusing on students' needs and expectations, educational institutions can build a stronger, more supportive environment that encourages students to stay and succeed.

Abstract: According to the Insolvency Department of Malaysia, as of December 2023, 233,483 Malaysians are currently involved in bankruptcy cases due to their defaults on hire purchase loans, credit card loans, personal loans, housing loans, and business loans. This is indeed a critical issue because the growing number of personal bankruptcy cases will hurt the Malaysian economy as well as society. From an individual's economic perspective, bankruptcy minimizes their chances of getting a job. Apart from that, their accounts will be frozen, they will lose control of their properties and assets, and they will not be allowed to start any business or be a part of any company's Board of Directors. Bankrupts also will be rejected from any loan application. This paper examines this problem by developing a personal bankruptcy prediction model using the logistic regression technique. This paper defines "bankrupt" as terminated members who failed to settle their loans. The sample comprised 24,546 cases with 17% settled cases and 83% terminated cases. The data included a dependent variable, i.e., bankruptcy status (Y=1(bankrupt), Y=0(non-bankrupt)), and 12 predictors. Upon completion, this paper succeeds in coming out with a reliable personal bankruptcy prediction model and significant variables of personal bankruptcy. The findings of this paper are very beneficial and significant to creditors, banks, the Malaysia Department of Insolvency, potential borrowers, members of AKPK, and society in general in raising awareness of personal bankruptcy risks and such information may help them to take preventive measures in minimizing the number of personal bankruptcy cases.

Keywords: *Bankruptcy, business loans, loan Malaysian Economy*

1. Introduction and Background

Personal bankruptcy has been a topic of extensive interest because personal bankruptcy filings are an important indicator of household financial problems nationally (International Monetary Fund, 2017; Garrido et al., 2020). In Malaysia, personal bankruptcy cases have been on an upward trend since 2007. However, from 2014 until 2018, the trend has been up and down with not less than twelve thousand cases per year (Malaysia Department of Insolvency, 2019). In addition, from 2020 to 2022, the trend has decreased, with 7221 cases in 2020, 6554 cases in 2021, and 5695 cases in 2022. (Malaysia Department of Insolvency, 2020,2021,2022). This was due to the amendment of the bankruptcy threshold amount. In Malaysia, a debtor is declared bankrupt, under an Adjudication Order made by the High Court against the debtor if he is unable to pay his debts of at least RM30,000.00 (Malaysia Department of Insolvency, 2017). On 29th of March 2017, the Bankruptcy (Amendment) Bill 2016 was passed in the Dewan Rakyat. Among the major changes to the Bankruptcy Act 1967 were substituting the term 'bankruptcy' in all proceedings to 'insolvency', the threshold to be declared as bankrupt increased to RM50k debt amount, automatically releasing bankrupts after three years and social guarantors cannot be declared bankrupt. Again in 2020, the Parliament sought to amend the Bankruptcy Act 1967 by increasing the minimum debt threshold for the presentation of a bankruptcy petition, from RM50,000 to RM100,000 (Malaysia Department of Insolvency, 2020)

As of December 2023, the Malaysia Department of Insolvency reported that the total accumulated number of bankrupt individuals was 233,483. These bankruptcy cases are mainly due to defaults in personal loans, business loans, housing loans, hire purchases, and credit cards (Malaysia Department of Insolvency, 2023). This is alarming because if the number of personal bankruptcy cases continues to increase, it will hurt the Malaysian economy and society. From the aspect of individuals' economy, bankruptcy minimizes their chances of securing a job.

As one of the efforts taken to curb the increasing household debt which mainly leads to personal bankruptcy, Bank Negara Malaysia has set up a debt management agency, Agensi Kaunseling and Pengurusan Kredit. This

agency is an avenue for potential individual borrowers and distressed borrowers to acquire assistance and seek advice in managing their debts and finances. Data used in this paper were provided by this agency. Thus, this paper illustrates the application of data mining techniques to determine the conditional probability of a borrower belonging to a class (bankrupt or non-bankrupt) using the logistic regression technique. The findings from this paper are useful for various parties to make decisions and take action, such as the management level of insolvency departments, banks, debt management agencies, hire-purchase companies, and credit companies. These actions are important to avoid or prevent default payments, bad debts, and personal bankruptcy. Therefore, the objectives of this paper are to identify the significant variables and to determine the conditional probability of a borrower belonging to a class (bankrupt or non-bankrupt) using the logistic regression technique.

2. Literature Review

Bankruptcy is a legal declaration of financial insolvency for an individual or firm that allows certain legal protections to both debtors and creditors (Cohen, 2015). It is crucial to have a better understanding of the causes of personal bankruptcy to provide practical solutions to this financial problem. Korol (2022) mentioned that forecasting consumer bankruptcy risk has received increasing scientific and public attention. In addition, Brygala and Korol (2024), indicated that it has become important to have an early prediction model that provides accurate assurance for users about the financial situation of consumers.

According to Papana and Spyridou (2020), research on bankruptcy prediction is of the utmost importance as it aims to build statistical models that can distinguish healthy firms from financially distressed ones. Meanwhile, Smiti et. Al., (2024) added that bankruptcy prediction is considered one of the most important research topics in the field of finance and accounting. The rapid increase of data science, artificial intelligence, and machine learning has led researchers to build an accurate bankruptcy prediction model.

Because it is critical to develop an effective bankruptcy prediction model, a few researchers discovered that logistic regression is the most commonly used statistical method for assessing consumer credit risk (Paleologo et al., 2010; Finlay, 2009). According to Li and Zhong (2012), logistic regression can forecast an applicant's default likelihood and identify the characteristics associated with his or her default behavior. Furthermore, Brygala (2022) employed logistic regression to anticipate household consumer bankruptcy and discovered that the logit model with a balanced sample has better predictive performance. In addition, Sahiq et al. (2021) employed the logistic regression model and effectively found that the primary factors of personal bankruptcy filings were demographic indicators, socioeconomic status indicators, debt indicators, financial indicators, social stigma indicators, behavioral indicators, and macroeconomic indicators.

3. Research Methodology

This study involved a dataset obtained from an authorized debt management agency. The data consisted of settled members and terminated members. Settled members were those who managed to settle their loans, while terminated were those who were unable to pay their loans. There were 4,174 settled members and 20372 terminated members. The total sample size was 24,546 with 17.0% (4,174) settled and 82.99% (20,372) terminated cases. It is noted here that the negative instances belong to the majority class (terminated) and the positive instances belong to the minority class (settled); an imbalanced dataset. According to Akosa (2017), the most commonly used classification algorithms dataset (e.g. scorecard, logistic regression, and decision tree) do not work well for imbalanced datasets. This is because the classifiers tend to be biased towards the majority class and therefore perform poorly on the minority class. He added, that to improve the performance of the classifiers or model, down-sampling or up-sampling techniques can be used. This paper deployed the random undersampling technique. The random undersampling technique is considered a basic sampling technique in handling imbalanced datasets (Yap, Rahman, He & Bulgiba, 2016). Random undersampling (RUS), also known as down-sampling, excludes the observations from the majority class to balance with the number of available observations in the minority class. The RUS was used by randomly selecting 4,174 cases from the 20,372 terminated cases. This RUS process was done using the IBM Statistical Package for the Social Science (SPSS) software. Therefore, the total sample size was 8,348 with 50% (4,174) representing settled cases and 50% (4,174) representing terminated cases for the balanced dataset. This paper used both sample sizes for further

analysis to see the differences in the results of the statistical analysis.

The data covered the period from 1st January 2010 to 31st October 2015, which were received in Excel files. Data cleaning was the first step to remove outliers and redundant data. Once the data cleaning process was completed, the Excel data file was converted into a SAS file using SAS 9.4 software. The logistic regression model was run using the SAS Enterprise Miner 14.1 software.

Logistic regression is an extensively used statistical modeling technique in which the probability of a dichotomous outcome (Y=0 or Y=1) is related to a set of potential predictor variables. The objective of a logistic regression model in personal bankruptcy prediction is to determine the probability of an individual belonging to a class (bankrupt or non-bankrupt), given the values of the independent variables of that individual (Hosmer & Lemeshow, 2013). For this study, logistic regression was used to model the event Y= 1(bankrupt).

The logistic regression model is written as:

$$\log\left[\frac{pi}{1-pi}\right] = \beta0 + \beta_1 X_{j1} + \beta_2 X_{j2} + \dots + \beta_k X_{jk}$$

Where
p_i = P(Y=1) for each case or observation, i = 1,2,…,n
β_0 = intercept of the logistic regression equation
β_j = the coefficient of the predictor variables, j= 1,2…..k
X_j = the predictor variable, j = 1,2,…k

In this logistic regression model, maximum likelihood is used to estimate parameters β_1 to β_k. These parameter estimates measure the rate of change of logit for one unit change in the input variable (adjusted for other inputs), that is, they are the slopes of the regression line between the target and their respective input variables X_1 to X_k. The parameters are dependent on the unit of the input (Siddiqi, 2006).
Whereas, Wald statistics is an alternative test that is commonly used to test the significance of individual logistic regression coefficient resulting in identifying the variables that influence the dependent variable (bankruptcy status):

H_o: β_1 = 0 (the independent variable does not affect the dependent variable)
H_1: β_1 ≠ 0 (the independent variable affects the dependent variable)

The Wald test calculates z statistics, z =($\frac{B}{SE}$) Where B is the regression coefficient estimation and SE is the standard error of estimation. The Z value is then squared where the Wald statistic follows the Chi-square distribution ($z^2 \sim x12$) with the Wald statistic now:
Wald Statistic = Z² = ($\frac{B}{SE}$)²
Reject H_o if Wald statistic > $x^2_{\infty,1}$ or p-value< 0.05 ((Katsaragakis et. Al., 2005)

4. Results

This study used the stepwise method in developing the logistic regression model. The stepwise method is useful and intuitively appealing in that it sequentially builds models and it allows for the examination of a collection of models which might not otherwise have been examined (Hosmer et al., 2013). This method was involved in adding and removing characteristics (variable) dynamically from the model in each step until the best combination of characteristics (variable) was achieved. The significance level used in this study was 0.05. Therefore, the best combination of characteristics (variable) is whereby when the p-value of individual characteristics is less than 0.05. Statistical measures like Chi-square or Standardized estimates were used to measure the strength of the predictive model (Siddiqi, 2006). The results showed that the logistic regression models based on imbalanced and balanced datasets were statistically significant. The logistic regression model (imbalanced dataset) was statistically significant with a likelihood ratio of 2542.7031, degree of freedom of 30, and p-values < 0.0001 (Table 1). Meanwhile, the logistic regression model based on a balanced dataset was also

statistically significant with a likelihood ratio of 1588.3079, degree of freedom of 27, and p-values <0.0001(Table 2).

Table 1: Logistic Regression Model Results (Imbalanced Dataset)

	Likelihood Ratio Test	DF	Likelihood Ratio Chi-Square	P-value
	Logistic Regression model	**30**	**2542.7031**	**<.0001**
No	**Variables**	**DF**	**Wald Chi-Square**	**P-value**

Race	I (Indian)	1	0.3661	<.0001	1.442

Table 3 and Table 4 display the Analysis of Maximum Likelihood Estimates results. In these results, the Odds ratio (OR) is used to measure the strength of association between the predictor variable and the predicted event (Wuensch, 2015; Hailpern & Visintainer, 2003). The predicted event in this study was bankrupt or non-bankrupt. From the odds ratio, it can be determined which category is more or less likely to be bankrupt. Guidelines for interpreting the odds ratio are as per below (Yap et al.,2011):

- If the ratio of category A vs R (reference category) is greater than one, it indicates that those in category A are more likely to be bankrupt.
- If the ratio of category A vs R (reference category) is less than one, it indicates that those in category A are less likely to be bankrupt.
- If the ratio of category A vs R (reference category) is equal to one, it indicates that cases in both A and R are equally likely to be bankrupt.

For reference category, SAS Enterprise E-miner automatically creates (number of categories; c - 1) dummy variables for categorical variables with c levels. The dummy variables for categorical variables with c levels are depicted in Table 5.

Table 5: Dummy Variables for Categorical Variables

Independent Variable	Dummy variables
Age (5 categories) - 20-29, 30-39, 40-49 50-59, 60 & above	4 dummy variables (5-1 = 4) 1,0,0,0 (20-29), 0,1,0,0(30-39), 0,0,1,0(40-49), 0,0,0,1 (50-59), *0,0,0,0(60 & above)*
Employment status (5 categories) - Private sector (PRS), Public sector (PUS), Retiree (R), Self-employed (SE), Unemployed (U)	4 dummy variables (5-1 = 4) 1,0,0,0 (PRS), 0,1,0,0(PUS), 0,0,1,0(R), 0,0,0,1 (SE), *0,0,0,0(U)*
Gender (2 categories)- Female, Male	1 dummy variable (2-1 = 1) 1(Female), 0 (Male)
Household Monthly Expenses (4 categories) - <RM1,000, RM1,001-RM2,000, RM2,001-RM3,000, >RM3,000	3 dummy variables (4-1=3) 1,0,0, (<RM1000), 0,1,0,(RM1001-RM2000), 0,0,1,(RM2001-RM3000), *0,0,0 (>RM3,000)*
Household Monthly Income (4 categories) <RM1,000, RM1,001-RM2,000, RM2,001-RM3,000, >RM3,000	3 dummy variables (4-1=3) 1,0,0, (<RM1000), 0,1,0,(RM1001-RM2000), 0,0,1,(RM2001-RM3000), *0,0,0 (>RM3,000)*
Outstanding Loan (6 categories) <RM29.9k, RM30k-RM59.9k, RM60k-RM89.9k, RM90k- RM119.9k,	5 dummy variables (6-1=5)

RM120k-RM149.9k, >RM150,000	1,0,0,0,0(<RM29.9k), 0,1,0,0,0(RM30k-RM59.9k), 0,0,1,0,0(RM60k-RM89.9k)), 0,0,0,1,0 (RM90k-RM119.9K), 0,0,0,0,1(RM120k-RM149.9k), *0,0,0,0,0 (>RM150k)*
Marital status (4 categories) – Divorced, Married, Single, Widow	3 dummy variables (4-1=3) 1,0,0 (Divorced), 0,1,0(Married), 0,0,1(Single), *0,0,0 (Widow)*
Number of Children (4 categories) 0, 1-3, 4-6, 7 & above	3 dummy variables (4-1=3) 1,0,0 (0), 0,1,0(1-3), 0,0,1(4-6), *0,0,0 (7& above)*
Number of Loans (3 categories) 1-4, 5-8, 9 & above	2 dummy variables (3-1=2) 1,0 (1-4), 0,1(5-8), *0,0(4-6)*
Race (3 categories) – Chinese, Indian, Malay	2 dummy variables (3-1=2) 1,0 (Chinese), 0,1(Indian), *0,0(Malay)*

*The reference category for each variable is bold and italicized

Referring to Table 3 for the imbalanced dataset, the significant variables are those variables with a p-value less than 0.05. Below are the interpretations of the odds ratio for the significant variables.

Age
(OR=1.178): Borrowers who are between 40 to 49 years old are slightly more likely to be bankrupt compared to borrowers aged 60 and above.
(OR=0.864): Borrowers who are between 50 to 59 years old are less likely to be bankrupt compared to borrowers aged 60 and above.

Race
(OR=0.655): Borrowers who are Chinese are less likely to be bankrupt compared to those who are Malay.
(OR=1.380): Borrowers who are Indian are 1.4 times more likely to be bankrupt compared to borrowers who are Malay.

Gender
(OR=0.925): Female borrowers are less likely to be bankrupt compared to male borrowers.

Number of Children
(OR=0.766): Borrowers who have no child are less likely to be bankrupt compared to borrowers with children 7 and above.
(OR=0.782): Borrowers who have 1 to 3 children are less likely to be bankrupt compared to those with children 7 and above.
(OR=1.154): Borrowers who have 4 to 6 children are slightly more likely to be bankrupt compared to borrowers with children 7 and above.

Marital Status
(OR=0.747): Single Borrowers are less likely to be bankrupt compared to borrowers who are widows.

Employment Status
(OR=0.617): Borrowers who are attached to the Public sector are less likely to be bankrupt compared to Unemployed borrowers.
(OR=0.1604): Self-employed Borrowers are 1.6 times more likely to be bankrupt compared to Unemployed borrowers.

Household Monthly Income
(OR=1.731): Borrowers who earn RM1,000 and below are 1.7 times more likely to be bankrupt compared to borrowers who earn RM3k and above.
(OR=1.228): Borrowers who earn RM1,001-RM2,000 are slightly more likely to be bankrupt compared to borrowers who earn RM3k and above.

Household Monthly Expenses
(OR=1.190): Borrowers who spend between RM2,001 to RM3,000 are slightly more likely to be bankrupt compared to borrowers who spend RM3k and above.

Outstanding Loan
(OR=0.275): Borrowers with outstanding loans of RM29,999 and below are less likely to be bankrupt compared to borrowers with outstanding loans of more than RM150k.
(OR=0.701): Borrowers with outstanding loans between RM30,000 to RM59,999 are less likely to be bankrupt compared to borrowers with outstanding loans of more than RM150k.

(OR=1.643): Borrowers with outstanding loans between RM90,000 to RM119,999 are 1.6 times more likely to be bankrupt compared to borrowers with outstanding loans of more than RM150k.

(OR=1.442): Borrowers with outstanding loans between RM120,000 to RM149,999 are 1.4 times more likely to be bankrupt compared to borrowers with outstanding loans of more than RM150k.

<u>Number of Loans</u>
(OR=0.320): Borrowers who have 1 to 4 loans are less likely to be bankrupt compared to borrowers with 9 loans and above.

Next, based on Table 4, below are the interpretations of odd ratios for the significant variables for the balanced dataset. The significant variables are those variables with a p-value less than 0.05.

<u>Age</u>
(OR=1.232): Borrowers who are between 40 to 49 years old are slightly more likely to be bankrupt compared to borrowers aged 60 and above.

(OR=0.834): Borrowers who are between 50 to 59 years old are less likely to be bankrupt compared to borrowers aged 60 and above.

<u>Race</u>
(OR=0.655): Borrowers who are Chinese are less likely to be bankrupt compared to those who are Malays.

(OR=1.442): Borrowers who are Indian are 1.4 times more likely to be bankrupt compared to borrowers who are Malay.

<u>Gender</u>
(OR=0.903): Female borrowers are less likely to be bankrupt compared to male borrowers.

<u>Number of Children</u>
(OR=0.754): Borrowers who have no child are less likely to be bankrupt compared to borrowers with 7 children and above.

(OR=0.818): Borrowers who have 1 to 3 children are less likely to be bankrupt compared to borrowers with 7 children and above.

(OR=1.258): Borrowers who have 4 to 6 children are slightly more likely to be bankrupt compared to borrowers with 7 children and above.

<u>Employment Status</u>
(OR=0.817): Borrowers who are attached to the Private sector are less likely to be bankrupt compared to Unemployed borrowers.

(OR=0.513): Borrowers who are attached to the Public sector are less likely to be bankrupt compared to Unemployed borrowers.

(OR=1.589): Self-employed Borrowers are 1.5 times more likely to be bankrupt compared to unemployed borrowers.

<u>Household Monthly Income</u>
(OR=1.609): Borrowers who earn RM1,000 and below are 1.6 times more likely to be bankrupt compared to borrowers who earn RM3k and above.

(OR=1.206): Borrowers who earn RM1,001-RM2,000 are slightly more likely to be bankrupt compared to borrowers who earn RM3k and above.

<u>Household Monthly Expenses</u>
(OR=1.258): Borrowers who spend between RM2,001 to RM3,000 are slightly more likely to be bankrupt compared to borrowers who spend RM3k and above.

<u>Outstanding Loan</u>
(OR=0.278): Borrowers with outstanding loans of RM29,999 and below are less likely to be bankrupt compared to borrowers with outstanding loans of more than RM150k.

(OR=0.470): Borrowers with outstanding loans between RM30,000 to RM59,999 are less likely to be bankrupt compared to borrowers with outstanding loans of more than RM150k.

(OR=1.448): Borrowers with outstanding loans between RM90,000 to RM119,999 are 1.4 times more likely to be bankrupt compared to borrowers with outstanding loans of more than RM150k.

<u>Number of Loans</u>
(OR=0.317): Borrowers who have 1 to 4 loans are less likely to be bankrupt compared to borrowers with 9 loans and above.

Therefore, based on Table 3 and Table 4, the estimated logistic regression for the imbalanced dataset and the balanced dataset is written as below:

Logistic Regression model (Imbalanced Dataset)
log $[\frac{pi}{1-pi}]$ = 3.6192 – 0.0899(Age 1) – 0.00791(Age 2) + 0.1636(Age 3) – 0.1456(Age 4) – 0.1051(PRS) – 0.4826(PUS) – 0.1884(R) + 0.4726(SE) – 0.0783(F) + 0.0614 (HME 1) + 0.0464(Household Monthly Expenses 2) + 0.1740(Household Monthly Expenses 3) + 0.5488(Household Monthly Income 1) + 0.2053 (Household Monthly Income 2) – 0.0900(Household Monthly Income 3) – 1.2892(Outstanding loan 1) – 0.3551(Outstanding loan 2) – 0.1406(Outstanding loan 3) + 0.4967(Outstanding loan 4) + 0.3658 (Outstanding loan 5) + 0.0848(D) – 0.0511(M) – 0.2919(S) – 0.2669(No of child 1) – 0.2455(No of child 2) + 0.1430(No of child 3) – 1.1387(No of loans 1) – 0.0458(No of loans2) – 0.4235(Chinese) + 0.3221(Indian).

Logistic Regression model (Balanced Dataset)
log $[\frac{pi}{1-pi}]$ = 1.9033 – 0.0724(Age 1) + 0.0802(Age 2) + 0.2090(Age 3) – 0.1817(Age 4) – 0.2016(PRS) – 0.6682(PUS) + 0.0411(R) + 0.4632(SE) – 0.1025(F) + 0.0619(HME 1) + 0.0886(HME 2) + 0.2293(HME 3) + 0.4759(HMI 1) + 0.2309(HMI 2) – 0.0347(HMI 3) – 1.2809(Outstanding loan 1) – 0.3006 (Outstanding loan 2) + 0.0222(Outstanding loan 3) + 0.3701(Outstanding loan 4) + 0.0914(Outstanding loan 5) – 0.2820(No of child 1) – 0.2004(No of child 2) + 0.2295(No of child 3) – 1.1474(No of loan 1-4) – 0.0744(No of loan 5-8) – 0.4237(Chinese) + 0.3661(Indian).

Based on the above result, the following is the discussion on the results of significant categories. The significant categories were those categories with p-values less than 0.05 (Table 1 and Table 2). In terms of age, both logistic regression models found that the age category that was more likely to be bankrupt was between 40 to 49 years as compared to 60 years and above. The finding on the age category between 40 to 49 years was the more likely to bankrupt fell within part of the range of age group of bankrupts (35 to 44) as reported by the Malaysia Department of Insolvency (2017-2023) and Hospodka (2015). They reported that the highest percentage of bankruptcies and the most vulnerable age group is between 35 to 44 years old. This model further identified that borrowers aged between 50 to 59 years old were less likely to be bankrupt as compared to borrowers aged between 60 and above.

Both logistic regression models found that the male category was more likely to be bankrupt compared to the female category. This finding is similar to Othman et al. (2015), Eaw et al. (2014, 2015), and Jullamon (2012) where they indicated that the majority of bankrupts are male. Malaysia Department of Insolvency also reported that the highest percentage of bankrupt is male (Malaysia Department of Insolvency, 2017-2023).
For employment status, the researcher found that borrowers who were attached to the public sector were less likely to be bankrupt compared to unemployed borrowers. This finding is similar to both Desai (2016) and Zhu (2011) who pointed out that the percentage of bankruptcy filing probability is higher for the unemployed filers compared to the employed filers. On the other hand, self-employed borrowers were 1.6 times more likely to be bankrupt as compared to unemployed borrowers. According to the Malaysia Department of Insolvency, self-employed are among the employment statuses declared by the bankrupts (Malaysia Department of Insolvency, 2017- 2023)

Hospodka et al. (2015) found that a higher percentage of lower-income debtors file for bankruptcy compared to higher-income debtors. Meanwhile, Agarwal et al. (2011) showed that a 1% increase in income could lead to a decrease of 20% in bankruptcy filing. In terms of income, the results showed that borrowers who earned RM1,000 and below were 1.7 times more likely to be bankrupt compared to borrowers who earned RM3k and above and borrowers who earned RM1,001-RM2,000 were slightly more likely to be bankrupt as compared to borrowers who earned RM3k and above. These findings support Hospodka (2015) and Agarwal et al. (2011) and it is an extension to the literature where the results indicated the specific range of income of bankrupt.

As for expenses, the results indicated that borrowers who spent between RM2001 and RM3000 were more likely to be bankrupt. This finding also furthers the literature as the result showed the exact range of expenses that the borrowers spent every month. Whereas, Zhu (2011), Agarwal et al. (2011), Azaizeh (2010), and Rhee (2001) only indicated that high expenses increase the likelihood of bankruptcy filing.

The outcome of the outstanding loan category showed that borrowers with outstanding loans of more than RM150k (high outstanding balance) were most likely to be bankrupt. This is similar to the findings of Hospodka et al. (2015), Dawsey (2014), Gross and Souleles (2002), and Stavins (2000) which indicated that households who had filed for bankruptcy carried high loan balances. The logistic regression models also found that borrowers with outstanding loans between RM90,000 to RM119,999 were 1.6 times more likely to be bankrupt as compared to borrowers with outstanding loans of more than RM150k.

The results indicated that married and divorce were an insignificant category and single borrowers were less likely to be bankrupt compared to borrowers who were widows. This finding supports the results found by Jullamon (2012) who indicated that 8.6% of the total respondents who filed for bankruptcy were widows. According to Zhu (2011), borrowers file for bankruptcy soon after the divorce or death of a spouse because of household income issues. Divorce or the death of a spouse puts household members into a difficult situation because they do not have much earning power or well-established credit. As a result, borrowers could file for bankruptcy after getting divorced or being a widow.

Borrowers with no child or 1 to 3 children were less likely to be bankrupt compared to those with 7 children and above. The finding above is consistent with Creswell (2014) who found that borrowers with larger families had a higher probability of bankruptcy. Zhu (2011) also found that the more children the borrowers have, the higher the probability of bankruptcy filing. In addition, the results also found that borrowers who had 4 to 6 children were slightly more likely to be bankrupt as compared to borrowers with 7 children and above. In terms of number of loans, borrowers who had 1 to 4 loans were less likely to be bankrupt as compared to borrowers with 9 loans and above. This result supports Desai (2016) and Dawsey (2014) who pointed out that the higher the number of loans, the more likely the borrowers file for bankruptcy.

Lastly, for the race category, borrowers who were Chinese were less likely to be bankrupt as compared to Malays. This is similar to the report from the Malaysia Department of Insolvency in 2009 and 2013 where they found that the Malay race is the majority of bankrupts in Malaysia (Malaysia Department of Insolvency, 2010, 2014). From 2014 onwards, the Malaysia Department of Insolvency does not report on the race category which the researcher believes is due to the issue of racial sensitivity. For Indian borrowers, they were 1.4 times more likely to be bankrupt as compared to Malay borrowers. One likely reason for this outcome could be that Indian households are earning low income as compared to Malay households. This result is in line with Khalid (2011) who found that the Indian has the least ownership in wealth where 23.7% of them did not have wealth compared to 14.7% of the Bumiputera and 10.5% of the Chinese.

In addition, the predictive performance of the logistic regression model can be evaluated by using performance measure which consists of misclassification, accuracy, sensitivity, and specificity rate. Misclassification is the probability that the model has wrongly predicted bankrupt as non-bankrupt and non-bankrupt as bankrupt. Accuracy means the probability of the model correctly predicted bankrupt and non-bankrupt. Sensitivity is the probability that the model can correctly predict bankruptcy and specificity means the probability that the model can correctly predict non-bankrupt. A good model consists of a lower misclassification rate and higher accuracy and sensitivity rate (Akosa, 2017; Brown, 2014).

Table 6 displays the performance measure results. The results showed that the validation classification accuracy and specificity for imbalanced datasets are 83.17% and 8.38% respectively. The specificity rate is low, less than 10% and the sensitivity rate is 98.49% (high rate, almost perfect) which indicates that the personal bankruptcy prediction model was affected by the imbalanced data. Then, undersampling was performed by randomly selecting 4,174 cases from the 20,372 terminated cases and re-evaluating the model using the balanced sample of 8,348 cases. The validation classification accuracy decreased slightly to 71.144% but the sensitivity rate increased to 78.43%.

Table 6: Performance Measure Results (Accuracy, Precision, Specificity and Sensitivity)

		Imbalanced data (n=24546)		Balanced data (n=8348)	
Model		**Training (%)**	**Validation (%)**	**Training (%)**	**Validation (%)**
Logistic Regression	Accuracy	83.35	83.17	71.71	71.14
	Misclassification	16.64	16.82	28.29	28.86
model	Specificity	9.75	8.38	78.16	78.43
	Sensitivity	98.43	98.49	65.25	63.84

5. Managerial Implications and Recommendations

This paper presents some important ideas to policy maker or managerial level of commercial banks and credit companies based on the statistical analysis results. They should give more attention to borrowers with the following characteristics: male, aged between 30-39 years old, Malay, married, number of children between 1 – 3 children, work in the private sector, monthly household income RM3,000 and above, monthly household expenses between RM1,001-RM2,000, number of loans between 1- 4, outstanding loan RM30,000 and above, never experience adversities and live in the city. This is because policymakers at or managerial level can develop strategies that can help to reduce defaulters. The fewer the defaulters, the lesser will be the bankrupts. Furthermore, wrong credit assessment leads to an increase in the number of defaulters and as a sequence could drive financial institutions toward bankruptcy (Kambal et al., 2013). In addition, policymakers maker or managerial levels can also develop strategies which meet the organisation requirements and potential borrowers' needs. The strategies include providing short financial management courses to potential loan applicants or borrowers, educating on personal bankruptcy impact through a personal bankruptcy awareness campaign, tightening loan application procedures, offering low loan amounts, shorter loan periods, and regular follow-up on default accounts.

Conclusion: This paper discussed the improvements in the prediction of personal bankruptcy using random undersampling to correct the imbalanced data. The application of the logistic regression technique in this study showed that the specificity rate increased after the random undersampling strategy was applied. In conclusion, the predictive performance of the personal bankruptcy model based on the balanced dataset is more reasonable compared to the imbalanced dataset. According to Yap et al. (2011), in practical applications, classification methods that are easy to understand such as decision trees and scorecards are more appealing to users (Yap et al.,2011). For future research, the researcher intends to consider a Decision Tree, Scorecard, Support Vector Machine and Naïve Bayes model.

Abstract: Artificial Intelligence (AI) is the primary force behind the organization's continued sustainability and competitiveness. The rise of AI software, cloud computing-based software and blockchain apps and services, together with the use of accounting information outcomes indicate that computerized accounting has become available to accountants. Even if there are great hopes for the application of AI in the accounting industry, numerous nations with little infrastructure are still lagging in using this type of technology. 88.89% of the 80 questionnaires that were initially issued were returned within a week. As a result, of the 80 questionnaires issued, 75 responses were received in one week, yielding a response return rate of 93.75 percent. Managerial and non-managerial staff members from American Express (Malaysia) Sdn. Bhd, Selangor, Malaysia were chosen as research participants. By employing a sample random sampling approach, a total of 75 legitimate surveys were gathered. The results of the study have shown a positive strong relationship between the level of readiness (AI Software, Cloud technology and Blockchain) and level of adoption (AI Software, Cloud technology and Blockchain) in the accounting industry toward employees' job efficiency. All eight hypotheses (H1 to H8) showed a significant relationship and were all accepted. The outcome of the moderating effect between working tenure and level of readiness presents a direct impact. However, the level of adoption shows an indirect impact on job efficiency whereas job efficiency shows a direct impact.

Keywords: *AI Software, Cloud Technology, Blockchain, Accounting Field, Malaysia*

1. Introduction

The technological age's Industrial Revolution (IR) 4.0 is being sparked by artificial intelligence (AI). It enables computers to carry out activities that resemble those of humans, acquire knowledge from mistakes, and adapt to new data. These innovations enable the processing of massive volumes of data, improving the recognition of similarities within the data (Miller, 2019). Large amounts of data may significantly boost the efficiency of an organization and technological advances allow for the skillful application of statistical analysis. To be durable in this rapidly evolving and highly competitive marketplace, every company entity needs to have a competitive advantage (Frisk and Bannister, 2017). Artificial intelligence (AI) is developing at an astounding rate, and this trend doesn't appear to be going down. According to Stancheva-Todorova (2018), deep machine learning and massive data science are two areas where advancements in AI are being driven.

AI is the primary force behind the organization's continued sustainability and competitiveness (Omar, Hasbolah, & Ulfah, 2017). Since AI is widely recognized for its benefits in terms of decreased costs, time savings, and enhanced productivity (Pavaloiu, 2018). Organizations must integrate AI technology within the way they operate in the fast-paced commercial world of today to remain viable. To further enable them to make better-informed decisions regarding their clients' financial affairs, accountants will also need to be proficient in both technological skills and business knowledge when they examine information collected from emerging sources like email messages, receipts, and social networking posts (ICAEW Volunteers, 2023). AI presents several difficulties in the accounting sector in addition to its possible benefits.

The job efficiency of accounting, accounting technological advances, changes in system administration, and the need for data gathering and analyzing of all these areas have been significantly impacted by this shift to computerized accounting. The rise of AI software, cloud computing-based software and blockchain apps and services, together with the use of accounting information outcomes indicate that computerized accounting has become available to accountants.

The function of computerized accounting shifts from that of traditional accounting to researchers in producing financial data or information for analysis. This allows accounting to establish skill accelerators and comprehend emerging technologies in the context of Society 5.0. For the accounting industry, digital accountant 5.0 has several noteworthy benefits.

The potential loss of jobs because of AI mechanization replacing much of the monotonous work currently done by accountants constitutes one of their primary concerns. According to their analysis, there is a clear developing pattern in the application of AI in accountancy. AI can be applied in a variety of accounting contexts, including taxation, bookkeeping, auditing, financial institutions, and trade in securities. In the traditional sense, all these procedures are laborious and time-consuming. But by giving such tedious jobs to machine learning, accountants may free up their valuable time to work on more complicated issues that need critical thinking. One way to lessen the drawbacks of conventional systems for accounting is to combine artificial intelligence (AI) with accountancy information (Jeneesh, 2017).

The work of handling payables from accounts (AP) and receivables from clients can be significantly simplified and optimized by incorporating based on artificial intelligence accounting applications into managerial responsibilities. An organization's strong connection with vendors will be supported by effective account payables administration. Additionally, it will fortify financial information and enhance corporate processes in preparation for future growth (Nwakaego & Ikechukwu, 2015). In the current age of rapid technological change, receiving APs in the old-fashioned way is not as appropriate. One of the ostensible advantages of shifting from traditional to digital ways is that organizations may do away with the problem of misplaced documentation and improve operational efficiency by conserving resources like paper, energy, and space. Additionally, it is now possible to complete payments to suppliers on schedule, which helps to improve credit scores (Deloitte, 2015).

By understanding how AI impacts accounting performance, it can help organizations to make better-informed decisions about technology investments. Hence, it can lead to a more effective allocation of resources, improved financial forecasting, and enhanced overall business strategy. It can also automate routine accounting tasks, minimize errors, and enhance data accuracy. Organizations can then leverage these insights to improve the financial reports and enhance overall business strategy. By adopting AI solutions that improve accounting functions, organizations can differentiate themselves in the market, offering more accurate and timely financial information to stakeholders. Enhanced AI capabilities can improve the audit trail and reporting processes, making it easier for organizations to provide transparent and verifiable financial information to regulators and auditors. The study can identify the best practices in AI implementation that enhance accounting performance. Malaysian organizations can use these insights to benchmark their processes against industry standards and gain a competitive edge. In short, this study has significant practical implications for Malaysian organizations by providing actionable insights into how AI can be effectively integrated into accounting practices to enhance performance, efficiency, and strategic decision-making.

Nowadays, there is a worldwide fear about the incorporation of intelligent machines (AI). Records indicate that the use of AI in accounting dates back more than 25 years, and its primary applications are in the fields of accounting auditing and reporting (Chukwudi et al., 2018). Malaysia has very little experience with AI adoption. The results of a poll that the Malaysian Institute of Accountants (MIA) carried out around July and September 2017 provide evidence. The results showed that, in comparison to other technologies like Microsoft apps, accounting software, cloud apps, fintech, instruments for data analysis, and so forth, the adoption as well as use percentage for AI was just 13% at this point. While global studies on AI in accounting exist, there is a scarcity of research focusing specifically on

Malaysian organizations. AI technology is evolving quickly, and organizations are continually adapting to these changes. Hence, there is a need to understand how these advancements are being integrated into Malaysian accounting practices and how they affect performance, efficiency and accuracy. Malaysian accounting standards and regulatory requirements differ from those in other regions. Investigating how AI influences compliance and reporting in the Malaysian context can provide valuable insights into managing AI-driven transformations while adhering to local regulations. This study aims to address this disparity by examining the potential effects of artificial intelligence deployment on Malaysia's financial sector. The research objectives are

stipulated as follows:

- To investigate the effect of readiness and adoption level of using AI software applications in the accounting field for job efficiency.
- To investigate the effect of readiness and adoption level of using cloud technology in the accounting field for job efficiency.
- To investigate the effect of readiness and adoption level of using blockchain in the accounting field for job efficiency.

2. Literature Review

Artificial intelligence (AI) has several advantages for businesses, but Malaysia is still in the early stages of using AI (Omar et al., 2017). With 24.6% of its organizations investing in AI technology, Indonesia led among ASEAN nations in the use of AI, according to data released by the International Data Corporation, or IDC, in 2018. Malaysia was substantially behind at 8.1%, in comparison. This demonstrates the limited use of AI by Malaysian enterprises. The Malaysian Institute of Accountants (MIA) performed a poll during July and September 2017 that yielded the following results. The results showed that in comparison with competing innovations like Microsoft apps, accounting programs, cloud apps, financial technologies, and tools for data analytics, the use and acceptance percentage of AI was barely 13% at the time. Nonetheless, it is anticipated that in three years, the use of AI will increase to 15% (MIA, 2019). Given how few applications of AI there are, a lot of Malaysian industries may be unaware of the tool's much greater capability. Given that AI is regarded as one of the forces behind IR 4.0, this issue has caused great anxiety.

The period of Culture 5.0, which has been influenced by different technologies involving big data, data privacy, AI software, computing in the cloud, and blockchain, has made significant changes to the field of accounting. Internet accounting is one of these changes, and it will help professionals in accounting fulfill their mission. The accounting profession needs to adapt to the changing circumstances and be innovative in the context of Society 5.0. To increase job efficiency and productivity, accounting companies must also comprehend technology and utilize it to its fullest potential. In this situation, auditors can provide correct information instantly by utilizing technologies like massive amounts of data, artificial intelligence (AI) software, computing on the cloud, blockchain, and cyber security.

Artificial Intelligence (AI) in accountancy has been the subject of numerous studies. For example, Guo, Shi, and Tu (2016) studied the application of AI to analyze texts to analyze uncontrolled financial and accountancy data. The researchers discovered that when it came to discovering trends in data, neural networks outperformed other forms of data mining. Chukwudi et. al. (2018) determined the AI in accounting procedures in Southeast Nigeria. Efficiency of the procedure for auditing and systems for expertise were found to be positively correlated.

This research concentrated on the reporting of earnings and auditing, even though they offer certain insights regarding the application of AI in accounting. The investigations likewise addressed how AI is affecting finance, but they did so using quantitative data, which carries the danger of bias and obscures the true nature of the issue.

Relationship Between the Readiness Level of AI Software Applications in the Accounting Field.
Throughout the past several decades, there has been a significant evolution in the corporate sector. As technology advances, there will be more instability and shifts in industries in the upcoming decade. Advances in technology coupled with the significance of conducting skills like expert judgment, mental agility, and constitutional and moral actions will present both benefits and challenges for a lot of users, both new and old. Most of the innovations are now goods or means of distributing assets and there is little distinction among them (Blut & Wang, 2020). Latest developments in technology have brought about drastic changes to the consumer and company paradigms that currently prevail. Drones, AI, big data, Blockchain, Fintech, cloud computing, smartphone apps, and cryptocurrency are just a few examples of the technologies that significantly impact company procedures.

According to Parasuraman (2000), readiness for technology is the ability of individuals to accept and utilize new technologies in their professional and private lives as well. It represents a complex interplay between psychological triggers and restraints that influence an individual's propensity for embracing new technologies (Parasuraman & Colby, 2015). Graduated accounting professionals need to be open to integrating emerging technologies to be prepared for future employment in the accounting sector, as improvements in technology are affecting the field. The speed at which a company gets done and its effectiveness have grown dramatically because of the effect that technology has on activities. Thanks to technological improvements, accountants can become more efficient than they have ever been (Zhang, Dai, & Vasarhelyi, 2018).

The predicted shifts brought about by technological improvement in their prospective job are something that graduate accountants are unable to prevent. For student accountants to perform at the highest level, they require greater familiarity with technology (Tan & Veal, 2005). The key motivator for them to stay up to date with the developments is the progress of technology, which is a primary force behind worldwide transformation. Accounting candidates and subsequent accounting professionals who will uphold the legitimacy and applicability of expert assistance in the age of the Internet both find this to be of comparable importance. Research regarding how personality traits affect technological readiness is needed as new technologies progress (Blut & Wang, 2020).

Relationship Between the Readiness Level of Cloud Technology in the Accounting Field.
Cloud computing services are usually categorized into three categories: the software as an offering (where users access software programs supplied by external cloud-based service suppliers) and structures as a service (where users control both infrastructure and applications) (Gangwar et al., 2015; Low et al., 2011). According to Mill and Grance (2011), clouds might be accessible for the publicly traded, community-accessible, restricted to an organization, or an intersection of these. Given the anticipated move away from internal processes, cloud-based computing was previously seen as an innovation in the accounting sector (Hsu and Lin, 2016; Ma et al., 2021). The economic value of cloud computing derives from its versatility, expansion, and ease of obtaining updated data for various individuals at multiple places. It also reduces the necessity for archived information and backups (CPA Australia, 2019; Fawcett, 2015). Cloud computing offers small and medium-sized companies (SMEs) more chances to utilize the latest innovations, enhanced flexibility in building up computer resources, and less expenditures on capital, development costs, and maintenance expenses (Hsu and Lin, 2016; Ma et al., 2021). Whilst some businesses are dubious concerning the safety elements of employing cloud computing, it might improve both interior and exterior partnerships and allow for easy accounting and spread of accounting data for successful business choices (Dimitriu and Matei, 2015, Tarmidi et al., 2014).

Relationship Between the Readiness Level of Blockchain in the Accounting Field.
Determining how accounting professionals are ready to embrace the application of blockchain technology is the motivation behind this investigation. Therefore, the purpose of the research is to assess accounting professionals' readiness according to Parasuraman's (2000) technological readiness rating and the way that readiness affects their decision to use blockchain technology. Based on theory, this study uses TRI to enhance our empirical knowledge of how prepared accounting professionals are for disruptive technologies. In particular, the current study provides statistical evidence for Malaysian accounting professionals' behavioral desire to use blockchain technology.

Pragmatically speaking, the results of the study will assist those who are interested, particularly the Blockchain Malaysia Association, the power source Malaysian Institute of Accountants (MIA), a MIGHT, and other officials or legislators in developing suitable and feasible tactics for motivating and enabling Malaysian organizations in effectively employing blockchain technology for the foreseeable company helps and to provide that blockchain applications will continue to be well-received by Malaysian accounting researchers. A summary of the several issues that need to be resolved before blockchain technology is widely applied, which might have a big influence on global trade, brings this study to a close.

Only the accounting professions' readiness for blockchain technology by 2019 is the primary concern of this study. The term "accounting professionals" describes the specific individuals working in Malaysia in accountancy-related fields. The cross-sectional design may yield outcomes that vary from continuous studies or data undertaken in other nations owing to differences in time, culture, and professional procedures. The

present research is centered on the participants' technological readiness and pre-adoption viewpoint because blockchain technology is nevertheless in its nascent stages. As a result, several inescapable external factors could influence the research's results, and the investigator was unable to restrict the external factors that the study involved.

Therefore, according to Parasuraman (2000), it's important to ascertain customers' readiness to employ technology-based procedures to ascertain their propensity for using new technology. Technology readiness was defined by Parasuraman (2000) as a person's propensity to understand and use new technology to achieve their targets at the job and home. A 5-demonstrate multiple-item rating was developed by Parasuraman (2000) to gauge users' readiness to accept new technologies.

Relationship Between the Adoption Level of AI Software Applications in the Accounting Field.
Additional research regarding the way accounting accepts and utilizes AI has been suggested for the data systems and accounting study fields (Issa et al., 2016; Sutton, Holt, & Arnold, 2016). For a deeper comprehension of the usage of AI in accounting, this research project looks at how accounting companies have implemented, enabled by artificial intelligence inspection technologies. The research investigation looks at how AI functions in the traits of accounting organizations and the outside world (Rogers, 1995; Tornatzky, Fleischer, & Chakrabarti, 1990).

Studies found that the notion of artificial intelligence is always changing and that it is occasionally easy to distinguish AI from other intelligent technologies (Collins, Dennehy, Conboy, & Mikalef, 2021). AI was initially defined as "the technological method of creating intelligent machines" in 1956 (McCarthy, 1960). However, investigators later adopted several AI concepts. According to Collins et al. (2021) and Wolfe (1991), artificial intelligence (AI) can be categorized into two types: rule-based AI, which follows predefined rules, and regulations AI, which does not follow established standards. Borges, Laurindo, Spínola, Gonçalves, and Mattos (2021) conducted a comparative analysis of applications utilizing artificial intelligence that varied in their reliance on human rulemaking and attribute definition to illustrate an issue. Deep learning, visual learning, machine learning, and artificial intelligence are all included in this paradigm.

According to Collins et al. (2021), the areas of machine learning, computer vision, processing of natural language, intelligent systems, and automation are some of the most frequently debated forms of AI technology among academics in the IS fields. This investigation considers the latest developments in the AI spectrum through a wide lens, rather than concentrating on any one of those groups in particular. Sutton et al. (2016) have informed the public that concentrating on certain AI frameworks while ignoring others may result in prejudiced study findings. As a result, the concept of "AI" as it is employed in the present dissertation refers to a broad range of information-based systems like expertise systems and decision-support infrastructure, and also machine learning (both supervised and unsupervised) techniques like artificial neural networks and learning with associations.

Relationship Between the Adoption Level of Cloud Technology in the Accounting Field.
This investigation is mostly motivated by the accounting field's apparent adoption of cloud computing to an extent that has significantly surpassed other industries. Research on the adoption of cloud computing that is now available likewise falls short in this area. Some of the material currently available on cloud computing is

Concentrated on the scientific, supply-side cloud computing concerns (what exactly is the most effective method for creating and disseminating content Computing capabilities that satisfy customers' requirements?), as opposed to the demand-side (why would individuals and companies use cloud computing?). The cloud computing research from the client side additionally differs greatly regarding the contextual elements. These elements, including the nation and industry, typically have a significant impact on how companies run their business activities and attain their objectives.

Furthermore, no specific connection is made between the adoption behavior and the organization's operational circumstances, tactics, or procedures in the adoption research. The purpose of this preliminary research is to investigate the demand-side characteristics of cloud computing. Computational methods inside the accounting sector. A design involving several case studies is employed. Accounting organizations (firm-level) are the basis

of examination, with a focus on minor bookkeeping companies. Discussions with the subjects are organized into phases to collect data. Individuals from six distinct accounting companies. The investigation is centered on the choice creators' perspectives on the emerging cloud issue and the causes for their choice to accept or deny the use of cloud computing.

Small firms may now adopt state-of-the-art computer systems, reap the rewards, and improve them since cloud computing eliminates the need for early expenditure. Sufficiently advanced computer systems to rival their bigger competitors (Marston and others, 2011). According to earlier research on cloud computing adoption, reduced expenses, flexibility, and convenience of access are the main reasons why companies have adopted cloud computing. However, the biggest challenges to using cloud computing are worries about the confidentiality and integrity of cloud computing.

Relationship Between the Adoption Level of Blockchain in the Accounting Field.
Blockchain's approach to operating. Analysts anticipate benefits from the adoption of blockchain in the process, including dedication, convertible status, certainty, and enthusiasm to push the technology forward in the retail sector. As an administrative strategy for the management of Blockchain, the adoption of Blockchain requires an intense commitment (Rusbult and Van Lange, 2003). Engaging in interpersonal engagement elicits a physical reaction and enhances habit formation and sustained engagement (Agnew, Van Lange, Rusbult, and Langston, 1998, for example). Kind ideas are the source of beneficial alterations (Rusbult and Van Lange, 2003). The partners' increasing dedication to each other highlights pro-social behaviors like reconciliation, housing, and helping sufferers (e.g., Finkel, Rusbul, Kumashiro and Hannon, 2002, Rusbult, Verette, Whitney, Slovik, Lipkus 1991, Van Lange Harinck, Steemers, 1997).

As a result, fulfillment plays a crucial role in the method of building relationships. To adhere to this procedure, blockchain adaptation involving blockchain with the accounting sector was specifically included in the present investigation's strategy. According to Rusbult and Van Lange (2003), knowledge of the "demand" or "dependency" of upcoming parties is essential to comprehending the adaptability and engagement that constitute this concept." The interrelationship in satisfaction or discomfort that results from addiction, which decides whether to maintain or leave an affiliation, is connected to Blockchain adaptability. Consumption is also associated with fragility since it exacerbates incompatibility and unilateral dominance. When there are competing goals that are not inverse, the more contentious partner will act for their own greatest good or that of their partner, provided that all partners are aware of each other's ability to respond. Even though relationships can carry through a violent one, it is believed that the companion is trustworthy if he reacts beneficially and does not abuse his enticing situation. This is either a poor substitute or an expensive gamble (Johnson, 1995, Rusbult & Martz, 1995). The beneficial blockchain knowledge, blockchain oversight, and blockchain management plan encourage blockchain's flexibility, zeal, and dedication, which in turn propels its blockchain-based accounting sector.

Mediating variable effect between job efficiency towards the relationship of level of readiness of using technologies in the accounting field.
Employee Development and Learning: Using AI in accounting and auditing calls for a staff equipped with the know-how to handle and operate these tools. Knowing the state of technological readiness makes it easier to create training programs that function and build a workforce that can implement and utilize AI solutions. Cost Efficiency and Resource Optimization: Technology readiness analysis helps determine how much money

And resources will be needed when adopting AI. Finding integration-ready technologies can help with distributing assets and implementation techniques that are less expensive (Duong and Vu 2023; Firoiu et al. 2023a).

Innovation Potential: Researching the connection between the acceptance of artificial intelligence and technological preparedness provides opportunities for novel approaches to accounting and auditing procedures. It offers perceptions of how cutting-edge technology may be used to fundamentally alter the industry and promote an innovative culture. In conclusion, it is critical to investigate the relationship between technological readiness and acceptance of artificial intelligence in the context of Vietnam's accounting and auditing to stay abreast of international developments, maintain regulatory compliance, enhance operational

effectiveness, and capitalize on AI's potential to spur innovation in the financial services industry. In the end, it helps the nation's accounting and auditing industry expand and become more competitive by offering an approach for the tactical application of AI technologies (Firoiu et al., 2023b).

The reduction of future expenses is another important advantage of integrating artificial intelligence (AI) within a business's accounting function. Long-term dependence on computer programs (AI) will decrease the need for human operations while enhancing both the efficiency and accuracy of accounting records from businesses.

Mediating variable effect between job efficiency towards the relationship of level of adoption of using technologies in the accounting field.
By analyzing and deciphering the vast amount of accounting information, the majority of which originates from non-traditional systems of accounting, accounting experts today around the globe offer important assistance to their upper management (Spiegel & Dilsizian, 2013; Haverson, 2014; Davenport & Harris, 2017). Financial and non-financial data is extracted from web server logs, Internet and smartphone clickstream audio Qiles, social networks, and a plethora of machine-generated as well as sensor-detected systems. The resulting data is then analyzed and interpreted to help make essential company choices (Bertolucci, 2023; LöfQler, 2013).

Additionally, as a crucial component of management processes, several governments globally have taken action to enhance third-party accessibility to data obtained from citizens and businesses as well as internal government data, which will expand the opportunities for statistical analysis (Casselman, 2015; Office of Management and Budget, 2015). Additionally, businesses can increase their efficiency and gain insightful data about their clients and employees to create more competitive personnel and customer strategies by utilizing artificial intelligence (AI) technologies, such as artificial intelligence (AI), natural language processing, recognition of words, and machine learning (Ernst & Young, 2020).

Professionals in accounting are becoming increasingly involved in the strategic use of artificial intelligence (AI) technologies. With the introduction of large amounts of data, data statistical analysis, and the use of artificial intelligence (AI), experts in accounting have proven they can provide more value to companies by increasing revenue and optimizing workflows. In the age of artificial intelligence, increasingly complex duties will be delegated to accounting software by traditional accounting staff, significantly enhancing efficiency, lowering the rate of error, and boosting company and industry competitiveness in the marketplace. This will also help to foster the evolution of the accounting sector.

The job responsibilities of accounting personnel typically vary by the company's operational process. However, in the context of artificial intelligence, AI will replace traditional accounting as well as auditing work, greatly increasing job efficiency, and altering the way that traditional accounting and auditor duties are separated. This will assist accounting personnel with enhancing the caliber and ability of their job duties. This will alter the conventional financial and operational working modes in addition to optimizing the structure layout and accounting post settings.

3. Research Methodology

Measures
The questionnaires were divided into five sections, each consisting of closed-ended statements. Section A; the respondents' demographic data, Section B; Level of readiness and adoption of using AI software; Section C: Level of readiness and adoption of using Cloud Technology; Section D: Level of readiness and adoption using Blockchain; Section E: AI usage in the accounting Field and Section F: Job Efficiency. The notion of adapting and adopting was employed from several sources, including Spector (1997), Mohammad et al. (2020), Ahmed (2020), and Kanapathipilla et al. (2020) for this work. Sections A, B, C, D, E and F of the survey were broken down as follows: The initial measurements from Zhang et. al. (2019) have undergone several adjustments to suit the current study's setting. Five-point Likert scale, with one denoting "strongly disagree" and Qive denoting "strongly agree," was used to rate the items.

Google Forms was the tool utilized to submit the survey to the responders. Each participant received a link to

the questionnaires via WhatsApp and email. It made clear the one-week timeframe that was assigned to the responders and guaranteed the privacy of their answers. According to Watt et al. (2018), 32.6% is the proper limit for a reply rate by % for online surveys.

Data Collection
For this study, a straightforward random selection seems to be the most appropriate sample strategy (Salkind, 2019). Eighty of the ninety managerial and non-managerial staff members from American Express, Selangor, Malaysia had their names drawn at random from an assortment using the chance method (Packham, 2015). An arbitrary number ranging from one and 90 was assigned to every one of the 90 employees; the remaining 80 were allocated to them. The members of the biggest group's subgroup were chosen at random, giving every member of the vast population a comparable likelihood of being chosen. Packham (2015) stated that this process resulted in, for the most part, an evenly distributed subset with a large prospective group that was usually devoid of discrimination.

A total of 80 questionnaires were distributed, with consideration paid to the sustainability of responses and the rate of return of respondents. A response return rate of 93.75% was obtained from the 75 questionnaires that were returned with complete responses.

Data Analysis
The Statistical Package for Social Sciences (SPSS), Version 27, is used for processing and interpreting the information contained in a data analysis matrix. Descriptive statistics, as well as inferential statistics, are both (2) categories of statistical techniques used. According to Watt et al. (2018), descriptive statistical techniques are used to characterize the basic choices of how to collect and evaluate data. As an illustration, descriptive statistics examine the study participants' demographic profile, taking note of the rate and percentage of responses.

Inferential statistics addresses the research questions and hypotheses (Said, 2018). Inferential statistics help in identifying and quantifying relationships between the variables of investigation, that is, the relationship between the degree of readiness and adoption of implementing AI software, Cloud technological advances, blockchain, and AI usage in the accounting industry.

Results

This section presents sets of results relating to the profile of respondents' experiences towards effects of AI on Accounting Performance, the characteristics of the total sample, and the comparison of participants regarding their experience based on the demographic characteristics (gender, age, race, working tenure and position).

Respondents' Demographic Profile: Table 1 displays a summary of the characteristics of the total sample of respondents who participated in the study.

Table 1: Respondents' Demographic Profile: n = 75

Variable	Frequency	Percentage
GENDER		
Males	32	42.7%
Females	43	57.3%
Total	**75**	**100%**
AGE		
Below 25	18	24.0%
26 - 34	26	34.7%

35 - 44	22	29.3%
45 - 54	3	4.0%
Above 55	6	8.0%
Total	**75**	**100%**
RACE		
Malay	24	57.3%
Indian	23	32.0%
Chinese	28	37.3%
Others	0	0.0%
Total	**75**	**100%**
WORKING TENURE		
Below 5 Years	18	24.0%
6 - 10	33	44.0%
11 - 15	15	20.0%
Above 15 Years	9	12.0%
Total	**75**	**100%**
POSITION		
Junior Executive	20	26.7%
Executive	20	26.7%
Senior Executive	21	28.0%
Manager	14	18.7%
Total	**75**	**100%**

Descriptive Statistics: Descriptive statistics were conducted, and Table 2 below displays the outcome. These provide the average mean scores of the respondents regarding their opinion on the effects of AI on the level of readiness and level of adoption on accounting performance from the perspective of Malaysian organizations.

Table 2: Descriptive Statistics

Variables	N	Mean		Std. Deviation
	Statistic	Statistic	Std. Error	Statistic
LEVEL OF READINESS				
AI SOFTWARE	75	2.8347	0.12044	1.04306
CLOUD TECHNOLOGY	75	2.9627	0.13335	1.15487
BLOCKCHAIN	75	2.9644	0.12676	1.09780
LEVEL OF ADOPTION				
AI SOFTWARE	75	2.8507	0.13158	1.13951
CLOUD TECHNOLOGY	75	2.9947	0.12546	1.08651
BLOCKCHAIN	75	3.0381	0.12573	1.08881
JOB EFFICIENCY	75	2.9280	0.12636	1.09428
AI IN THE ACCOUNTING FIELD	75	3.0133	0.12916	1.11856

The mean scores ranging from 2.8347, 2.9627, and 2.9644 were obtained from the level of readiness (AI Software, Cloud Technology and Blockchain) while 2.8507, 2.9947, 3.0381, 2.9280 and 3.0133 were obtained from the level of adoption (AI Software, Cloud Technology, Blockchain, Job Efficiency and AI in Accounting Field). Every variable's standard deviation was determined to be above 0.70, indicating that all respondents agreed with the claims made for every factor (Pallant, 2016).

Correlation Analysis: The correlation study looks at how strongly the independent variables level of readiness and adoption (AI Software, Cloud Technology and Blockchain) mediate variable job efficiency to the dependent variable of AI in the accounting field. Two variables were compared, and a correlation coefficient was calculated, yielding values between -1 and +1. As per the findings of Ratnasari et al. (2016), Table 3 below illustrates the interpretation of r values: $r < -0.20$ for weak negative correlation, $r < -0.30$ for moderate negative correlation, $r < -0.50$ for strong negative correlation, and $r < -0.90$ for very strong negative correlation. There are four types of positive correlations: weak ($r < 0.20$), moderate ($0.30 < r < 0.50$), strong ($0.60 < r < 0.80$), and extremely strong ($0.90 < r < 1.00$).

Table 3: Correlation Analysis

No	Research Questions	Findings
Q1	Is there a relationship between the readiness and adoption level of Malaysian organizations for using AI software applications in the accounting field?	The finding for the level of readiness and adoption of using AI software indicates which is r= 0.670, p < 0.01 and r= 0.658, p< 0.01. There is a strong relationship between the level of readiness and the adoption of AI software in the accounting field.
Q2	Is there a relationship between the readiness and adoption level of Malaysian organizations for using cloud technology in the accounting field?	The finding for the level of readiness and adoption of using cloud technology indicates which is r= 0.681, p < 0.01 and r= 0.808, p < 0.01. There is a strong relationship between the level of readiness and the adoption of cloud technology in the accounting field.
Q3	Is there a relationship between the readiness and adoption level of Malaysian organizations for using blockchain in the accounting field?	The finding for the level of readiness and adoption of using blockchain indicates which is r= 0.716, p < 0.01 and r= 0.735, p < 0.01. There is a strong relationship between the level of readiness and the adoption of using blockchain in the accounting field.

| Q4 | Is there a significant effect of the mediating variable of job efficiency on the level of readiness in the accounting field? | The finding for the level of readiness and job efficiency indicates which is r= 0.776, p < 0.01. There is a strong relationship between the level of readiness and job efficiency in the accounting field. |
| Q5 | Is there a significant effect of the mediating variable of job efficiency on the level of adoption in the accounting field? | The finding for the level of adoption and job efficiency indicates which is r= 0.776, p < 0.01. There is a strong relationship between the level of adoption and job efficiency in the accounting field. |

Table 4: Regression Analysis of Level of Readiness (AI Software, Cloud Technology and Blockchain), Job Efficiency in the Accounting Field

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	Level of readiness	1.103	1.183		.933	.354
	AI Software	.114	.115	.108	.988	.327
	Cloud Technology	.150	.111	.158	1.348	.182
	Blockchain	.146	.112	.175	1.298	.199
	Job Efficiency	.472	.097	.483	4.882	<.001

a. Dependent Variable: AI in the accounting field

According to Jack (2019), any beta percentage of more than 10 percent indicates a direct influence on the moderating variable. The impact proportion between the variables is shown by a percentage greater than 10 percent (Landry et al., 2015). Table 4 indicates that for AI Software, there is a direct effect of 0.108 in the accounting field (DV) (B=.108, p=.327). This effect is noteworthy since 11 percent is greater than 10 percent. Since 16 percent is greater than 10 percent, cloud technology (B=.158, p=0.182) indicates that there is a direct influence toward DV by 0.158 as if there is a one-unit increase in cloud technology. This is significant. With a one-unit rise, Blockchain (B=.175, p=.199) shows a direct effect toward DV of 0.175 where it is significant since 18 percent is greater than 10 percent. The indirect impact of job efficiency (B=.483, p=<.001) on DV is shown to be 0.483 with a unit increase, although this effect is statistically significant.

Table 5: Regression Analysis of Level of Adoption (AI Software, Cloud Technology and Blockchain), Job Efficiency in the Accounting Field

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	Level of adoption	.350	1.058		.331	.742
	AI Software	-.087	.101	-.091	-.867	.389
	Cloud Technology	.468	.106	.465	4.417	<.001
	Blockchain	.188	.074	.261	2.532	.014
	Job Efficiency	.301	.095	.308	3.163	.002

a. Dependent Variable: AI in the accounting field

Any beta percentage greater than 10 percent, as defined by Jack (2019), suggests a direct impact on the variable that acts as a moderator. More than 10% of the percentage indicates the influence proportion among the variables (Landry et al., 2015). Table 5 shows that the accounting field (DV) has a direct influence of -0.091 for AI Software (B=-.091, p=.389). Since 9 percent is less than 10 percent, this effect is not significant. Cloud technology (B=.465, p=<.001) suggests that there is a direct effect toward DV by 0.465, as if there is a one-unit rise in cloud technology, as 47 percent is bigger than 10 percent. Blockchain (B=.261, p=.014) has a direct influence on DV of 0.261 with a one-unit increment; this effect is significant because 26% is higher than 10%. With one unit increase, the indirect impact of job efficiency (B=.308, p=.002) on DV is shown to be 0.308, while statistically not significant.

Table 6: Summary Findings for Hypotheses

No	Hypotheses of Study	Alternate Hypotheses
H1	The significant relationship between the readiness level of AI software applications in the accounting field.	Accepted
H2	The significant relationship between the readiness level of cloud technology in the accounting field.	Accepted
H3	The significant relationship between the readiness level of blockchain in accounting field.	Accepted
H4	The significant relationship between the adoption level of AI software applications in the accounting field.	Accepted
H5	The significant relationship between the adoption level of cloud technology in the accounting field.	Accepted
H6	The significant relationship between the adoption level of cloud Blockchain in the accounting field.	Accepted
H7	There is a significant mediating variable effect between job efficiency towards the relationship between the level of readiness to use technologies in the accounting field.	Accepted
H8	There is a significant mediating variable effect between job efficiency towards the relationship of level of adoption of using technologies in the accounting field.	Accepted

Discussion

The results of the study have shown a positive strong relationship between the level of readiness (AI Software, Cloud technology and Blockchain) and level of adoption (AI Software, Cloud technology and Blockchain) in the accounting field towards employees' job efficiency. All eight hypotheses (H1 to H8) showed a significant relationship and were all accepted. The outcome of the moderating effect between working tenure and level of readiness presents a direct impact. However, the level of adoption shows an indirect impact on job efficiency whereas job efficiency shows a direct impact.

5. Managerial Implications and Recommendations

Rules and incentives are paramount to the growth and success of the performance of the organization. Regarding the firms, it is advised that they utilize the study's conclusions as a guide to improve employee job efficiency. Giving out rewards is a good way to keep people motivated and loyal. To encourage job happiness at work, maintaining current practices involves staff participation and training. Meanwhile, it is also advisable to expand the research to include Sabah and Sarawak in east Malaysia as well as the Malaysian Peninsula to have a more dynamic and broad scope. These two states are home to a diverse range of ethnic groups, which may provide novel study findings and differing viewpoints. The study's expansion to further states will also produce

a broad understanding of Malaysia's overall development in the deployment of digital and electronic marketing.

Conclusion

The integration of artificial intelligence (AI) into accounting practices has notably transformed the landscape of financial management within Malaysian organizations. This study reveals several critical points regarding the impact of AI on accounting performance such as significantly improving the efficiency of the accounting process, reduction in operational costs and informed decision-making. Companies should prioritize providing more tools, such as AI Software, Cloud technology and Blockchain. To boost workers' job happiness, which will in turn raise their commitment, drive, and propensity for increased productivity inside the company. Greater profit returns will result from this, enabling the company to compete and set an example for other businesses. This will then draw the interest of other firms to enhance operations and a receptive attitude toward others learning about the strategies, which will ultimately benefit workers' and employers' businesses and provide the company with a competitive edge.

In conclusion, AI has profoundly impacted the performance of accounting functions within Malaysian organizations, driving efficiency, accuracy, and strategic decision-making while also presenting challenges that must be managed. The future of accounting will likely continue to evolve with AI advancements, necessitating a proactive approach to embracing technological change and harnessing its full potential. This highlights the main effects of AI on accounting performance while acknowledging both the advantages and challenges associated with its implementation.

Abstract: Malaysian banking users have encountered negative experiences while adopting traditional bank services. Several customers and businesses face limited access to traditional banking products and services due to factors such as low or irregular income, bad credit, or a lack of conveniently located banks. The acceptability of digital banking products and services in Malaysia is currently unknown and inadequate due to the general lack of familiarity among Malaysians with the notion of digital banking. Conventional methods of analyzing consumer behavior, which primarily consider historical data and current resources, will not result in the achievement of branchless banking in the future. This paper presents a framework that examines how various factors such as performance expectancy, effort expectancy, social influence, facilitating condition, hedonic motivation, price value, and habit may influence behavioral intention. Additionally, the framework considers gender as a moderator variable. The results of this study are anticipated to expand the existing body of knowledge on behavioral intention and bring advantages to marketers and digital banking providers.

Keywords: *Performance Expectancy, Effort Expectancy, Social Influence, Facilitating Condition, Hedonic Motivation, Price Value, Habit, Gender, UTAUT2*

1. Introduction and Background

The emergence of digital banking is revolutionizing the traditional banking operations and financial services that were previously limited to physical bank branches (Windasari et al., 2022). Every aspect of digital banking, including account opening, money transfers, and various financial services, may be conveniently carried out using smartphones without the necessity of physically visiting a bank branch (Riadi et al., 2023).

Survey done by McKinsey & Company (2021) Found that most Malaysians expect to continue or expand their use of mobile and online banking channels when the epidemic of Coronavirus disease 2019 (COVID-19) subsides, as shown in Figure 1. It suggests that 36 percent of respondents will visit their branch less often and 6% will never visit after the outbreak.

Figure 1: Post-COVID Bank Services Usage Frequency
Nevertheless, a significant majority of consumers (60%) still opt to maintain their primary banking accounts with traditional banks rather than digital banks as can be seen in Figure 2. Traditional banks possess well-established reputations and extensive histories, which can foster a feeling of confidence and safety. Several individuals may prefer traditional banks that they have been familiar with for a long time. Certain individuals place importance on personal interactions and the personalized assistance provided by traditional banks. They may have a preference for accessing a physical branch to seek assistance with intricate financial issues. As digital banks continue to expand and develop, these aspects may change. As people become more accustomed to technology and digital banking becomes more ingrained in daily life, the balance between traditional and digital banking preferences may shift.

Figure 2: Comparison of Digital Banks and Traditional Banks
Source: Survey Consumer Payment Attitudes Study – VISA (2022)

A study conducted by Barquin et al. (2021) Revealed that despite customer interest in online banking products in Malaysia, banks have not successfully translated this desire into digital sales. The reason for this is that just 20 to 30 percent of the participants reported having purchased a financial product, such as a savings account, loan, or credit card, through a mobile app or online platform. Approximately 70% of respondents express a willingness to utilize digital channels for purposes other than commerce, as depicted in Figure 3.

Figure 3: Digital Sales Behavior Across Asia-Pacific including Malaysia
Source: McKinsey & Company (2021)

Several studies have been conducted in developing countries such as Pakistan (Khan, 2022), Bangladesh (Ashraf, 2022), India (Divya Meena et al., 2017), Vietnam (Nguyen & Dang, 2018; Nguyen et al., 2020), and Indonesia (Anggraeni et al., 2021; Rachmawati et al., 2019; Setiyono et al., 2019; Sintha, 2021) to investigate

the intention to adopt digital banking. Nevertheless, there is a scarcity of research investigating the determinants that impact consumers' intention to use digital banking, particularly within the Malaysian setting (Azmi et al., 2021; Suhaimi & Hassan, 2019; Tiong, 2020).

The introduction of digital banking services is anticipated to broaden and enhance financial inclusion, enabling individuals to access financial services without constraints of time and location. (Maulidya & Afifah, 2021). For digital banks to achieve success in Malaysia, they must possess a comprehensive understanding of the specific requirements of the target demographics they cater to. In addition, it is imperative for them to actively contribute to the advancement of financial literacy and financial inclusion throughout the entire nation (KPMG, 2020).

To promote a wider adoption of digital banking, it is crucial to identify the specific areas that require more focus in the implementation process. Gaining insight into the factors that drive customers to adopt digital banking can assist governments in promoting financial inclusion and empowering individuals to have greater control over their financial well-being, particularly in recovering from setbacks such as the COVID-19 outbreak. The purpose of this study is to analyze the UTAUT2 model of the behavioral intention of digital banking with gender as a moderator variable.

2. Literature Review

The Extended Unified Theory of Acceptance and Use of Technology (UTAUT2): Venkatesh et al. (2012) Created the Extended Unified Theory of Acceptance and Use of Technology (UTAUT2) to specifically examine how consumers perceive and utilize technology. This theory considers the acceptance of innovations for personal use and has been further explored by Alalwan et al. (2017), Baptista & Oliveira (2015), and Merhi et al. (2019). While UTAUT only accounts for 40% to 52% of the variation in customers' adoption of focal technology, UTAUT2 accounts for 56% to 74% of the variation in consumers' behavioral intentions. (Shankar et al., 2016; Venkatesh et al., 2012). Several researchers have acknowledged that the UTAUT2 is comprehensive and superior since it encompasses all the essential factors that predict the adoption of any technological innovation. (Tamilmani et al., 2021). Furthermore, the lack of the moderator variable which is age and experience does not damage the theoretical model when investigating the direct influence within the UTAUT2 model (Dwivedi, 2017).

Behavior Intention: Parkins et al. (2018) Defined behavioral intention as an individual's plan for the future. Research suggests that the decision to use technology is influenced by the behavioral intention to use it (Rizun & Strzelecki, 2020) and the adoption of a technology innovation is influenced by individual motivation (Turner et al., 2010). Prior studies conducted by several researchers (Parkins et al., 2018; Perri et al., 2020) have demonstrated that intention is the primary factor in determining the actual adoption of technology (Vairetti et al., 2019). Behavioral intention is well recognized as a crucial factor in determining the actual use and willingness to adopt new technologies (Ajzen, 1991; Venkatesh et al., 2003).

Performance Expectancy and the influence of gender as moderator variable: Performance expectancy, as defined by Davis et al. (1989) and Venkatesh et al. (2003), is a measure of consumer confidence that indicates the extent to which customers believe that using a specific platform will improve their performance. Wu and Ho (2022) Found that digital banking users believe that digital features can enhance problem-solving by providing rapid, convenient, and efficient solutions, thanks to their sophisticated technological attributes. A study conducted by Khan (2022) investigated the impact of behavioral intention and usage behavior on digital banking in Pakistan and Mainland China. Behavioral intention to adopt digital banking is influenced by performance expectancy both in Pakistan and China. As a result, it is hypothesized that:
H1: Performance expectancy positively influences banking consumers' behavioral intention to adopt digital banking.
H1a: The effect of performance expectancy on banking consumers' behavioral intention to adopt digital banking is moderated by gender.

Effort Expectancy and the influence of gender as a moderator variable: Effort expectancy is defined as the understanding that an individual can utilize information technology systems without any effort (Venkatesh &

Davis, 2000) and they are easy to use (Anggraeni et al., 2021). The study conducted by Windasari et al. (2022) centers around the examination of young consumers belonging to the demographic cohorts of Generation Y and Generation Z. The study was conducted in Indonesia due to the twofold increase in the utilization of digital banking within the past three years. The results indicated that consumers' willingness to embrace a digital-only bank is influenced positively by their perception of how easy it is to use digital-only banking services. Contrary to this, a study conducted by Merhi et al. (2019) found that effort expectancy does not have a major role for Lebanese participants, but it does have a mildly significant impact on English participants. Based on these analyses, it is hypothesized that:

H2: Effort expectancy positively influences banking consumers' behavioral intention to adopt digital banking.
H2a: The effect of effort expectancy on banking consumers' behavioral intention to adopt digital banking is moderated by gender.

Social Influence and the Influence of Gender as a Moderator Variable: Social influence is defined as an individual's perception of how their relatives or friends would react to their use of technology (Venkatesh et al., 2003), as well as the extent to which other individuals such as family members, friends, and colleagues, as well as external factors such as the environment, advertisements, and feedback from real customers, influence their beliefs (Khan, 2022; Rembulan & Firmansyah, 2020; Sharma et al., 2017). Study done by Alkhowaiter (2020) This is to investigate the variables that impact the favorable attitude, intention to adopt, and actual usage of mobile payments in GCC nations. Regarding attitude, social influence was found to have a relatively moderate correlation, whereas its connection with behavioral intention was significantly stronger. Consequently, it is hypothesized that:

H3: Social influence positively influences banking consumers' behavioral intention to adopt digital banking.
H3a: The effect of social influence on banking consumers' behavioral intention to adopt digital banking is moderated by gender.

Facilitating Condition and the Influence of Gender as a Moderator Variable: Facilitating condition refers to the availability and accessibility of resources that are crucial for promoting the adoption of a specific behavior on the platform (Rahman et al., 2020) With an assumption that there is an adequate infrastructure in place to facilitate the usage of the technology (Songkram, 2023). Infrastructure encompasses knowledge, management, organization, and technical support capabilities (Nikou & Economides, 2017). Thusi and Maduku (2020) Conducted a study on Generation Y retail banking users to investigate the factors that influence the uptake and utilization of mobile banking services. The desire of Generation Y to use mobile banking apps is significantly influenced by factors such as performance expectancy, facilitating conditions, and habit. As a result, it is hypothesized that:

H4: Facilitating conditions positively influence banking consumer's behavioral intention to adopt digital banking
H4a: The effect of facilitating conditions on banking consumers' behavioral intention to adopt digital banking is moderated by gender.

Hedonic Motivation and the influence of gender as moderator variable: Hedonic motivation pertains to the pleasure one experiences from the activity, such as an aesthetically pleasing and visually stunning design of the platform, which stimulates the consumer's inclination to adopt technological advancement (Anggraeni et al., 2021). The study conducted by Hassan et al. (2022) Revealed a statistically significant positive correlation between hedonic motivation and the intention to use health information applications. This finding aligns with other research that demonstrated consumers derive satisfaction from using health information applications. (Brown & Venkatesh, 2005; Venkatesh et al., 2012). Consumers who participate in mobile commerce are driven by hedonic motivation, which is a significant factor for them. (Vinerean et al., 2022). Based on these analyses, it is hypothesized that:

H5: Hedonic motivation positively influences banking consumers' behavioral intention to adopt digital banking.
H5a: The effect of hedonic motivation on banking consumers' behavioral intention to adopt digital banking is moderated by gender.

Price Value and the Influence of Gender as a Moderator Variable: Price value refers to the consideration that consumers give to the amount of money they will need to invest to use an application, as well as their

perception of the application's worth (Venkatesh et al., 2012). Adopting technology in the consumer's setting may result in extra costs for the consumer (Alalwan et al., 2017). The UTAUT2 model includes the price value as it has an impact on consumer intention to adopt, as customers are the ones who suffer the expenses (Venkatesh et al., 2012). The study conducted by Chaveesuk et al. (2022) reveals that prices have a significant impact on the behavioral intention to adopt massive online open courses (MOOCs) in Poland. In addition, the pricing value of a telemedicine application has a significant role in determining its adoption by individuals, as shown by Rahi (2022) and consistent with prior studies by Baudier et al. (2020) and Gao et al. (2015). Consequently, it is hypothesized that:

H6: Price value positively influences banking consumers' behavioral intention to adopt digital banking.

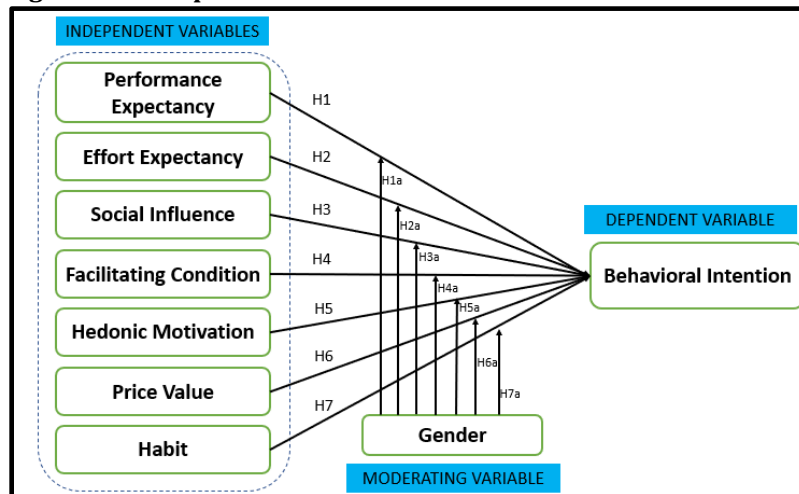
H6a: The effect of price value on banking consumers' behavioral intention to adopt digital banking is moderated by gender.

Habit and the influence of gender as moderator variable: A habit can be defined as a learned behavior that is triggered by an unintended stimulus and provides rewarding outcomes (Merhi et al., 2019). Consequently, consumers will cultivate a propensity for deploying technology with more frequency. In the study done by Samsudeen et al. (2022) Surveyed Islamic Banking consumers in Sri Lanka to identify the elements that impact their inclination to adopt mobile banking services. They employ the Unified Theory of Acceptance and Use of Technology (UTAUT2) as their framework. There is a significant correlation between habit and customer adoption intention. This indicates that the way customers use technology significantly influences their willingness to embrace mobile banking. Based on these analyses, it is hypothesized that:

H7: Habit positively influences banking consumers' behavioral intention to adopt digital banking.

H7a: The effect of habit on banking consumers' behavioral intention to adopt digital banking is moderated by gender.

Conceptual Model
In developing nations, digital banking offers a distinct perceived benefit compared to its application in wealthy countries. (KPMG, 2020). Following the approval from the Minister of Finance, Bank Negara Malaysia (BNM) publicly released the names of the five applicants who were granted digital bank licenses on April 29, 2022 (Hen, 2022). This news garnered extensive attention to the potential of digital banking in Malaysia. Understanding the requirements of Malaysian customers in certain target demographics is crucial for ensuring the efficiency of digital banking in the country. The researchers have revised the framework of UTAUT2 by incorporating a single moderator, namely gender as can be seen in Figure 4.

Figure 4: Conceptual Model


3. Methodology

A self-administered questionnaire will be employed to gather data on the suggested model. This study will use a Purposive sample technique to select a non-probability sample frame from the specified population. The

approach was selected because it will assist researchers in comprehending consumers' intention to adopt digital banking. The completed surveys will be evaluated using the Statistical Package for Social Science (SPSS) and the Structural Equation Model (SEM).

4. Conclusion

Digital banking is essential in the banking sector as it enhances operational efficiency and customer service, providing consumers with a convenient and user-friendly banking experience. (Ahn & Lee, 2019). It improves the efficiency and effectiveness of the business model by decreasing operating costs, such as the inefficiencies of using paper-based documents for billing, credit card statements, receipts, and other uses. The banking business has been significantly influenced by information technology, leading to the development of user-friendly banking systems. This has enabled individuals without bank accounts to access new markets and benefit from various financial services. (Zahid et al., 2021). Based on the results of a survey conducted by PricewaterhouseCoopers (PwC) among banking consumers in Malaysia, it was found that the consumers had a negative experience when accessing traditional banking services. (PwC, 2019). Consumers exhibit a lack of commitment toward their existing financial institutions and will seek alternatives if their needs are not fulfilled. (Marcous, 2014). Thus, this proposed study aims to understand how performance expectancy, effort expectancy social influence, facilitating condition, hedonic motivation, price value and habit can influence behavioral intention with gender as a moderator variable.

Abstract: Today's digital-centric world has spawned a new phenomenon called 'technostress', a stress condition due to constant changes, advancements and reliance on technology. Technostress is a rising issue in terms of its influence on employee well-being as technostress has been causing the deterioration of employee well-being. There is an urgency to understand and study the influence of technostress on employee well-being so that measures can be taken to rectify the matter and improve employee well-being. This study aims to examine which technostress creators have the most influence on employee well-being among Generation Z employees in Malaysia. Past literature to understand employee well-being, technostress and the relationship between the two were studied. Technostress creators were identified as techno-overload, techno-complexity, techno-uncertainty, and techno-insecurity. The study found that techno-uncertainty is the technostress creator that has the most influence on Generation Z employees' well-being in Malaysia. Data collection was conducted by using a virtual questionnaire. 135 respondents among Generation Z employees in Malaysia participated in this study.

Keywords: *Technostress, employee well-being, Generation Z employees, techno-overload, techno-complexity, techno-uncertainty, techno-insecurity.*

1. Introduction and Background

Employee well-being is a concept that is particularly familiar to those involved in human resources. It encompasses various aspects of an employee's health, including physical health, mental health, emotional health, and spiritual health. Additionally, it refers to an employee's overall experience and satisfaction with their job and organization (Mertala et al., 2023). When employees have a positive experience and satisfaction with their job and the organization, their well-being is considered high. According to Wang et al. (2022), employee well-being is a crucial outcome of organizational studies and is tied to unlocking human potential. This implies that employees in good health are more likely to feel empowered, motivated, and productive, ultimately enhancing the organization's overall performance. Therefore, organizations should prioritize employees' well-being and investigate factors that influence it to address any challenges that arise.

A growing concern is the impact of technology-induced stress, or technostress on employee well-being. Despite advancements in technology, there is limited research on the extent of technostress's influence on employee well-being (Wang et al., 2022). This study examines the relationship between technostress and employee well-being. Employee well-being can be simply described as a positive work-related experience. However, its significance extends beyond the individual, affecting an organization's health and output. In a healthy organization, both performance and employee well-being can co-exist and reinforce each other (Singh & Jha, 2021). As Generation Z enters the workforce, organizations must consider unique approaches to enhance their well-being, given their generational differences.

In today's digital era, technostress is a factor that may influence employee well-being. Constantly adapting to new or complex technology leads to technostress, which Tiwari (2020) defines as the inability to cope with ever-evolving information and communication technologies (ICTs). Technostress consists of four creators, namely, techno-overload, techno-complexity, techno-uncertainty and techno-insecurity (Wang et al., 2020). These creators can cause stressful situations related to technology use, negatively impacting employee well-being by causing burnout, feelings of inadequacy and job security fears. Generation Z, as digital natives, is likely

to experience technostress due to their constant interaction with technology (Putriani & Apriani, 2022). This raises questions about technostress's impact on Generation Z's well-being in the workforce, considering the rapid technological changes shaping their values and behavior (Pichler et al., 2021).

There is a lack of literature providing sufficient insights into the relationship between technostress and employee well-being (Wang et al., 2022). Furthermore, Yener et al. (2020) note that previous research on technostress and workplace harm lacks clarity and conclusive answers. This suggests that existing studies do not adequately address the relationship between technostress and employee well-being, particularly among Generation Z employees in Malaysia. This study aims to identify which technostress creators (techno-overload, techno-complexity, techno-uncertainty, techno-insecurity) most significantly affect employee well-being, among Generation Z employees in Malaysia.

Following the introduction of this paper, the subsequent topics will explain the literature related to the topic, research methods conducted by the researchers, findings, and discussion of the research findings. This paper also will explain the practical implications of the research and recommendations for future research.

2. Literature Review

Past studies have distinguished two philosophies of well-being: (1) the hedonic approach, which focuses on maximizing pleasure and making life more enjoyable, and (2) the eudaimonic approach, which emphasizes meaning, life purpose and self-actualization (Pataki-Bittó & Kun, 2022). Employee well-being tends to align more with the hedonic approach, encompassing cognitive and affective job evaluations (Bartels et al., 2019). This happiness-oriented perspective defines employee well-being as subjective experiences, measured by indicators such as positive affect and job satisfaction (Zhang et al., 2020). Therefore, this study is grounded in the hedonic approach, presenting employee well-being as a positive work experience.

Employee Well-Being
Although there is no single definition of employee well-being (Tuzovic & Kabadayi, 2020), it can generally be categorized into two main definitions: positive experience and overall experience. Hasan and Kashif (2020) define employee well-being as a set of positive feelings that arise when employees feel they contribute to their work's development. Rurkkhum (2023) simplifies this definition by stating that employee well-being involves positive experiences gained as members of an organization. Additionally, Mahomed et al. (2023) define employee well-being as a positive emotional state resulting from evaluating one's work or work experience.

On the other hand, Wang et al. (2022) define employee well-being as overall job satisfaction, where employees assess and balance their positive affect and negative affect. Luu (2020) describes it as the overall quality of an employee's experience and functioning at work. Similarly, Islam and Amin (2021) define employee well-being as the optimal psychological experience and functioning of individual employees. Well-being is further recognized as the overall quality of employee experience and functioning, which is crucial for positive individual and organizational outcomes (Sutton & Atkinson, 2023).

Dimensions of Employee Well-being
Pataki-Bittó and Kun (2022) identify three key dimensions in employee well-being research: subjective well-being, physical and mental health, and social well-being. Conversely, Singh and Jha (2021) distinguish two dimensions: employee well-being in terms of work engagement and burnout. Meanwhile, Nabawanuka and Ekmekcioglu (2021) highlight three fundamental aspects of employee well-being: life, work and psychological needs in both life and work domains.

This study examines employee well-being within the workplace context, specifically focusing on the influence of technostress. Employee well-being in the workplace can encompass various aspects such as human functioning, safe employment basic needs, expression of virtues/character strengths, as well as the self-actualization and fulfillment of a meaningful vocation or integrating spirituality with work (Nabawanuka & Ekmekcioglu, 2021). Research also indicates a close link between employee well-being and various performance metrics like productivity, employee turnover, job satisfaction, stress and work-life balance

(Tuzovic & Kabadayi, 2020). Improving employee well-being is associated with positive outcomes such as increased employee commitment and enhanced individual performance (Singh & Jha, 2021). Consequently, contemporary organizations are urged to view employee well-being as a critical business concern and actively foster positive and enriching work environments (Jaiswal & Arun, 2021).

On the flip side, ignoring employee well-being leads to adverse outcomes. For instance, stress can deteriorate an employee's well-being. When this happens, productivity drops, negatively affecting the organization. Tuzovic and Kabadayi (2020) highlight employee well-being as critical for employees and employers, emphasizing its importance. Ensuring an employee's well-being is essential not only for the employee's health but also for the organization's overall performance (Singh & Jha, 2021). This is supported by Zhong et al. (2019) who stated that employee well-being is crucial to the survival and development of organizations.

Generation Z Employee Well-being
Generation Z is the latest generation to enter the workforce. While there is no universally agreed-upon age range, they are generally considered to be born from the mid-1990s to the early 2010s. Specifically in Malaysia, Generation Z includes those born between 1998 – 2002 (Tjiptono et al., 2020). This generation is known for its extensive use of digital technology, having never experienced a time before the internet (Seibert, 2021).

Generation Z is well-known for their commitment to maintaining well-being and mental health, and as they enter the workforce, they are recognized for demanding work-life balance. This highlights that Generation Z prioritizes well-being as employees. Organizational support for psychological health and well-being greatly benefits Generation Z employees (Pichler et al., 2021). Described as the most achievement-oriented, Generation Z is economically better off, highly educated, and very diverse (Harris, 2020) demonstrating their potential to strive in the workplace.

However, mental health issues and well-being challenges are also prevalent among Generation Z. This is likely because Generation Z employees are more open about their mental health struggles and the treatment or therapy they receive (Bernecker & Becker, 2021), viewing it not as a stigma but as an effort enhance well-being. In contrast, older generations may perceive Generation Z's dedication to well-being as sensitivity or an inability to adapt. Therefore, it is crucial to study Generation Z's employee well-being in the workplace, as they will shape the future workforce.

Technostress on Employee Well-being
Currently, the potential impact of technostress on employee well-being is gaining attention (Mohammed, 2022). Wang et al. (2022) assert that technostress negatively affects employee well-being, a view shared by Pansini et al. (2023), who also link technostress to negative effects on behavior, thoughts, attitude, and overall well-being. According to Rurkkhum (2023), organizations must adapt to new routines and methods, heavily relying on technology to thrive. Garg et al. (2022) highlight that prolonged screen time during the pandemic has exacerbated technostress, leading to reduced cognitive performance, discomfort, physical health issues, and decreased mental capacity – all indicative of poor well-being. Therefore, examining the relationship between technostress and employee well-being is crucial.

Technostress combines the terms *technology* and *stress*. According to El Kiassi and Jahidi (2023), Brod (1984) coined the term, defining it as a modern disease stemming from the inability to healthily manage new computer technologies. Technostress is characterized as a negative individual phenomenon caused, either directly or indirectly, by technology (Dahabiyeh et al., 2022). Originating from Anglo-Saxon literature, the concept of technostress has seen increased study over the decades, although it remains under development (Kiassi & Jahidi, 2023). The literature explains technostress as resulting from interactions with technology that lack usability or from inadequate organizational conditions for its use. Additionally, Garg et al. (2022) suggest that technostress arises when individuals struggle to adapt to technological advancements (Garg et al., 2022).

Definition of Technostress: Ibrahim et al. (2023) define technostress as any adverse effects on human behaviors, thoughts, attitudes, and psychology imposed by technology use. Meanwhile, Bondanini et al. (2020) simplify the definition of technostress as stress experienced by end users in organizations because of the use of their technology. Sharma and Gupta (2022) on the other hand define technostress as the mental stress and the negative psychophysical effects that an individual can experience due to the use of information and communications technology (ICT). As the scope of this study is narrowed down to actively working employees, technostress is defined as a phenomenon that is described as the stress that an employee feels owing to the constant presence and change of ICT (Harunavamwe & Kanengoni, 2023). Prior et al. (2023) also define technostress in a workforce sense as workers' stress caused by using digital platforms or ICTs.

Technostress Among Generation Z: Despite being known as the first generation of true digital natives who grew up alongside the advancement of technology, Generation Z has been found to face the phenomenon of technostress (Prior et al., 2023). Lee (2023) attributes the technostress in Generation Z to be caused by rapidly changing digital technologies. Meanwhile, Generation Z's constant technology usage especially on their smartphones has been deemed as a cause of technostress, followed by an overload of social media usage (James et al., 2023). The overload of technology usage heightened during the COVID-19 pandemic, and it led to negative effects on the psychological well-being of Generation Z which is considered as a manifestation of technostress (Wu et al., 2021). The study further states that although the pandemic witnessed an increase in technology usage from Generation Z, they also demanded a digital detox due to the technostress that they were facing because of the lockdown.

Technostress Creators
Ramesh et al. (2021) describe aspects of technology that create stress as technostress creators. This indicates that technostress comprises technostress creators as its dimensions. Several past literature name four technostress creators in common: techno-overload, techno-complexity, techno-uncertainty and techno-insecurity (Bondanini et al., 2020; Korzynski et al., 2020; Wang et al., 2020).

Techno-Overload: Techno-overload is one of the technostress creators identified for this study. Korzynski et al. (2020) simply define techno-overload as a higher workload generated by ICTs. Further defined by Wang et al. (2022), techno-overload refers to a stressful situation where employees have to work longer and faster than usual due to technology. The literature further describes techno-overload as a condition where employees have to spend more time trying to adapt to new technologies that are introduced to their job scope. This is supported by another definition by Shadbad and Biros (2020) where techno-overload is said to occur when users work more, longer and faster due to IT use. A more detailed definition refers to techno-overload as when technology requires employees to work longer and faster, characterized by the completion of more work in less time, information overload and multitasking (Ramesh et al., 2021). El Kiassi and Jahidi (2023) define techno-overload as the increased workload, higher work speed, or change in work habits brought about by new technologies.

Similarly, techno-overload is also said to be experienced when ICT forces users to work faster and longer. (Harunavamwe & Kanengoni, 2023). For instance, Hwang et al. (2021) who studied security technostress give an example of techno-overload occurring when policies or systems require the performance of additional behaviors for document security beyond rudimentary word-processing work. Another example was provided by Pullins et al. (2020) in a sales context whereby techno-overload is described as the stress-creating condition where the sales professional must do additional tasks, faces an increase in the repertoire, ambit and scope of the role and extra work solely due to the use of technology.

Rasool et al. (2022) find that techno-overload has a negative influence on employee well-being whereby techno-overload causes a loss of focus at work and a decline in productivity. According to Wang et al. (2022), there is a negative relationship between techno-overload and employee well-being. The never-ending stream of new information and new concepts to learn and adapt to may affect an employee negatively. This is especially caused by how techno-overload results in longer work hours and a faster work pace. Techno-overload may physically affect an employee in terms of causing them to fall sick due to the constant chase at work. It was also found by Hang et al. (2022) that there is a significant relationship between techno-overload and employee well-

being. Thus, for this study, the actual relationship between techno-overload and employee well-being will be identified.

H₁: There is a significant relationship between techno-overload and employee well-being.

Techno-complexity: Techno-complexity is another technostressor. It is difficult to learn to use ICTs (Korzynski et al., 2020). Wang et al. (2022) define techno-complexity as where employees perceive the complexity of using the technology and experience feeling inadequate about their existing technology skills. Some employees may find modern and new technology to be very complex. Even if they have previously worked with technology, being unable to cope with how complex technology can become may cause the employees to feel like their skills have not been enough. The feelings of inadequacy related to techno-complexity are also linked to the definition by Ramesh et al. (2021) where techno-complexity refers to situations when employees feel inadequate because of the time and effort spent in learning and understanding complex technology. Besides that, El Kiassi and Jahidi (2023) define techno-overload as the inability to learn or manage the complexity of new technologies.

According to Bondanini et al. (2020), techno-complexity is where the technology is so inherently complex that users find it difficult to understand resulting in the users feeling incompetent. Techno-complexity also describes the complexity associated with ICT, which may decrease employee work efficacy whilst increasing the time needed to learn and understand various aspects of ICT (Harunavamwe & Kanengoni, 2023). The idea that techno-complexity may become highly time-consuming is further supported by Shadbad and Biros (2020) whereby the study states that techno-complexity refers to circumstances in which a user is inexpert in using IT and needs to spend time and energy to gain knowledge about IT.

Wu et al. (2021) believe that feelings of complexity may lead to more mistakes and may reduce productivity. An example scenario related to techno-complexity is when management often requires employees to spend additional time and effort to understand complex technology concepts and terms and follow standardized processes and methodologies regardless of their work duties (Hwang et al., 2021). Techno-complexity can be said to primarily occur amongst older generations who are unfamiliar with the advancements of technology as well as employees who do not usually interact with technology in their daily lives. Hwang et al. (2021) support this by stating that older workers or those with longer professional experience reported greater difficulty with the increase in technological complexity for executing tasks.

The difficulty of understanding how complex technology may be able to lower an employee's self-esteem due to feelings of incompetence and inadequacy. A low self-esteem will negatively affect an employee's well-being. Therefore, Wang et al. (2022) states that there is a negative relationship between techno-complexity and employee well-being. Hang et al. (2022) support this by observing that there is a significant relationship between techno-complexity and employee well-being. This study aims to identify whether there is a relationship between techno-complexity and employee well-being.

H₂: There is a significant relationship between techno-complexity and employee well-being.

Techno-Uncertainty: Another technostressor that will be studied is techno-uncertainty. Simply put, techno-uncertainty is related to new ICT developments (Korzynski et al., 2020). According to Wang et al. (2022), techno-uncertainty is feelings of uncertainty due to the pace at which software, hardware and computer networks are constantly changing or evolving. This uncertainty may cause an employee to feel restless as well as feel a lack of stability; they might feel that even if they master a certain technology, there may be advancements in the future that would have to cause them to start from square one all over again. Techno-uncertainty is said to occur when users feel unsettled due to frequent organization-wide upgrades and accompanying software and hardware changes. (Ramesh et al., 2021) Furthermore, techno-uncertainty is also similarly defined as the constant changes in computer hardware and software (El Kiassi & Jahidi, 2023).

Bondanini et al. (2020) explain techno-uncertainty as ambiguity around expectations related to changes, particularly about technology. Employees may not know what to expect from time to time, especially when technology happens to sprout a new advancement or evolution without a warning. This is supported by Hang et al. (2022) explanation of techno-uncertainty where employees feel organizations move from one cycle to another with reduced time between systems upgrades, leaving them unsettled. Shadbad and Biros (2020)

further support this by stating: "Techno-uncertainty relates to users who feel uncertain due to the constant change/upgrades of IT."

Techno-uncertainty involves the continuous changes or upgrades in ICTs that cause ambiguity and stress and add to the daily job demands so that individuals who do not possess the necessary technological skills experience an imbalance between the technological demands and the skills resources that they possess (Harunavamwe & Kanengoni, 2023). This indicates that techno-uncertainty may be a more stressful situation for employees who do not originate from an ICT-centric background or have any technology-centric skills in the first place.

Based on Wang et al. (2022), there is a negative relationship between techno-uncertainty and employee well-being. Uncertainty is a feeling that can cause restlessness, anxiety or the desire to give up before a bad thing happens. Techno-uncertainty may induce fear in employees about what to expect and if further advancements or changes to technology can affect them or their jobs (Hang et al., 2022). This fear will affect the employee's mental state as they are conditioned to feel fear of the unknown which will then cause their well-being to deteriorate. Hang et al. (2022) also found that techno-uncertainty has a significant relationship with employee well-being. In this study, it will be identified whether techno-uncertainty and employee well-being have a relationship.

H₃: There is a significant relationship between techno-uncertainty and employee well-being.

Techno-Insecurity: Lastly, techno-insecurity is the final technostressor that will be studied. Techno-insecurity is simply defined as a job threat due to ICTs by Korzynski et al. (2020). Wang et al. (2022)'s more elaborate definition of techno-insecurity is "a stressful situation where employees feel threatened about losing their jobs to other people who have a better understanding of the technology". Bondanini et al. (2020) support this by describing techno-insecurity as employees feeling threatened by job loss to technology or other people with more technology understanding. Additionally, El Kiassi and Jahidi (2023) define techno-insecurity as job insecurity caused by using technology at work. As commonly understood by most, in today's era of digitalization, more tech-savvy people have a higher likelihood of surviving the workforce. Most job descriptions—regardless of job scope—would ask for at least basic skills in technology.

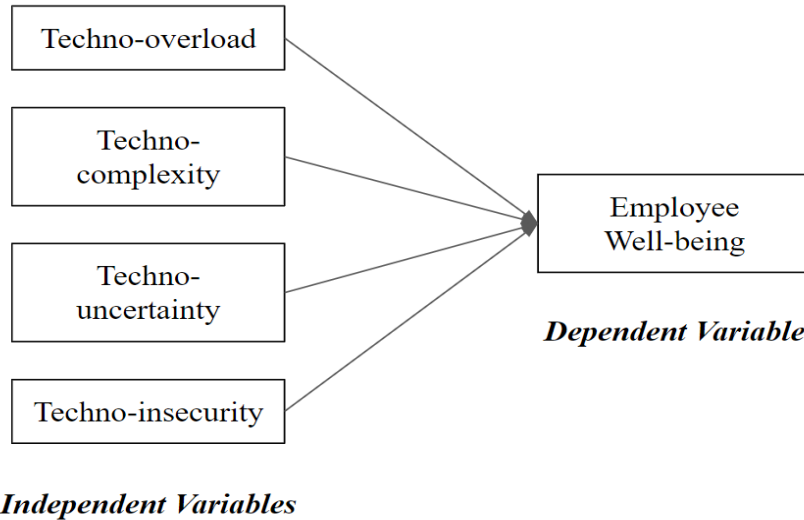
Techno-insecurity also describes situations where a user feels he/she may lose his/her job either by computerization of job tasks or having less knowledge about IT compared to others (Shadbad & Biros, 2020). Ramesh et al. (2021) define techno-insecurity as when employees feel insecure about losing their jobs in the face of new technology and co-workers who might know more about these technologies (Ramesh et al., 2021). Martínez-Navalon et al. (2022) also describe techno-insecurity as a situation when workers are not confident in using ICTs, leading them to think that they cannot cope with the tasks requested and that, in the future, they will be replaced by others. Techno-insecurity creates job loss fear among employees, believing that new technology could lead to automation or could be replaced by people with better skills and abilities. (Garg et al., 2022)

It is a valid concern for employees to not only be threatened by job loss to people with better technology skills but nowadays, employees are also threatened to have their jobs "stolen" by technology itself. The IR4.0 proves how jobs are becoming more automated, making certain jobs redundant to be done by humans because they can be done by technology instead. This may include robots and artificial intelligence (AI). Napolitano (2023) reported that AI was responsible for roughly 5% of jobs lost in the United States alone, while Helhoski (2023) reported that roughly two-thirds of current jobs are likely to be affected by some degree of AI automation.

Techno-insecurity and techno-uncertainty are quite interrelated. They share a common denominator of inducing fear in employees regarding technology (Hang et al., 2022). It is said that techno-insecurity has a negative influence on employee well-being because it causes a lot of stress. Therefore, Wang et al. (2022) states that there is a negative relationship between techno-insecurity and employee well-being. This is supported by Hang et al. (2022) who also found that there is a significant relationship between techno-insecurity and employee well-being. Hence, the relationship between techno-insecurity and employee well-being will be studied.

H₄: There is a significant relationship between techno-insecurity and employee well-being.

Therefore, the research framework adopted in this research, as illustrated in Figure 1, revolves around technology that creates stress as technostress creators that may influence employee well-being (Ramesh et al. (2021). In line with several past literatures, there are four common technostress creators, namely, techno-overload, techno-complexity, techno-uncertainty and techno-insecurity (Bondanini et al., 2020; Korzynski et al., 2020; Wang et al., 2020).

Figure 1: Conceptual Framework of the research


Source: Wang, Ding, and Kong (2022)

3. Research Methodology

This research was conducted from a positivist paradigm perspective that assumes that reality exists out there and is observable, stable, and measurable (Merriam, 2009). In line with that perspective, this cross-sectional correlational research was conducted in line with the objective of this study, which is to determine the relationship between the four dimensions of technostress (i.e. techno-overload, techno-complexity, techno-uncertainty, and techno-insecurity) and employee well-being.

The population of the study was Generation Z employees (those born between 1998 and 2002 in Malaysia), educated and employed in Malaysia. The researchers distributed online survey questionnaires via Google Forms through a social networking platform that is primarily used by Generation Z such as LinkedIn. A total of 135 respondents participated in the research. The research instruments used in the study to measure the independent variables (i.e. technostress) were adopted from Wang et al. (2022) while measurements for the dependent variable (i.e. employee well-being) were adopted from Rurkkhum (2023). Items used in this study are in line with the research framework as Figure 1.

4. Results

This section presents the results of the study which includes the background of respondents, descriptive analysis of the variables, and relationship between the variables.

Backgrounds of Respondents: During the data collection, the researchers took steps to ensure all respondents fulfilled the predetermined criteria i.e. belong to the Generation Z age group, born, educated, and currently employed in Malaysia. From the background information of the respondents, all of them are currently employed. Out of 135 respondents, 11 of them (8.1%) are working in an Information Technology (IT) related job and 124 of them (91.1%) are working in other than IT-related jobs. However, all the respondents are using

technology in the form of applications or software in their jobs. This indicates that the questionnaire of the research, which is about technostress, is relevant as they are technology users. Details of the respondents' background are summarized in Table 1.

Table 1: Demographics Analysis

Demographic	Item	N	N%
Highest level of education	SPM & other certificates	10	7.4%
	Diploma in IT	1	0.7%
	Diploma in other than IT	12	8.9%
	Degree in IT	14	10.4%
	Degree in other than IT	79	58.5%
	Postgraduate in IT	2	1.5%
	Postgraduate in other than IT	17	12.6%
Current employment sector	IT	11	8.1%
	Other than IT	124	91.9%
Frequency of using applications/software	Infrequent	28	20.7%
	Slightly frequent	17	12.6%
	Frequent	40	29.6%
	Very frequent	50	37.0%

Source: Authors own work

Descriptive Analysis of The Variables: To explain the level of the respondents' technostress and their general state of well-being, the researchers conducted a descriptive analysis of the variables under study. As illustrated in Table 2, the scale for employee well-being ranged in high mean. This indicates that the respondents had a high level of employee well-being in their employment, as the mean was in the range of (M = 3.9022, SD = 0.73662). It was near the scale "4 = Agree". Meaning to say, most of them agreed regarding having a good employee well-being.

The scale for the independent variables was similarly ranged from "2 – disagree" to "3 – neutral". This indicates that the respondents were mostly neutral about-facing techno-overload, techno-uncertainty and techno-insecurity. Meanwhile, most of the respondents disagreed about facing techno-complexity which suggests that the respondents are adequate in their technological skills.

Table 2: Descriptive analysis (n=135)

VARIABLES	MEAN (M)	STANDARD DEVIATION (SD)
Dependent Variable		
Employee Well-being	3.9022	.73662
Independent Variables		
Techno-overload	3.1698	1.07533
Techno-complexity	2.9867	1.02919
Techno-uncertainty	3.6037	.90983
Techno-insecurity	3.0630	1.06886

Note: Dependent Variable: "1 = Strongly disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly agree"
Independent Variable: "1 = Strongly disagree, 2 = Disagree, 3 = Neutral, 4 = Agree, 5 = Strongly agree"

Association Between Technostress and Employee Well-Being: To explain the association between the three dimensions of technostress (namely, techno-overload, techno-complexity, techno-uncertainty, and techno-insecurity) and employee well-being, the researchers conducted a Pearson Correlation Analysis of the variables under study. Correlations analysis looks at the relationship and describes the strength and direction

between two variables. In this research, the Pearson correlation coefficient (r) was used to examine the relationship between technostress and employee well-being. According to Hair et al. (2010), the correlation coefficient r that is equal to or greater than 0.70 indicates a strong relationship between variables; if the r coefficient is between 0.30 and 0.69, the relationship is moderate; and if the r coefficient is less than 0.30, the relationship is considered to be weak.

This study's result indicated a positive and significant relationship between techno-uncertainty (r=0.232, p<0.01) and employee well-being. There is a positive and insignificant relationship between techno-overload (r=0.124, p>0.01), techno-complexity (r=0.360, p>0.01) and techno-insecurity (r=0.290, p>0.01) with employee well-being. This finding is illustrated in Table 3.

Table 3: Pearson Correlation Analysis (n=135)

	Employee Well-being	Techno-overload	Techno-complexity	Techno-uncertainty	Techno-insecurity
Employee Well-being	1				
Sig. (2-tailed)					
Techno-overload	.124	1			
Sig. (2-tailed)	.152				
Techno-complexity	0.36	.605**	1		
Sig. (2-tailed)	.678	<.001			
Techno-uncertainty	.232**	.450**	. 398**	1	
Sig. (2-tailed)	.007	<.001	<.001		
Techno-insecurity	.0.29	.618**	.703**	.516**	1
Sig. (2-tailed)	.741	<.001	<.001	<.001	

**. Correlation is significant at the 0.01 level (2-tailed).

Relationship Between Technostress and Employee Well-Being: To explain the relationship between the variables under study, the researchers conducted a Multiple Regression Analysis. The analysis was conducted to determine the relationship between four technostress creators (techno-overload, techno-complexity, techno-uncertainty and techno-insecurity) and explore which of the technostress creators have the most influence on employee well-being.

As illustrated in Table 4, the largest beta coefficient is techno-uncertainty (β .276, p = .007, p <0.05). However, the other technostress creators were not significantly (p >0.05) related to employee well-being. This concludes that only techno-uncertainty is related to employee well-being.

Table 4 also shows that the R^2 value of 0.073 implies that all the independent variables (techno-overload, techno-complexity, techno-uncertainty and techno-insecurity) explained 7.3 percent of the variance (R = 0.217) in the influence of technostress on employee well-being. Hence, the regression model is significant in explaining relationships between the variables.

Table 4: Multiple linear regression

Independent Variables	Standardized Coefficients Beta (β)	t	Sig.
Constant		11.926	<.001
Techno-overload	.121	1.055	.293
Techno-complexity	-.029	-.230	.819
Techno-uncertainty	.276	2.746	.007
Techno-insecurity	-.168	-1.274	.205
R	.271[a]		
R Square (R^2)	0.073		
F	2.570		
Sig. of F Value	.041[b]

Discussion
The study has found that there is a significant relationship between techno-uncertainty and employee well-being. Based on the results and findings of this study, it is found that techno-uncertainty is the only variable that has a significant relationship with employee well-being. Furthermore, techno-uncertainty is also the technostress creator that has the most influence on employee well-being. It can be said that Generation Z significantly faces techno-uncertainty where they are stressed due to the constant changes in technology in a workplace setting.

Generation Z's struggle in facing uncertainty can be attributed to major world changes that have occurred throughout their prime years. They have grown up in a time of turbulence and instability mixed with hope for a better future (Tjiptono et al., 2020) which can be assumed as the reason why Generation Z faces difficulty with uncertain things. The greatest example would be the COVID-19 pandemic which ties in with a sudden skyrocket in reliance on technology, particularly due to online classes and virtual internships as Generation Z was still studying at the time. Techno-uncertainty brings a lot of stress to Generation Z which then influences their well-being. Thus, it is important to consider what can be done to ensure that Generation Z is well-prepared for technological advancements and changes in the workplace.

This finding is in line with the literature on Generation Z, that despite being known as the first generation of true digital natives who grew up alongside the advancement of technology, Generation Z has been found to face the phenomenon of technostress (Prior et al., 2023). Lee (2023) attributes the technostress in Generation Z to be caused by rapidly changing digital technologies. Meanwhile, Generation Z's constant technology usage especially on their smartphones has been deemed as a cause of technostress, followed by an overload of social media usage (James et al., 2023). The overload of technology usage heightened during the COVID-19 pandemic, and it led to negative effects on the psychological well-being of Generation Z which is considered as a manifestation of technostress (Wu et al., 2021). The study further states that although the pandemic witnessed an increase in technology usage from Generation Z, they also demanded a digital detox due to the technostress that they were facing because of the lockdown.

This finding that techno-uncertainty is negatively related to employee well-being is also in line with the literature. Techno-uncertainty is related to new ICT developments (Korzynski et al., 2020). According to Wang et al. (2022), techno-uncertainty is feelings of uncertainty due to the pace at which software, hardware and computer networks are constantly changing or evolving. This uncertainty may cause an employee to feel restless as well as feel a lack of stability; they might feel that even if they master a certain technology, there may be advancements in the future that would have to cause them to start from square one all over again. Techno-uncertainty is said to occur when users feel unsettled due to frequent organization-wide upgrades and accompanying software and hardware changes. (Ramesh et al., 2021) Furthermore, techno-uncertainty is also similarly defined as the constant changes in computer hardware and software (El Kiassi & Jahidi, 2023).

Bondanini et al. (2020) explain techno-uncertainty as ambiguity around expectations related to changes, particularly about technology. Employees may not know what to expect from time to time, especially when technology happens to sprout a new advancement or evolution without a warning. This is supported by Hang et al. (2022) explanation of techno-uncertainty where employees feel organizations move from one cycle to another with reduced time between systems upgrades, leaving them unsettled. Shadbad and Biros (2020) further support this by stating: "Techno-uncertainty relates to users who feel uncertain due to the constant change/upgrades of IT."

Techno-uncertainty involves the continuous changes or upgrades in ICTs that cause ambiguity and stress and add to the daily job demands so that individuals who do not possess the necessary technological skills experience an imbalance between the technological demands and the skills resources that they possess (Harunavamwe & Kanengoni, 2023). This indicates that techno-uncertainty may be a more stressful situation for employees who do not originate from an ICT-centric background or have any technology-centric skills in the first place.

Based on Wang et al. (2022), there is a negative relationship between techno-uncertainty and employee well-being. Uncertainty is a feeling that can cause restlessness, anxiety or the desire to give up before a bad thing

happens. Techno-uncertainty may induce fear in employees about what to expect and if further advancements or changes to technology can affect them or their jobs (Hang et al., 2022). This fear will affect the employee's mental state as they are conditioned to feel fear of the unknown which will then cause their well-being to deteriorate. Hang et al. (2022) also found that techno-uncertainty has a significant relationship with employee well-being.

While the other independent variables of the study, namely, techno-overload, techno-complexity, and techno-insecurity (Bondanini et al., 2020; Korzynski et al., 2020; Wang et al., 2020) were found in this study to be not significant in contributing to employee well-being. This finding is in line with findings reported from an exploratorily qualitative study conducted by (Prior et al., 2023). In their study, Prior et al. (2023) collected qualitative data to explore how Generation Z workers experienced technostress and they found that there are two technostress creators, namely, privacy concerns (i.e. prone tracking, badge monitoring, and surveillance cameras) and technology hassle (i.e. confusing updates, outdated software, and inadequate support). The findings reported by Prior et al. (2023) about technology hassles are in line with the dimension of techno-uncertainty as reported by Wang et al. (2022). However, privacy concerns as reported by Prior et al. (2023) are not being reported by Wang et al. (2022). Since research conducted by Prior et al. (2023) was meant to explore how Generation Z workers experienced technostress, thus it could be concluded that Generation Z workers may have experienced technostress a little differently due to their digital native status (Lee, 2023).

5. Managerial Implications and Recommendations

The managerial implication can be drawn from this study is mainly about the phenomena of technostress at the workplace. Firstly, employees whose well-being is not well taken care of may face higher risks of mental health problems. The World Health Organization (2022) supports this in a study where it is found that poor working environments - including excessive workload and job insecurity which are two of the independent variables - pose a risk to the mental health of employees. What makes the issue more concerning is that what affects an employee at the workplace can sometimes be brought back home which causes the employees' well-being to deteriorate even further.

Secondly, the organization would face low productivity among its employees. Aside from mental health, an employee's physical health can also be impacted because of poor well-being. For example, dealing with technostress may lead an employee to spend more time on the computer or the internet. This may physically strain the employee's eyes, and back or cause a headache. When employees are in a poor state of health, they would be unable to deliver their optimum performance at work. There may also be an increase in the rate of absenteeism as well as medical leave. Employees are the backbone of an organization's operations and without the employees, the organization would not be able to achieve its goals and targets.

Lastly, it will harm the community or society. Employees are an integral part of the community as they drive business and income. If employees have poor well-being, the whole community will have to face the consequences of having unhealthy, ill members. Aside from the rise of mental and physical health issues that will affect social circles as well as families, employees who have poor well-being may be unable to lead their children's development which would in turn affect the future workforce. On the other hand, employees with good well-being would be able to give back to their community and raise their children to become future leaders in the workforce one day.

Therefore, it is recommended that, firstly, the implementation of technology-oriented training programs. Regardless of age, generation and background, training is always required to keep up with changes in the working world. For Generation Z who faces techno-uncertainty, organizations should implement technology-oriented training programs to provide them with proficient technology skills and to prepare for any future advancements. This way, Generation Z would feel adequate in their technology skills and would be ready to face any unexpected changes in terms of technology usage. A study found that Generation Z's preference for training is assignments or experimental training (Hasanah & Saragih, 2023). Thus, organizations can implement hands-on training for Generation Z employees to equip them with the necessary technology skills.

Secondly, mentoring is a culture that should be fostered in the workplace. Especially considering that Generation Z is still relatively new in the working world, organizations should foster a culture where Generation Z can reach out to more tech-savvy colleagues who can assist them in using more advanced technology. Although Generation Z is known to be the tech-savvy generation, they might find the usage of technology in the workplace to be different compared to usage for leisure or fun and would require assistance from their seniors. This is supported by a study that has found that Generation Z is interested in having mentor support in the workplace. (Pietroń--Pyszczek & Borowska, 2022). Therefore, senior colleagues should play a role in extending a helping hand to Generation Z.

Lastly, it is recommended to establish clear communication channels when there are any changes or updates to the organization's technology. Generation Z is accustomed to having information at their fingertips and being in constant communication through digital media (Bredbenner, 2020). This suggests that the techno-uncertainty that Generation Z faces can be worsened if the changes happen suddenly without any prior notice. Generation Z is a generation that prefers to stay in the know at all times rather than having to abruptly adapt to changes. Thus, communicating these changes would allow Generation Z employees to prepare themselves and understand which areas of the technology change they would need assistance with.

Conclusion
The impact of technology-induced stress (technostress) is a rising matter whereby the advancements in technology have been shown to influence the well-being of employees. Yet, there are not enough studies which identify the extent of the influence of technostress on employee well-being (Wang et al., 2022). Therefore, this study has examined the influence of technostress on employee well-being. Employee well-being can be simply described as a positive experience that an employee feels related to their work or in the workplace. However, it holds more significance than just to the employee and may determine the health and output of an organization. In a healthy organization, performance (profit and productivity) as well as employee well-being can not only co-exist but can be mutually reinforced (Singh & Jha, 2021). Now that Generation Z has recently started entering the workforce, organizations need to consider the unique approaches to enhancing Generation Z employee well-being, considering their generational differences.

It is predicted that Generation Z is most likely to experience technostress problems because they live in a digital world (Putriani & Apriani, 2022). It raises a curiosity as to whether technostress would impact Generation Z's well-being as employees in the workforce. Especially considering that Generation Z is the generation of digital natives, it would be beneficial to understand if technology poses a challenge for them in a working context. The rapid growth in technology is a foundational catalyst for the change in values and behavior among Generation Z, compared to those of the previous generations (Pichler et al., 2021).

There is a scarcity of literature that provides sufficient insights into the relationship between technostress and employee well-being (Wang et al., 2022). Furthermore, Yener et al. (2020) question that previous literature on technostress causing harm to employees at the workplace contains unanswered questions and inconclusive answers. This indicates that the existing research does not provide enough clarity on the relationship between technostress and employee well-being, particularly among Generation Z employees in Malaysia. Therefore, the purpose of this study is to examine which of the technostress creators (techno-overload, techno-complexity, techno-uncertainty, techno-insecurity) have the most influence on employee well-being, among Generation Z employees in Malaysia.

This research found that only techno-uncertainty is related to employee well-being. However, the other technostress creators (techno-overload, techno-complexity, and techno-insecurity) were not significantly related to the Generation Z employee well-being under study. This finding is in line with the literature on Generation Z, that despite being known as the first generation of true digital natives who grew up alongside the advancement of technology, Generation Z has been found to face the phenomenon of technostress (Prior et al., 2023). This finding that techno-uncertainty is negatively related to employee well-being is also in line with the literature. Techno-uncertainty is related to new ICT developments (Korzynski et al., 2020). According to Wang et al. (2022), techno-uncertainty is feelings of uncertainty due to the pace at which software, hardware and computer networks are constantly changing or evolving.

Therefore, it is recommended that, firstly, the implementation of technology-oriented training programs. Regardless of age, generation and background, training is always required to keep up with changes in the working world. For Generation Z who faces techno-uncertainty, organizations should implement technology-oriented training programs to provide them with proficient technology skills and to prepare for any future advancements. This way, Generation Z would feel adequate in their technology skills and would be ready to face any unexpected changes in terms of technology usage. A study found that Generation Z's preference for training is assignments or experimental training (Hasanah & Saragih, 2023). Thus, organizations can implement hands-on training for Generation Z employees to equip them with the necessary technology skills.

Abstract: In today's dynamic work environment, understanding the impact of hybrid working on job performance is crucial. Many organizations, including FELCRA Berhad, adopted hybrid working during the COVID-19 pandemic to enhance employee efficiency and flexibility. This study explores FELCRA Berhad's job performance and satisfaction during the pandemic and evaluates the potential success of hybrid working post-pandemic. Using a quantitative research design and purposive sampling, data were collected from FELCRA Berhad employees through online and physical questionnaires. The data were analyzed with IBM SPSS Version 28 to examine the relationship between hybrid working (working conditions, work-life balance, and recognition) and job performance, with job satisfaction as a moderating factor. The results indicated a significant positive relationship between working conditions and job performance. While work-life balance and recognition showed moderate positive relationships with job performance, they were not statistically significant. Job satisfaction did not significantly moderate these relationships. However, the group effect for hybrid working remained significant across all dimensions. In conclusion, the study confirms a significant positive relationship between hybrid work conditions and job performance, providing a foundation for FELCRA Berhad to consider implementing hybrid work practices based on their direct effects on job performance.

Keywords: *Hybrid Working, Job Performance, Job Satisfaction, Working Conditions, Work-Life Balance*

1. Introduction and Background

The COVID-19 pandemic in 2020 initiated significant changes in the global work environment as efforts intensified to curb the virus's spread. The World Health Organization (WHO) provided workplace guidelines that necessitated considerable adjustments to traditional work models (Shaw et al., 2020). Governments worldwide mandated remote working policies, accelerating a trend that had been slowly gaining traction. In 2019, only 5.4 percent of workers in European Union (EU) countries regularly worked from home, with 9 percent doing so occasionally (European Union, 2020). The pandemic transformed this gradual shift into an urgent requirement, compelling businesses to swiftly adopt new operational models and invest in necessary technology and infrastructure. This rapid adaptation included widespread adoption of video conferencing by companies, governments, and educational institutions (Teräs et al., 2020).

By mid-2020, 17.4 percent of the global workforce was engaged in remote work, according to the International Labor Organization (ILO, 2021). In Malaysia, during the Movement Control Order, 44 percent of surveyed employees reported working from home (DOS, 2020). However, hybrid working was more prevalent among regular employees in the public or private sectors. Industries such as retail, hospitality, and tourism, however, found it difficult to transition to hybrid working due to the nature of their operations (Soares et al., 2021).

FELCRA Berhad, a Malaysian government-linked corporation focused on rural economic development, experienced significant disruptions due to the pandemic. The company, responsible for managing large agricultural areas and providing support services, had to halt its operations and shift its employees to remote work. The focus of the study is on the employees working at the headquarters of FELCRA Berhad including those who worked hybrid when COVID-19 hit Malaysia, encompassing all departments. After the first Malaysian Movement Control Order (MCO) was lifted in May 2020, FELCRA Berhad reopened its office to employees. To ensure safety and operational continuity, FELCRA Berhad implemented hybrid working by enforcing a rotational work schedule, dividing employees into Group A and Group B, with each group working on alternate days. This transition was challenging due to inadequate technology and infrastructure. Despite these obstacles, the pandemic highlighted the necessity of flexible work models. The shift to remote work improved productivity, control, and impact of work-life balance (WLB) for many employees. Before the pandemic, teleworking was a term primarily used in scientific research to describe both fully remote and

hybrid work models. The pandemic expanded the adoption of teleworking across all levels of society (López-Igual & Rodríguez-Modroño, 2020). Hybrid working, which combines remote and in-person work, has become increasingly important as organizations seek to enhance employee satisfaction, and job performance, and reduce costs while curbing infectious diseases. This model offers employees the flexibility to choose their work location and schedule, potentially increasing job satisfaction and reducing stress (Sokolic, 2022). For employers, hybrid working provides access to a broader talent pool and reduces real estate costs (De Lucas Ancillo et al., 2020). It also boosts productivity by allowing employees to work in environments best suited to their needs. Additionally, hybrid working positively impacts WLB, helping employees manage work and personal responsibilities more effectively, leading to better mental health and job performance (Gayathiri et al., 2013). However, hybrid working also presents challenges. Research indicates that work-life conflicts can negatively affect employee well-being and productivity, particularly for women, due to the lack of inclusive leadership in domestic care (Palumbo, 2020; Bhumika, 2020).

This study adopts Herzberg's Two-Factor Theory (1959), which identifies hygiene factors (e.g., work conditions and WLB) and motivators (e.g., recognition and autonomy) as key to employee motivation. Understanding these factors is crucial for developing effective hybrid work environments. The COVID-19 pandemic has accelerated the adoption of hybrid working, revealing both its benefits and challenges. However, hybrid working can also lead to work-life conflicts and negatively impact employee well-being. The purpose of this study is to analyze the opportunities and challenges of implementing hybrid working in Malaysia and its effects on job satisfaction and performance. The study focuses on FELCRA Berhad during the pandemic and explores the potential for successful hybrid working post-pandemic. Using a quantitative research design, data were collected from employees who experienced hybrid working during COVID-19. The analysis examines the relationship between hybrid work dimensions (working conditions, WLB, and recognition) and job performance, with job satisfaction as a moderating factor. In conclusion, this study aims to provide a comprehensive understanding of hybrid working's impact on employee performance and job satisfaction, offering insights for future policies and practices in Malaysia.

2. Literature Review

Hybrid Working: The COVID-19 pandemic has significantly transformed traditional work environments, leading to the widespread adoption of hybrid work models that combine remote and in-office work. This literature review summarizes key findings on the impact of hybrid working on job performance and job satisfaction, with a focus on studies conducted during the pandemic. Hybrid working has been shown to positively impact job performance by offering employees the flexibility to choose their work environment, thereby enhancing productivity and engagement. Yang et al. (2021) found that employees in hybrid or work-from-home programs reported higher job satisfaction and perceived performance compared to those solely in-office. Similarly, research in Malaysia by Yee et al. (2023) indicated improved job performance due to reduced commuting time and a comfortable home environment. Hybrid work environments also foster creativity by allowing employees to work in spaces where they feel most productive, thereby stimulating innovative thinking and problem-solving (Choudhury et al., 2020). However, maintaining effective communication and collaboration remains challenging. While hybrid work models provide considerable advantages, organizations must overcome these challenges to maximize their potential. As hybrid working becomes more prevalent, it will play a crucial role in creating more productive, innovative, and engaging work environments. The hybrid working relationship with Job Performance is moderated by job satisfaction.

Working Condition: The COVID-19 pandemic has made working from home a primary workplace for many employees, yet the impact of home office environments on job satisfaction and productivity remains underexplored (Xiao et al., 2020). Studies often overlook the detailed conditions of home offices, generalizing remote work experiences without accounting for diverse home environments. Although reduced commute time and fewer office distractions are recognized as factors that enhance productivity, the quality of home office setups is often overlooked. Proper home office conditions, including ergonomic furniture, technology, and a designated workspace, play a crucial role in ensuring job satisfaction and performance (Yang et al., 2021). Research shows varied outcomes regarding productivity in remote work, with some studies highlighting improvements driven by personalized work environments (Choudhury et al., 2020). However, interruptions, inadequate workspace, and lack of office equipment can hinder productivity (Bailey & Kurland, 2002). A well-

designed home office aligns with Herzberg's Two-Factor Theory, emphasizing the importance of hygiene factors in avoiding job dissatisfaction. To develop effective remote work policies, it is essential to understand the specific components of home office environments and their impact on diverse demographic groups (Vyas & Butakhieo, 2021). Future research should focus on these elements to optimize remote work conditions and enhance employee well-being and productivity. Therefore, this leads to the first hypothesis (H1) of this study, which is:

H1: There is a significant relationship between Working Conditions and Job Performance.

Work-Life Balance and Job Performance: The impact of hybrid working on work-life balance (WLB) has gained significant attention, particularly as the distinctions between work and personal life continue to blur. Bellmann and Hübler (2021) noted that working from home can diminish WLB, leading to burnout and difficulties in disconnecting from work. Singer-Velush et al. (2020) further supported this observation, finding that employees often engage in work during non-traditional hours. However, hybrid working can also enhance WLB by enabling employees to manage responsibilities more effectively, which in turn can improve job performance (Aprilina & Martdianty, 2023). This flexibility is particularly beneficial for those with caregiving duties or long commutes (Kossek et al., 2021). Despite its widespread adoption during the COVID-19 pandemic, the full impact of hybrid working on WLB and employee well-being remains underexplored. Research by Krajčík et al. (2023) suggests that hybrid working offers the best WLB compared to exclusively office-based or remote work. Factors such as organizational culture, managerial support, and job nature significantly influence these outcomes (Vyas, 2022). In Malaysia, Zainal et al. (2022) found that a well-planned WLB strategy positively affects health, motivation, and employee retention. Effective WLB is especially crucial during unprecedented challenges like the pandemic (Kori & Omar, 2022). Comparative studies of different hybrid arrangements could further optimize these models for employee benefits. However, despite the advantages, hybrid working in public agencies often encounters challenges. Research by Colley (2010) found that in traditional cultures, a strong work ethic often emphasizes long hours and physical presence in the workplace as markers of commitment. This cultural perspective can discourage employees from taking advantage of work-life balance (WLB) arrangements, such as flexible hours or remote work, as these options may be viewed as indicative of a lack of dedication. Understanding these dynamics is key to helping organizations enhance job satisfaction and productivity through tailored WLB strategies. This understanding is directly related to the study's second hypothesis (H2) as follows:

H2: There is a significant relationship between WLB and Job Performance.

Recognition: The shift to hybrid work environments, combining remote and in-office work, has significant implications for rewards and recognition programs in organizations. Traditional recognition methods may be less effective in hybrid settings, potentially leading to feelings of isolation among employees. Therefore, organizations must adapt their recognition strategies to meet the unique challenges and opportunities presented by hybrid working, aiming to enhance employee motivation, satisfaction, and performance (Yang et al., 2021). Research demonstrates a positive correlation between employee recognition and job performance (Vyas, 2022). Effective recognition programs foster high performance by acknowledging and supporting employees (Hussain et al., 2019). However, improper implementation of these programs can lead to resentment and decreased job satisfaction (Stasiła-Sieradzka et al., 2023). It is essential to tailor recognition approaches to individual preferences and leverage digital tools for virtual acknowledgment (Bailey & Kurland, 2002). In government agencies, traditional norms that prioritize seniority over performance can undermine the effectiveness of recognition programs, leading to decreased motivation and job satisfaction (Shrout, 2024). Additionally, occupational stress and perceived unfairness in reward distribution negatively impact job performance (Devi & Lahkar, 2021; Hassan, 2012). In conclusion, adapting recognition programs to hybrid work environments is crucial for boosting employee motivation and performance. Organizations must understand the nuances of hybrid work to create supportive and engaging workplaces. Future studies comparing recognition in hybrid versus fully remote or in-office environments will provide further insights into optimizing these programs. Thus, H3 becomes the third hypothesis of this study:

H3: There is a significant relationship between Recognition (in hybrid working) and Job Performance.

Job Satisfaction as Moderator: The relationship between job satisfaction and job performance has been extensively studied, consistently revealing a positive correlation. High job satisfaction leads to increased employee engagement, motivation, and commitment, all of which enhance job performance. Satisfied

employees are more committed, proactive, and productive, driven primarily by intrinsic motivation (Cooper, 2020). Job satisfaction also moderates the impact of work-life balance (WLB) on performance by amplifying positive effects and mitigating conflicts (Soomro et al., 2019). In hybrid work environments, job satisfaction boosts performance by fostering a sense of fulfillment and alignment with work conditions (Corral, 2024). The flexibility and autonomy inherent in hybrid models enhance motivation and satisfaction, thereby improving performance (Sampat et al., 2022). In Malaysia, Yunus and Kamal (2017) emphasized Herzberg's Two-Factor Theory, highlighting the critical role of job satisfaction in enhancing performance. Overall, the literature supports the positive relationship between job satisfaction and job performance. Organizations that prioritize job satisfaction by fostering a supportive environment, providing professional growth opportunities, offering recognition, and involving employees in decision-making processes can create a virtuous cycle of enhanced performance and satisfaction. Understanding and leveraging job satisfaction as a moderating factor is essential for achieving high performance and competitive advantage in a dynamic business environment. Hence, a hypothesis is formed as H4 below:

H4: To what extent does job satisfaction mediate the relationship between hybrid working conditions (work-life balance and recognition) and job performance?

3. Research Methodology

This research adopts a quantitative approach, focusing on correlational studies to explore the relationship between hybrid working, job performance, and the moderating effect of job satisfaction among employees at FELCRA Berhad. The study encompasses all employees based at the FELCRA Berhad Headquarters in Wangsa Maju, Kuala Lumpur, with a purposive sample of 128 participants selected. The research instrument includes adapted questions sourced from various references, organized into sections covering demographics, hybrid working (working conditions, WLB, and recognition), job satisfaction and job performance. The chapter concludes with a detailed description of the data analysis stages, encompassing reliability and validity testing, frequency analysis, and correlation analysis. The study's findings and conclusions were derived from quantitative statistical analyses performed using Statistical Package for the Social Sciences Version 28 (SPSS 28), known for its robust capabilities in analyzing academic research, particularly in quantitative studies. A summary of the data analysis for each research question is provided in Table 1.

Table 1: **Summary of Data Analysis**

Research Objective	Measurement	Concept/Construct	Scale	Statistic
To identify the relationship between hybrid working and job performance	Is there a significant relationship between Working Conditions (hybrid working) and Job Performance?	What relationship between Working Conditions (hybrid working) and Job Performance?	Interval-Likert scale	Pearson Correlation Multiple Regression
To identify the relationship between hybrid working and job performance	Is there a significant relationship between WLB (hybrid working) and Job Performance?	Relationship between WLB (hybrid working) and Job Performance	Interval-Likert scale	Pearson Correlation Multiple Regression
To identify the relationship between hybrid working and job performance	Is there a significant relationship between recognition (hybrid working) and job performance?	Relationship between recognition (hybrid working) and job performance	Interval-Likert scale	Pearson Correlation Multiple Regression
To determine whether job satisfaction moderates the relationship between hybrid working arrangements and job performance	Does job satisfaction moderate the relationship between hybrid working (working conditions, WLB and recognition) and job performance?	The influence of job satisfaction as a moderator on the relationship between hybrid working and job performance	Interval-Likert scale	Hierarchical Regression Analysis

4. Results

A total of 150 questionnaires were distributed and all were returned, demonstrating a high engagement rate. However, 12 questionnaires were unusable due to incomplete responses, resulting in 128 usable questionnaires. This represents 85.3 percent of the total, indicating strong participant cooperation and effective data collection.

Profile of Respondents: The demographic distribution of the respondents shows a balanced representation with 57.8 percent female and 42.2 percent male participants. The age group is predominantly 26–35 years old (50.8 percent), followed by 36–45 years old (28.9 percent), with smaller percentages in other age brackets. Most respondents are married (65.6 percent), while singles and widowed/separated individuals account for 26.6 percent and 7.8 percent, respectively. In terms of education, 43.8 percent hold a Bachelor's degree, 25.8 percent have an STPM/Diploma, 20.3 percent completed SPM, and 10.2 percent possess a Master's or PhD. The job positions vary, with non-executives comprising 36.7 percent, managers 34.4 percent, executives 25.8 percent, and upper management 3.1 percent. Notably, all respondents were employed during the COVID-19 pandemic, indicating a 100 percent employment rate during this period.

Normality after Factor Analysis: Table 2 reveals varying degrees of skewness and kurtosis across different dimensions, all showing negative skewness—Work Condition (-0.672), WLB (-0.638), Recognition (-0.862), Job Satisfaction (-0.892), and Job Performance (-1.264)—indicating a general trend towards higher ratings. According to established guidelines by Hair et al. (2010) and Kline (2011), these skewness values fall within acceptable ranges (±2 and ±3, respectively), suggesting no severe deviation from normality. Kurtosis values for Work Condition (-0.084) and WLB (0.346) are near zero, while Recognition (1.449) and Job Satisfaction (0.867) show positive kurtosis. However, Job Performance (3.908) exceeds normal levels, indicating the presence of more outliers. Despite this, all values adhere to acceptable kurtosis ranges (±7 by Hair et al. and Bryne, and ±10 by Kline), ensuring the data suitability for further analysis. These findings suggest a generally positive sentiment towards work conditions, with some variability, particularly in Job Performance.

Table 2: Normality Results: Values for Skewness and Kurtosis (n=128)

Dimensions	Skewness		Kurtosis	
	Statistic	Std. Error	Statistic	Std. Error
Work Condition	-.672	.214	-.084	.425
WLB	-.638	.214	.346	.425
Recognition	-.862	.214	1.449	.425
Job Satisfaction	-.892	.214	.867	.425
Job Performance	-1.264	.214	3.908	.425

Reliability after Factor Analysis: To assess reliability, Cronbach's alpha was calculated for each measure to evaluate the consistency and stability of the instrument used. According to Hair et al. (2010), a minimum acceptable value for Cronbach's alpha is 0.70, although a value of 0.60 is acceptable for exploratory studies. This analysis ensures the quality and reliability of the measures used in the research (Sekaran & Bougie, 2013).

Table 4: Summary of Reliability Analysis after Factor Analysis (n=141)

Dimensions	No. of Items	Cronbach's Alpha	Internal Consistency
Work Condition	6	.756	Good
WLB	5	.885	Excellent
Recognition	5	.787	Good
Job Satisfaction	5	.819	Excellent
Job Performance	5	.900	Excellent

The results in Table 4 show the reliability analysis of the survey revealed strong internal consistency across all dimensions, as measured by Cronbach's alpha. The Work Condition dimension (6 items) had an alpha of 0.756, indicating good reliability. The WLB dimension (5 items) showed excellent consistency with an alpha of 0.885.

The Recognition dimension (5 items) had a good alpha of 0.787, while the Job Satisfaction dimension (5 items) exhibited excellent reliability with an alpha of 0.819. The Job Performance dimension (5 items) achieved the highest alpha of 0.900, demonstrating exceptional reliability. These results confirm that the survey reliably measures work conditions, WLB, recognition, job satisfaction, and job performance, making it a dependable tool for assessing workplace environments.

Pearson Correlation Analysis: Table 5 below shows the correlation analysis between the components of the physical workplace environment (lighting, room temperature, and ergonomics) and the components of the behavioral workplace environment (WLB, incentive and recognition plan, training and development, transparent or open communication, and good relations with co-workers) against the dependent variable of the study, which is employee productivity

Table 5: Pearson Correlation Analysis

Variable	Working Condition	WLB	Recognition	Job Performance
Working Condition	1			
WLB	.554**	1		
Recognition	.389**	.347**	1	
Job Performance	**.377****	**.300****	**.265****	1

**. Correlation is significant at the 0.01 level (2-tailed).

The correlation analysis strongly supports the hypothesis that better working conditions, WLB, and recognition are significantly associated with improved job performance in hybrid work environments.

Multiple Regression Analysis: Table 6 below shows the multiple regression analysis between working conditions, WLB, recognition, and job performance

Table 6: Multiple Regression Analysis

Independent Variable	Standard Coefficients Beta	t	Sig.
Working Condition	.269	2.649	.009
WLB	.109	1.087	.279
Recognition	.123	1.36	.176
R Square		.167	
F		8.279	
Sig. of F value		<.001	
Durbin Watson		1.938	

Table 6 illustrates the analysis of the relationship between working conditions, WLB, recognition, and job performance in hybrid work environments, revealing nuanced findings.

Hierarchical Regression Analysis: Table 7 below shows the hierarchical regression analysis between working conditions, WLB, recognition, job satisfaction, and job performance

Table 7: Hierarchical Regression Analysis

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Change Statistics				
					R Square Change	F Change	df1	df2	Sig. F Change
1	.409a	.167	.147	.60667	.167	8.279	3	124	<.001
2	.506b	.256	.232	.57558	.089	14.761	1	123	<.001
3	.527c	.278	.236	.57417	.022	1.201	3	120	.312

The analysis of the three models reveals varying explanatory power regarding job performance, highlighting the importance of specific workplace variables. Model 1, which includes working conditions, WLB, and recognition as predictors, accounts for 16.7 percent of the variance in job performance and is statistically significant ($R^2 = 0.167$, Sig. F Change <.001). This indicates that these factors are meaningful contributors to job performance. In Model 2, the inclusion of job satisfaction enhances the explained variance to 25.6 percent ($R^2 = 0.256$), highlighting job satisfaction as a crucial predictor. The significant R Square Change of 0.089 (Sig. F Change <.001) underscores its substantial impact on job performance. However, Model 3, which incorporates interaction terms between job satisfaction and the three initial predictors, shows only a slight increase in explained variance to 27.8 percent ($R^2 = 0.278$). The additional variance explained by the interaction terms is minimal (R Square Change = 0.022) and not statistically significant (Sig. F Change = 0.312). This suggests that while job satisfaction directly influences job performance, it does not significantly moderate the effects of working conditions, WLB, and recognition on job performance, leading to the rejection of Hypothesis H4.

Summary of Hypotheses: Table 8 shows the result of the summarized hypotheses for the study on the moderating effect of job satisfaction towards the relationship between hybrid working and job performance among employees at FELCRA Berhad.

Table 8: Summary of Hypotheses

H	Hypotheses	Analysis	Data	Results
H1	There is a significant relationship between Working Conditions (hybrid working) and Job Performance.	Pearson Correlation	(0.377)	Moderate Positive Relationship
		Multiple Regression	(r.=0.009, p>0.05)	Accepted
			$r^2=0.167$, F value = 8.279 F<0.001	Significant positive relationship Accepted as a Group (Hybrid Working)
H2	There is a significant relationship between WLB (hybrid working) and Job Performance.	Pearson Correlation	(0.300)	Moderate Positive Relationship
		Multiple Regression	(Sig.=.279, p>0.05)	Rejected No significant relationship
			(r2=0.167, F value = 8.279 F<0.001)	Accepted as a Group (Hybrid Working)
H3	There is a significant relationship between Recognition (hybrid working) and Job Performance.	Pearson Correlation	(0.265) (r.=0.176, p>0.01)	Positive Relationship
		Multiple Regression		Rejected No significant relationship
			($r^2=0.167$, F value = 8.279 F<0.001)	Accepted as a Group (Hybrid Working)
H4	Job satisfaction moderates the relationship between hybrid working (working conditions, WLB and recognition) and job performance.	Hierarchical Regression Analysis	**Model 1** ($R^2 = 0.167$, Sig. F Change <.001)	**Model 1** Accepted statistically significant
			Model 2 ($R^2 = 0.256$, Sig. F Change <.001)	**Model 2** Accepted
			Model 3 ($r^2=0.278$, Sig. F Change = 0.312)	**Model 3** Rejected

Discussion

The findings reveal statistically significant positive correlations between these factors and job performance, suggesting that enhancing these aspects can lead to higher employee productivity, improved work quality, and overall efficiency. The Pearson correlation coefficient between working conditions and job performance is 0.377, indicating a moderate positive relationship. This suggests that as the quality of working conditions improves, employees tend to perform their tasks more effectively. The significance level for this correlation is less than 0.001, indicating that the observed relationship is highly unlikely to have occurred by chance. Practical improvements in working conditions, such as better resource availability, effective communication, and flexible scheduling, can significantly enhance job performance. Organizations should focus on providing adequate technological support, clear communication channels, flexible work schedules, and a supportive organizational culture to boost employee engagement and productivity (Sokolic, 2022). The correlation analysis also reveals a significant relationship between WLB and job performance, with a Pearson correlation coefficient of 0.300. This positive correlation suggests that better WLB is associated with improved job performance. The significance level is less than 0.001, indicating a low probability that this relationship is due to chance. Improving WLB involves implementing flexible working hours, providing resources for stress management, fostering a culture that respects personal time, and ensuring manageable workloads. Employees who experience a better balance between their professional and personal lives are likely to be more satisfied, less stressed, and more motivated, leading to better job performance. Studies by Sharma and Yadav (2023) and Budhkar and Salve (2023) support these findings, emphasizing the importance of flexibility, supportive leadership, and effective management in hybrid work settings. Additionally, the analysis reveals a positive relationship between recognition and job performance, with a Pearson correlation coefficient of 0.265.

Although this correlation is modest, it is statistically significant with a p-value of 0.002, indicating a strong likelihood that the observed relationship is genuine. Recognition serves as a motivational factor, enhancing employees' sense of accomplishment and morale, which can lead to increased productivity and performance. The study's sample size of 128 participants further enhances the reliability and generalizability of these findings. Consistent with previous research by Lartey (2021), recognition is identified as a critical component of employee motivation and performance.

These findings underscore the importance of improving working conditions, WLB, and recognition to enhance job performance in hybrid work environments. Organizations can achieve this by providing technological support, fostering clear communication, offering flexible scheduling, promoting WLB policies, and implementing effective recognition strategies. By leveraging these insights, employers can better motivate and support their employees, leading to higher engagement, job satisfaction, and performance outcomes. In conclusion, the correlation analysis provides robust evidence supporting the hypothesis that there is a significant relationship between working conditions, WLB, recognition, and job performance in hybrid work models. The statistically significant positive correlations emphasize the importance of these factors in fostering a productive and high-performing workforce. Organizations should design and implement policies and practices that enhance these aspects to maximize employee well-being and performance, ultimately leading to a more successful and sustainable business.

The study also indicates that improved working conditions significantly enhance job performance, as evidenced in multiple regression analysis by a Beta coefficient of .269 and a significant t-value of 2.649 (p = .009). This aligns with Hypothesis 1 (H1) and corroborates previous research, such as Naz et al. (2020), which highlights the critical role of a supportive work environment in boosting employee productivity. In hybrid work settings, factors like flexible scheduling, effective communication, and ergonomic furniture are pivotal in creating a productive atmosphere. These elements collectively improve employee well-being and engagement, leading to higher levels of job performance and satisfaction (Yang et al., 2021). Contrary to expectations, the analysis revealed no significant relationship between WLB and job performance (Beta = .109, t = 1.087, p = .279), thus not supporting Hypothesis 2 (H2). This finding contrasts with earlier studies, such as those by Kossek and Lautsch (2018), which emphasized the importance of WLB in influencing job performance. The discrepancy may be due to unique characteristics of the study's sample or specific context, which could mitigate the impact of WLB on performance. Similarly, the study found no significant effect of recognition on job performance (Beta = .123, t = 1.36, p = .176), not supporting Hypothesis 3 (H3). This result is unexpected given the extensive literature on the motivational benefits of recognition, such as the study by Manzoor et al. (2021).

In a hybrid work environment, factors like intrinsic motivation and virtual communication may have a more substantial impact than traditional recognition programs.

Overall, the regression model was statistically significant (F = 8.279, p < .001) with an R Square of .167, indicating that 16.7 percent of the variance in job performance can be explained by working conditions, WLB, and recognition. The Durbin-Watson statistic of 1.938 suggests no significant autocorrelation, indicating that the model's assumptions are met. These findings suggest that organizations should prioritize improving working conditions to enhance job performance in hybrid environments. However, the non-significant effects of WLB and recognition indicate that additional or alternative factors may need to be considered to improve job performance. Future research should explore other potential determinants, such as employee autonomy, technological support, and virtual team dynamics, and include longitudinal studies to understand how these relationships evolve as hybrid work models become more established.

The study's hierarchical regression analysis results highlight the critical impact of specific workplace variables on job performance. Model 1 demonstrates that working conditions, WLB, and recognition collectively account for a substantial portion of the variance in job performance (R^2 = 0.167, Sig. F Change <.001). This finding aligns with existing literature that posits optimal working conditions and appropriate recognition are crucial for enhancing employee productivity and satisfaction (Ntimba et al., 2021). The significant enhancement in explanatory power observed in Model 2 with the inclusion of job satisfaction (R^2 = 0.256, Sig. F Change <.001) underscores its importance as a determinant of job performance. Recent studies, including those by Wang et al. (2020) and Fisher et al. (2019), emphasize the critical role of job satisfaction in improving employee performance, motivation, and overall productivity. Specifically, Wang et al. (2020) note that job satisfaction and work motivation are reciprocally related, with satisfied employees being more motivated and engaged, leading to higher performance levels.

The addition of interaction terms between job satisfaction and the initial predictors in Model 3 does not lead to a statistically significant improvement (R^2 = 0.278, R Square Change = 0.022, Sig. F Change = 0.312). This indicates that while job satisfaction is a crucial direct predictor of job performance, it does not significantly moderate the relationships between working conditions, WLB, recognition, and job performance. This finding aligns with the study's broader conclusions regarding the complex dynamics between job satisfaction and job performance. Despite being a direct predictor, job satisfaction does not significantly alter the impact of other factors on performance. Research by Katebi et al. (2021) supports this nuanced view, indicating that job satisfaction and performance are reciprocally influential but do not moderate the effects of other factors. This study underscores the importance of focusing on improving working conditions and recognizing employees to enhance job performance directly, while also acknowledging the pivotal role of job satisfaction as an independent predictor.

5. Managerial Implications and Recommendations

If in the future employers at FELCRA Berhad decide to implement a hybrid working model, they must prioritize the improvement of home working conditions. Ensuring that employees have a conducive and productive home environment is crucial for the success of such a model. This includes providing necessary equipment, ergonomic furniture, reliable internet access, and any other resources that support efficient remote work. Specifically, FELCRA Berhad could offer allowances for Unifi fiber internet to ensure stable and high-speed connectivity and replace all desktop computers with laptops to facilitate flexibility and mobility. By addressing these aspects, FELCRA Berhad can enhance employee well-being, maintain productivity, and ensure a seamless transition between home and office work environments.

Additionally, it is recommended that FELCRA Berhad place more emphasis on physical recognition rather than online recognition. The findings indicate that virtual acknowledgments have not shown a significant impact on employee morale and engagement. While online recognition can be convenient, it often lacks the personal touch and immediacy that in-person recognition provides. By organizing events, award ceremonies, and face-to-face appreciation moments, FELCRA Berhad can foster a stronger sense of community and appreciation among employees. Managers should also make a conscious effort to compliment and acknowledge staff achievements in person when they are at the office, rather than relying solely on virtual praise. This approach helps build a

more cohesive and motivated workforce, reinforcing the value of each employee's contributions in a tangible and impactful way. By adopting these recommendations, FELCRA Berhad can create a more supportive and effective hybrid working environment, ultimately contributing to the organization's overall success and employee satisfaction.

This study can be further extended by exploring additional factors that influence job performance in hybrid settings. This includes examining the role of organizational culture alongside WLB and recognition. Understanding how various aspects of the work environment contribute to employee satisfaction and productivity is crucial. Future studies should also include diverse participants from different government agencies to enhance the generalizability of the findings. Employing qualitative methods, such as interviews or focus groups, can provide deeper insights into employees' experiences with hybrid working. These methods can uncover the nuanced interplay between job satisfaction and job performance, revealing personal perspectives and contextual factors that quantitative methods may overlook. Additionally, considering job satisfaction as a mediating variable in the relationship between hybrid work conditions and job performance could offer further insights. Moreover, including independent variables related to hybrid work conditions, such as technological support, communication quality, and organizational support, can provide a more comprehensive understanding of the factors influencing job performance. These elements are essential for maintaining employee engagement and productivity in a hybrid work environment. By addressing these areas, future research can offer more detailed guidance on optimizing hybrid work models to enhance employee performance and satisfaction.

Conclusion

The study explores the relationships between working conditions, WLB, recognition, and job performance in hybrid work environments, revealing valuable insights. A moderate positive relationship was found between working conditions and job performance, as confirmed by both Pearson correlation and regression analysis. This highlights the importance of ergonomic setups, digital tools, and flexible office spaces (Grzegorczyk et al., 2021; Kossek et al., 2021). While WLB showed a moderate positive correlation with job performance, regression analysis did not find it statistically significant, suggesting that other factors may play a more dominant role (Talukder, 2021). Recognition also did not show a significant impact on job performance, potentially due to the complexities of hybrid work environments, where intrinsic motivation and the quality of virtual communication are more influential (Pandya, 2024; Hopkins & Figaro, 2021).

Furthermore, job satisfaction was identified as a crucial direct predictor of job performance, significantly enhancing the explanatory power of the models. However, it did not significantly moderate the relationship between hybrid work conditions and job performance (Davidescu et al., 2020; Judge et al., 2001). These findings suggest that organizations should focus on improving both working conditions and job satisfaction independently to enhance job performance.

Conceptualizing the Implications of Artificial Intelligence (AI) Tools and Personalization Marketing on Consumer Purchase Intention: Insights from the Malaysian E-Commerce Market

Mohamad Fariz Abdullah*, Muhamad Azman Ibrahim, Azlin Zanariah Bahtar, Noor Rita Mohamad Khan
Faculty of Business and Management, UiTM Kampus Puncak Alam, Selangor, Malaysia

Corresponding author: Mohamad Fariz Abdullah

Abstract: Artificial intelligence (AI) has emerged as a powerful tool, enabling online retailers to offer highly personalized shopping experiences tailored to individual preferences and behaviors. As e-commerce continues to grow in Malaysia, understanding the influence of AI and personalization marketing on consumer purchase intentions has become increasingly important for businesses seeking to remain competitive. However, the rapid adoption of AI also raises concerns about data privacy, ethical AI usage, and compliance with emerging data protection regulations, such as Malaysia's Personal Data Protection Act (PDPA). This study aims to explore the potential impact of artificial intelligence (AI) and personalization marketing on consumer purchase intention within the Malaysian e-commerce market. By reviewing previous literature and theoretical frameworks, the study explores how the use of AI tools including predictive analytics automation, and personalization experiences might influence consumer behavior in online shopping environments. The study adopts a quantitative approach, in which quota sampling will be used for the participant selection. A self-administered questionnaire with a five-point Likert scale will be employed to gather data from e-commerce users in Malaysia. The findings from this study have important implications for both e-commerce businesses and policymakers in Malaysia. For businesses, understanding which aspects of AI and personalization most influence consumer purchase intentions can help them strategically implement these technologies to enhance customer engagement and drive sales. For policymakers, the study highlights the need to consider ethical and legal issues, such as data privacy and policy issues, in the growing use of AI in the e-commerce market.

Keywords: *Artificial intelligence, Predictive analytics, Automation, Personalization marketing, Customer purchase intention*

1. Introduction and Background

The rapid implementation of artificial intelligence (AI) in the e-commerce market has drastically transformed how businesses interact with consumers. The application of AI technologies, in addition to personalized experiences, is reforming online shopping by tailoring content to individual consumer preferences and behaviors. AI is transforming the e-commerce market by creating new opportunities for entrepreneurs to innovate and improve their business strategies (Bansal & Bansal, 2023). Taylor (2024) has claimed that the AI market within the marketing domain was evaluated at $15.84 billion in 2021, revealing its significant impact on the industry. Forecasts indicate that this market is expected to experience substantial growth, with its overall value anticipated to exceed $107.5 billion by 2028. This rapid development underscores the increasing reliance on AI technologies in marketing and their potential to transform e-commerce landscapes on a global scale. Previous studies have underscored the growing importance of AI tools and personalization marketing in enhancing customer engagement and driving purchase intentions. For example, a study by Huang and Rust (2021) has highlighted the critical role of AI in creating dynamic shopping experiences, which significantly influence consumer behavior. Equally, Yadav and Pavlou (2020) have emphasized that personalization, powered by AI not only improves customer satisfaction but also positively impacts purchase intentions.

Furthermore, Nguyen and Simkin (2022) discover how AI algorithms, particularly those focused on customer segmentation and recommendation systems, can predict consumer preferences and improve the accuracy of targeted marketing efforts. In the context of the Malaysian e-commerce market, Rahman et al. (2021) specifically address the increasing reliance on AI in the Malaysian e-commerce market, noting that businesses leveraging these technologies report higher conversion rates and customer retention. Given the rapid growth of e-commerce in the Malaysian market, understanding the impact of AI and personalization marketing on consumer purchase intention is crucial for businesses striving to remain competitive.

The integration of artificial AI into the e-commerce market has significantly altered consumer interactions, with AI tools and personalization marketing strategies each playing a distinct role in this evolution. Nonetheless,

despite the widespread adoption of AI tools in research studies, there remains a critical gap in understanding their specific impact within emerging e-commerce markets like Malaysia. Most existing studies focus on foreign e-commerce markets, leaving a void in the literature concerning cultural and regional influences on consumer responses to AI-based tools and personalization (Grewal et al., 2020; Huang & Rust, 2021). Moreover, the ethical implications and data privacy concerns associated with AI tools usage have not been thoroughly addressed, particularly in regions where regulatory frameworks may lag behind technological advancements, potentially prioritizing innovation at the expense of consumer privacy (Kaplan & Haenlein, 2019; Sundar et al., 2019; Lommatzsch et al., 2020; Kumar et al., 2021). Although various AI tools, such as recommendation systems, chatbots, and machine learning algorithms, have been examined about consumer behavior and purchase intention (Luo et al., 2019; Huang & Rust, 2020; Qin & Jiang, 2021), there is a notable gap in understanding how predictive analytics and automation specifically influence customer purchase intention.

Hence, this study seeks to bridge these gaps by exploring the theoretical and practical implications of AI tools and personalization marketing on consumer purchase intentions in the Malaysian e-commerce market by focusing on predictive analytics and automation as independent variables. In addition, it addresses the ethical and privacy challenges associated with these technologies, offering a comprehensive analysis of their impact. This study seeks to examine the potential influence of AI tools and personalized marketing on consumer purchase intentions within the Malaysian e-commerce market, offering insights that may guide future research and strategic decisions in the industry. The research objectives and research questions are as follows:

Research Objectives
RO1: To examine the impact of predictive analytics on consumer purchase intention within the Malaysian e-commerce market.
RO2: To examine the impact of automation on consumer purchase intention within the Malaysian e-commerce market.
RO3: To evaluate the influence of personalization marketing on consumer purchase intention within the Malaysian e-commerce market.

Research Questions
RQ1: How does predictive analytics impact consumer purchase intention within the Malaysian e-commerce market?
RQ2: How does automation affect consumer purchase intention within the Malaysian e-commerce market?
RQ3: What is the influence of personalization marketing on consumer purchase intention within the Malaysian e-commerce market?

2. Literature Review

Malaysian E-Commerce Markets
The Malaysian e-commerce market has undergone substantial growth, led by increasing internet penetration and evolving consumer preferences. According to Statista (2023) as of 2023, the market is valued at approximately RM 24.5 billion and is projected to expand at a compound annual growth rate (CAGR) of 12.6% through 2027. Main e-commerce platforms such as Shopee, Lazada or TikTok Shop lead the market due to their user-friendly interfaces, extensive product ranges, and competitive pricing. A study by Ahmad et al. (2023) discovered that these platforms collectively capture over 60% of the Malaysian market share, significantly influencing consumer purchasing behavior. Moreover, e-commerce is becoming increasingly prominent in Malaysia, with platforms like Facebook, Instagram and TikTok playing a crucial role in online shopping activities. According to a report by eMarketer (2024), social commerce sales in Malaysia are expected to reach RM 5.4 billion by the end of 2024, highlighting the growing integration of social interactions with online shopping. Lim and Lee (2022) determined that this integration enhances consumer engagement and purchase intentions through the use of social proof and peer recommendations. Besides, mobile commerce which also on the rise, suggesting the increasing trend of shopping via mobile apps and optimized websites. Data from the Malaysian Communications and Multimedia Commission (MCMC) (2023) indicates that mobile commerce transactions account for approximately 45% of total e-commerce sales in Malaysia. Tan et al. (2024) stated that platforms such as GrabMart and Shopee's mobile app are particularly popular, contributing to the convenience and accessibility that drive market growth. These findings underscore the rapid growth of the Malaysian e-

commerce landscape and the significant impact of various platforms on consumer behavior and market dynamics.

Underpinning Theories

The Technology Acceptance Model (TAM) presents a comprehensive framework for understanding how users come to accept and use technology. In the context of AI tools and personalization marketing, the model emphasizes that consumers' perceptions of usefulness and ease of use are crucial determinants of their intention to engage with AI-driven tools. Davis (1989) defines perceived usefulness as the extent to which consumers believe that a system will enhance their shopping experience, while perceived ease of use indicates the degree to which they expect the technology to be effortless to use. Past studies have expanded TAM to assess AI's influence on consumer behavior, demonstrating that AI-driven tools, such as predictive analytics and recommendation systems, positively impact purchase intentions when consumers view these tools as enhancing their shopping efficiency and experience (Venkatesh & Davis, 2000; Gefen et al., 2003). Kapoor et al. (2021) found that personalized product recommendations based on user preferences increased purchase intentions due to their perceived usefulness in simplifying decision-making. Moreover, consumers are more likely to engage with AI tools perceived as user-friendly and capable of delivering relevant, personalized content with minimal effort (Sun & Zhang, 2022). TAM thus suggests a theoretical perspective on how the effectiveness of AI tools and personalization marketing strategies can drive customer purchase intentions by aligning with consumers' expectations of utility and ease of use. Conversely, the Theory of Planned Behavior (TPB) provides another significant framework for this study in examining the impact of AI tools and personalization marketing on customer purchase intentions. TPB suggests that an individual's behavioral intentions are influenced by their attitudes towards the behavior, subjective norms, and perceived behavioral control (Ajzen, 1991). From the AI tools and personalization marketing point of view, these enhance customer experience by tailoring content and recommendations to individual preferences, which positively influences attitudes towards the brand and products (Zhang et al., 2023). Additionally, personalization marketing facilitated by AI shapes subjective norms through social proof and peer influences, further affecting purchase intentions (Lee & Kim, 2022). AI-driven tools also enhance perceived behavioral control by providing more relevant and timely options, thereby simplifying decision-making and increasing confidence in purchasing decisions (Wang & Zhang, 2023). These insights highlight the significant role of AI tools and personalization marketing in shaping consumer behavior, in line with TPB's core principles.

Artificial Intelligence Tools

Recent research has extensively explored the impact of various AI tools on consumer purchase intentions, demonstrating their significant role in modern marketing strategies. Luo et al. (2021) assessed the effectiveness of chatbots, revealing that these AI-driven systems enhance customer engagement and satisfaction by providing real-time, personalized interactions. This improvement in user experience positively influences purchase intentions by addressing customer needs more effectively. Similarly, Choi et al. (2022) investigated predictive analytics, finding that these tools enable more precise forecasting of consumer behavior, which enhances targeting and personalization. This increased accuracy in addressing consumer preferences contributes to a higher likelihood of purchase. Hwang et al. (2023) focused on AI-driven email marketing, showing that personalized content delivered through AI algorithms significantly boosts open and click-through rates, which are strongly associated with increased purchase intentions. Additionally, Kumar et al. (2023) reviewed the impact of marketing automation tools, highlighting how automation streamlines processes and improves targeting, thereby enhancing consumer engagement and boosting purchase intentions through more relevant and timely content. Collectively, these studies illustrate the transformative effect of AI tools on consumer behavior, emphasizing their critical role in driving purchase intentions through improved personalization and marketing efficiency.

Personalization Marketing

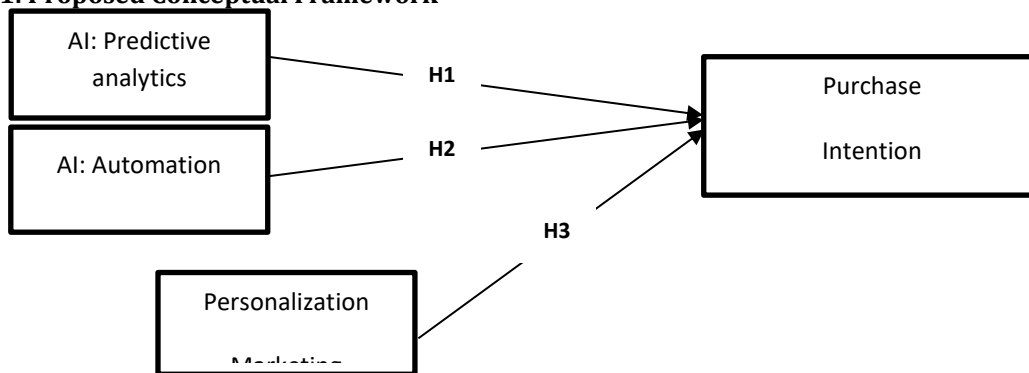
Personalization marketing involves the practice of tailoring marketing messages and experiences to individual consumers based on their behaviors, preferences, and interactions. This method seeks to enhance relevance and engagement by delivering content and offers that are specifically designed to meet the needs and interests of each user (Arora et al., 2021). Personalization marketing strategies often utilize data analytics and machine learning algorithms to segment audiences, predict customer behavior, and deliver customized experiences across various digital channels, including websites, emails, and social media (Lambrecht & Tucker, 2020).

Previous studies have pointed out the effectiveness of personalization marketing in driving consumer engagement and purchase intentions. For example, Ansari et al. (2022) established that personalized product recommendations significantly increase consumer satisfaction and purchase likelihood by providing tailored suggestions that align with individual preferences. Likewise, a study by Choudhury et al. (2023) highlighted that personalization marketing communications, which leverage data-driven insights, develop higher response rates and strengthen customer loyalty. Also, Kordzadeh and Gable (2023) discovered that personalized digital experiences improve consumer retention and conversion rates by generating more meaningful and relevant interactions. These findings collectively demonstrate the significant impact of personalization on digital marketing outcomes, emphasizing its role in enhancing customer engagement and driving purchase intentions.

Consumer Purchase Intention
Kotler and Keller (2016) defined consumer purchase intention as the likelihood or probability that a consumer will engage in a purchase decision based on various marketing stimuli and interactions experienced through digital channels. It is often characterized as the consumer's readiness or propensity to buy a product or service, which can be influenced by factors such as perceived value, personal relevance, and marketing effectiveness. Understanding consumer purchase intention is important for digital marketers, as it helps to design strategies that can effectively drive conversions and enhance sales performance. Recent studies have highlighted the key factors influencing consumer purchase intention in digital marketing contexts. A study by Zhang et al. (2023) showed that personalization and targeted content significantly enhance purchase intentions by making marketing messages more relevant and engaging for individual consumers. Additionally, Kim and Kim (2022) found that the perceived quality of digital interactions and user experience plays a critical part in shaping purchase intentions, with higher-quality interactions leading to an increased likelihood of purchase. Furthermore, Lee et al. (2023) highlighted the impact of social proof and user reviews on consumer purchase decisions, noting that positive feedback and ratings can significantly boost customer purchase intentions by building trust and credibility. These studies collectively point out the importance of various digital marketing factors in influencing consumer purchase intentions, stressing the need for businesses to optimize their strategies based on these insights.

3. Proposed Conceptual Framework and Hypotheses Development

The conceptual framework proposed for this study is illustrated in Figure 1, showing the relationship between AI tools; predictive analytics and automation, and personalization marketing with the consumer purchase intention within the Malaysian e-commerce market.

Figure 1: Proposed Conceptual Framework


Relationship between Artificial Intelligence Tools with Purchase Intention
Predictive analytics involves the utilization of historical data and statistical algorithms to forecast consumer behaviors (Choi, Lee, & Kim, 2022). Research has shown that such a method enhances purchase intentions. For example, Choi, Lee, and Kim (2022) discovered that predictive analytics improves marketing effectiveness by tailoring offers to consumer preferences, which increases engagement and purchase likelihood. Similarly, Kumar, Rajan, Gupta, and Pozza (2021) demonstrated that personalized recommendations based on predictive models positively influence purchase intentions. Qin and Jiang (2021) further corroborated this by

demonstrating that innovative predictive analytics systems are particularly effective at driving purchase intentions. Sun and Zhang (2022) added that predictive analytics not only personalizes marketing but also enhances the overall consumer experience, leading to higher purchase intentions. Therefore, this study attempts to measure the relationship between AI tools: predictive analytics and consumer purchase intention by proposing the following hypothesis:

H1: Predictive analytics has a positive impact on consumer purchase intention within the Malaysian e-commerce market.

Automation refers to the utilization of technology to perform tasks with minimal human intervention (Kapoor, Dwivedi, & Piercy, 2021). Automation plays a critical role in enhancing marketing efficiency and effectiveness. Previous studies highlight that automation positively influences consumer purchase intention by streamlining processes and personalizing interactions. For instance, Kumar, Aksoy, and Donkers (2023) found that marketing automation systems increase engagement by delivering timely and relevant communications, which increases the likelihood of purchase. Similarly, Hwang, Kim, and Yang (2023) emphasize that automated tools like chatbots enhance the shopping experience by providing instant customer support and personalized recommendations, leading to higher purchase intentions. Moreover, automated advertising strategies improve targeting accuracy, making ads more relevant to consumers and thus more likely to drive purchases (Kapoor et al., 2021). All in all, automation improves marketing effectiveness by personalizing consumer interactions, streamlining processes, and optimizing engagement strategies. These improvements contribute to increased consumer purchase intentions. Based on the aforementioned arguments, this study aims to explore the impact of automation on consumer purchase intention by proposing the following hypothesis:

H2: Automation has a positive impact on consumer purchase intention within the Malaysian e-commerce market

Relationship between Personalization Marketing with Purchase Intention
Kotler and Keller (2016) described personalization marketing as the practice of tailoring marketing efforts to individual consumer preferences and behaviors, which plays a vital role in influencing consumer purchase intentions. The authors argued that personalization marketing involves customizing messages, offers, and experiences to meet the specific needs of individual consumers, thereby enhancing the relevance and impact of marketing communications. Unlike AI-driven personalization, traditional personalization approaches rely on segmentation and consumer data analysis to craft targeted strategies. Previous research has shown that such personalized efforts significantly boost consumer engagement. Arora, Lodish, and Rawal (2021) found that personalization marketing increases consumer responsiveness, as it aligns closely with their preferences. Additionally, Ansari, Koenigsberg, and Stahl (2022) demonstrated that personalization marketing communications elevate the perceived value of offers, thereby strengthening purchase intentions. Lee and Kim (2022) also observed that personalization fosters consumer trust and satisfaction, which are critical for driving purchase decisions. Therefore, this study attempts to measure the relationship between personalization marketing and consumer purchase intention by proposing the following hypothesis:

H3: Personalization marketing positively influences consumer purchase intention within the Malaysian e-commerce market.

4. Research Implications

The implications of this study are multifaceted. Theoretically, this study contributes to the growing body of knowledge on AI in marketing by proposing a conceptual framework that links AI tools with consumer purchase intention. It invites further empirical research to validate these relationships, particularly within the Malaysian e-commerce context, where the adoption of AI technologies is rapidly evolving but remains underexplored. However, the study's conceptual nature means it lacks empirical data to support its hypotheses, and the framework may not fully capture all variables influencing consumer behavior. Practically, the findings suggest that businesses should strategically invest in AI technologies to enhance their marketing efforts, leading to higher consumer conversion rates, improved customer loyalty, and a greater competitive advantage. Nonetheless, the study's recommendations may not account for industry-specific variations or regional differences outside of Malaysia. From a policymaker's perspective, the study highlights the importance of establishing supportive regulations and guidelines that facilitate the ethical use of AI tools and personalization in marketing. This involves ensuring that consumer privacy and data security are maintained while promoting

innovation within the e-commerce sector. The limitations of this study underscore the need for further empirical validation and broader contextual analysis.

5. Conclusion

This study proposes to examine the potential impact of AI tools, particularly focusing on predictive analytics, automation, and personalization marketing, on consumer purchase intention within the Malaysian e-commerce market. By synthesizing insights from previous literature, the study proposed that these AI tools and personalization marketing could significantly enhance consumer purchase behavior. In particular, predictive analytics, which forecasts consumer preferences and behaviors, allows marketers to deliver highly personalized experiences, thereby increasing consumer engagement and purchase intention. On the other hand, automation enhances operational efficiency and streamlines customer interactions, contributing to a seamless shopping experience that fosters consumer trust and satisfaction. Although this study is conceptual and does not incorporate empirical data, it lays essential groundwork for future research. Validating the proposed framework through empirical studies could provide actionable insights for e-commerce businesses and policymakers, ultimately fostering a more competitive, innovative, and consumer-friendly market environment in Malaysia. Additionally, future research could also examine the effects of specific AI tools on various consumer segments and assess their effectiveness across different e-commerce platforms.

Abstract: Nowadays, Indigenous tourism contributes to the conservation of cultural heritage and further supports sustainable development for Indigenous communities, which ultimately increases socio-economic well-being. By providing unique cultural experiences, Indigenous tourism gives greater recognition and respect for the culture while also economically benefiting. This paper aims to examine how such dynamics operate in the context of Indigenous tourism from the viewpoint and experiences of Indigenous community members who participated in tourism initiatives. Identifying culture as one of the crucial parameters that determine successful outcomes in this field, this study intends to explore how people participate in sustainable development through tourism and close important gaps using a cultural lens. Numerous databases containing scholarly research, including the Emerald Insights, Science Direct, and Web of Science, have been used in this study. As a response to the ever-growing call for inclusive and respectful tourism, this study aims to contribute valuable insights and geographical relevance to defining policy change, practice modifications, or academic pursuits of Indigenous tourism. The result of this study will fill crucial empirical research gaps in terms of how cultural restoration, tourism management, and community participation can be optimized for sustainable development with nuanced voices that are necessary to drive policy change as well as practice modifications.

Keywords: *Indigenous Tourism, Community Participation, Sustainability, Tourism Management, Culture.*

1. Introduction and Background

According to Tourism Malaysia (2023), tourism plays a critical role in bolstering Malaysia's economy, with the industry contributing RM28,228.3 million in 2022. Hamid et al. (2022) emphasized that the 12th Malaysia Plan supports this by enhancing economic opportunities for various communities, including Indigenous populations. Designating tourism as a National Key Economic Activity (NKEA) opens doors for rural and Indigenous tourism, which is increasingly popular worldwide for showcasing unique cultural heritage.

Indigenous populations form a substantial and varied demographic segment globally, covering an extensive spectrum of ethnic, cultural, and linguistic backgrounds. According to the United Nations (2023), there are 476 million Indigenous individuals worldwide, accounting for 6.2% of the total global population. These communities are distributed over 90 countries and encompass more than 5,000 distinct groups. Such diversity manifests in a rich tapestry of cultures, religions, traditions, languages, and histories (Bruchac, 2020). The widespread presence and cultural depth of these Indigenous groups highlight the intricacy of their roles and contributions within society, underscoring the importance of recognizing this diversity for understanding their unique viewpoints and effectively addressing the challenges they encounter today.

In Malaysia, the Department of Orang Asli Development (2022) identified three main categories of Indigenous populations in Peninsular Malaysia: The Senoi, Negrito, and Proto-Malay. The total Indigenous population in this region is reported to be 209,575 individuals, with the Senoi tribe being the most populous, accounting for 115,712 individuals or 55.21% of the Indigenous total. The Proto-Malay group follows with 87,541 individuals or 41.77%, while the Negrito, the smallest group, comprises 6,322 individuals or 3.02%. This characteristic, where a few groups constitute a major portion of the Indigenous demographic, echoes trends observed globally, similar to Canada such as First Nations, Métis, and Inuit populations, as reported in 2021 (Statistics Canada, 2024).

Indigenous tourism has been attracting a lot of focus in the wider tourism business, which means that many are becoming more involved with Indigenous as well (Butler, 2021). This heightened involvement marks their

participation in steering and leveraging wider tourism and economic developments. Despite the potential for social and economic benefits, Indigenous tourism remains marred with challenges related to understanding how culture informs community participation (Fan et al., 2020), which ultimately determines sustainable development outcomes (Matatolu, 2020). This study aims to understand the complexities of Indigenous tourism, focusing on how culture and sustainability impact community commitment and link with performance outcomes from tourism activities within an Indigenous context.

Indigenous communities worldwide are on the rise in interacting with tourism, and thus there is an urgent necessity to improve its power of preserving or making a gain out of their cultural heritage (Alamineh et al., 2023) while respecting them as well. Indigenous tourism can provide pathways to economic development as well as cultural renewal, but it also raises questions about what is considered authentic and how indigeneity should be represented amid settler colonialism. This ethnographic study of the culture and sustainability underlying Indigenous tourism is intended to make a scholarly contribution toward more socially inclusive and equitable forms of tourism practice for both Indigenous communities and the overarching sector.

Tourism has been popularly acknowledged as an effective economic growth driver from the perspective of Indigenous communities (Mansor et al., 2019). As highlighted by Mansor et al. (2019), tourism development includes the participation of the Indigenous community, contributing to transformational impacts on socio-cultural aspects. Their participation not only helps to maintain economic opportunities but also benefits the survival and perpetuation of ancestral culture, which therefore strengthens community resilience to socio-economic transformations. There are some ways in which Indigenous communities have negotiated the changes associated with tourism development and found a balance between accommodation for and benefiting from it (Scheyvens et al., 2021). The focus of sustainable tourism planning and research on tourist impacts is concerns over attitudes and perceptions by Indigenous communities.

Therefore, this study seeks to explore the perceptions and outlooks of Indigenous communities on tourism development to shape these findings for sustainable policy measures as well as future inquiry into understanding sustainability implications through an Indigenous perspective. Specifically, the objectives of this study are:

- To evaluate the cultural aspects of Indigenous community participation in promoting tourism initiatives.
- To investigate the effect of culture on the success and sustainability of Indigenous tourism initiatives.
- To analyze the Indigenous tourism strategies towards enhancing the sustainability of cultural awareness and sustainable tourism practices.

To achieve the above objectives, this study intends to answer the following research questions:
- What are the aspects of promoting tourism initiatives about cultural considerations in terms of involving Indigenous communities?
- What kind of cultural factors may contribute to or detract from the success and sustainability of Indigenous tourism initiatives?
- What are the Indigenous tourism strategies that can be applied to enhance the sustainability of cultural awareness and sustainable tourism practices?

2. Literature Review

Indigenous Tourism
The concept of Indigenous tourism has been identified as a critical area that may mediate cultural preservation, economic development and social justice among Indigenous communities. Indigenous tourism activities are generally related to the appreciation of nature, participation in local practices and immersion into cultural experiences that lead to increased overall happiness (Wu et al., 2020). Wei et al. (2021) have pointed to the potential of thinking about Indigenous people as just another group of tourists for advancing deeper frameworks that could understand indigeneity and explain the meaning of indigenization. This perspective is intended to contribute to a theoretical understanding of the trans-local constitution of indigeneity by

emphasizing complexity beyond any singular identity categories that can be subsumed within Indigenous communities. It recognizes Indigenous people as other tourists, in search of meaningful experiences that reflect who they are and what they want to become, thus complicating the rather fixed representations of Indigenous people and their cultures. This approach helps in presenting Indigenous tourism as a favorable approach that not only acknowledges the modernity and globalization in Indigenous peoples' communities.

According to Dahlan et al. (2023), Indigenous tourism can play a much bigger role in improving socio-economic conditions for people by providing jobs and keeping land and infrastructure well maintained as assets to local economies, all the while bolstering pride among those who are involved. However, it poses complex issues in maintaining cultural identity and an efficient local administration at the same time. For instance, the arrival of tourists tends to create consumerization of cultures, which may in turn reduce the importance and meaning behind various practices. This underlines the need for Malaysia to fine-tune its management approaches that would enhance the conservation-usage balance that the people had adopted on cultural resources in their bid to develop profitable tourism products without compromising on culture.

Even though roles in employment and economic development of Indigenous people have moved beyond the traditional forms, Butler (2021) argued that future studies must explore further the economic development dimensions, which appear to have changed with the new motivation and expansion of tourism activities. For example, Butler (2021) mentioned that in the course of the growing complexity of Indigenous tourism businesses, the parties can intensify the discussion regarding the increased tourist flows' management and the expansion of the types of tourism offerings. Raja et al. (2022) also highlighted that Indigenous tourism in Madhya Pradesh, India, requires an integrated approach relating to human resources, social capacities, concerns for nature and heritage, engagement of Indigenous communities, and marketing of local products. Thus, there is balance and fairness in the distribution of the impact of tourist activities within the community and, at the same time, it guarantees that the said activities will adhere to the community's ideals and standards.

Self-identifications presented by Indigenous people on tourism platforms are diametrically opposite to the non-Indigenous tourists' landscapes hence reaffirming Indigenous identity as well as acknowledging the authority of cultural heritage managers (Ambros & Buzinde, 2021). Such self-representations are valuable assets for Indigenous people in their way of controlling the discursive field and providing truthful information to tourists about their cultures. Thus, through Indigenous cultures' presentation of their cultural terms, Indigenous communities can effectively work against stereotyping and mediate a proper and more appropriately engaging interaction with the tourists.

Moreover, Chen (2021) sought to improve the significance of Indigenous tourism in a multicultural segmented market by matching the tourists' expectations and experiences. This means in the process of constructing tourism products, emphasis should be placed on the creation of products with real cultural content that will at the same time meet the desires of different tourist groups. In this way, Chen (2021) wanted to promote sustainable tourism that will help in the development of the economy while paying respect to the local culture. Therefore, this approach emphasizes the importance of culture and sustainability in the existence of tourism development planning.

Indigenous Community Participation
Today, Indigenous community participation is incorporated into sustainable development, environmental management, and cultural conservation frameworks. Thompson et al., (2020) in their paper highlighted that a higher level of Indigenous community participation in environmental monitoring indicates that they have different monitoring goals, measures, and results compared to the cases with lower Indigenous community participation. This discovery revealed that Indigenous people contribute valuable 'epistemic resources' to enhance processes of environmental development by offering their valuable Indigenous knowledge and principles within these programs. For instance, Bullock et al. (2020) illustrated how Indigenous participation in collaborative environmental governance in Canada, initiated by NGOs, can be effectively enhanced through four specific participation structures: In the first category, there are external advisory committees, the second category is internal board subcommittees, the third category is hybrid internal-external advisory boards and in the last category there still internal ad hoc groups, but their members are selected from internal resources.

These structures create a more appropriate and proper way of involving these Indigenous people so that they are not left out of governance systems.

Drake et al. (2022) performed a scoping review of the literature on Indigenous participation in carrying out coastal and marine research and monitoring in Inuit Nunangat, Canada. Hence, it is evident that there is a significant gap in the definition and measurement of participation as demonstrated by articles published in the scientific journals. The qualitative analysis of 72 works revealed that only 10 percent of the sources provided distinct definitions for participation terms aggravating a severe absence of coherence in the literature and the subsequent requirement for the more distinct definitions of the participation terms. This can cause a breakdown in the effectiveness of participatory approaches, significant to the enhancement of culture such as definition and structure for enabled Indigenous groups participation. They include theoretical and methodological issues arising from the fact that important definitions, which are fundamental tools for the operationalization of the concept of participation concerning Indigenous stakeholders' input and needs, are unclear and inconsistent.

Musadad et al. (2022) discussed about tourism participation of the Indigenous community in the context of Bukit Tigapuluh National Park, Indonesia. Consequently, the study found that explaining Indigenous participation in tourism activities, there is a positive relationship with set conservation goals, forest management as well as improvement of the community because they are positively impacting activities. As demonstrated in this case, the incorporation of Indigenous people leads to sustainable tourism as an effort an expand the sector that is socially and economically beneficial to the environment and Indigenous persons. Therefore, this study has highlighted that Indigenous people in the area of Bukit Tigapuluh have effectively achieved the link of sustainable economic activities with conservation and cultural sustainability goals. The positive impacts that the community perceives are increased concern for the environment, local people's additional income, and cultural heritage marketing.

Sustainable Development
The Indigenous peoples' right to sustainable development has been labeled as a "cornerstone" of modern policy agendas as a reflection of self-determination as well as the need to diversify support instruments (Nikitin, 2022). This principle postulates that Indigenous people should have control over their affairs and be involved in any decisions concerning their physical space, assets, and culture. The measures related to sustainable development policies have to involve Indigenous people, providing them with the opportunity to determine their further development. This empowerment includes the promotion of their autonomy as well as providing an adequate accompaniment of their projects and proper legislation. In this way, policies can make almost any initiative not only sustainable but also more sensitive to equity and inclusion.

There are issues like the protection of land rights, the appropriate estimation of the tourists' demand, and the management structures that should be supported to ensure the sustainability of Indigenous people's tourism within protected areas (Mach & Vahradian, 2019). The secure land rights offer flexibility to the Indigenous people and their communities to steward their land resources using their Indigenous practices and the principles of sustainability. The correct estimation of tourist' demand is useful to further coordinate and control tourism-related actions to prevent excessive overcrowding that results in negative impacts on the environment and traditional culture. Participatory management approaches with communities, national and local governments and other stakeholders ensure that measures of tourism development and promotion are premised on benefitting the communities and their values hence; promoting the shared stewardship of resources.

Thus, Indigenous tourism in the forested area targets sustainability goals that require the engagement of both the community people and administrative bodies. Salazar-Sepúlveda et al. (2022) offered a massive systematic review that figured out the features of sustainable tourism including limiting the number of tourists, bringing adequate infrastructures, and enforcing conservative measures. They also call for measures for the controlling number of tourists with a view of avoiding exploitation of natural resources by many people. Moreover, they call for adequate infrastructure that may include environmentally friendly products, especially tourism-related products like accommodation units that will have the least impact on the environment. Conservation also forms another important pillar of tourism because, through the conservation of habitats and species, the balance of nature should be preserved to avoid the negative impact of tourism activities.

Similarly, Chang et al. (2021) warned that Indigenous tourism should try to reach sustainability by adopting supportive government policies and pursuing the benefits related to business, people, and the environment. There is often a need for government support for entering and maintaining active participation and the necessary funding and investment as well as adequate policies that support Indigenous people and their sustainable needs. In addition, government support refers to the direct and indirect funding of community-based tourism initiatives, skills development interventions that strengthen the local human capital and policies that support Indigenous peoples' justice and sustainable ecotourism. When implemented, such initiatives can generate employment and income for the Indigenous people hence, improving the economic effects of the policy. From the social aspect, they may bring about unity of the people as well as a boost to cultural personality while from the environmental aspect, they can extend support towards the preservation of the natural base as well as the species.

Maza and Calfucura (2020) provided a critical insight into the policies on tourism development in Chile, and South America: on the one hand, Indigenous tourism and on the other, Indigenous people's political representation. Such disparities show that while approved policies seek to stimulate tourism, there is a vacuum as regards the political and social rights of indigenous people. Failure to be granted political identity and support, Indigenous tourism ventures may experience the above difficulties like inadequate funding, poor infrastructure, and inadequate marketing. To overcome it, they call for the political and cultural rights of Indigenous people to be respected in the process of tourism improvement. This includes addressing past wrongs done to them, affording legal status to their territories and natural endowments, and encouraging Indigenous people's inclusion in tourism management.

Sustainable Indigenous tourism development must hence involve processes of building Indigenous pride, the retention of Indigenous knowledge, and partnership with the tourism sector partners as evident at the Pha Mi Indigenous Tourism in Chiang Rai, Thailand (Yiamjanya et al., 2022). These measures help minimize cases of cultural misunderstandings and scenarios where Indigenous populations end up being disadvantaged by tourism development. This intervention has positively incorporated cultural values and cultural practices in tourism-related activities making the experience real to the tourists. This has gone a long way in generating pride among the Pha Mi community members concerning their culture and history to undertake the responsibility of passing down this information to the next generations. Collaboration with tourism partners like local traders, the government and non-governmental organizations has also been essential in getting all the support necessary to come up with sustainable tourism that will benefit the society both economically and socially.

Some Indigenous tourism enterprises in Fiji, Australia, and New Zealand use appropriate strategies of sustainable tourism management based on Indigenous philosophies and practices (Scheyvens et al., 2021). These enterprises are twofold as they help other Indigenous & non-Indigenous people to understand cultural differences, assist in developing local businesses, and improve the environment in which they exist. For instance, in Fiji, tourism enterprises offer cultural tourism working with local people to organize cultural tourism packages and ecotourism accommodations that depict the cultural practices and lifestyle of Indigenous Fijians. Australia's Indigenous tourism enterprises provide services like guided tours through which people are explained about the region's geography, fauna, and the Indigenous culture. In New Zealand, owning to the tourism ventures owned by Māori, various activities have been developed that have the aim of introducing Māori culture, history and way of life to the tourists. These enterprises act as successful templates for sustainable development pointing at how Indigenous people's support through tourism can be attained concurrently with cultural exchange and conservation of natural resources.

Culture
Culture is one of the factors that may or may not help in the nourishment and enhancement of Indigenous tourism. Indigenous tourism functions as a channel through which Indigenous people and their traditions signifying languages, history, chants, art, movements, ways of hunting, celebrations, and rules can be preserved. However, the problems are with the navigational practices of individuals and communities who own cultural assets and representations. These issues have been mentioned by Ruhanen and Whitford (2019) concerning Indigenous tourism or cultural tourism as they support the maintenance of cultural identification but, it must

be recognized and dealt with depending on its case so that Indigenous culture will not turn into another product that is for sale. The acute issue lies in the fact that only the Indigenous communities have to be supported with their potential to manage their intangible heritage unsuitably for external demand that functions predominantly in the sphere of standardized global tourism.

Even though tourism is generally frowned upon since it brings confusion to their culture, the Indigenous people of the Tz'utujil Maya Community, specifically the people of Santiago Atitlán, Guatemala, have proven that in as much as tourism poses many challenges to Indigenous communities, it equally can be used to empower them by embracing their cultural beliefs. Harbor and Hunt (2021) explained in detail how this model increases, for example, self-governance, self-determination, and equity concerning tourism-related issues. Their research presents insights into how the Tz'utujil Maya try to redress some of the improper uses of their culture such as in tourism activities. There is no passive acceptance of cultural depictions, but rather the negotiation of culture production about authenticity and representation, which determines how the participants' culture ends up in tourism circulation. This process entails an ongoing discussion in the community on the kind of cultural portrayal that is acceptable for the dissemination of their culture to the outside world while at the same time satisfying the tourism market.

Suggesting some examples in Malaysia, the Mah Meri tribe failed to become assimilated into tourism by integrating their cultural assets including wood carving, the carving of masks, the weaving of pandanus, cultural dances, and other performances into their tourism package. Some of the exposure to the Mah Meri culture was acknowledged by Wahab et al. (2020) as partly owed to the intervention of the involved tourism authorities. These authorities also assist the tribe, to oversee the preservation of the true nature of the cultural practices in their midst and also in advertising the specialty of these practices. It is the double vision that would guarantee that the Mah Meri would not be deprived of the economic advantages that come from tourism while at the same time remaining culturally intact. Tourism authorities also support the process and contribute resources, training, and marketing to guarantee the sustainability, and profitability of the Mah Meri's cultural tourism activities.

As another example, the Batek tribe of Malaysia struggles with the need to preserve their cultural integrity and develop tourism services at the same time. Fan et al. (2020) discussed various dilemmas concerning the process of modernization that the Batek tribe faces as well as their attempts to maintain their cultural identity. Thus, the Batek face the problem of how to realize tourism without risking domination over their history and culture. This struggle is emblematic of a broader issue faced by many Indigenous communities, where they have to find ways to effectively use tourism as a source of income, while at the same time preserving the cultures of the peoples that live in those areas.

While analyzing the cultural aspect in the tourism context, Indonesian interpretation tends to define cultural elements in terms of identification and tourism attractiveness without emphasizing the value of culture as an economic asset. According to Mangku et al. (2022), this narrow aim is problematic because it does not mention the overall endogenous economic impacts that could be created if there is a more collaborative approach to cultural tourism. Based on their findings, culture could be seen as an economic capital meaning that the promotion of tourism should be done in a way that will foster cultural tourism that will promote the establishment of economic opportunities in Indigenous communities. This course of action implies a different way of thinking and perceiving, where cultural heritage has to cease to be looked at as a mere sightseeing spot, but, as a living and beneficial economic resource.

3. Methodology

The systematic literature review (SLR) concluded from this study provided the following results that correspond with the research objectives revolving around Indigenous tourism, community participation, and sustainability. The steps involved in the review process were asserting different databases including Emerald Insight, Science Direct, and Web of Science, which was done based on their database of peer-reviewed journals ascertaining its availability of material. In total, 23 articles were scrutinized, which entails the presence of a solid base for the discussion concerning this study. One of the recurring topics to be discussed is the participation of Indigenous community members in the destinations. In doing so, this participation improves

the reality of the tourists' experiences and exemplifies the implementation of sustainable practices that align with cultural and environmental preservation.

Furthermore, in the course of the review, several successful sustainable practices geared towards culture conservation with equal concern for the environment when contrasting economic gains and cultural values were also witnessed. Another area of learning was the economic outcomes of Indigenous tourism, highlighted by surveys that showed that community participation results in improved revenues and employment for the Indigenous people hence serving the purpose of the research which aimed at gauging such returns. Nevertheless, literature also revealed some of the key issues of Indigenous populations, such as scarcity of resources, prejudice, and influence of non-Indigenous tourism actors, which are essential to analyze the multifaceted nature of Indigenous tourism. In addition, emerged more pronounced knowledge gaps, especially those associated with the long-term impacts of Indigenous tourism on culture and community resilience. These insights not only give an overview of the state of knowledge of Indigenous tourism but also suggest the future of this study, thus staying in tune with the scholarly literature while addressing the challenges and gaps identified.

To perform this study, a set of specific keywords was used in the search strategy that would encompass the whole idea of the study. The primary keywords were "indigenous tourism" and compound keywords, which consisted of "indigenous AND tourism," which aimed to search for information about the specialized characteristics of tourism related to Indigenous peoples. In more detail, to expand the focus on the dynamics of local engagement identified in the literature, the study also used "indigenous community participation," and "indigenous AND community participation." Consequently, the search allowed for the consideration of the Indigenous people's participation in tourism activities.

Apart from the keywords on community participation, other keywords used in the review were connected to sustainability and tourism management to capture the research that analyses the sustainability of practices applied in Indigenous communities concerning tourism. The addition of the word "Indigenous" and the blend of two words "Indigenous AND culture" enabled the research to connect with works that address survival, transformation, and the consequences of cultural assets resulting from tourism advancement.

By employing these keywords, the literature search was conducted to construct a strong notion of how Indigenous tourism works, how it impacts and incorporates Indigenous communities, and finally, how impediments towards sustainable Indigenous tourism can be conquered. The findings from these databases were similarly diverse as they included work with theoretical discussion, case studies, and empirical research findings that collectively offered the basis for analysis in this study.

4. Potential Outcome and Direction for Future Research

The objective of this study is to provide a deep analysis of the cultural and sustainable intervention in Indigenous tourism in Malaysia. It is equally important to identify the expected impacts since the goals are multiple, complex, and highly important. In the first place, it is believed that this paper will elucidate the roles of cultural artifacts, including practices, arts, and communal activities as critical determinants of elusive Indigenous tourism development. Thus, it will expose how cultural values are central to tourism operations as a means of generating remarkable economic returns to the Indigenous people's societies (Wahab et al., 2020). Furthermore, the study will yield important findings concerning the degree and type of community participation in tourism activities, stressing positive incentives and negative restraints on participation. Through the assessment of existing community-centered tourism development initiatives, the research shall present examples, which shall inform the implementation of similar contexts among Indigenous communities (Mansor et al., 2019).

Moreover, the research seeks to find out how sustainability is understood and practiced in Indigenous tourism, and perhaps more distinctive, how the development and conservation of Indigenous cultures interrelate. It will be possible to discover the vital long-term success of sustainable activities, for instance, the environmental management within tourism and culturally sound advertisements (Ransfield & Reichenberger, 2021). Last but not least, this study is ready to provide strong policy implications for governments, tourism authorities, and

Indigenous communities regarding the support of Indigenous tourism initiatives and business models in such a way that the Indigenous people's culture and values will be respected while the economic growth will be achieved. Useful recommendations will be made to ensure that tourism operators and community leaders implement and improve the efficiency and sustainability of their interventions (Dahlan et al., 2023).

In addition, there are some suggestions for potential future studies to improve the conceptualization of Indigenous tourism. Firstly, the longitudinal study is important to cover the Indigenous tourism projects' developments over several years to determine their sustainability and cultural imprinting. Exploring the external environment that affects Indigenous tourism initiatives' ability to be successful and sustainable will also be necessary (Simpong et al., 2022). A comparative study of the progress of Indigenous tourism efforts at the regional and international level within Malaysia will enable researchers to find out common success promoters and contextualized challenges facing the success of Indigenous tourism initiatives. Comparing and analyzing how different Indigenous populations change their setting up of tourism with regards to culture or environment will therefore lead to a better understanding of the possibilities and viability of such initiatives (Scheyvens et al., 2021).

Furthermore, how social media and technology, in general, can be used to boost Indigenous tourism and maintain cultural integrity at the same time, can also present new approaches to enrich the tourists' experience and safeguard the Indigenous peoples' identities (Choo & Halim, 2022). Targeted economic analysis research is essential to measure the constituent value of Indigenous tourism to analyze how possible revenues are fairly divided. The professionals will also have to devise mitigation measures that will enable them to effectively address global issues, for instance, pandemics or economic downturns, when evaluating the economic sustainability of Indigenous tourism initiatives (Sanip & Mustapha, 2020).

The participation of anthropologists, environmental scientists, economists and culture specialists from other fields will enhance the growth of an inter-disciplinary kind of approach towards Indigenous tourism. Indigenous people's participation in the formulation of research topics and approaches is particularly crucial owing to the primary consideration of Indigenous ways of knowing (Aisyah, 2023). Finally, future research may focus on an examination of the processes by which the policy recommendations resulting from this type of study are put into practice, as well as assess the utility and outcomes of those initiatives on Indigenous tourism. Understanding the factors that may hinder the policies' implementation and recommending ways to effectively improve the policies' approval by the governments and other stakeholders will help to adopt policies that will be efficient and beneficial for Indigenous people. As highlighted in the literature gaps above, future research focusing on these areas will enhance the understanding and improvement of Indigenous tourism for the future development of Indigenous people's culture in Malaysia and other parts of the world.

5. Conclusion

Overall, this paper is capable of providing a clear understanding of the complexity of culture, community participation, and sustainability in tourism activities for the Indigenous peoples in Malaysia. Thus, the present research underscores the concept and significance of culture and participation of the Indigenous people as vital ingredients to implement sustainable measures in tourism practices. Therefore, this study also points to the importance of the centering of the Indigenous paradigm to affirm and protect Indigenous peoples' sovereignty and cultural assets in tourism. It ensures that economic development does not compromise on cultural principles. This paper also confirms that; tourism plans, that respect cultural values and remain sensitive to the historical background of Indigenous people and artifacts are critical to achieving sustainable development.

As Indigenous tourism is entering the global sphere of attention the findings of this research contribute to understanding what policy improvements are necessary for Indigenous peoples, aiding in the development of effective recommendations and practices, and contributing to further Indigenous tourism research. Subsequently, population and cultural specifics related to Indigenous peoples can be one of the prerequisites for applying comprehensive strategies for sustainable Indigenous people's tourism. It is, therefore, the modest endeavor of this study to add its voice to the global discourse on sustainable tourism, especially given the fact that methods and approaches empowering the Indigenous knowledge, values and culture are imperative for sustainable development. Finally, this paper argues for the improvement of Indigenous tourists' treatment that

allows Indigenous populations to protect and promote Indigenous cultures and provide sustainable income-generating activities for Indigenous people. Instead, it embraces the need to fundamentally change the tourism development paradigms in such a way that Indigenous people's voices and experiences as custodians of vibrant cultures are accorded primacy and protection within the global tourism domain.

The Impact of Social Media on Mental Health of Young Adults: A Literature Review

*Sarinah Sabar, Natasha Dzulkalnine, Masrur Mohd Khir
Universiti Teknologi Mara, Faculty of Business and Management, Selangor, Malaysia
*sarinahs@uitm.edu.my, natashad@uitm.edu.my, masrur@uitm.edu.my

Abstract: This concept paper explores the complex relationship between social media usage and the mental health of young adults. The paper introduces the notion of social media and its significance in the lives of young adult, emphasizing the importance of studying its effects on their mental health and psychological well-being. Social media platforms have become an integral part of daily activities in the lives of young people. It has also become an invasive element in the lives of youth, shaping their social interactions, self-perception, and access to lots of information. Even though these platforms offer opportunities for social connection, creative expression, and educational engagement, they also present significant mental health challenges, including anxiety, depression, and low self-esteem, which are often driven by social comparison, cyberbullying, and the pressure to maintain an idealized online image. The paper investigates key areas of concern, including the rise of anxiety, depression, and low self-esteem linked to social comparison, cyberbullying, and the relentless pursuit of online validation. It also examines the addictive nature of social media, its impact on sleep, and the destruction of face-to-face social skills. By analysing existing literature and identifying research gaps, this paper aims to provide a comprehensive framework for understanding the two-edged nature of social media's influence on mental health. It advocates for the development of digital literacy programs, mental health support systems, and balanced usage strategies to help young people navigate the challenges posed by social media while maximizing its potential benefits.

Keywords: *Social media, Trends, Mental Health, cyberbullying, Social Participation, Social Comparison, Self-Presentation, Young Adults*

1. Introduction and Background

The rapid rise of social media (formerly referred to as social network sites) has profoundly transformed the social landscape for young adults, who are among the most active users of these platforms. Social media, as defined by Carr and Hayes (2015), refers to online platforms that facilitate interactions through sharing pictures, comments, and reactions to content. With many teenagers being regular users of social media (Anderson & Jiang, 2018), understanding its impact on their mental health is crucial. Young adults, typically aged 18 to 30, are the most users of social media, with studies showing that they spend substantial amounts of time on these platforms daily (Pew Research Center, 2021). Social media provides avenues for social interaction, information sharing, and entertainment, aligning with the developmental needs of young adults who are navigating major life transitions such as completing education, starting careers, and forming intimate relationships. Social media has redefined how they interact, communicate, and perceive themselves and others. The Internet Users Survey 2020 undertaken by the Malaysian Communications and Multimedia Commission (MCMC) showed that Internet users in the country were mainly adults aged between 20-29, accounting for 46%. This makes youth aged between 20-24, the biggest group of internet users in Malaysia (MCMC, 2020). The national survey revealed that people used the internet for text communication (98.1% of respondents), social media (93.3%), to watch videos (87.3%), voice/video communication (81.1%) and to get information (74.3%). 43% of internet users had shared online content. In 2023, Malaysia had approximately 30.25 million active social media users.

Representing about 91% of the country's total population of around 33.57 million people. Social media platforms such as Facebook, Instagram, TikTok, and Twitter are particularly popular among Malaysians, with a significant portion of the population using these platforms daily for communication, entertainment, news, and commerce. This high level of social media penetration reflects the growing importance of digital platforms in the everyday lives of Malaysians. Thus, this paper discusses the imperative areas that revolve the social media and its impacts on users such as the emerging trends of social media use, its implications on mental health, social participation and social behaviour, identity formation and self-representation and regulatory enforcement of social media in Malaysia.

Social media platforms such as Facebook, Instagram, Twitter or X, and TikTok, have evolved rapidly over the past decade. These platforms offer users the ability to share content, engage with others, and participate in virtual communities. For young adults, social media serves as a primary means of communication and self-expression, playing a central role in their social lives and identity formation. This paper also clarifies the key term 'psychological wellbeing,' which described by Waterman et al. (2010), relates to an individual's ability to live meaningfully according to their deeply held values. According to the World Health Organization (WHO, 2018), mental health is defined as a state of well-being where an individual can flourish by realizing their potential, engaging in positive social interactions, and contributing to society. Although existing research in this area has been mainly quantitative, providing evidence for the association between social media use and mental health outcomes, it has offered limited insight into how young adults perceive and experience these effects. To address this gap, this paper introduces a narrative review that aims to synthesize recent qualitative research focusing on young adults' perspectives regarding the impact of social media on their mental health and psychological well-being. This approach seeks to deepen the understanding of how social media influences the lives of young people from their viewpoints, offering valuable insights beyond what quantitative data can provide.

With sorts of social media platforms, young adults have unparalleled access to global networks, enabling them to stay connected with peers, share experiences, and access diverse information. However, this digital shift has also introduced new challenges that affect their mental health and social participation. Young adulthood is a critical developmental stage characterized by significant emotional, psychological, and social changes. During this period, individuals are particularly sensitive to external influences, including peer approval and social feedback, both of which are magnified in the context of social media. Recent studies confirm that identity formation continues throughout young adulthood, influenced by personal experiences and social interactions (Downes & Kim, 2019). Other than that, the need for social validation, often measured through likes, comments, and followers, can foster a sense of self-worth that is contingent on external approval, further worsening mental health issues. The pressure to maintain an idealized online image, combined with constant exposure to curated portrayals of others' lives, can contribute to feelings of inadequacy, anxiety, and depression. The phenomenon of social comparison where young adults measure their worth against the unrealistic standards set by their peers and influencers can intensify these mental health issues.

Cyberbullying is another significant concern associated with social media use. Unlike traditional bullying, cyberbullying can occur at any time, 24/7, with the potential for wide and rapid dissemination, making it more pervasive and damaging (Alim, 2016). Victims of cyberbullying are at increased risk of experiencing anxiety, depression, and even suicidal thoughts. Furthermore, the anonymous nature of online interactions can lead to a lack of accountability, making it easier for bullies to target their victims. Social media also impacts young adults' social participation. While these platforms offer opportunities for community building and activism, they can also lead to social isolation and a decrease in face-to-face interactions. The reliance on virtual communication can weaken real-world social skills, making it difficult for young adults to form and maintain meaningful relationships outside the digital realm. Moreover, the constant connectivity associated with social media can disrupt sleep patterns, further affecting young adults' mental health and social functioning (Nesi, 2024). Despite these challenges, social media is not without its benefits. It can provide a sense of belonging,

Particularly for those who may feel marginalized in their offline communities. Online support networks can be invaluable for young adults dealing with issues such as mental health struggles, identity exploration, or social stigma. Additionally, social media can be a platform for positive self-expression, creativity, and civic engagement, allowing young adults to connect with like-minded individuals and causes they care about.

In addition to these psychological impacts, social media has also reshaped the way young adults participate in social life. Social media has fundamentally transformed how young adults lead their social lives, influencing everything from interpersonal relationships and social interactions to identity formation and community engagement. In other words, social media has reshaped the social landscape for young adults, offering new opportunities for connection and expression while also introducing complexities and challenges that influence their social experiences and mental well-being. The multidimensional social media platforms offer avenues for building connections and engaging in community activities, they can also lead to social isolation, reduced face-to-face interactions, and an over-reliance on virtual relationships. This can distort their perception of

what is normal or achievable, leading to dissatisfaction with their own lives and increased pressure to conform to these ideals (Chou & Edge, 2012). The constant exposure to idealised and often unattainable standards on social media can create unrealistic benchmarks for success and happiness. As a result, individuals may feel inadequate or pressured to align their lives with these portrayed ideals, which can intensify feelings of dissatisfaction and contribute to a range of psychological issues, such as anxiety or nervousness, depression, and low self-esteem.

The digital environment, with its relentless pace and the potential for negative interactions such as cyberbullying, can create stressors that undermine mental well-being. Despite the potential risks, social media also offers significant benefits, including access to support networks, educational resources, and opportunities for creative expression. For many young adults, these platforms provide a sense of belonging and a means to connect with like-minded individuals, particularly those who may feel marginalized in their offline lives. Understanding the impact of social media on the mental health of young adults is crucial for developing strategies that promote healthy online behaviours and support mental well-being (Zhao, Da & Yan, 2020). As social media continues to evolve and embed itself in the composition of young adults' lives, it is essential to address the complex ways it influences their mental health and social participation. This exploration will provide insights into how to balance the advantages of social media with the need to mitigate its potential harms, ensuring that young adults can navigate the digital world in a way that supports their overall well-being.

In summary, recent literature features on new trends and developments in social media use, focusing on its impact on mental health, social behaviour, and societal issues, while social media presents unique opportunities for young adults to engage with the world, it also poses significant risks to their mental health and social development. Understanding the dual impact of social media use on this critical age group is crucial for developing interventions that promote healthy online behaviours and support young adults in navigating the complexities of the digital world.

2. Literature Review

Emerging Trends in Social Media Use
The field of social media research has rapidly evolved, reflecting the dynamic nature of digital platforms and their growing influence on various aspects of life. Recent literature highlights the evolving impact of social media on the social lives of young adults, emphasizing both the transformative effects and emerging challenges. The digital landscape continues to shape how young adults connect, communicate, and construct their social identities, with new trends and technologies influencing these processes. Several studies have examined the patterns of social media use among different age groups, particularly young adults. The latest research underscores the role of social media in expanding social networks beyond geographical boundaries. Young adults are now able to form and maintain relationships with peers across the globe, creating diverse and multicultural social networks (Boulianne & Lee, 2022).

The concept of hybrid socialization, where online and offline interactions blend seamlessly, is gaining more attention. Young adults increasingly navigate both worlds simultaneously, with social media enhancing face-to-face interactions through pre-event planning, post-event sharing, and continuous engagement with social circles (Robards & Lincoln, 2020). Global connectivity fosters cross-cultural exchange and broadens social perspectives. Research indicates that young adults engage with social media frequently, often using multiple platforms to fulfil various needs such as social interaction, entertainment, and information consumption (Smith & Duggan, 2013). Patterns of use are influenced by factors such as social norms, personal interests, and technological advancements (Myrow, 2024). Social media use has been escalated and integrated into many areas in recent years. Social media is becoming more incorporated into daily activities, including work and education. The rise of remote work and online learning has increased the use of social media for professional networking and educational purposes (Trunfio & Rossi, 2021). The concern about keeping the privacy has also created with growing awareness of data privacy issues, users are becoming more concerned about how their information is collected and used. Recent studies explore the impact of privacy policies and data breaches on user trust and engagement (Martin & Murphy, 2017). Studies emphasize the importance of giving users control over their data. Features that allow users to manage their privacy settings and understand the implications of

their choices contribute to greater trust and satisfaction. Providing users with control and autonomy over their information can enhance their overall engagement with the platform.

In terms of frequency and duration of social media use, young adults typically spend significant time on social media, with some studies reporting daily usage exceeding several hours (Vogel et al., 2014). The time spent on these platforms can vary based on individual preferences and the types of content consumed. Other than that, the purpose of use has also significantly emerged in the trend. According to Boyd and Ellison (2007), social media use among young adults serves multiple purposes, including maintaining social connections, seeking social recognition and validation, and engaging in self-expression. The motivations behind use can influence the nature of interactions and the impact on mental well-being. Platforms like Facebook, Instagram, and TikTok enable users to connect with people across the globe, facilitating cross-cultural exchanges and broadening social horizons (Ellison et al., 2021). These interactions not only expand social networks but also promote inclusivity and diversity, allowing young adults to engage with perspectives different from their own. Social media platforms are increasingly facilitating the creation of niche digital communities where young adults can engage with specific interests and identities. These communities, whether centred around hobbies, social causes, or shared experiences, offer a sense of belonging and validation that might be lacking in offline settings (Papacharissi et al., 2023). Recent studies have documented shifts in social media usage patterns, including the rise of new platforms and changes in user behaviour. The shift in social media usage is likely due to the emergence of platform diversification. The landscape of social media continues to diversify with the emergence of new platforms like TikTok and the evolving features of existing ones. Research indicates that younger demographics are increasingly gravitating towards platforms that offer short-form video content and interactive experiences (Anderson & Jiang, 2018).

Mental Health Implications
The relationship between social media use and mental health has been a major focus of research. While social media can offer support and connectivity, it is also associated with several negative mental health outcomes. The growing concern about mental health challenges among young adults has been discussed by many social media researchers, and the concern is particularly related to the impact of social media use per se. The data points out (WHO, 2020a, 2000b) that mental health issues increase prevalently among young adults, amounting to 16% of diseases in 10–19-year-olds. This number shows a significant portion of disease in young individuals, with social, emotional and psychological well-being being critical to their overall relationships and sense of belonging. According to a report by the CDC (2018), psychological well-being is also emphasized as essential for self-acceptance, personal growth, and effective coping strategies.

Numerous quantitative studies have established a clear link between social media use and various psychological problems, for instance, research by Keles et al. (2019) supports the association between social media use and increased rates of depression, anxiety or nervousness, and reduced self-esteem. Specific studies by Lin et al. (2016) and Dhir et al. (2018) underscore the rising rates of depression and anxiety linked to social media usage, whereas Woods and Scott (2016) focus on how social media can negatively impact self-esteem. All these studies suggest that while social media may offer some benefits, its potential to exacerbate mental health issues in young adults cannot be ignored. The findings call for a deeper understanding of the mechanisms behind these associations and the development of strategies to mitigate the negative effects of social media on young adults' mental health. In today's generation, many young people spend a significant amount of time on social media, often leading to prolonged periods online without breaks, which can result in insufficient sleep. According to Li et al. (2020), nearly 64.5% of young adults sleep less than 8 hours on weekdays. This lack of adequate sleep can disrupt their daily functioning and contribute to considerable personal distress, increasing the risk of psychiatric illnesses and engaging in risky behaviours such as drug abuse and dangerous driving. Sleep is crucial for long-term health and well-being; it plays a vital role in maintaining brain function, physical health, and cognitive abilities. Adequate sleep is essential for effective thinking, reaction, work performance, and learning, underscoring its importance in overall life quality.

Excessive social media use, particularly before bedtime, can significantly disrupt students' sleep cycles due to social media addiction and related negative habits. The screens of digital devices emit blue light, which interferes with the production of melatonin which is the hormone crucial for regulating sleep-wake cycles (Newsom & Singh, 2024). This disruption can lead to difficulties falling asleep, staying asleep, and achieving

restorative sleep. Consequently, students may experience sleep-related disorders, including excessive daytime sleepiness, which has become increasingly common among this demographic. The impact of these sleep disturbances underscores the need to address the relationship between social media use and sleep health. The article highlights that excessive social media use among young adults and students can lead to internet dependence, with behavioural and emotional functioning showing psychopathological risk characteristics (Kline, 2014). This overreliance on social media may cause symptoms of melancholy and anxiety, particularly when access to the internet is restricted. Consequently, excessive use of social media can result in internet addiction and psychological issues, including depression and anxiety. The constant nature of social media, operating 24/7, disrupts sleep cycles, contributing to exhaustion and inadequate rest. Many students report staying up late and scrolling through social media, which is associated with increased stress levels and decreased resilience. Promoting healthy digital behaviours is crucial for improving well-being and mitigating the negative impacts of excessive social media use.

There are studies which address the concerning link between exposure to harmful content on social media and the increased risk of psychological harm, self-harm, and suicidal ideation, particularly among vulnerable young users. Arendt et al. (2019) highlight the troubling association between viewing self-harm content on social media and its detrimental impact on mental health. Given the central role social media plays in the lives of teenagers, the potential for such exposure to cause significant psychological distress is especially alarming. The term "psychological harm" encompasses a range of negative emotional experiences, including feelings of being threatened, intimidated, and excluded by others. Yoo and Smetana (2019) emphasize that the effects of psychological harm are influenced by the specific context in which it occurs, as well as individual factors that either protect against or heighten vulnerability to such harm. These findings underline the importance of understanding the contextual and personal variables that contribute to the impact of social media on mental health, particularly in adolescents. Thus, the studies suggest a critical need for protective measures and interventions to safeguard vulnerable young people from the negative effects of harmful content encountered online.

Social comparison always happens due to the inferiority and insecurity of young adults. Social comparison theory, first introduced by Festinger (1954), explores how individuals evaluate themselves by comparing with others. This concept is particularly relevant in the context of social media, where platforms provide constant opportunities for users to engage in social comparison. Social comparison can be categorized into upward and downward comparisons. Upward comparisons involve comparing oneself to those perceived as superior, which can lead to feelings of inadequacy or inspiration depending on the context (Wood, 1989). Downward comparisons, where individuals compare themselves to those they perceive as worse off, may enhance self-esteem but can also foster complacency (Morse & Gergen, 1970). Research indicates that frequent upward social comparisons on social media are associated with lower self-esteem and higher levels of depression and anxiety. This is because users often encounter idealized portrayals of others' lives, which can lead to negative self-evaluations and dissatisfaction (Vogel et al., 2014). Conversely, downward comparisons may temporarily boost self-esteem but can contribute to a skewed perception of one's life satisfaction (Bergagna & Stefano, 2018). Studies have shown that exposure to idealized representations of others' lives on social media can lead to negative self-evaluations and increased feelings of inadequacy (Festinger, 1954). This social comparison can contribute to anxiety, depression, and low self-esteem (Perloff, 2014).

Cyberbullying is a significant issue on social media platforms, with research indicating that victims are more likely to experience mental health issues such as depression and anxiety (Kowalski et al., 2014). The anonymity of online interactions can exacerbate the severity of bullying. Social media addiction is characterized by excessive use that interferes with daily functioning and well-being. The results of social media compulsive use were generated in previous research which asserted that social media is associated with addiction, and it is proven to increase stress, reduce the academic performance of students, and disrupt sleep patterns (Andreassen et al., 2016). One factor to consider is the potential link between the frequency of social media use and feelings of loneliness and social isolation among students. Even if, social media appears to foster social engagement and connection, research reveals that excessive dependence on digital communication can increase feelings of loneliness and isolation. People who spend an excessive amount of time on social media platforms may find themselves substituting meaningful face-to-face interactions with superficial online exchanges, leading to a sense of disconnection from their peers and the broader community (Nazari et al.,

2023).

Furthermore, the constant browsing through some picture collections and status updates on social media feeds may promote inaccurate ideas about others' lives, contributing to the phenomena known as "social comparison." As students repeatedly compare their own lives to the seemingly perfect portrayals of others online, they may experience heightened levels of self-doubt, inadequacy, and dissatisfaction (Ofuebe et al., 2022). This perpetual cycle of comparison and self-evaluation can significantly impact their mental well-being, potentially leading to increased feelings of depression and anxiety. According to Abd Rasid et al. (2024), constant investigation of the frequency of social media use among young adults reveals the intricate interplay between digital engagement and mental health outcomes. Researchers may acquire a better understanding of the multiple effects of social media on students' well-being by investigating how their online actions alter their experiences of loneliness, social comparison, sleep quality, and academic performance. With this understanding, interventions can be devised to promote healthy digital habits and foster a supportive online environment for students' mental health and overall well-being.

Current research continues to explore the nuanced relationship between social media use and mental health and shed exposure on both adverse effects and potential benefits. Social media could also lead to anxiety and recent studies have reinforced the link between excessive social media use and increased anxiety, for instance, Elhai et al. (2020) stated that research has shown that social media-induced anxiety is often related to exposure to negative content and the fear of missing out (FOMO). Other research has progressively focused on how social media affects body image and self-esteem. Studies indicate that exposure to idealized body images and beauty standards on platforms like Instagram can lead to body dissatisfaction and self-esteem issues, particularly among young women (Fardouly et al., 2018). Attention to positive mental health outcomes has been alarming to social media experts, thus several research have been conducted to investigate some prominent negative impacts. There is some topical literature which highlights the positive aspects of social media. Studies have found that social media can facilitate social support, foster positive relationships, and provide resources for mental health awareness and intervention (Naslund et al., 2016). From the literature above literature, most of it focuses on the negative consequences of social media use, such as addiction, FOMO (fear of missing out), and depression. To address this issue, it is recommended that future research is needed to explore the potential positive effects, such as social support, community building, and mental health awareness, which can offer a more balanced view.

There is a growing focus on the impact of social media on mental health, with recent research exploring digital detoxication. The concept of digital detox refers to periods of intentional disconnection from social media that are gaining traction as users seek to mitigate the negative effects of excessive use (Ahn & Park, 2022). Besides, the platform providers spare some initiatives to promote positive mental health amongst its users. Robert and David (2022) asserted that social media companies are gradually incorporating features designed to promote mental well-being, such as reminders to take breaks, tools to manage screen time, and resources for mental health support. Other research has also found that ongoing research and advocacy efforts are addressing the mental health implications of social media, emphasizing the need for balanced usage and support strategies (O'Reilly et al., 2023).

Most people's mental health has been declining since Facebook became mainstream and took off in popularity circa 2008, from year to year it surpassed Myspace as the most-visited social media website and billions of people registered on Facebook. This trend has continually preceded, and researchers continued to observe a 40 per cent increase in depressive symptoms, suicidal ideation, and suicidal behaviour among young people in the decade before the pandemic (CDC, 2018). Moreover, the frequency of social media use can also intersect with other aspects of young adults' lives especially higher institution students' sleep quality and academic performance. Research indicates that excessive screen time, particularly before bedtime, can disrupt sleep patterns and impair overall sleep quality. The constant stimulation from social media notifications and content consumption may interfere with students' ability to unwind and relax, leading to difficulties in falling asleep and obtaining recuperative rest (Bragazzi et al., 2022). As a result, sleep deprivation caused by excessive social media use can aggravate weariness, irritability, and mood swings, jeopardizing students' mental health and academic performance.

3. Social Participation and Social Behavior

Social media has transformed social participation, offering both opportunities and challenges for young adults. There are also studies which examine the perspectives of social media's impact on the quality of interpersonal relationships, particularly within family settings. Several views presumed that social media diminishes quality time among family members as well as friends. According to Mulisa and Getahun (2018), many individuals reported that social media usage reduced the quality of time spent with family and friends, leading to feelings of emotional detachment. This suggests that the predominant presence of social media can interfere with meaningful, in-person interactions, potentially weakening the emotional bonds that are critical for healthy relationships. Moreover, Kennedy and Lynch (2016) found that adolescents often experienced tension and problems within their household dynamics when phone use was prioritized over face-to-face communication. This preference for digital interaction over direct engagement with family members can lead to misunderstandings, conflicts, and a sense of disconnection within the family. These findings emphasize the need for a balanced approach to social media use, particularly among young people, to ensure that it does not undermine important familial relationships and emotional well-being.

Social media enables young adults to enhance their connectivity with others across geographic boundaries, fostering engagement with diverse communities and support networks (Ellison et al., 2021). This increased connectivity can help cultivate a sense of belonging, allowing young individuals to feel more integrated within various social spheres. Additionally, social media provides access to a wide range of resources and information, which can be particularly valuable for personal growth, education, and emotional support. This digital interaction thus plays a critical role in broadening young adults' social experiences and enhancing their ability to connect with like-minded individuals or groups, regardless of physical distance. Despite the connectivity benefits that social media offers, its use can unexpectedly lead to social isolation. Research suggests that intense social media use is often linked to a reduction in face-to-face interactions, which in turn, increases feelings of loneliness (Primack et al., 2017). Social media facilitates communication and connection, nevertheless, the quality of these online interactions may not be sufficient to replace the depth and emotional fulfilment that comes from in-person engagement. As a result, individuals who rely heavily on social media for social interaction may experience a sense of disconnection and loneliness, despite being constantly connected online.

Relying heavily on digital communication can have significant effects on the development and maintenance of real-world social skills. Research indicates that extensive use of social media may impair the ability to effectively navigate face-to-face social situations (Uhls et al., 2014). This reliance on online interactions can lead to difficulties in reading social indications, engaging in meaningful conversations, and building strong interpersonal relationships in person. Undoubtedly social media has undeniably transformed social participation by offering new opportunities for connection and engagement, it also presents challenges for young adults, who must balance the benefits of online communication with the need to cultivate and maintain essential social skills in the offline world. The impact of social media on social participation and behaviour continues to be a significant area of research, with recent studies providing new insights into its effects.

Social media has been shown to significantly enhance social capital by connecting users with supportive communities and fostering social engagement. Recent research by Putnam (2022) suggests that online communities can play a crucial role in strengthening real-world social ties and promoting active community involvement. By providing platforms for users to share information, mobilize around common causes, and engage in meaningful dialogue, social media can contribute to the development of stronger, more connected communities. Social media platforms facilitate the sharing of information, mobilization around common causes, and meaningful dialogue among users. This ability to connect people and foster communication contributes to the development of stronger, more cohesive communities. Enhanced social capital, driven by these interactions, can lead to increased engagement in civic activities, such as volunteering, advocacy, and local initiatives. As a result, social media helps reinforce the social fabric of communities, both online and offline, by encouraging active participation and collaboration among members. This strengthened sense of community can enhance collective efforts and support for various causes, ultimately benefiting society. This enhanced social capital can lead to increased participation in civic activities, such as volunteering, advocacy, and local initiatives, thereby reinforcing the social fabric of communities both online and offline.

The role of social media in shaping political attitudes and behaviours has become a significant area of study. Recent research has focused on how social media platforms influence political participation, the formation of opinions, and the dissemination of misinformation (Tucker et al., 2018). These platforms provide a space for individuals to engage with political content, share their views, and mobilize around political causes. However, they also pose challenges by enabling the rapid spread of false information, which can shape public opinion and influence electoral outcomes. In parallel, the rise of digital activism and online social movements highlights the power of social media to mobilize collective action. Recent studies by Boulianne (2019) examine how social media platforms are leveraged to advocate for social justice issues and drive societal change. These platforms have become critical tools for organizing protests, raising awareness, and building support for various causes. The ability to quickly gather large groups of people around a common goal underscores the transformative potential of social media in facilitating grassroots activism and influencing public policy. Social media has emerged as a potent instrument for digital activism and the organization of social movements. Boulianne (2019) emphasizes the significant role of platforms such as Twitter and Facebook in facilitating collective action and advocating for social justice issues. These platforms enable users to efficiently coordinate protests, increase awareness about various social causes, and shape public opinion on a diverse array of issues. The ability to quickly disseminate information and mobilize support underscores the transformative impact of social media in driving societal change and fostering civic engagement.

Social Media, Identity Formation and Self-Presentation

Recent literature continues to investigate how social media influences identity formation and self-presentation. Studies have explored how young adults curate their online personalities and manage the balance between authenticity and self-presentation. Research by Marwick (2021) indicates that users often navigate a delicate balance between showcasing an idealized version of themselves and maintaining a sense of authenticity. This dynamic illustrates the broader challenge of balancing the presentation of a refined, idealized image with the need to remain true to one's authentic self in the digital space. Social media users often contend with the tension between crafting a strong personality that aligns with societal standards or personal aspirations and maintaining genuine self-representation. This interplay between self-presentation and authenticity is central to understanding how individuals navigate their online identities and the impact of these multiple personas on their real-world interactions and self-perceptions.

Additionally, the integration of online and offline identities has become a significant focus of research. Studies, such as those by Vasalou et al. (2008), examine how interactions on social media shape and reflect users' real-world identities. These studies suggest that online personalities can significantly influence offline behaviours and vice versa, emphasizing the interconnectedness between digital and real-life identities. This relationship highlights how interactions and self-representations on social media can shape real-world actions, attitudes, and relationships. Conversely, offline experiences and behaviours can also impact how individuals present themselves online, reflecting a continuous interplay between the digital and physical aspects of identity. Understanding this interplay is crucial for comprehending how social media affects personal identity and social media on how individuals perceive themselves and interact with others, both online and in person. How people develop and present their online personas can shape their self-image and influence their real-world behaviours and interactions. Similarly, offline experiences and social contexts can affect how individuals manage their digital identities. This dynamic interplay highlights the role of social media in shaping personal identity and social relationships, bridging the gap between virtual and physical experiences.

Much of the research focuses on the negative aspects of social media, but there are also notable benefits. Social media can serve as a valuable resource for individuals facing personal challenges or seeking information on specific issues. Online communities provide emotional support and practical advice, which can contribute significantly to overall well-being (Hampton et al., 2011). These platforms facilitate connections with others who share similar experiences, providing a sense of solidarity and valuable guidance. By joining online communities that align with their challenges or interests, individuals can find support, share advice, and receive encouragement from peers who understand their situation. This shared understanding fosters a supportive environment that can alleviate feelings of isolation and help individuals navigate their challenges more effectively. In addition to the above, social media platforms offer opportunities for creative expression and identity exploration. Young adults often use these platforms to showcase their talents, interests, and personal achievements, which can enhance self-esteem and self-awareness (Marwick & Boyd, 2014). By sharing their

creative work and personal milestones on social media, individuals can gain recognition and receive feedback, which can help them further explore and develop their identities. This process contributes to a more positive self-concept and enhances self-awareness by validating their abilities and achievements. Engaging with others through these platforms allows individuals to reflect on their talents and aspirations, fostering personal growth and a deeper understanding of their potential.

Social media plays a significant role in facilitating civic engagement and activism by connecting individuals with various causes and movements. Research by Tufekci (2017) demonstrates that these platforms are effective in mobilizing communities and amplifying voices on social and political issues. Social media facilitates the rapid dissemination of information, allows for widespread outreach, and enables coordinated efforts for advocacy and activism. By connecting like-minded individuals and organizations, social media helps to rally support, organize actions, and influence public discourse on various social and political matters. Social media also enables users to organize and participate in campaigns, advocate for policy changes, and spread awareness about pressing issues. The provision of a platform for the widespread dissemination of information and the coordination of collective action, social media significantly enhances individuals' ability to engage in civic activities and contribute to societal change. It allows for the rapid spread of information, mobilizes communities around shared causes, and facilitates the organization of events and campaigns. This capability not only amplifies individual voices but also fosters broader community involvement and participation in social and political movements.

4. Regulatory Enforcement of Social Media Usage in Malaysia

The literature on regulatory frameworks for social media usage among young adults in Malaysia focuses on the balance between protecting young users and ensuring their rights to free expression and access to information. This body of research highlights the role of laws, regulatory bodies, and public initiatives in managing the complexities of social media in the lives of young Malaysians. Social media regulatory enforcement for young adults in Malaysia is important since it faces several key concerns, reflecting the complexities of balancing regulation with freedom of expression, privacy, and the unique vulnerabilities of this age group. These concerns are particularly relevant in a rapidly evolving digital landscape where young adults are highly active online. Regulatory enforcement on social media usage among young adults in Malaysia is shaped by a comprehensive legal framework aimed at protecting users from online harms while balancing the need for free expression. The CMA, PDPA, and other laws provide the foundation for regulating social media, with the MCMC and other bodies playing critical roles in enforcement. However, the challenges of balancing regulation with civil liberties, adapting to technological changes, and ensuring effective enforcement remain central to ongoing discussions in this area. As social media continues to be an integral part of young adults' lives, the development of responsive and effective regulatory strategies will be crucial in ensuring their safety and well-being online.

The Malaysian Communications and Multimedia Commission (MCMC) is the primary regulatory body overseeing social media use in Malaysia. It plays a crucial role in enforcing some relevant acts and other related regulations in social media use. The MCMC has been active in monitoring and addressing issues such as cyberbullying, online harassment, and the spread of fake news, which disproportionately affect young adults (Balakrishnan & Norman, 2020). The commission also collaborates with social media companies to ensure that harmful content is removed and that platforms comply with Malaysian regulations. The cybersecurity agency in Malaysia works alongside the MCMC to protect young adults from cyber threats, including phishing, hacking, and online exploitation. It provides resources and support for victims of cybercrime and promotes cybersecurity awareness among young Malaysians (Jalapar, et al., 2024). Their efforts include educational campaigns aimed at teaching young adults to adopt safe online practices.

The legislative framework and regulatory policies for the usage of social media are governed by the Communications and Multimedia Act 1998 (CMA). The CMA 1998 is the cornerstone of Malaysia's digital regulation, providing the Malaysian Communications and Multimedia Commission (MCMC) with the authority to oversee and regulate internet and social media use if there should be any misuse of social media. The act provides a legal framework for regulating the communications and multimedia industry in Malaysia, and it has been a beneficial instrument for addressing various issues related to social media misuse such as cyber harassment, the spread of obscene or harmful online content, and the misuse of network facilities, all of which

are particularly relevant to young adults with the purpose to protect them from harmful online content (Ahmad & Othman, 2021). In summary, the CMA 1998 plays a crucial role in Malaysia's legal landscape by allowing for the prosecution of social media misuse, with a strong focus on safeguarding young users from harmful content and online behaviours. This legislation serves as a key legal instrument to ensure that social media platforms are not used to exploit, harm, or endanger young individuals.

Besides the above regulations, the Personal Data Protection Act 2010 (PDPA) has its role in regulating the collection, processing, and storage of personal data, with significant implications for young adults who are active on social media. This act aims to protect users from data breaches and unauthorized use of personal information by social media platforms, ensuring that young adults' privacy is safeguarded (Camerini et al., 2020). Compliance with the PDPA is mandatory for companies operating in Malaysia, including social media platforms, which must ensure that user data is handled securely by the law. In conclusion, compliance with the PDPA is essential for social media platforms operating in Malaysia. It ensures that user data is handled securely and by the law, protecting both the users' privacy and the platforms' integrity.

In Malaysia, the Penal Code and the Sedition Act 1948 are two significant pieces of legislation that have implications for social media use. These laws can be invoked to address issues such as hate speech, defamation, incitement, and other forms of harmful content that may be shared or disseminated through social media platforms. These laws have been applied in cases where social media usage involves hate speech, defamation, or content that threatens public order. Young adults are often the subject of enforcement actions under these laws, particularly in cases involving the spread of seditious or defamatory content online (Soyleyici & Kalkan, 2023). The use of these laws has sparked debates about the impact on freedom of expression, especially among the younger population who are more active on social media. Acts related to social media usage are important in Malaysia for several reasons, primarily because the acts help to regulate online behaviour, protect individuals and communities, maintain public order, and ensure that digital platforms are used responsibly. Given the extensive influence of social media in modern society, these regulations play a critical role in addressing the challenges and risks associated with digital communication. Addressing these challenges requires ongoing efforts to refine regulations, enhance digital literacy, and foster collaboration among stakeholders to create a safer and more supportive online environment for young adults. Regulatory efforts in Malaysia have increasingly focused on addressing cyberbullying and online harassment, which are significant concerns for young adults. The CMA and Penal Code have been used to prosecute cases involving these issues, with the MCMC actively working to remove harmful content and support victims (Ismail & Ahmad, 2020). Nonetheless, enforcement remains challenging due to the unknown nature of online interactions.

The spread of misinformation and hoax news on social media has also been a growing concern, particularly in how it affects young adults' perceptions and behaviours. The MCMC has implemented measures to counter fake news, including public awareness campaigns and collaboration with social media platforms to flag and remove false content (MCMC, 2020). These efforts aim to protect young users from being misled by inaccurate information online. Other than that, there has been a push to improve digital literacy and online safety among young adults in Malaysia, to promote responsible social media use. Educational initiatives led by the government and non-governmental organizations (NGOs) focus on teaching young people about privacy, data protection, and the risks associated with social media use (Ayub et al., 2020). These programs are designed to empower young adults to navigate social media safely and make informed decisions about their online activities. One of the main criticisms of Malaysia's regulatory approach to social media is the potential for overreach, which could stifle free expression, particularly among young adults. The use of the Sedition Act and Penal Code to penalize online speech has raised concerns about the impact on civil liberties (Sreedharam & Ramayah, 2020). Critics argue that while regulation is necessary to protect young users, it should not infringe on their rights to express themselves freely.

Despite the robust legal framework, the effectiveness of enforcement remains a challenge. The vastness of social media platforms and the speed at which content can spread make it difficult for regulatory bodies to monitor and address all issues in real-time (Al-Dheleai et al., 2020). This has led to calls for more sophisticated tools and increased collaboration between the government, social media companies, and civil society to ensure that regulations are effectively enforced. As social media platforms continue to evolve, there should also the regulatory frameworks that govern the emerging technology. There is an ongoing need to update laws and

enforcement strategies to keep pace with new developments, such as the rise of encrypted messaging apps and the increasing use of artificial intelligence in content moderation (Balakrishnan & Norman, 2020). Ensuring that regulations remain relevant in the face of technological change is a key challenge for policymakers.

In summary, acts related to social media usage are vital in Malaysia for maintaining public order, protecting individuals, promoting responsible digital citizenship, balancing freedom of expression with legal boundaries, and adapting to the challenges of the digital age. These regulations ensure that social media remains a positive force in society while mitigating its potential risks.

5. Conclusion

The literature review on the impact of social media on the mental health of young adults presents a nuanced picture of both positive and negative influences. Social media, while offering significant benefits, also poses substantial risks to the mental well-being of this demographic. Social media platforms facilitate enhanced connectivity, enabling young adults to engage with diverse communities, form supportive networks, and participate in civic activities. These platforms offer opportunities for creative expression, identity exploration, and the development of a sense of belonging, all of which contribute positively to self-esteem and overall well-being. Studies often treat social media as a massive entity without differentiating between platforms like Instagram, TikTok, X (Twitter), or Facebook, each with unique features and user interactions. Hence, there is a need to examine the specific effects of different platforms on mental health, considering variations in user behaviour, content exposure, and platform design.

Despite these benefits, excessive social media use has been linked to adverse mental health outcomes, including increased rates of depression, anxiety, and diminished self-esteem. The pressure to maintain idealized online personas and the prevalence of social comparison can lead to dissatisfaction with one's own life. Additionally, exposure to harmful content and the disruption of sleep patterns due to social media addiction further exacerbate these mental health challenges. Most existing studies are cross-sectional, providing a glimpse of the relationship between social media use and mental health at a single point in time. It is proposed that future research should conduct a longitudinal study to monitor and track changes in mental health over extended periods to better understand causality and long-term effects. Other than that, the existing research frequently highlights associations between social media use and mental health issues, such as anxiety, depression, and low self-esteem, but often lacks depth in explaining the underlying mechanisms. Nevertheless, further exploration of how factors like social comparison, cyberbullying, validation-seeking behaviour and algorithm-driven content consumption impact mental health is necessary to be research in the future.

The literature highlights the importance of regulatory frameworks and educational initiatives in mitigating the negative effects of social media. In regions like Malaysia, regulations such as the Personal Data Protection Act (PDPA) and the Communications and Multimedia Act (CMA) aim to protect young adults from the harmful impacts of social media while promoting safe and responsible use. However, the effectiveness of these measures in addressing mental health concerns is still under examination, emphasizing the need for continuous evaluation and adaptation of policies.

The overall conclusion from the literature suggests that while social media offers valuable tools for communication and self-expression, it also carries significant risks to mental health, particularly when usage becomes excessive or unregulated. Addressing these challenges requires a balanced approach that includes promoting digital literacy, encouraging healthy social media habits, and implementing effective regulatory measures. By fostering a more informed and mindful approach to social media use, stakeholders can help young adults navigate the digital landscape in a way that supports rather than undermines their mental health.

The interplay between social media regulation and mental health among young adults in Malaysia underscores the need for a nuanced approach to digital governance. Social media platforms have a profound impact on the mental well-being of young people, presenting both opportunities for positive engagement and risks that require careful management. The regulatory enforcement of social media in Malaysia plays a critical role in shaping the mental health outcomes of young adults. By addressing mental health risks, protecting privacy, balancing freedom with regulation, and fostering digital literacy, Malaysia can create a safer and more

supportive online environment. Effective regulation, combined with educational and supportive measures, can help young adults navigate social media in a way that enhances their overall well-being and mitigates potential negative impacts.

Understanding Gen Z's Online Purchase Behavior through their Hedonic and Utilitarian Motivation

Yvonne S. M. Ang
Universiti Teknologi MARA, Puncak Alam Campus, Selangor, Malaysia
yvonneming@uitm.edu.my

Abstract: The COVID-19 pandemic ushered in lockdowns, limiting consumer movement to their homes and preventing consumers from shopping in brick-and-mortar stores. Consequently, consumers were reliant on e-commerce to manage their daily purchases of goods and services. This exacerbated the use of e-commerce and fast-tracked the growth of the digital economy. In this study, Gen Z's consumer motivation is investigated using hedonic and utilitarian motivation and the Unified Theory of Acceptance and Use of Technology (UTAUT). Consumer motivation remains a crucial part of consumer behavior studies given its prominence in influencing consumer action, consumer decision-making and preferences. In particular, the effects of hedonic and utilitarian motivation on online purchase behavior were investigated. This study utilized a quantitative approach through the deployment of a survey questionnaire online. The data from 156 respondents was analyzed using SmartPLS 4.0 utilizing Partial-Least Squares Structural Equation Modelling. Approximately 44% of the respondents started shopping online for the first time during the pandemic (i.e., 2020 and 2022). The results indicated that the Gen Z respondents were motivated by utilitarian and hedonic motivation when shopping online, in particular by Idea Shopping motivation and Efficiency motivation. Additionally, Social Influence and Facilitating Conditions were significant factors in influencing Behavioural Intention, and Behavioural Intention influenced Purchase Behaviour. The evidence suggests that the respondents were not novice online shoppers but rather experienced online shoppers.

Keywords: *Technology Acceptance Model, shopping motivation, utilitarian motivation, hedonic motivation, online purchase behavior*

1. Introduction and Background

The value of Asia's e-commerce revenue in 2023 amounts to USD 1,664 billion, the highest when compared to global regions and surpassing the Americas by almost half the value (Statista, 2024). Undoubtedly, e-commerce has expanded rapidly over the past decade and its growth was further spurred by the Covid-19 pandemic. The COVID-19 pandemic resulted in lockdowns and movement orders where consumers were not able to leave their homes and convene in public spaces, a crucial public health policy that was used as a temporary measure to control the spread of the COVID-19 disease. As a consequence of the pandemic, the consumer's shift to the digital economy was deemed to be necessary and inevitable. Following the easing of lockdowns, consumers continued to use e-commerce in their daily lifestyles with almost 92% of consumers embracing online shopping and then continuing as e-commerce users even after the easing of movement restrictions (McKinsey, 2024). Consumers continuing to use ecommerce platforms resulted in a massive growth of the ecommerce sector which incidentally aligns with the growth of digital economies in the Southeast Asia region as indicated by the direction of local government policies. In Southeast Asia, where the estimated population is around 570 million, the trend of e-commerce is expected to grow with a projected expansion rate of 20 – 30% annually (Hrjnic, 2020).

Consumer adoption of e-commerce or consumer use of technology takes place when consumers begin using technology (via online sites, platforms, apps, and mobile devices) for their daily tasks. Within information systems literature, technology acceptance research has resulted in a substantial amount of literature on the adoption and use of technology in the consumer's life (Hu et al., 1999). Specifically, the prominence of the Unified Theory of Acceptance and Use of Technology (UTUAT) (Venkatesh et al., 2003) prevails due to its application to multiple technology adoption contexts. In recent years in consumer online shopping, UTAUT has been applied to various contexts including e-wallet adoption (Bommer et al., 2022), social e-commerce (Habeeb et al., 2021), mobile payment (de Sena Abrahão et al., 2016) and webrooming (Chimborazo-Azogue et al., 2021). The wide use of UTAUT is encouraged by calls to extend and use the theory in various contexts. In 2003, Venkatesh et al. suggested testing UTAUT across various technologies, specifically on e-commerce applications. Additionally, Venkatesh et al. (2016) highlighted the necessity of extending the UTAUT model to better understand technology acceptance and use. Further analysis of UTAUT's contributions by incorporating new

exogenous or endogenous variables would extend the understanding of consumer acceptance phenomena.

In this study, UTAUT will be extended through an investigation into consumer shopping motivation. Shopping motivation has been studied through various approaches resulting in multiple interpretations (Arnold and Reynolds, 2003; Westbrook and Black, 1985; Bloch et al., 1994). In consumer behavior, motivation is a pertinent area of study given its importance in motivating consumer behavior (Lee, 2006; Rajamma et al., 2007) and consumer preference (Dawson et al., 1990). Therefore, the investigation into hedonic and utilitarian motivation in the larger online shopping context is needed to understand the consumers' drive towards their goal which is to purchase using e-commerce (Novela et al., 2020). The importance of understanding consumer motivation in e-commerce is crucial given that shopping motivation is an established area of study whereby, consumers can be motivated by utilitarian motivation (Babin et al., 1994) and hedonic motivation (Arnold and Reynolds, 2003). Consumer motivation can influence engagement, user experience (O'Brien, 2010), purchase intention (Koch et al., 2020) and even persuasive marketing strategies (Adaji et al., 2020) in e-commerce. Evidently, a consumer's motivational drive is a pertinent and ever-evolving puzzle for consumer researchers to understand. Therefore, this study pursues the investigation of utilitarian and hedonic motivation in online shopping focusing on Gen Z. Gen Zs are the focus of this study given that are likely to adopt the use of e-commerce platforms for the first time during and post-pandemic (i.e., 2020, 2021); beyond the lifting of movement restrictions.

2. Literature Review

Unified Theory of Acceptance and Use of Technology: UTAUT was introduced in 2003 by Venkatesh et al. and was first developed to integrate various theories explaining technology and innovation adoption across fields such as management, marketing, social psychology, and information systems (Williams, Rana, and Dwivedi, 2015). UTAUT was put forward based on the synthesis of eight competing theoretical models during a time when the influence of the internet and personal computers for consumer use was growing. The models that formed the basis for UTAUT include Social Cognitive Theory (SCT), Motivational Model (MM), Innovation Diffusion Theory (IDT), TPB and TAM (C-TPB-TAM), Theory of Planned Behaviour (TPB), Theory of Reasoned Action (TRA), Technology Acceptance Model (TAM), and Model of PC Utilization (MPCU). In UTUAT, the probability of adopting technology is shaped by four main factors which are - 1) Performance Expectancy, 2) Effort Expectancy, 4) Social Influence, and 5) Facilitating Conditions. Additionally, the impact of these factors is moderated by variables such as age, gender, experience, and the voluntariness of use. The fundamental concept of UTAUT rests on the principle that behavioral intention predicts behavior which also aligns with that of TAM (Venkatesh et al., 2003).

In an analysis of UTAUT studies, the theory has been used in multiple contexts including studies in information systems, systems used in the office, general-purpose systems, and specific business systems (Williams et al., 2016). Specifically in consumer behavior, UTAUT has been employed repeatedly to explain consumer behavior in mobile shopping (Tan et al., 2010) online banking (Zhou et al., 2010), online shopping (Chang et al., 2016; Amjad-ur-Rehman, 2019; Erjavec et al., 2022) and mobile commerce (Marinković et al., 2020).

According to Venkatesh et al. (2003), Performance Expectancy refers to the likelihood that an individual believes that using the system will help him or her to attain gains in job performance. In voluntary and mandatory settings, evidence indicates that Performance Expectancy becomes the key predictor of both, behavioral intention and behavior (Zhou, Lu and Wang, 2010; Venkatesh, Thong and Xu, 2016). Studies also indicate that Performance Expectancy is a key determinant in user acceptance or rejection of technology (Yang and Forney, 2013; Ratten, 2015; Tarhini et al., 2016;). It is inferred through previous studies that Performance Expectancy has a significant influence on the users' intention to purchase online (Musleh et al., 2015; Yeganegi and Elias, 2016). The proposed hypothesis is as follows:
H1: Performance Expectancy has a significant influence on Behavioural Intention

Effort Expectancy is defined to be the degree of ease associated with the use of the system (Venkatesh et al., 2003). The concept of Effort Expectancy revolves around the users' perception of their ease or difficulty in using a specific technology. Naturally, when users increase their experience and become more familiar with the said technology, Effort Expectancy then loses its' significance as a factor that shapes user intention to use the technology (Gupta, Dasgupta and Gupta, 2008; Chauhan and Jaiswal, 2016). Evidence from previous studies

indicates that behavioral intention is shaped by Effort Expectancy (San Martín and Herrero, 2012; Alleyne and Lavine, 2013; Escobar-Rodríguez and Carvajal-Trujillo, 2014; Ho et al., 2016; Isaias et al., 2017; Tan and Lau, 2016). Thus, the following hypothesis is proposed:

H2: Effort Expectancy has a significant influence on Behavioural Intention

Another factor influencing behavioral intention in UTAUT is Social Influence. Social Influence indicates the degree to which an individual perceives that important others believe he or she should use technology. Social Influence refers to social norms that might shape the individual's decision to use technology. In particular, social norms can mediate the relationship between intention and behavior adoption (Venkatesh et al., 2003). Evidence suggests Social Influence emerges in mandatory contexts that require user compliance, however, is less influential in non-mandatory user contexts (Venkatesh and Davis, 2000). Even though the evidence is mixed on the consistency of social norms on adoption behavior across different contexts, Ho et al. (2016) specify that in online purchases, user adoption is influenced by social norms. Thus, it is likely that the prominence of Social Influence in user adoption can vary across different contexts (Zhou, Lu and Wang, 2010; Chauhan and Jaiswal, 2016). Resultant to the above, the following hypothesis is proposed:

H3: Social Influence has a significant influence on Behavioural Intention

Facilitating Conditions refer to the degree to which a user believes that infrastructure exists to support the use of the system, whether organizational or technical. In the early stages of adoption, Facilitating Conditions has a significant positive effect on behavioral intention. However, the effect fades as the user continues with technology use and eventually becomes not significant. Facilitating Conditions can also have a direct effect on technology adoption behavior (Venkatesh et al., 2003). El-Masri and Tarhini (2017) and Slade et al. (2015) have found a significant effect of Facilitating Conditions on behavioral intention in online shopping. As such, the following hypotheses are proposed:

H4: Facilitating Conditions have a significant influence on Behavioral Intention
H6: Facilitating Conditions have a significant influence on Behavior

The underlying framework for UTAUT is based on the user technology acceptance model which posits that individual reactions to using information technology influence intentions, thereby shaping the actual use or behavior – whereby, behavioral intention is defined as the intention to use technology (Venkatesh et al., 2003). In UTAUT, intention is a key predictor of behavior, even in the online purchase context (Yeganegi and Elias, 2016) and is not limited to mandatory context. Previous findings indicate that behavioral intention has a significant influence on actual behavior (Venkatesh et al., 2003). Consequently, the following hypothesis is proposed:

H5: Behavioural Intention has a significant influence on Behavior

Shopping Motivation: Arnold and Reynolds (2003) identified six dimensions of hedonic shopping motivation in their study which are the following: 1) Adventure; 2) Social; 3) Gratification; 4) Idea; 5) Role; and 6) Value. Consumers can be motivated by hedonic motivations (Adventure, Gratification, Value, Social, and Idea Shopping) and utilitarian motivations (Achievement and Efficiency) (Kim, 2006). In online shopping experiences, O'Brien (2010) posits the influence of Adventure and Gratification shopping motivation and Achievement shopping motivation. When consumers look for enjoyable experiences to improve their mood or anxiety, consumers are deemed to have gratification-seeking motivation (Arnold and Reynolds, 2003). Gratification is delivered through the convenience of online platforms which are accessible at all times and enable the user to readily indulge in pleasurable shopping experiences (Jones et al., 2003). Additionally, consumers also seek adventure shopping whereby stimulation, excitement, and a sense of escapism are sought. Some consumers also seek out thrill and adventure. This concept aligns with previous research, which highlights that shoppers frequently pursue sensory stimulation as part of their shopping activities (Arnold and Reynolds, 2003). Attainment of delight and enthusiasm when shopping forms an aspect of adventure-seeking in consumer shopping (To et al., 2007). Conversely, Idea shopping motivation requires consumers to obtain and gather information and evidence about product use and the latest trends while they are (Horváth and Adıgüzel, 2018). Idea shopping can be a pleasurable experience for consumers who obtain pleasure from learning about new products and staying in the know (Arnold and Reynolds, 2003). Role shopping motivation is characterized by the enjoyment buyers experience when purchasing items for those other than themselves. Frequently, role shopping is seen to be utilitarian and less likely to be a hedonic impulse (Horváth and Adıgüzel,

2018). Consumers also can derive pleasure from shopping with friends and family – referring to social shopping motivation, consumers take part in it so that they can network and make connections with others (Arnold and Reynolds, 2003). In the online shopping context, consumers who share and exchange product information do so to build social relationships (Filipowski et al., 2012) and even build and sustain online relationships by engaging with online social groups (Lev-On and Lissitsa, 2015). Consumers seeking bargains, discounts and sales while shopping are shoppers who display value shopping motivation. These consumers invest effort in pursuit of products at discounted prices and view the attainment of a deal as rewarding (Kwon and Jain, 2009) and even pleasurable (Arnold and Reynolds, 2003).

As a result, the following hypotheses are proposed:

H7: Adventure shopping motivation has a significant influence on Behavioural Intention
H8: Gratification-seeking motivation has a significant influence on Behavioural Intention.
H9: Idea shopping motivation has a significant influence on Behavioural Intention
H10: Social shopping motivation has a significant influence on Behavioural Intention
H11: Role shopping motivation has a significant influence on Behavioural Intention
H12: Value shopping motivation has a significant influence on Behavioural Intention

In contrast to hedonic motivations, Babin et al. (1994) emphasize that utilitarian motivations center on efficiency and achieving specific goals during shopping. Rationality and the attainment of goals become the central theme in utilitarian shoppers where consumers strive for deliberate shopping experiences which are logical and efficient (Babin et al., 1994; Wolfinbarger and Gilly, 2001; Monsuwe et al., 2004; Delafrooz et al., 2009). A benefit of utilitarian-motivated online shopping includes crowd avoidance, time-efficient transactions and convenience (Brusch et al., 2019). Consumers favoring utilitarian motivations while shopping are looking for convenience, timely delivery, security, service and time savings. These consumers also use the Internet for information gathering contributing to decision-making (Shim et al., 2001). The inherent value consumers hold in shopping convenience has the potential to influence the decision of whether or not to shop online (Clemes et al., 2014) and thus, their online purchase intention. As such, the following hypotheses are proposed:

H13: Achievement motivation has a significant influence on Behavioural Intention
H14: Efficiency motivation has a significant influence on Behavioural Intention

3. Research Methodology

This research focuses on Gen Z (born between 1997 to 2012) aged between 20 to 24 years old who shop online. 156 respondents were retained from an initial 160 respondents after data cleaning whereby four respondents were removed due to inconsistent responses. The total number of respondents exceeds the minimum sample size calculated using G*Power (Faul, Erdfelder, Lang and Buchner, 2007). The minimum sample size was ascertained with a minimum power of 0.80, an effect size of 0.15, a 5% probability of error, with twelve predictors, whereby a minimum sample size of 87 is required. This study uses purposive sampling where respondents selected were online shoppers. Purposive sampling was chosen due to its efficiency and cost-effectiveness in attaining the objectives of this research design. Moreover, an online questionnaire incorporating the UTAUT construct items (Venkatesh et al., 2003) and the hedonic and utilitarian motivation items (O'Brien, 2010) was used in the questionnaire and was measured using a 7-point Likert scale ranging from 'Strongly Disagree' to 'Strongly Agree'. Finally, demographic information about the respondents' online shopping behavior formed the last part of the questionnaire. For data analysis, Partial Least Squares Structural Equation Modelling (PLS-SEM) analysis was conducted using SmartPLS4 software. This approach was chosen because PLS-SEM is potent for testing theoretical models for prediction purposes and is especially useful for complex models that include many constructs (Hair et al., 2019).

4. Results

Profile of Respondents: The respondents were undergraduate students aged between 21 and 22 years old and were of Malay ethnicity who were currently shopping online. From the sample, a total of 43.59% of the respondents only started purchasing online since the introduction of the Movement Control Order in 2020 and 2021 during the Covid-19 pandemic, where Malaysian citizens were restricted to their homes and could travel only within a radius of 10 km or less. Even so, about 67% of the respondents claim to be moderately to highly experienced in using online portals for shopping. Although the respondents were based in different geographic

locations across Malaysia, all respondents were able to purchase online. A larger majority of the respondents were from Selangor and Johor, making up about 53% of the total. The respondents from the remaining states comprise not more than 6% of the total each (Refer to Table 1)

Table 1: Online Purchasing Information and Geographic Location (n=156)

Measurement Model Analysis: In the measurement model analysis, the analysis of reliability and validity for the constructs are detailed in Table 2. Construct reliability—with Cronbach's alpha, composite reliability, and rho A—exceeding the 0.7 threshold (Hair et al., 2022) indicates that construct reliability was achieved for all measures with one exception - Cronbach's alpha for Efficiency motivation. However, the Cronbach alpha for Efficiency motivation is still within the acceptable range of being above 0.60 (Hair and Brunsveld, 2019) and thus was accepted. Outer loading scores were observed to be above 0.70 except for item AC1 (removed), demonstrating reliability (Hair et al., 2022). For convergent validity, the average variance extracted (AVE) scores were found to be 0.50 (Hair et al., 2022). The discriminant validity assessment using the heterotrait-monotrait ratio (HTMT) indicated values below 0.90. Also, the Fornell-Larcker Criterion (Table 6) revealed the square root of the AVE for each construct to be greater than the inter-construct correlations. The cross-loadings

(Table 7) show that all items were strongly associated with their corresponding constructs, thereby displaying discriminant validity (Hair et al., 2022).

Structural Model Evaluation: Through the VIF scores (below 5), multicollinearity was not observed (Hair et al., 2022). Using bootstrapping with 10,000 resampling as specified by Becker et al. (2023), significance testing was carried out. The findings as reported in Table 3 show significant relationships for SI → BI (β = 0.223, t = 2.21, p < 0.05), FC → BI (β = 0.387, t = 2.971, p < 0.05), BI → BEH (β = 0.261, t = 2.581, p < 0.05), ID → BI (β = 0.152, t = 2.155, p < 0.05) and EF → BI (β = -0.131, t = 2.071, p < 0.05). The remainder of the hypotheses were not significant. Small effect sizes (f²) were obtained for SI → BI (f² = 0.043, p < 0.05), FC → BI (f² = 0.084, p < 0.05), BI → BEH (f² = 0.032, p < 0.05), ID → BI (f² = 0.033, p < 0.05) and EF → BI (f² = 0.027, p < 0.05) (Cohen, 2013). The results indicate that 66.6% of the variance in BEH was explained by the variables in the study and 9.6% of the variance in BEH was accounted for by the BI construct (Figure 1). The Q² prediction scores were above zero thus showing predictive relevance for BI (0.574) and BEH (0.051) (Chin et al., 2020; Shmueli et al., 2019) (Table 4).

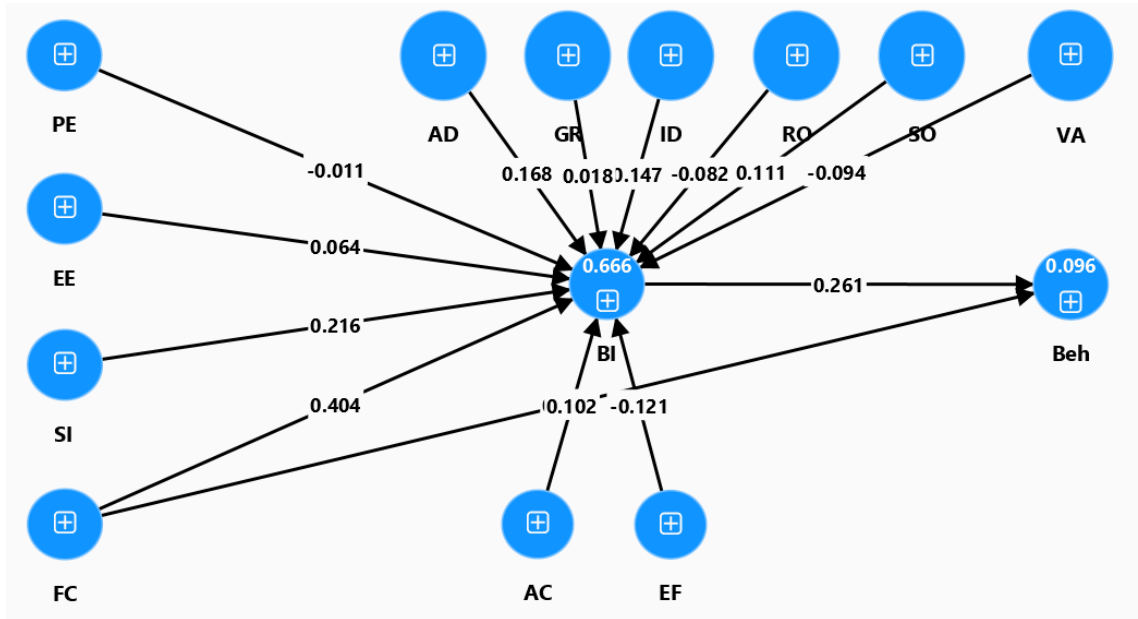
Figure 1: Results of the Model Assessment


Discussion

Facilitating Conditions and Social Influence both had a significant impact on Behavioural Intention. Some observations indicate that in mandatory settings, Social Influence directly affects Behavioural Intentions because compliance is driven by the prospect of social rewards or punishments related to technology use or non-use. In contrast, others propose that in voluntary settings, Social Influence directly influences personal beliefs about technology. This observation stems from internalization and also identification, as individuals would want to keep a positive image and enhance their social status within their reference group by adopting the technology (Venkatesh and Morris, 2000; Venkatesh and Davis, 2000). The effect of Facilitating Conditions on Behavioural Intention is expected to increase with experience. Users are able to find multiple avenues for help and support needed to act on the behavior, and thus are able to remove any usage obstacles that may hinder long-term use (Bergeron et al. 1990). For this study, consumers shopping online display the ability to navigate and use online sites to fulfill their need to shop online. Moreover, Behavioural Intention has a significant influence on Purchase Behaviour, indicating that Gen Z consumers followed through with their intention to shop online.

Motivations exist as shopping goals (Westbrook and Black, 1985) and utilitarian and hedonic motivations are seen as the basic categories for understanding consumers (Babin, Darden and Griffin, 1994). Consumers prone to utilitarian shopping motivation seek efficiency while consumers shopping due to hedonic motivation seek entertainment and enjoyment (Hirschman and Holbrook, 1982). Babin et al. (1994) observe that consumers motivated by hedonic motivation shop because they enjoy the process of shopping while consumers motivated by utilitarian motivation shop for utility or functional benefits. In this study, Idea Shopping emerges to be a significant hedonic motivator of Gen Z's online shopping behavioral intention. Given that Idea Shopping refers to the consumers' act of collecting information, ideas and keeping abreast of trends when they are shopping (Horváth and Adıgüzel, 2018), consumers who are motivated in this manner derive pleasure from obtaining information about new products and services to stay on top of the latest trends (Arnold and Reynolds, 2003). Within the dimensions of utilitarian motivation, Efficiency emerged in this study to have a significant effect on behavioral intention. Shopping efficiency is reflected in factors like convenience, product variety, product

information, and cost savings. Convenience is a major advantage of online shopping, offering the ability to shop from anywhere at any time (Rohm and Swaminathan, 2004). Online shopping also provides utilities such as location convenience, extended store hours, and fast, efficient checkouts (Rohm and Swaminathan, 2004). Thus, efficient shopping is a key feature of task-oriented shopping activities (Tauber, 1972).

5. Conclusion

This study explores both utilitarian and hedonic motivations in online shopping with a specific focus on Generation Z. Generation Z is of particular interest because they are expected to have begun using e-commerce platforms for the first time during and after the pandemic, especially as movement restrictions are lifted. The study revealed that Gen Z consumers are motivated by both utilitarian and hedonic motivations. For utilitarian motivation, Efficiency was a significant factor influencing the consumer's behavioral intention. Furthermore, for hedonic motivation, Idea Shopping emerged to be a significant factor in shaping behavioral intention. Facilitating Conditions and Social Influence were also significant factors contributing to Behavioural Intention while Behavioural Intention significantly influences Purchase Behaviour. According to the factors from UTAUT that were significant (Facilitating Conditions and Social Influence), it would appear that Gen Z online shoppers can easily navigate online shopping sites. Limitations to this study include a lack of specificity of the online sites that were used and the categories of products or services that were purchased online. This factor could provide a clearer picture of the motivation behind online purchases and such, future studies should consider the investigation of motivation based on specific types of products and services or online platforms rather than a generalized approach such as that employed in this study. Of particular interest, it would be noteworthy to see how Gen Z's motivation changes over a longitudinal period as they transition into different life phases.

The practical implications of note include the role of peer and Social Influence on youth online purchases where Gen Z's online purchase intention is shaped by those whose opinions matter to them. Thus, social shopping or shopping functions on social media platforms are expected to perform well with users in their early 20s. For this age cohort specifically, the connections between social media influence and what these consumers purchase would be beneficial to observe given that they are influenced by social norms. Additionally, Gen Zs are confident in their ability to purchase online despite (44% of the respondents) only having four years' experience in shopping online. Gen Z appears to be able to navigate through online shopping platforms easily. Practitioners looking to roll out or test variations of online shopping sites, apps and social shopping could look to Gen Z as early adopters. Gen Z users would likely adopt quickly to platform and functional changes in online platforms. Finally, given that Gen Z is motivated by both utilitarian and hedonic motivation namely, Efficiency and Idea Shopping – online shopping sites and apps should remain easy to use with quick speeds, easy checkout and a simple repeat purchase process to appeal to shoppers seeking efficiency. E-commerce and e-business platforms targeting Gen Z should bear in mind that speed and accessibility would matter to form the perception of efficiency in the young consumer's mind. Also, users from Gen Z enjoy online shopping given their indulgence in Idea Shopping to keep up with trends and new products. Practitioners would benefit from ensuring trendy items and the latest products are stocked in their online store if they want to appeal to consumers from Gen Z.

Abstract: This research explored the role of gender as a moderating effect on the relationship between factors affecting ecotourism experiential value. Previous studies have investigated tourist satisfaction; however, the role of gender towards the experiential value remains unclear. More importantly, the tourist's actual behavior at a destination is a critical determinant factor of tourist loyalty compared to the perception. Accordingly, the purpose of this study was to explore the role of gender in the relationship between factors influencing the Ecotourist Experiential Value on Actual Tourist Behaviour. More specifically, this study delved into the consequences of destination experience (i.e. attachment and advocate) and investigated the influence of Ecotourist Experiential Value on Actual Behaviour between genders. A survey was conducted among the Taman Negara patrons in Malaysia. The research model was tested and confirmed with 243 tourists. The data was analyzed using Smart Partial Least Squares which is the variance-based structural equation modelling. The results evoked from the survey indicate that aesthetics is very much important as the influential factors towards positive total experience quality among male compared to female. In contrast, Customer Return on Investment becomes the main concern of female tourists towards Total Experience Quality as compared to male tourists. In light of the major finding, this study accentuates the importance of understanding gender behavior to provide valuable insights for destination marketers to establish positioning plans for the tourism industry.

Keywords: *Ecotourism, Experiential value, Advocate, Attachment, Multigroup Analysis*

1. Introduction and Background

In the past few decades, the tourism sector has developed into one of the most substantial sources of external income (Adil, Nasir, & Kumar, 2021a, Adil et al., 2021b). As one of the most significant sectors nowadays (Tasia & Yasri, 2021), the tourist experience has concerned a lot of study consideration in the extent of tourism studies (Chakraborty, Adil, & Sadiq, 2023), with the notion of memorable tourism experiences (MTEs) (Zhong et al., 2017). A study by Kim, Ritchie, and McCormick (2012) explains that "an MTE is selectively constructed from tourism experiences based on the individual's assessment of the experience". Similarly, previous studies also state that MTEs are the concept that defines the "experience economy", emphasizing the significance of experience in the tourism sector (Zhou et al., 2022a, 2022b). Furthermore, ecotourism' has been defined as a "*practice of traveling to relatively less exploited natural destinations to appreciate the natural settings, acquire knowledge about wildlife and enjoy local cultures in authentic settings while conserving the environments of the destinations*" (Khanra et al., 2021). In other words, ecotourism is a subsector of tourism that is exceptional and portrays ethical meanings, care for the environment and its effect on them (Ansari et al., 2022; Fennell, 2001; Rafiq et al., 2022a, 2022b; Sadiq & Adil, 2021). Instead, 'ecotourism experience' is "*a subjective phenomenon, which involves visitors' experience of interacting with the firms/nature at 'pre-visit', 'on-site visit' and 'post-visit' of ecotourism sites.*" This will support in considering the intricate nature of the tourist experience that varies with diverse phases of consumption (Godovykh & Tasci, 2020). In reality, ecotourism experiences differ liable on the destination and/or activities.

Ecotourism can be considered one of the vital subsectors of tourism in Malaysia that has been recognized by the Malaysian government. Based on past research, about 35% of visitors from developing countries came to Malaysia because of its tourist sites attraction (The Star, 2003). The increasing trend in ecotourism is related to the shifting of consumer affection for retreats, especially in their curiosity towards nature-based vacations. They have confidence that these sorts of holidays afford them educational experience engagement and also improve their environment and social accountability as a traveller (Parks, Parks and Allen, 2009). In the

Malaysian setting, ecotourism is defined as, "*travel and visitation that is environmentally responsible to relatively undisturbed natural areas to enjoy and appreciate nature (including any accompanying cultural features; both past and present), promotes conservation, has low visitor impact and provides for beneficially active socioeconomic involvement of local populations*" (World Wide Fund for Nature Malaysia. 1996). There is quite a wide-ranging ecotourism literature that permits evidence relating to the development and management of eco-tourists profiles, expectations, satisfaction, and motivation (Musa et al, 2010; Palacio & McCool, 1997; and William, 1992). Nevertheless, there is slight empirical evidence in the literature that studies indirect predictors of experiential value related to ecotourism and its significance. Still, empirical studies on 'ecotourism' and 'customer experience' have progressively improved over the past twenty years, existing literature on 'ecotourism experience' appears to be mostly uneven and disjointed. For example, Godovykh and Tasci (2020) measured 'customer experience' as a whole, observing the general tourism experience that confines the scope of their results. Likewise, Liu and Li (2020) and Khanra et al. (2021) studied ecotourism research trends over bibliometric analysis, nonetheless mostly ignored the experiences of ecotourists.

Recently, the significant role of experiential value has been recognized by researchers (Mathwick, Malhotra and Rigdon; 2001), and the overall customer experience has inclined the customer loyalty level (Berry, Carbone & Haeckel, 2002; Mascarenhas, Kesavan & Bernacchi, 2006; and Musa, Putit & Kassim, 2009) Consequently, marketing trend has transformation beyond the customer loyalty in this globalization era, then further into producing the attractive experience that is be certain of last longer for the customer (Pine & Gilmore, 1999). This study intends to explore gender differences as a moderating effect in determining total experience quality in eco-tourism.

2. Literature Review

Previously, the world economy was mostly grounded on products and services, but nowadays the phenomenon has transformed a lot. Nowadays, experience is an important substance for users (Oh, Fiore & Jeong, 2007, Kim, Ritchie & McCormick, 2012). Thus, a memorable quality experience will have a positive effect on a business. Many studies have been done in the context of retailing and hospitality, which have taken into account the issues of experience, but studies in the context of tourism are still very limited, except the study by Oh, Fiore and Jeong (Oh, Fiore & Jeong, 2007).

This study was carried out using environmental psychology theory, which was accepted by many researchers, namely the S-O-R model by Mehrabian-Russell (Mehrabian & Russell, 1974). They assume that the relationship between the three variables is a stimulus-organism reaction.

Ecotourism Experiential Value (EEV): Customers are looking more toward the value they will receive, the options being offered, and the experience they gain. From the retailing point of view (Keng, Huang, Zheng & Hsu, 2007; Mathwick, Malhotra & Rigdon, 2001) experience in the services sector plays a very critical and important role. Therefore, retailers need to focus on providing the environment with fun elements, entertainment with fun and promoting greater participation among consumers. In this research, experimental value means 'Preferred, relativistic priority for product characteristics or service performance that yield from interactions in usage settings that facilitates or obstructs the achievement of customer goals" (Mathwick, Malhotra & Rigdon, 1997) And in the context of this research also, the value concept of ecotourism experience (EEV) is seen as a beneficial when it involved in ecotourism product offerings and services. These EEV estimates will be based on the value of the ecotourist gained. The enrichment of knowledge when visiting this ecotourism spot and feeling the excitement deviates to a new one when immersed in the ecotourism environment Bitner, W. Faranda, A. Hubbert, and V. Zeithaml, 1997; Pine & Gilmore, 1999). EEV is conceptualized as an experience-based value consisting of aesthetics, excellent service, social, return on customer investment, education component and escapism; hence it is a hierarchical model. Bitner and Brown (2000) suggest that the level of experience value utilization can affect customer satisfaction and subsequently loyalty.

Total Ecotourist Experience Quality (TEQ): Literature is very limited in the field of research that engages the customer experience as the concept since it is new and has begun to gain a lot of attention through the study of Macarenhas, Kesavan and Bernacchi (2006) [9]. Many researchers have emphasized the importance of overall customer experience, as it will lead to lasting loyalty. Researchers also agreed that 'emotional

involvement' is also very important in all interactions between customers and sellers. They practice the total customer experience as a truly positive, interesting, enduring and social experience physically and emotionally across all major stages of one's consumption chain (Mascarenhas, Kesavan & Bernacchi, 2006). Customer experience is conceptualized as a customer affective response (attachment, advocate) when engaging and taking the offering of products and services. On the other hand, the quality of the experience is seen as the excellence or superiority of experience (Lemke, Clark & Wilson, 2010). The quality of experience in the ecotourism context revolves around every touch point during interaction with service providers and travel sites. It can be said that affective or emotional elements form the basis for evaluating the quality-of-service experience. In conclusion, this study focuses on the overall quality of customer experience and stimulus to respond to the sense of being served and maintained by its expectations or standards, throughout the holistic journey of consuming the ecotourism experience.

Aesthetics and Total Experience Quality: Aesthetics in tourism includes the sensory experiences resulting from the environment, architecture, art, and overall environment of a destination. According to Agapito, Valle, and Mendes (2020), aesthetics contributes meaningfully to generating unforgettable tourist experiences by engaging the senses, which in turn affects emotional responses and satisfaction levels. The study emphasizes those destinations with well-curated aesthetic elements, such as art installations, architectural beauty, and natural landscapes, enhance the sensory appeal and contribute to the overall positive perception of the destination. Furthermore, Kim and Kim (2019) highlight the importance of aesthetic value in heritage tourism. Their research displays that aesthetic gratitude for cultural heritage sites not only enhances tourists' satisfaction but also nurtures a deeper emotional connection with the destination. This connection is principally important in the context of cultural and heritage tourism, where the aesthetic experience is frequently secured to the historical and cultural significance of the site.

Total experience quality refers to the inclusive valuation of all aspects of a tourist's experience, together with service quality, environmental factors, and personal interactions. Current studies have shifted focus from individual elements of service quality to a more holistic understanding of the tourist experience. For example, Tsaur, Yen, and Yan (2018) claim that total experience quality covers both tangible and intangible elements, for instance, the emotional and psychological effects of the tourist experience. Their study proposes that destinations that prioritize a holistic approach to experience quality, integrating aesthetics, service, and emotional engagement, are more likely to accomplish high levels of tourist satisfaction and loyalty. A comparable study by Ali, Ryu, and Hussain (2018) underlines the part of experiential factors, as well as aesthetics, in enhancing total experience quality. The study finds that tourists' perceptions of beauty, design, and atmosphere meaningfully affect their total gratification and inclination to endorse the destination. This discovery brings into line with the larger understanding that total experience quality is a complex concept, where aesthetics plays a critical role.

The relationship between aesthetics and total experience quality is multifaceted and complex. According to a study by Oh, Fiore, and Jeong (2020), aesthetic experiences act as a mediator between service quality and overall satisfaction. The study highlights that the aesthetic appeal of a destination increases the apparent value of the experience, leading to higher satisfaction levels. This mediating role of aesthetics proposes that destinations that capitalize on creating aesthetically attractive environments can significantly increase their overall experience quality. Additionally, current research by Sthapit and Jiménez-Barreto (2019) discovers the role of co-creation in enhancing aesthetic experiences and total experience quality. The study suggests that when tourists are actively involved in the creation of their experiences, mainly in aesthetically rich environments, their overall satisfaction and perception of quality increase. This partaking approach not only improves the aesthetic value but then again also contributes to a more personalized and memorable experience.

Service Excellence and Total Experience Quality: Service excellence is a key driver of achievement in the tourism sector, impelling both customer satisfaction and competitive advantage. Based on Martínez and Del Bosque (2021), service excellence includes some dimensions, comprising reliability, responsiveness, empathy, assurance, and tangibles. These dimensions contribute to a whole service experience that can meaningfully strengthen the perceived quality of a tourism experience. In addition, a Study by Wu and Ko (2020) focuses on the significance of personalized service in achieving service excellence in tourism. The study showed that

personalization-adapting services to meet individual customer needs play a fundamental part in creating memorable experiences. This study recommends that service excellence is not just about high-quality service delivery but also about creating a unique and personalized experience for each customer. Furthermore, Kabadayi, Ozturk, and Bilgihan (2022) emphasize the role of digital technologies in improving service excellence. They discovered in what way the integration of technology in service delivery, for example, mobile apps and artificial intelligence, can develop service efficiency and customer satisfaction. The study claims that digital transformation in tourism services is essential for supporting service excellence in a fast-developing sector.

The relationship between service excellence and TEQ is well recognized in the literature, with many findings demonstrating that high levels of service excellence indicate higher TEQ. A study by Lee, Lee, and Choi (2020) studied the effect of service excellence on TEQ from the perspective of luxury hotels. Results establish that exceptional service quality, specifically in terms of responsiveness and empathy, considerably improves the overall quality of the guest experience, leading to higher satisfaction and loyalty. Likewise, Xu, Huang, and Su (2022) investigated the relationship between service quality and TEQ from the perspective of cultural tourism. Their results identify that service excellence in the areas of guiding services, cultural interpretation, and customer care significantly contributes to a positive overall experience. Furthermore, Kwon, Yoon, and Kim (2021) establish that engaged and motivated employees are more prone to deliver superior service, which in turn increases the overall experience quality.

The results from the current study have important effects on tourism management and service delivery. To attain service excellence and improve TEQ, the tourism sector must emphasize continuous training and development of their employees to ensure high levels of service quality. Personalized service, enabled by digital technologies, can also play a crucial role in creating memorable experiences for tourists (Wu & Ko, 2020). Furthermore, tourism businesses should deliberate incorporating customer feedback into their service improvement strategies to ensure that the services offered associate with customer expectations and contribute positively to TEQ. Ritchie and Hudson (2019) highlighted that understanding the factors that influence TEQ can assist businesses plan better experiences that boost customer satisfaction and loyalty.

Social and Total Experience Quality: Social interactions are a main factor in the tourism experience, impelling tourists' perceptions, satisfaction, and behavioral intentions. Cohen and Cohen (2019) explained that social interactions in tourism could be considered into three main categories: interactions with service providers, interactions with other tourists, and interactions with local communities. Each of these interactions contributes differently to the overall experience quality. Research by Wu, Li, and Park (2020) highlights the significance of positive social interactions with service providers in improving tourists' satisfaction and loyalty. Their analysis discovered that personalized and friendly interactions with staff significantly increase the perceived quality of the experience, leading to higher levels of satisfaction.

In addition, a study by Kim, Song, and Choe (2021) discovered the role of socialization in tourists' in-group travel situations. The analysis discovered that positive interactions and shared experiences among group members lead to a more enjoyable and memorable experience, improving the overall quality of the trip. This research highlights the importance of social bonds and communal experiences in tourism. Also, social interactions with local communities play an important role in TEQ. Hwang, Baloglu, and Choi (2022) explained that engaging with locals and partaking in cultural activities provide tourists with a greater understanding of the destination, leading to a more authentic and fulfilling experience. This report proposes that meaningful interactions with local communities can improve the emotional and cultural dimensions of the tourism experience and contribute to higher TEQ.

Research by Wang, Zhang, and Li (2020) studied the effect of social interactions on TEQ in the context of cultural tourism. They establish that meaningful interactions with local communities, such as participating in traditional ceremonies or festivals, significantly improve TEQ in offering tourists authentic and culturally amusing experiences. Likewise, research by Lee and Kim (2021) investigated the role of social interactions in luxury tourism. They discovered that personalized service and attention from staff, accompanied by positive interactions with other guests, contribute to a higher overall experience quality. This study underlines the significance of social interactions in producing a sense of exclusivity and personalized attention, which are the

main mechanisms of luxury tourism experiences. Besides that, in terms of adventure tourism, social interactions also play a vital role in determining TEQ. A study by Park, Lee, and Hwang (2022) showed that social interactions among participants in adventure activities, for example, group hiking or white-water rafting, improve the overall experience by nurturing a feeling of comradeship and shared achievement. This analysis indicates that social bonds and group dynamics are significant elements in shaping TEQ in adventure tourism settings.

The relationship between social factors and TEQ has important effects on tourism management and service delivery. Tourism businesses should emphasis on aiding positive social interactions between tourists, service providers, and local communities to improve TEQ. For instance, training employees to provide personalized and friendly service can increase the quality of interactions with tourists, leading to higher satisfaction and loyalty (Wu et al., 2020). Furthermore, tourism operators must deliberate producing opportunities for tourists to engage with local communities and participate in cultural activities. By promoting authentic and meaningful interactions, businesses can enhance the emotional and cultural dimensions of the experience, contributing to higher TEQ (Hwang et al., 2022). Marketing strategies should also highlight the social aspects of the tourism experience, emphasizing the chances for socialization, cultural exchange, and personalized service. By encouraging these components, tourism businesses can attract tourists who value social interactions and obtain a high-quality overall experience (Kim et al., 2021).

Customers' Return on Investment and Total Experience Quality: Customers' ROI in the tourism sector is complex, concerning financial, emotional, and experiential returns. Conventionally, ROI has been assessed based on the cost-benefit analysis of tourism investments from a business viewpoint. Nevertheless, from a consumer viewpoint, ROI is more subjective and tangled to the overall satisfaction and perceived value of the tourism experience. According to a study by Lee and Xue (2019), tourists reflect not only the direct financial costs but also the emotional satisfaction and the quality of the experiences when estimating their ROI. The research showed that the perceived value of the experience, when it surpasses the cost, improves customer satisfaction and raises the probability of recurrence visits (Lee & Xue, 2019).

Experience quality is a critical element of perceived ROI in tourism. Experience quality states the overall assessment of the tourism experience, including service quality, destination attributes, and personal interactions. A study by Ali, Hussain, and Raghavan (2020) highlights that high-quality experiences lead to higher perceived ROI among tourists. The study shows that when tourists perceive that they have received high-quality service, enjoyed unique attractions, and had meaningful interactions, they are more likely to feel that their investment was valuable. This sense of value improves their overall satisfaction and increases their willingness to return or recommend the destination to others (Ali et al., 2020).

Emotional and psychological returns are also important mechanisms of customers' ROI in tourism. These returns are regularly resulting from the feelings of joy, relaxation, and personal growth that tourists experience during their travels. A study by Zhang, Zhang, and Li (2021) discovered the relationship between emotional experiences and perceived ROI in luxury tourism. The results propose that tourists who experience strong positive emotions, such as happiness and contentment, during their trips report a higher ROI, although the financial costs are large. This underlines the importance of making emotionally appealing experiences to improve perceived ROI (Zhang et al., 2021).

Besides that, cultural and educational experiences also play a substantial role in shaping customers' ROI in tourism. Tourists who are involved in culturally inspiring activities or educational programs regularly perceive a higher ROI because these experiences offer lasting benefits, for example, increased knowledge and personal growth. According to a study by Packer and Ballantyne (2019), tourists who join educational tours or cultural exchanges report a higher perceived ROI, as these experiences contribute to their personal development and offer unique, memorable experiences. The study highlights that destinations offering educational and cultural experiences can improve tourists' perceived ROI, leading to greater satisfaction and recurrence visits (Packer & Ballantyne, 2019).

The literature indicates that the perceived ROI in tourism is closely linked to the total experience quality. High-quality experiences, particularly those that offer emotional, cultural, and educational value, significantly

enhance tourists' perceptions of ROI. This suggests that tourism providers should focus on delivering exceptional experience quality to ensure that customers feel their investment in travel is worthwhile, leading to higher satisfaction and loyalty.

Educational and Total Experience Quality: Educational tourism, a niche segment within the larger tourism sector, highlights the learning aspect of travel. It comprises activities for instance cultural tours, historical site visits, language immersion programs, and other forms of travel where education is a main goal. According to a study by Ritchie and Crouch (2020), the addition of educational content in tourism improves the intellectual engagement of tourists, leading to higher satisfaction levels and perceived value of the experience. The study illustrates that educational tourism not only improves the tourists' knowledge but also deepens their emotional connection to the destination, which is a significant contributor to overall experience quality (Ritchie & Crouch, 2020). Furthermore, heritage tourism is another area where education plays a critical role in determining the total experience quality. Interpretation, as a form of educational delivery in heritage sites, has been shown to significantly influence tourists' experiences. A study by Zhang et al. (2019) found that well-designed interpretive programs at heritage sites enhance visitors' understanding and appreciation of the cultural significance of the site, which in turn increases their overall satisfaction. The research suggests that when tourists feel they have gained new knowledge or insights from their visit, their perception of the quality of the experience is elevated (Zhang et al., 2019).

The concept of experiential learning in sustainable tourism is another area of interest. Experiential learning encompasses active participation in meaningful activities, where tourists learn through direct experience. A study by Packer and Ballantyne (2018) explored the impact of experiential learning programs on tourists' environmental awareness and overall experience quality. The study concluded that tourists who engage in experiential learning activities, such as eco-tours or conservation projects, report higher satisfaction levels and a stronger commitment to sustainable practices post-visit. This suggests that education, when integrated into tourism experiences, not only enhances the immediate quality of the experience but also promotes long-term positive outcomes (Packer & Ballantyne, 2018). Museums and cultural institutions are major examples of venues where education directly affects the total experience quality of visitors. Falk and Dierking (2019) examined the relationship between educational content delivery and visitor satisfaction in museum situations. Their study shows that interactive and engaging educational exhibits meaningfully improve the overall visitor experience. The study found that when visitors are actively involved in the learning process, they are more likely to have a positive and memorable experience, which enhances the perceived quality of their visit (Falk & Dierking, 2019).

Recent literature underscores the significant impact of education on the total experience quality in tourism. These findings suggest that integrating educational components into tourism experiences is a valuable strategy for improving overall experience quality and fostering deeper connections between tourists and destinations.

Escapism and Total Experience Quality: Escapism is a psychological concept that has long been related to tourism. It indicates the need to momentarily leave behind the routine, stress, and demands of everyday life in pursuit of leisure and freedom. As said by Kim, Lee, and Uysal (2019), escapism is one of the main reasons for travel, driving individuals to seek out new environments, activities, and experiences that offer a mental and emotional respite. Chen, Lin, and Kuo (2020) highlight the role of escapism in adventure and nature-based tourism where tourists requesting escape through adventure activities, such as hiking or diving, often experience a heightened sense of freedom and thrill, which considerably contributes to their overall satisfaction and well-being. The analysis also notes that the desire for escapism is narrowly related to the search for novelty and excitement, which are the main factors of the tourism experience. Besides, escapism has been discovered to influence the choice of destination and type of tourism. For example, a study by Wang, Li, and Song (2021) discovers the role of escapism in luxury tourism, where tourists look for exclusive and tranquil environments that offer a break from their chaotic lifestyles. The analysis implies that the desire to escape is an important aspect of the choice of high-end resorts and destinations that promise peace, privacy, and comfort.

In addition, a study by Lee, Lee, and Choe (2021) investigates the effect of escapism on TEQ in the aspect of wellness tourism. Tourists who requested escape through wellness activities, for example, spa treatments and meditation, testified higher levels of emotional satisfaction and overall experience quality. This recommends

that escapism can improve the emotional and psychological dimensions of TEQ. Relatedly, a study by Lin, Wu, and Tsai (2022) inspects the role of escapism in cultural tourism. The analysis initiated that tourists who engaged in cultural activities as a form of escapism, for example visiting museums or attending traditional festivals, experienced a deeper feel of completion and satisfaction. The study focuses on the cultural immersion afforded by these activities permits tourists to disengage from their normal environments and engage in meaningful and enriching experiences, thus improving TEQ. Also, research by Huang, Liu, and Li (2022) discovers the effect of escapism on TEQ in the setting of adventure tourism. The analysis establishes that the adventure and thrill accompanying adventure activities, for example, skydiving or white-water rafting, meaningfully contribute to the overall quality of the experience. The study recommends that the feeling of liberty and excitement provided by these activities fill the escapist desires of tourists, leading to higher TEQ.

Tourism operators should consider incorporating elements of escapism into their service offerings to cater to the emotional and psychological needs of tourists. For example, designing experiences that allow tourists to disconnect from their routine and immerse themselves in novel and exciting activities can enhance TEQ and lead to higher levels of satisfaction and loyalty (Chen et al., 2020). Moreover, marketing strategies should emphasize the escapist potential of tourism experiences, highlighting the mental and emotional benefits of travel. By promoting services that offer a break from the mundane, tourism businesses can attract tourists seeking escapism and enhance their overall experience quality (Wang et al., 2021).

Total Experience Quality and Attachment: Attachment in tourism is often studied through the lens of "place attachment," a psychological concept that defines the attachment between people and specific locations. Place attachment is multidimensional, encompassing emotional, functional, and symbolic relations to a place (Lewicka, 2019). Current findings have highlighted that place attachment is critical in determining tourist behavior, comprising repeat visitation, loyalty, and word-of-mouth recommendations. For example, a report by Ramkissoon, Smith, and Weiler (2019) discovers how place attachment affects environmental behaviors in ecotourism settings. They establish that tourists with strong emotional connections to a place are more likely to engage in pro-environmental behaviors, implying that attachment can improve the overall quality of the experience by nurturing a sense of responsibility and care for the destination.

Besides, Prayag et al. (2020) studied the role of place attachment in improving tourists' emotional experiences. Their results propose that strong place attachment can meaningfully intensify the positive emotions experienced during a trip, leading to a higher perception of TEQ. The relationship between attachment and TEQ is multifaceted and complex. Research implies that attachment can both directly and indirectly influence TEQ. A study by Zhang, Wu, and Buhalis (2022) discovered how place attachment mediates the relationship between experience quality and tourist satisfaction. They discovered that tourists with strong place attachments are inclined to sense higher TEQ, which in turn leads to greater satisfaction and loyalty. Furthermore, Yuksel, Yuksel, and Bilim (2020) recommend that attachment can act as a moderating factor in the relationship between TEQ and behavioral intentions, such as revisiting intentions and positive word-of-mouth. Their study displays that the stronger the attachment, the more likely tourists are to overlook minor flaws in the experience, thereby maintaining a high perception of TEQ.

Destination marketers can leverage place attachment by creating and promoting experiences that foster emotional connections with the destination. For instance, offering personalized services, emphasizing local culture, and ensuring environmental sustainability can enhance both attachment and TEQ (Zhang et al., 2022). Additionally, tourism operators can focus on creating memorable experiences that resonate emotionally with tourists, as this can lead to stronger attachment and higher TEQ. As suggested by Ramkissoon et al. (2019), encouraging responsible tourism behaviors can also strengthen the bond between tourists and the destination, contributing to a higher overall quality of experience.

Total Experience Quality and Advocate: Advocate behavior means the willingness of customers to recommend a destination or service to others, often seen as an expression of customer loyalty. Advocacy goes afar satisfaction, as it includes aggressively encouraging the service or destination to others. Current findings have focused on finding the backgrounds of advocate behavior in tourism. For example, Lu et al. (2021) discovered the relationship between destination image, service quality, and advocate behavior in the context of cultural tourism. They discovered that a positive destination image and high service quality significantly

enhance tourists' likelihood of advocating for the destination. Likewise, Rahman et al. (2022) studied the influence of emotional experiences on advocacy, exhibiting that tourists who have emotionally engaging and positive experiences are more likely to recommend the destination to others.

The relationship between advocate behavior and TEQ is vital for understanding how an inclusive and high-quality experience can lead to active promotion by tourists. Findings have recommended that TEQ act as a precursor to advocacy, as tourists who experience high-quality service across all dimensions are more likely to engage in advocate behavior. A study by Lee et al. (2020) underlined the direct impact of TEQ on advocacy in the context of luxury tourism. They establish that tourists who perceive high TEQ are not only more satisfied but also more likely to recommend the luxury destination to others, thus acting as advocates. Likewise, Al-Ansi and Han (2021) focused on the role of cultural and environmental factors in shaping TEQ and, subsequently, advocating behavior. They concluded that destinations that excel in delivering a holistic and high-quality experience are more likely to see their visitors become advocates.

Gender and Total Experience Quality: The recent study debates that gender forms the relationships between destination service quality (DSQ), destination affective image (DAI), and revisit intention (Tosun, Dedeoglu & Usakli, 2024). Undeniably, both the agency–communion theory and the empathizing–systemizing theory propose that the attitudes and behaviors of females and males can differ based on their social identities and biological structures (Bakan, 1966; Greenberg & Baron-Cohen, 2020). Earlier research has established that this variation is also apparent in consumption habits. Consistent with this, the tourism literature discloses that the factors influencing the attitudinal loyalty of tourists may vary depending on their gender (Boo et al., 2013; Dedeoğlu et al., 2016; Suki, 2014; Yang et al., 2022). Nonetheless, it is worth noticing that studies on how gender shapes the effect of DSQ on DAI and revisits intention is limited (Aliedan et al., 2021; Dedeoglu, 2019; Dedeoğlu et al., 2016), representing a significant gap in the literature. This study mainly pursues to address this research gap and extend the remaining body of research in tourism by examining how gender moderates the relationships among DSQ, DAI, and tourists' revisit intention. Highlighting the role of gender in shaping DSQ, DAI, and revisit intention can afford a deeper understanding of personalized marketing strategies that boost visitor loyalty.

Besides that, a study by Tosun, Dedeoglu & Usakli, (2024) examines the moderating role of gender on the relationships between destination service quality, affective image, and revisit intention. The results show that "*accommodation*, *local transport*, *hospitality,* and *airport services*" have positive effects on affective image, and affective image, in turn, positively influences revisit intention. The study also discloses three significant results concerning the moderating role of gender. Whereas the positive impact of *hospitality* on the affective image was found to be stronger for female visitors, the positive impacts of *local transport* and *airport services* on the affective image were found to be stronger for male visitors.

Figure 1 signifies the conceptual framework between factors affecting Total Experience Quality and further influencing the attachment and advocate. Thus, the study hypothesizes:
H1: There was a significant positive relationship between Aesthetic and Total Experience Quality
H2: There was a significant positive relationship between Service Excellent and Total Experience Quality
H3: There was a significant positive relationship between Social and Total Experience Quality
H4: There was a significant positive relationship between CROI and Total Experience Quality
H5: There was a significant positive relationship between Educational and Total Experience Quality
H6: There was a significant positive relationship between Escapism and Total Experience Quality
H7: There was a significant positive relationship between Total Experience Quality and Attachment
H8: There was a significant positive relationship between Total Experience Quality and Advocate

3. Research Methodology

Questionnaires are developed by adapting previous research done to suit the current study. The findings from the focus group sessions are also taken into consideration. The process is then followed by an interview session and validation of the questionnaire with two industry personnel in the eco-tourism and also professors who are experts in the area of study.

Data were then collected at Taman Negara in Malaysia. 243 respondents completed the questionnaire and deemed it to be valid. Respondent ranges from age above 20 to 60 years old. Since this is an exploratory study, therefore these usable data were then analyzed using Smart Partial Least Squares (SmartPLS) version 4.1.0.6.

Figure 1: Conceptual Framework
4. Results

Validity was measured by using two criteria, which were convergent validity and discriminant validity. Convergent validity consists of factor loadings, average variance extracted (AVE) and composite reliability (CR) as in Table 1. Within this study, the factor loadings mostly exceeded 0.620 at the acceptance rate of 0.6 (Hair, Hult, Ringle & Sarstedt, 2017). The factor loadings ranged from 0.625 to 0.935. The AVE of the result indicates that all the variables have a value greater than 0.5, which means that less error remains (Hair, Babin & Anderson, 2010). The highest AVE is CROI which is 0.801 followed by Escapism 0.682. The lowest AVE is Advocate, which is 0.530. While the lowest CR value was 0.771, which was above the cut-off point of 0.7 (Hair, Hult, Ringle & Sarstedt, 2017). Based on Table 1, it is initiated that all of the AVE and CR values are more than 0.5 and 0.7 respectively.

While discriminant validity using the Heterotrait-monotrait ratio (HTMT) is summarized in Table 2. HTMT analysis summarized in Table 2 also showed that all the values are below 0.90. Hence, all variables achieved reliable and valid results (Hair, Hult, Ringle & Sarstedt, 2017).

Discussion
The results shown in Table 3 indicate that gender moderates the relationship between Aesthetics and CROI toward Total Experience Quality, where Aesthetics is the main concern for male tourists with a significant positive relationship at a 99% confidence level toward Total Experience Quality. Meanwhile, CROI is the main concern for female tourists with a significant positive relationship at a 95% confidence level toward Total Experience Quality. The findings are consistent with studies by Boo et al., (2013), Dedeoğlu et al., (2016),

Suki, (2014) and Yang et al., (2022). Unexpectedly, contradicting previous studies, Service Excellent, Social and Escapism did not influence their total experience quality for both genders.

Table 1: Convergent Validity (Factor Loadings, CR and AVE)

Construct	Items	Factor Loadings	Composite Reliability (CR)	Average Variance Extracted (AVE)	R-square

*** indicates significance at a 99% confidence level
** indicates significance at a 95% confidence level
* indicates significance at a 90% confidence level

It is also found that education is a factor that affects Total Experience Quality for both male and female tourists with a positive relationship at a 99% confidence level toward Total Experience Quality. Besides that Total Experience Quality was found to have a significant positive impact on Attachment and Advocate for both male and female tourists with a significant positive relationship at a 99% confidence level.

5. Managerial Implications and Recommendations

This study found gender roles in factors affecting the total experience quality of tourists particularly in the eco-tourism industry. Thus, it is recommended that the service provider of the eco-tourism industry highlight aesthetics in attracting male tourists while focusing on customer return on investment in influencing female tourists. In addition, in targeting both male and female tourists, the service provider of the eco-tourism industry might highlight on educational aspect.

Since this study is limited to forest nature eco-tourism in Taman Negara, future study is recommended to observe another type of Eco-Tourism such as marine eco-tourism to get further validation on gender roles towards the relationship between factors affecting Total Experience Quality in Eco-Tourism.

Conclusion
